## FOREWORD OF THE AESOP PRESIDENT

Dear members and friends of the AESOP community,

Welcome in Prague for the 2015 annual AESOP Congress!

In these challenging and troubled times, the unpredictable and contested nature of our shared spaces forces us to develop innovative planning research, in the light of intellectual freedom, democratic enhancement of differences, cooperation, ethics and justice. This requires a deep sense of responsibility, individually as well as collectively, considering our ethical sensitivity, civic engagement and research commitment as parts of a wider social practice.

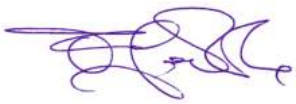
This issue – and the consequential dialectical tension – is at the core of the AESOP Prague Congress; in fact, the gap between sprawled powers and blurred sense of responsibility is the focus of the 2015 Congress debates. According to its intriguing title “Definite space – fuzzy responsibility”, the Prague Congress asks us: who should take responsibility for how cities and regions are being changed? Our community will face this difficult question, with hundreds of papers and presences in Prague. This is a great occasion in order to consider whether anything systematic can be said about how such ethical and political issues arise, hence how they might be understood, and addressed today.

The AESOP Prague Congress also provides an opportunity for researchers in planning to think about the implications for their work of the changes in governance and planning which have been both a spur for, and object of, their academic work. In large measure, these derive from a perennial set of ethical issues surrounding research which seeks to inform public policy. There are ethical challenges which are distinctive of the kind of research which at least some planning researchers undertake, in contexts of social tension and/or conflict, sometimes associated with clear oppression and injustice. These circumstances are only more extreme versions of the challenge to any planning scholar, because the definition and use of space is bound up with social justice in the broadest sense, and the way power – and governmental responsibility – is exercised in society.

Consequently, one of the purposes of the Congress is to explore ways of thinking about planning which considers the social context of ethical perception and public political behaviour. By doing this, we hope to shift the emphasis of discussion from individual and/or occasional probity to those circumstances that help planners and public officials develop and use sound ethical judgement: in public life, in society, in our cities as well as in our schools. Although the moral landscape within which planning is undertaken is not an easy one to read or traverse, the Conference debate and contributions will certainly identify significant planning issues which can constitute part of an agenda for discussion among researchers and policy-makers.

Due to the excellent and terrific work of the Prague Local Organizing Committee, the AESOP Congress 2015 is providing the best environment for all this, and I wish a fruitful and intellectually attractive experience to all the participants!

Francesco Lo Piccolo



## CONGRESS THEME

### Definite space – blurred / fuzzy responsibility

***While many of the initiatives and powers moved outside public control, the sense of responsibility for spatial change and sustainable development of cities and regions hardly overstepped the domain of city halls and ministries, and planners as their experts. The gap between sprawled powers / potency and blurred sense of responsibility should be the focus of the Congress debates.***

Our cities are spreading, the distances that most of us have to travel for jobs, shopping, entertainment, etc. are steadily increasing, and money available for maintenance and improvement of roads, utilities and public services is shrinking. Rich people are retiring to gated communities while some others may remain trapped in social and ethnic ghettoes.

All these problems are expected to be tackled by planning as an instrument for urban and regional management. But planning itself was affected by drift from hierarchic control by state and local governments, through public-private partnership projects, to governance where the actual field of municipalities´ and states´ action is dissolved and shared with business. Also many services formerly provided by public domain have been outsourced. Who should take responsibility for how the cities and regions are being changed?

## LOC MEMBERS

**Chair**

Professor Zdeněk Zavřel, Vice-Dean, Faculty of Architecture, Czech Technical University in Prague

**Executive Chair**

Professor Karel Maier, Czech Technical University in Prague

Arch. Petr Durdík, President of the Association of Urbanism and Planning

Prof. Maroš Finka, Slovak Technology University in Bratislava – PhD workshop

Arch. Jan Kasl, planning practitioner, Ex-Mayor of Prague

Prof. Ladislav Lábus, the Dean of the Faculty of Architecture, Czech Technical University in Prague

Prof. Vojtěch Petráček, Vice-Rector of the Czech Technical University in Prague

Arch. Ivan Plicka, Chair of the Czech Chamber of Architects

Tomáš Sklenář, Ministry of Regional Development of the Czech Republic

Dr. Matěj Stropnický, Vice-Mayor of the Capital City of Prague

Dr. Jakub Vorel, Vice-Dean, Faculty of Architecture, Czech Technical University in Prague

**Contact person**

Vít Řezáč

**Executive part**

Irena Benešová, Veronika Brejchová (GUARANT – congress organiser), Zuzana Krmelová, Milan Macoun, Kateřina Rottová, Martin Šilha, Jana Tóthová, Daniel Zahrádka, Petra Zhřívalová

## KEYNOTE SPEAKERS

### Peter Mehlbye

Peter Mehlbye is Director of the Coordination Unit for the ESPON Programme since 2002. Before coming to ESPON, Peter worked in a Danish Ministry as Head of Unit for national spatial development and planning, regional policy and international cooperation, attached to the cabinet of the Minister. He then worked at the European Commission, DG Regional Policy, where he was involved in the conceptual development of EU regional policy, including the European Spatial Development Perspective.

By education Peter holds a master degree in Economics and a master degree in Architecture, specialised in regional development and spatial planning.

**The European Territory – Policy dynamics, territorial trends, governance challenges and long-term futures?**

New times and decisive game changers are emerging that will influence European space. The digital revolution and the accelerating global interdependencies of European regions and cities in the world economy are among the important ones. This happens in times of crisis and economic recovery, with continued calls for innovation, growth and more jobs. At the same time, Europe is ageing and experiencing internal and external migration flows, largely driven by economic concerns and emerging life style changes that may redefine the “hot” places within the European territory.

The economic downturn from 2008 affected economies in some countries, their regions and cities, and had more important negative consequences in some places than in others. The resilience of individual regions and cities were not equal, the economic conditions and governance defence was not in place everywhere to limit impacts, and despite many today have recovered to levels before the crisis or even beyond, there are still parts of Europe and specific types of regions and cities suffering. The Greek example shows that the recovery is still not stable and that more could happen.

Current trends, fuelled extra by the crisis, has accentuated territorial concentration forces within Europe where more developed, urban areas, in particular metropolitan regions, stand out as key drivers and magnets of activities and investments. The positive growth rates in second tier cities before the crisis, above the level of capital cities in many countries, has been fading out, and the positive regional convergence process within Europe until 2008 has due to many sources experienced a 10-15 years set-back. All in all, these developments have dragged the territorial structure at European level towards a stronger European core and given more importance to metropolitan agglomerations, capitals and the larger cities.

The current policy debate related to territorial cohesion and urban policy focus on these trends and developments. The basic mindset in this policy arena is to counteract territorial concentration and stimulate a balanced and polycentric Europe. Several issues are currently on the policy agenda: A European attention to small and medium sized urban areas and new emerging inner peripheries within countries, focus on polycentric benefits from cooperation of neighbouring towns, cities and larger urban agglomerations across all borders, national, regional and municipal, an EU Urban Agenda reinvigorating an urban policy discussion, to mention but a few. On the latter, lately, EU Member States agreed on a declaration in Riga building up to further towards further urban policy focus at the Dutch EU Presidency in 2016.

However, framing these policy considerations in the era of rapid globalisation seems to require a stronger global sensitivity and perspective. That is why a reference framework at European level for the European territory in the long term is being considered that could act as guidance

or reference for different sectors and for the responsible decision makers and bodies at different administrative levels. In the current European reality with strong positions of EU Member States, this is for sure a particular challenge to install a shared responsibility and ownership and to promote horizontal and vertical coordination and multi-level governance for its implementation.

Nevertheless, the Luxembourg EU Presidency has taken up the challenge of starting the discussion of scenarios and visioning for the European territory during autumn 2015. A special emphasis is expected on raising awareness of likely consequences of different territorial scenarios. An important input for this policy discussion is the ESPON project on Vision and Scenarios for the European Territory 2050 proposing the long-term aim of an “Open and Polycentric European Territory 2050”.

The key note speech will address relevant issues related to the policy dynamics, territorial trends, governance challenges and long-term futures set out above with the purpose of providing a context for the discussion of the conference theme “Definite spaces versus fuzzy responsibilities”. Recent ESPON territorial evidence will be displayed to underpin key messages, and in addition, the speech will address the future ESPON 2020 Cooperation Programme and inform about the objectives and opportunities for AESOP members that the programme will offer.

### Insurgent Planners and the Spectral Return of the Political in the Post-Democratic City

Over the summer of 2013, the Taksim Square revolt in Istanbul and the Brazilian urban insurgencies rocked the established urban order, with still uncertain and largely unpredictable outcomes. Rumanian activists mobilise Occupy!-type tactics to fight against accumulation by dispossession and threatened socio-environmental destruction by Canadian company Gabriel Resources around planned gold-mining in Rosia Montana and against the pending restructuring and further privatization of the country's medical services.

These urban rebellions by insurgent planners are the latest in a long sequence of political insurgencies that erupted rather unexpectedly after Mohamed Bouazizi's self-immolation on 17 December 2010 ignited the Tunisian revolution. During the magical year 2011, a seemingly never ending proliferation of urban rebellions sparked off by a variety of conditions and unfolding against the backdrop of very different historical and geographical contexts profoundly disturbed the apparently cosy neoliberal status-quo and disquieted various economic and political elites. There is nonetheless an uncanny choreographic affinity between the eruptions of discontent in cities as heterogeneous as Istanbul, Cairo, Tunis, Athens, Madrid, Lyon, Lisbon, Rome, New York, Tel Aviv, Chicago, Hong Kong, London, Berlin, Thessaloniki, Santiago, Stockholm, Barcelona, Montreal, Oakland, Sao Paulo, Bucharest, or Paris, among many others. The end of history proved to be remarkably short-lived as incipient political movements staged, albeit in often contradictory and confusing manners, a profound discontent with the state of the situation and choreographed new urban modes of being-in-common.

A wave of deeply political protest is rolling through the world's cities, whereby those who do not count demand a new constituent process for producing space politically. The era of urban social movements as the horizon of progressive urban struggles, celebrated ever since Manuel Castells' seminal 1980s book The City and the Grassroots (Castells 1993), seems to be over. A much more politicized if not radical mobilization, animated by insurgent urban planners, is increasingly choreographing the contemporary theatre of urban politicized struggle and conflict.

It is precisely the aftermath of such urban insurrections that provides the starting point for the arguments developed in this presentation. From a critical political perspective, the central question that has opened up, after the wave of insurgencies of the past few years petered out, revolves centrally around what to do and what to think next. Is there further thought and practice possible after the squares are cleared, the tents broken up, the energies dissipated, and everyday urban life resumes its routine practices?

This figure of the Post-Democratic City will be leitmotiv of this contribution. Taking our cue from Jacques Rancière, Slavoj Žižek, Chantal Mouffe, Mustafa Dikeç, Alain Badiou and assorted other critics of the cynical radicalism that has rendered critical theory and radical political praxis impotent and infertile in the face of the rapidly de-politicising gestures that pass for urban policy and politics in the contemporary neo-liberalising police order, we shall attempt to re-centre the political in contemporary debates on the urban. While taking the city as our point of entry, we shall develop the argument in four steps. The first part recovers the notion of the political and of the political polis from the debris of contemporary obsessions with governing, management, and urban polic(y)ing. A theoretical, yet eminently practical, position of what constitutes an urban political space will be enunciated. In the second section, the depoliticised condition of the late

capitalist urban will be explored, arguing that the urban frame has been thoroughly, and perhaps fatally, infested by an ordering that is thoroughly post-political and post-democratic. This evacuation of the political from the plane of immanence that defines the very possibility of the polis and the concomitant consolidation of an urban post-political arrangement runs, so we argue, parallel to the rise of a neo-liberal governmentality that has replaced debate, disagreement and dissensus with a series of technologies of governing that fuse around consensus, agreement, and technocratic environmental management. However, the incoherencies of the contemporary urban ordering, the excess and the gaps that are left in the interstices of the post-democratic urban order permits thinking through if not materially widening and occupying genuine political urban spaces. This will be the theme of the final section. While the city as polis may be dead, spaces of political engagement occur within the cracks, in-between the meshes and the strange inter-locations that shape places that contest the police order. It is here that utopias as concrete political interventions germinate.

## Iván Tosics

Head of the Metropolitan Research Institute, Budapest He is mathematician and sociologist, research fellow with long experience in urban sociology, strategic development, housing policy and EU regional policy issues.

### 25 Years After: The Development Path of The "East" of Europe

***The changes of post-socialist countries in 25 years: the transition and the new system***

Post-socialist countries became free 25 years ago and had high expectations for democracy and quick economic development. Both aims have been achieved to a given extent, however, not without ccontradictions and externalities.

The reality today in these countries is the dominance of market forces and the weak performance of the public sector. Economic development is accompanied with increase of inequalities between social strata, growing disparities between the layers of the settlement system, brain-waste through outmigration, car-dominated urban sprawl and market-based urban regeneration.

It is clear that compared to the original expectations something went wrong. The post-socialist countries have been affected by two sets of factors:

- the general features of the capitalist economic model, causing unequal development, loss of power and control by the state and local governments against market actors, growing inequalities between social groups, market dominated urban development and emerging segregation of the excluded
- the specificities of post-socialist transition, such as the politics-dominated allocation of the resources, corruption, urban development led by the coalition of political leaders with the investors (opportunity planning).

The presentation aims to focus on the second set of factors, highlighting the specificities of post-socialist development.

After a decade of slip to market economy, in the course of the 2000s some interesting policy initiatives emerged in post-socialist countries and cities to tackle to the above mentioned problems:

- integrated urban development through a top-down led new planning system of EU resources, ensuring also social proofing (Hungary)
- a new regional policy with the reinforcement of regional centers and initiating functional urban area planning (Poland)
- integrated and participative local regeneration with strong social goals (Hungary)

These policy innovations can be considered as good practices also on pan-European level.

Unfortunately most of them could not prevail for long: they did not become embedded enough into the policy-thinking and practice. Such multi-governance structures were mostly swept away by the changes in national and local politics towards top-down, power based authoritarian governments.

**The post-crisis period**

In the post-crisis period, in all parts of the EU there are a series of bottom-up initiatives and governance innovations observable. Many of such initiatives also mushroom in post-socialist cities.

However, there are large differences, how the established forms of political power react on these new initiatives in the different parts of Europe:

- in many of the core EU countries increasing flexibility can be observed from the side of public institutions in order to better accommodate the new bottom-up initiatives
- in the post-socialist countries there are only a few examples of taking the new initiatives on board; instead the new, pragmatic forms of political power push through drastic measures in order to strengthen their own top-down systems, leading to further aggravation of societal problems (e.g. new policies against the homeless and the most disadvantaged along the idea of "undeserving poor")

It can be rightly said that the new bottom-up initiatives and governance innovations in themselves do not guarantee a better and more just society (and are in fact controversial from the perspective of inclusion). However, if no chances are given to such initiatives through cooperation from the side of the public sector, the situation is much worse and much larger burden of the crisis is pushed on the poorest parts of society.

**Some outlook to the future**

Europe is facing serious challenges regarding energy and climate, economic competition, migration, social inequalities, etc., which jeopardise both the core and peripheries of Europe. Increasingly, cohesion inside and among countries, cities, regions and nations is vanishing vis-à-vis volatile economy, unsecurity and risks for future. Basic political problems have to be addressed, such as how to deal with populism and extremism. Can the shortcomings of representative democracy be compensated by giving more role to participative mechanisms? Will stakeholders and other actors of participation accept also their part of responsibility? Are the EU peripheries different in this respect from the core?

Different development scenarios for the EU are under discussion, such as heading towards more global efficiency (economy led development) or towards more equality/solidarity. Will the EU withstand the tension between the endeavour for global competitiveness and increasing disparities? Do Europeans feel responsibility for how their welfare is paid for?

Post-socialist countries and cities have proved once how positive for the "old Europe" it was to integrate these dynamic and ambitious countries and there were also some innovative policy solutions coming from these countries in the recent years. However, the political changes towards top-down power politics threaten to totally eliminate the positive role of these new democracies.

In urban terms, the key to reverse the recent unfortunate tendencies lies in enhancing the performance of the public sector towards more integrated planning. Special efforts have to be taken towards more participatory and socially inculsive development, enforcing the „social proofing" of all new development ideas.

The dominance of free-market economic policies over social and territorial considerations increases disparities. The EU should pay more attention to its peripheral areas and also an EU Urban Agenda could make steps into this direction – if having chances at all to be accepted in any meaningful form.

There are huge tasks to accomplish in politics, planning and governance to orientate the post-socialist countries towards a model which would help the EU to overcome its crisis and address the upcoming challenges.

## Matěj Stropnický

Deputy Mayor of the Capital City of Prague, actor, journalist. He is a graduate of journalism and international territorial studies at Charles University in Prague, subsequently also media studies. In 2014, has succeeded thanks to the preferential votes in the elections to the city of Prague and subsequently became Deputy Mayor for the area development plan.

## FULL PAPERS (ORAL PRESENTATIONS)

Arranged by tracks and name of the first author.

# TRACK 01

# Planning Theory and Methodologies: Towards an 'ethics of responsibility'?

## Track description

Co-chairs: **Willem Salet**, **Enrico Gualini**

Spaces for democratic politics and for the governance and regulation of the living environment are increasingly indeterminate: they are either 'fuzzy' or overtly contested, and so are the social and political responsibilities attached to them. Relevant agenda-setting and decision-making take place in multi-level and multi-scalar environments, and related multi-actor arenas are defined by practices and discourses in which the devolution/delegation and the sharing of responsibilities play a significant strategic role. On the one hand, this often threatens to result in dissolution of accountability, in a 'post-political' dispersion of a sense of public responsibility. This might disguise not only the established modes of regulation but also the underlying hegemonic practices and relations of power. On the other hand, several new forms of social mobilization and civic initiative bear the potential of radically questioning the way responsibilities for shaping the 'common good' in cities are traditionally defined, assigned and distributed.

Under such conditions, it is more than warranted for planning to critically reconsider itself with regard to this issue of repositioning public responsibility. How does planning theory conceptualize the question of democratic accountability in defining new forms of public responsibility? How does it cope with established routines of public interest while being challenged by new, more radical civic initiatives? The track welcomes papers which critically discuss current challenges to planning related to rethinking the meaning of public responsibility as well as papers which present significant experimental and/or methodological applications for addressing these challenges in practice.

# REEVALUATING THE ANALYTICAL POWER OF REGIME THEORY

Ilona Akkila

Aalto University, Ilona.akkila@aalto.fi

*How is urban space produced? Planners, politicians, building companies, real estate owners, investors, entrepreneurs and citizens are all entangled in the process, but the challenge is how to describe this complex, multi-actor process? Urban politics is a spatially and temporally bound process between the actors involved. There is no single institution or actor which explains the local political process; rather, there are several, dissonant actors cooperating on emerging agendas. The construction of power between them depends on the agenda, the composition of actors and their relations. To understand these intricate courses of action, I suggest the application of a case-sensitive urban regime analysis. Whilst regime theory is based on the context of North American cities in the 1980s and 1990s, it still offers an insightful analytical tool to investigate urban politics. Urban regime theory enables the examination of politics from the inside, rather than outside, similar to urban governance theory. Although urban regime theory has been accused of ethnocentrism, I believe it is suitable for research in European or even Nordic cities if one is sensitive to the legal, economic and political differences amongst different countries. I will illustrate this by presenting a case study I have conducted in Finland the city of Lahti. My aim has been to re-evaluate the analytical explanation power of regime theory in today´s Nordic city.*

Keywords: urban regime theory, city center, urban renewal

## 1. Urban renewal – from industrial to attractive?

This article reevaluates the analytical power of regime theory (Stone, 1989; Stoker & Mossberger, 1994) in explaining political processes especially in Nordic cities. The article is based on a case study conducted on city center renewal in the Finnish city of Lahti. The originally North-American regime theory has been used to describe relationships between the institutionally strong local state and financially powerful private business sector. Even though the theory has been accused of being a product of its time and for ethno-centrism (Pierre, 2014), I argue that the regime theory is still useful to examine local urban politics due to its focus on the dynamics and political process. It seems that no other theory offers such a clear-cut but societally all-encompassing way to approach local urban politics.

Lahti is a former industrial city that is known amongst other things as a winter sports city, its vivid past as an entrepreneur city and for its design school (Ahokas *et al.,* 2005). Inhabiting 100 000 people (a middle-size Finnish city), it is not a declining but neither is it particularly successful or attractive city. Two heavily trafficked roads intersect at the very commercial center of Lahti, which makes walking, cycling and lingering unpleasant (Akkila, 2013). The population is growing slowly due to regional in-migration, but structural issues make it lag behind. Lahti has a high unemployment rate, small amount of highly skilled jobs and less educated work force than other cities of similar size (TILDA statistics Lahti, 26.1.2015). Its location in Helsinki´s economic influence secures its position, but it does not guarantee success in the ever-tightening competition between cities (cp. Ache *et al*., 2008).

The strategy and master plan of Lahti state the city center urban renewal as one of the key goals. The city center should have more pedestrian areas and better bike routes, more residential buildings and it should become more accessible from outside. The aim of the renewal is to strengthen the city center in relation to the external shopping centers (Strategy of Lahti 2025, 2013; The goals of Lahti master plan 2025, 2013, pp.17–18.) Local, especially small, entrepreneurs have opposed to the pedestrian areas because they think it would be bad for their business.

This is not the first time the city of Lahti has made plans to regenerate the city center by decreasing the amount of cars and car spaces. The oldest such plan is from 1973. After that similar plans have been made regularly (Proposal for transport development in Lahti city center, 1973; Plan for transportation and environment in Lahti city center, 1988; Vision for Lahti city center, 2002).

Urban renewal projects are a popular way of boosting a city´s competitiveness and image, but they have also been questioned for their societal effects. Managerial and entrepreneurealistic policies, which increase the authority of private businesses, are often associated with such projects (Sager, 2011, p. 154; Harvey, 1989, p. 7). The city center of Lahti is also developed with the local business sector. On one hand this follows from the participatory planning obligations stated in the Finnish Land Use and Building Act (Finnish Land Use and Building Act 5.2.1999/132, 5 § & 6 §), on the other the businesses seem to have a more unofficial and pragmatic role in the local planning: They are included in the planning process due to their resistance of pedestrian areas.

Urban politics is viewed here from an interpretive perspective: politics is not bound to institutions or actors. Politics has the potential to emerge wherever via action political action (Keränen, 2014, p. 34; cp. Leino, 2006, p. 8). Political processes include increasing amount of civil society and private business actors. The relationships between city officials, elected local politicians and private business and their cooperation in the Finnish city Lahti are examined in order to see how regime theory fits to a Nordic context.

The research material consists of interviews with the city officials, planners, politicians, private businesses and local organizations and field notes from planning workshops for local businesses. The material is analyzed with intrepretative policy analysis, which views political processes as struggles to define political meanings (Häikiö & Leino, 2014).

## 1.1. Material and methods

A qualitative case study was chosen as a research method, since it enables a more in depth description of the topic (Laine *et al*., 2007, pp. 9-10). The research material consists of 19 interviews, which duration is approximately one hour each. In addition to that, field observations were conducted in three urban renewal workshops for local businesses.

The interviewees were chosen by elite research method that is based on their reputation and expertise (Kainulainen, 2000, pp. 290–291): the interviewees were asked who they thought were the central actors in the city center renewal so that one person led to the next interviewee. The method has proved to be suitable to small communities, such as municipalities (ibid.) In the end, four local politicians, four planners, three leading city officials, three real-estate owners, one representative of the local media, three representatives of the Lahti City -association and one regional development company Ladec representative. They form seven groups of actors: politicians, leading officials, planners, real estate owners, entrepreneurs´ association, local media and regional development company. The first four actor groups proved to be the most important ones.

I participated as an observant to three workshops, where urban renewal was planned in cooperation with the city, entrepreneurs, real estate owners, transport operators, and

organizations. In addition I participated two sessions where the workshops were planned by the consultants and council officers. These occasions were useful to gain an understanding of the relationships and positions between different actors. The fieldnotes were used as a complementary method to the interviews (Emerson *et al*., 2001).

The material was analyzed by using interpretative policy analysis, which views politics as a result of struggle over definition – who gets to define politics and who does not (Häikiö & Leino, 2014). Similar to regime theory, interpretative policy analysis focuses on structural power between the known official and the emerging actors. Political power is generated trough action. It is not limited only to official institutions. (ibid., p. 14; cp. Mossberger & Stoker, 2001, p. 829 or Pierre 1999, p.375.)

The scope of the research was limited to the city organization and businesses and associations in the city center. Research on regimes is often limited like this. It is justified by the fact that the citizens define the terms for the relationships between different actors. (Stone, 1989, p.184). Regional or state level actors were not involved in the research because the aim of the research was to understand the policy process on the local level.

## 2. Governance and regime theory

Research literature on urban politics is often based on North-American or English context, which differ significantly from the Nordic cities in their political, economic and juridical systems. This is something one needs to keep in mind.

Governance is a comprehensive way to describe urban politics. It goes beyond studying planning projects, it takes into consideration the political and economic forces within planning (cp. Häikiö, 2005, pp. 13–14). Governance describes the transformation from hierarchical, bureaucratic *government* to a more flexible and horizontal *governance*. Governance entails cooperation with private sector, such as local businesses, and possibly civil society actors (Pierre, 2014, pp.10–12; Healey, 2006, pp. 59, 206). Cooperation is necessary for the local government, since it cannot maintain its tasks without the economic resources of the private sector (Pierre, 2014, p. 10). Instead of official and institutional politics, research on governance focuses on the unofficial cooperation of private and public sector (ibid., p. 59). This cooperation, or relationship, is seen as an empirical question

(Pierre, 1999, pp. 375–376). Businesses influence on urban politics, but governance theory recognizes the authority of the public sector in relation to the private sector (Pierre, 2014, p.11.) The private and public sector are intertwined, and decision making power is constructed between them depending on the relationships between the actors and resources that are needed for the specific policy agenda.

Similar to local governance, urban regime theory focuses on unofficial governance networks and ways to cooperate (Kainulainen, 2000, pp. 292, 293; Stone, 1989, pp. 6-9). A regime is one type of local governance. But unlike governance, regimes do not exist in every city. Regimes are cooperation networks that are centered on the cooperation of the city organization and the local business elite.

Regime theory goes deeper in examining the local cooperation than governance theory, since it focuses on interaction between the local stakeholders, collective organization of action and problems that are involved with it. Whereas local governance is interested in politics viewed from the outside, urban regime theory describes the inner dynamics of urban politics (Pierre, 2014, p. 21; Häikiö, 2005). Regime theory has been described as a "middle way" theory, since it´s interest is not on specific institutions or the penetration of the private to the public sector, rather the long-term consensual cooperation between different actors (Mossberger & Stoker, 2001, p. 812).

Power is constructed between the local actors in both regime and governance theory. But unlike governance, regimes do not form unintentionally, but via conscious action and negotiation and it always involves influential private businesses. Regimes are a result of elitist urban politics: real political influence is open only to those who have the institutional, social and/or economic resources, the desire and motivation to cooperate and the ability to maintain it. (ibid., p.198.) Regime theory is thus essentially a political economy approach to urban space (Logan & Molotch 1987).

Regimes in continental Europe have often actors from civil society organizations and associations. Civil society organizations can also work as intermediaries between the local government and citizens (Stone, 2005, p. 314.) The role of none-elected public officials is central due to the broad public sector in continental Europe. (Stoker & Mossberger, 1994, pp. 198, 202; Stoker, 1997, p. 60.)

## 2.1. Regime types - an analytical tool

Characteristics of different regime types can be found within one city and the regimes also change trough time (Stoker & Mossberger, 1994, p. 208). Regime typification by Stoker and Mossberger consists of instrumental, organic and symbolic regimes. The typification describes the different aims, motivations, creation of a common agenda, quality of the coalition (competing or cohesive interests) and the exclusiveness or inclusiveness of a regime. (1994, p. 199.)

The instrumental regime is based on accomplishing short-term projects. The goal of an instrumental regime is the realization of projects and the actors are motivated by concrete results. (Stoker & Mossberger, 1994, p. 199.) The businesses are naturally motivated by the profit to be gained from the projects, politicians and non-elected officials by the reputation the project could bring or just of ”getting things done”. The civil society actors are often uninterested in cooperation unless they see how they could benefit from it. (ibid., p. 203.) Common understanding is created by material or immaterial incentives (ibid., p. 204.) Incentives are assumedly less common in Finnish cities, where local officials are obliged to treat businesses equally by law (Savikuja, 2003, p. 32). Instrumental regimes are exclusive: the actors do not want to share their resources or networks to outsiders (ibid., p. 207). The regime chooses projects based on the likelihood that they will be realized. Negotiation and bargaining, which help the identification of common interests, defines the relationships of the network (ibid., p. 206).

The organic regime´s aim is to retain the status quo political power relations. (Stoker & Mossberger, 1994, p.199). Its actors´ motivation is based on their dependency on the locality (ibid., p.203; Logan & Molotch 1987). The coalition´s common understanding stems from tradition, sense of community and social cohesion (ibid., p. 204). Actors are politically like-minded and those with competing interests are excluded from the regime (ibid., pp. 206-207). Organic regimes have a clear identity based on local history, traditions, or the locality. They do not have a need for growth or change, like the other two regime types. Organic regimes can be found in small cities that hold on to their small-town lifestyle and low taxes (cp. Stone, 1993: maintenance regimes; Stoker & Mossberger 1994: 199.) As the

globalization of economics and politics has proceeded, it is difficult to imagine purely organic regimes in a capitalist western city.

Symbolic regimes aim to change the ideology and/or image of the city (Stoker & Mossberger, 1994, p. 201). Regime´s actors are motivated by expressive politics that uses strategic symbols in order to change the local attitudes to the regime´s policy. The business actors are motivated by their concern for the success of the city; they might feel societal responcibility, guilt or just want to improve their own public image. The politicians and city officials are motivated by their concern for the local economy or desire to be seen as an innovator. (ibid., p. 203.) A common understanding is created by symbolic politics and political rhetorics (ibid., p. 205). Members of the coalition can have conflicting interests, but they might find a common understanding if they have a clear policy agenda. Symbolic regimes are more open to new actors than the other regime types because they need a broad legitimation to their policy (ibid., p. 201). These regimes are common in cities that are severely influenced by the economic structureal change or sluggish growth. They strive for growth, but based on commonly agreed values and visions. Symbolic regimes require change in people´s attitudes so that they accept the new policies. In this way the regime can mobilize even actors who have been negligent to its policy agenda. (1994, p. 201.) The regimes existence might also be result from absence or weakness of other coalitions. A symbolic regime can also be a transitional regime to a new type of governance (Ibid., pp. 201, 205, 209.)

## 3. Renewal- and businesscoalition in Lahti

The intreviews and workshops revealed that Lahti city center is a particular kind of planning processe for the following reasons: firstly, there are powerful business interest groups with differing views on how the city center should look like. They consist of entrepreneurs and real estate owners. This is challenging to city officials and planners, who are obliged to make participatory arrangements and plan “with the people and communities whose conditions and perquisities the plan influences or might influence considerably” (Finnish Land Use and Building Act 5.2.1999/132 5 § & 6 §). Secondly, real estate developers´ scope for action is limited by the fact that the city of Lahti is the largest land owner in the city center – it can therefore control the development by zoning. Thirdly, the public officials´, planners´ and elected politicians´ actions are limited by their duty to saguard common public interest and

treat businesses equally (Savikuja, 2003, p. 32). In other words, they cannot make planning solutions that advantage one business over another. Fourthly, protected sites that are nationally valuable are located in the city center, which sets limits to planning. Powerful interest groups, state as the majority land owner, public servants obligation to safeguard public interest and treat the businesses as equals and cultural heritage sites sets a framework for the local cooperation.

*In comparison to a master plan or a neighborhood project, the city center renewal is a more difficult task to conduct. Other projects are more straight-forward but the city center is a living organism: there are a multitude of stakeholders and every single one of them thinks theie opinion is the right one. City center involves a great deal of emotions, economy and action. Managing that is difficult. As a public official one can influence, but in a more limited manner than elsewhere. Zoning and plans are not enough to do it. A lot of other kind of wheeling and dealing is required.* (Planner)

Modes of transportation made a clear divide among the local actors. The "business-coalition" would like to keep the transportation system as it is, thus letting the cars drive trough and in the city center. The opposite group of actors, "the renewal-coalition", would like to transform the city center into more walkable, bicycle- and public transport –friendly. Motives of both coalitions are essentially economic: they aim for local growth, which is typical for symbolic regimes (Stoker & Mossberger, 1994, pp. 199–201). The two coalitions just have different means to maintain and increase growth: the former sees accessibility by car as the central means for growth, whereas the latter is in the opinion that a walkable, cycling and public transport –centered city is the best way to maintain and add growth.

*Some of the city officials and planners find it impossible to understand that people need to drive in the city center. Some of the public officials lack realism in where the money comes from. They don´t listen to politicians either.*
(Real estate developer)

*Take ten minutes from where ever, and you´re in the city center. I think Lahti could offer an easy lifestyle with all the services close by. Lahti´s proximity to Helsinki makes it easy to travel there by train to work, but Lahti and its city center need an image-reform.*
(Leading city official)

### 3.1. Poweful public officials and businesses as participants

The central role of non-elected public officials and planners was emphasized in the interviews. This corresponds to findings in previous Finnish and Nordic research (Niiranen

*et al*., 2013; Goldsmith & Larsen, 2004, pp. 121–122; Puustinen, 2006; Leino 2006, p. 141). This differs from the North-American context, where local politicians are central actors (Stoker & Mossberger, 1994, p. 198).

The interviewees thought that the public officials´s and politicians´ tasks are clearly divided: public officials are technical experts, who prepare matters for decisionmaking, and politicians decide upon them, often on a yes/no –basis. Politicians are expected to keep distance from the preparation and deliberative processes with the businesses or citizens. Politicians´ role in the city center regeneration is more distanced than the public officials´ or planners´. The politicians were not keen to take part in the urban redevelopment, because businesses were so much involved in it, and politicians could be accused for favoring a business or inside trading.

*City center businesses, especially big ones, might lean towards the political right wing. Our challenge is, how we can be objective so that we understand different interests of the stakeholders, but also understand, what common interest we have and how can we influence in their realization together.* (Local politician)

According to the interviewees position politicians take differ even within parties and seem to be based more on personal relations than partisan politics. In a small city, the politicians listen to their voters, such as business owners and real estate owners carefully. The interviewees thought that this leads to unpredictable policy making and wasting of public resources. Unlike in Laine and Peltonen´s (2003; Peltonen, 2004) or Nevalainen´s (2004a & b) regime reseach, Lahti lacked clear partisan alignments in city center planning.

*There is the yes- and the no-movement. And this does not go according to which political party one belongs, rather it goes right trough the parties.* (Local politician)

The interviewed real estate owners are in regular contact with the city planning office and they also have one to one meetings with the leading public officials. The public officials and politicians thought that local businesses need to be involved in the planning of the city center because without their investments the city center will fade away.

The ”Lahti City”-association is an organization for city center businesses and its aim is to keep the city center alive and active. It is funded partly by membership fees and partly by the city of Lahti. Its board members are business and real estate owners and there is also one

public official from the local government. According to the interviewees, the Lahti City-association is mainly seen as the advocate of city center businesses, but also as an extencion of the local government. In the latter sense its purpose is to be the mediator between the city and the businesses. These kinds of mediators are required when the local government does not have access to the participants whose support they need for the political processes (cp. Stone, 2005, p. 314). In Lahti´s case, the businesses felt alianeted from planning and decision-making and Lahti City-association brought them closer to the public officials.

According to Stone, the reason for local actors low motivation can be the experience of not being included in the decisionmaking process (2005, p. 315). The interviewees in Lahti said that the local business owners had become frustrated and cynical, because they felt that their voice was not heard. Previously, the city center development plans were represented to them at a quite final stage and they felt that they had no real influence on planning. In the past few years, new participatory actions, such as the mentioned workshops, have been taken to involve the businesses at an earlier stage, which has brought them and the city closer.

In the past few years, the role of Lahti City –association has grown and become more independent (cp. Akkila, 2013). The progress in construction and involving the entrepreneurs more closely have broadened and changed its role. The association has become more of a lobbyist for entrepreneurs´ and real estate developers´ viewpoints, whereas previously its role was ambiguous and weak (Akkila, 2013, p. 113). This change in role invokes certain questions. Lahti City -association is an advocate for private business interest. It does not have the mandate of public administration or elected representatives, rather it is the spokesperson of a limited group of actors: the association had 63 members in 2014 (Lahti City –association´s home page, 2014). As a co-funder, the city has a say to the associations´ actions, but according to the interviewees, the association and its members act fairly autonomously.

Nordic cities are known to have more distant relationships to the businesses than the Anglo-American ones (Pierre, 2014). Lahti City –association is a legitimate way for the city to be engaged with the businesses. When there is a neutral actor between the city officials and businesses, the city can not be blamed for too close relatioships to entrepreneurs or real estate developers. Still, the close cooperation between the city and Lahti City –association makes one wonder if the businesses gain too much power in terms of planning in comparison

to the ”resource-poorer” organizations and city-dwellers. According to the interviewees, there is no active residential association that is involved in the city center renewal.

As previous research has shown, the actors related to Lahti´s competitiveness are dispersed (Kanninen & Ylä-Anttila, 2011; Ache *et al*., 2008). Based on the interviews and workshops, the roles of regional development company Ladec´s and regional marketing company Lahti Region´s roles in urban renewal were unclear. Some interviewees said that because the companies are regional, not local, they do not participate in the city center renewal process. One real estate owner did find Lahti Region important in promoting its business and the city center. There were a few interviewees who thought the regional companies should be more involved in the process. The city center is an important part of the whole region, even the whole county. Considering the common interests of growth and attractiveness, it is surprising that the city and the regional companies do not work more closely together on the city center.

### 3.2. Demarcations of public, private and political

The city officials and politicians viewed cooperation with the local businesses necessary when the city center is in question.

*There are several issues the city can decide on and implement on its own. These issues are mostly attached to production of public services. But there are numerous issues which the city can not decide or implement on its own. For example urban planning requires a more flexible attitude: the only things we manage to do on our own are zoning and building the streets. A city remains quite empty if one settles with that.* (Leading city official)

The interviewed city officials and politicians were still divided on how much and what kind of public-private cooperation the city should conduct: does the city take the leading role and simply enable the businesses - or should private sector have more leeway in urban planning? On one side the interviewees stressed the need for more entrepreneurial and pro growth-governance, but on the other they limited their task to be a service provider and enabler of businesses.

*I think our planning projects are viewed mainly as transport and land use planning, but not as economic policy, even though it could be a more intregrated part of planning.* (Leading city official)

*The city´s task is only to provide infrastructure to businesses, not to support them.* (Planner)

*We can´t say to a developer or a business, that ´listen, you have to do this and this if you want to be located here´, Lahti´s leverage is not that big that we could set terms for businesses like they do in Helsinki. We have to be simultaneously growth-oriented but also official public authorities.* (Leading city official)

Lahti´s urban renewal process differs for example from Joensuu´s, where the urban development projects were driven by the local business elite (Nevalainen, 2004a, p. 19). The development projects in Lahti have been initiated and pushed by the local government. Even though some would like to see the city to take a more entrepreneurial stand in urban regeneration, the city still seems to have the authority in the city center.

In addition to the partisan incoherence there is a lack of political leadership when it comes to urban renewal. This was seen in voting situations, where decisions were made with one vote majorities. It was surprising that the themes environment and design were almost absent in the interviews, since they are often linked to urban renewal and central in the strategy and master plan of Lahti (Strategy of Lahti 2025, 2013; The goals of Lahti master plan 2025, 2013). The urban renewal appeared as a project to improve the space for existing and future businesses rather than long-sighted strategic planning of the whole city.

### 3.3. Towards a stronger local identity?

Stoker and Mossberger write that some cities, whose identity is built mostly on industrial production, can have difficulties to renew their identities (1994, p. 205). The interviews indicated that Lahti lacks a clear local identity, which would create a mental basis for urban renewal. Some interviewees thought that this could be a result of the rootlessness created by short industrial history, and the lack of human and cultural capital associated with it. Whereas some cities have turned that into a marketing strategy (e.g. Zukin, 2010), industrial past was not seen in as an asset in Lahti. The interviewees thought that entrepreneurial spirit, the combination of urban lifestyle and closeness to nature and the reputation of a sport city are central to Lahti´s identity.

*We are on our way of transforming from an old, industrial, chimney-city into something new, but the process is still going on.* (Local politician)

*I think the the mindset of the 1960s boom is still visible in the background in Lahti.There is this optimistic attitude and dynamic activity, which shows that we are not defeated. Lahti has a different kind of mental atmosphere, because it´s a city of athletes and businessmen.*
(Planner)

The local actors had no common vision, how Lahti´s identity could be strengthened. Letting the identity and image to develop genuingly from the city and not by making superficial marketing stunts was stressed. Similar to previous research, the interviewees believed that the beneficiary location close to Helsinki is the most essential factor for its success (Kanninen & Ylä-Anttila, 2011; Ache *et al*., 2008). Proximity to Helsinki assures Lahti´s growth, especially as a residential city.

Lahti´s position in the national city network as a an ”average” influences the local cooperation and city center renewal. It is a middle-size city, that is neither successful nor declining, has no significant concentration of commercial or technological businesses but its strategic location is beneficial. This has lead to a polarized development ideology: Lahti tries to compete with larger cites, but the proximity to Helsinki increases its competitiveness so that the renewal activities lack the wider local support.

## 4. Forming a common agenda

The central ideology in Lahti city center renewal is growth. The interviewees found increasing competitiveness and growth as the primary goals, but the measures to reach this divided the local actors into two coalitions. On one side is the pro-pedestrian, pro-renewal and politically “green” renewal coalition, and on the other the anti-pedestrian, pro-car, slightly right-wing (in economic policy) business coalition that aims to maintain the local power *status quo*. The divition into coalitions is not based on partisan politics; it is based more on the actors´ local personal relations and negotiations.

The leading city officials, planners and part of the politicians belong to the renewal coalition that resembles a symbolic regime (Stoker & Mossberger, 1994, p. 201). The coalition aims to change the physical image of the city center, but also further improve the whole image of Lahti to attract new investments, residents and tourists. The renewal coalition is motivated by the transformation from an industrial city into something else, and the assumed increase

in growth and competitiveness that follows. Typical to symbolic regimes, the actors had competing interests, but they were united by the aim of growth and competititveness. The renewal coalition was open to new actors, since it needed all possible support in order to go trough with the urban renewal and changing the image of the city. Even though the coalition resembles a symbolic regime, expressive politics that uses strategic symbols could not be detected in the interviews. The coalition aimed for a common purpose more practically: by trying to convince the businesses of the advantages of cooperation - this kind of use of incentives is more typical to instrumental regimes.

The business coalition is most similar to the organic regime type that aims to maintain the local political and business elite in power. The coalition´s interest is to keep the transport system in the city center the way it is: car-centered. The business coalition consists of city center entrepreneurs, real estate owners, and politicians. They lobby for their own economic interests via local politicians and Lahti City –association. The coalition is motivated by local dependency, thus the investments they have made in the city center (Logan & Molotch 1987). Changing the city center into a more pedestrian-friendly direction can have negative consequences to their businesses, since they have maximized the profit of their investment based on the current transport system. The politicians in the coalition listen to the business actors, because they want to keep in good terms with them and stay in the elitist coalition.

Nevertherless, the aim of growth and increasing the competitive potential of Lahti has brought the two coalitions closer to each other. The renewal coalition has had to mobilize the resources it needs for renewal (Stoker, 1997, p. 61), in this case the city center entrepreneurs and real estate owners who investi in the city. Lahti City –association has been a mediator of this resource mobilization (cp. Stone, 2005, p. 314) by bringing the city officials and businesses around the same table. The focus on growth and competitiveness resembles a symbolic regime, but unlike North American regimes, Lahti´s regime is run by leading city officials, who have an upper hand over the business actors. Their authority results from an active municipal zoning policy and the secured legal status of the public government.

However, the renewal coalition has not succeeded in its goal to change the whole city´s image. This would require a change in local ideology (Stoker & Mossberger, 1994, p. 201; Hynynen, 2000, p. 68). The coalition has not been able to link the urban renewal projects into the strategy of the city or some other “greater purpose” (Stone, 2005, p. 318), which the

business-coalition could join. The regime´s common sense of purpose has remained at a practical level similar to instrumental regimes. Change in ideology and image could be reinforced by the regional development companies and a stronger political leadership, which are currently absent. The leverage of city officials is not enough alone to implement the strategy or finding a common purpose.

The research shows that the power to produce urban space is mainly in the hands of the city officials due to the extensive preparation, expertise and legal position they posess. Also the bystander-position that the local politicians have adopted has increased the power of the city officials. The businesses have increased their influence via their early involvement into planning process. Nonetheless, it seems that the public and private sector are clearly separate entities in Lahti. The governance of urban renewal has a business-centered entrepreneurial and market-relying neoliberal ideology (Sager, 2011, p. 154; Harvey, 2008), but governance practices are publicly lead new public management, where the city organization is managed like a business corporation (Christensen & Lægreid, 2011).

Governance that is based on partnerships and unofficial practices has been idealized as the newcoming of direct, deliberative democracy (Blanco, 2013; Boelens, 2010; Häikiö, 2005). Nevertheless, networked and horizontal governance form has its downsides: if resourceful interest groups, such as local businesses, plan the city with city officials, and politicians take the role of a bystander, what is the role of representational democracy in urban politics? If the decisions are not made openly and chances to participate are unequal, the legitimacy of the planning process is challenged.

## 5. Local cooperation at the expence of representational democracy?

Unlike in regime theory, the public city officials were central actors instead of politicians in the Lahti city center urban renewal process (Stoker & Mossberger 1994: 198). In addistion to them the business owners and real estate developers gained a central role with the help of Lahti City –association. The politicians remained in the background and handed over their authority to the city officials. There were two coalitions in the city center: the urban renewal coalition that wants to change the city center into a more pedestrian, bike and mass transport –friendly direction and the business-coalition which wants to maintain the modes of transport car-centered. The former wants to change the city´s image and the latter wants to

keep the political and economic *status quo*. Both coalitions aim to increase local growth and competitiveness, but this is not enough to build a cohesive regime. The city center regeneration has been difficult because the two coalitions lack a shared ideological base. A "we-sense" could be created by stronger political leadership and involving the regional marketing companies into planning.

The residents´ voice might become neglected, beacuse there are no organized residential associations in the city center of Lahti and the city is cooperating tightly with the local businesses. Even tough there have been numerous hearing occasions and workshops for citizens there is no certainty that the gathered opinions travel as efficiently to the politicians as the business actors´. Business actors are fewer than citizens and organized and they have the resources that the city needs - therefore they get their voice heard more easily.

The relationship between participatory planning and representative democracy ought to be discussed more in urban studies. Participatory planning is always skewed. Ther is always a danger that stakeholders, who do not posess the required institutional or economic resources are set aside. A planning system, that priveledges one group over another is risking its legitimacy. Therefore representational democracy should secure democratic planning at first hand: politicians should openly engage in value discussions on planning. Participatory measures should not replace representative democracy.

Even though there were two opposite coalitions in Lahti city center urban renewal, the regime theory was suitable for studying the political process. The theory provided a necessary framework for studying the relations and dynamics between the local actors. The central advantage of regime theory is that it focuses on the inner dynamics of the local politics, which further enables the tracing of political power relations. The challenge is to develop a regime theory that fits the European context that would not take the North American coalition of politicians businesses as given.

# Meeting the Challenge of Public Responsibility: Planning as Institutional Design

E. R. Alexander

University of Wisconsin-Milwaukee, USA/APD, Tel-Aviv, Israel eralexander96@gmail.com

Keywords: planning, institutional design, public responsibility

## Abstract

Planning must "critically reconsider…the issue of repositioning public responsibility", our Track chairs said. This can be understood in several ways. One is as responsibility *to* publics, i.e. accountability, which involves public values. Another is as responsibility *of* the public, raising structural issues. A useful approach for addressing these is institutional design (ID). What is ID, who does it and where, are answered and reviewed. How ID is done involves knowledge and methods. Public values and their relationship to ID are explored. Here "repositioning" means prioritizing accountability vs. other values e.g. efficiency or equity. Concrete implications are developed in discussion of public value promotion and conflict.

Public responsibility in the structural sense conventionally refers to the public sector: state and government. Here "repositioning" means sharing responsibility with others: private actors and the market, NGOs and civil society. ID explores repositioning alternatives of non-traditional forms of governance and service delivery: public-private partnerships, outsourcing and privatization. Selected cases show relevant ID applications; for institutions effectuating public values and as arenas to mediate value conflicts: EU institutions, metro-regional planning in New York and Queensland, and military base closing in the USA; to reposition and share public responsibility: New Towns and planned communities in Britain and the USA, groundwater conservation in Apulia. The discussion and cases show how ID can help planners to effectively reposition public responsibility.

## 1. Introduction

Planning must "critically reconsider…the issue of repositioning public responsibility", our Track chairs said. This can be understood in several ways. One is as responsibility *to* publics, i.e. accountability, which involves public values. Another is as responsibility *of* the public, raising structural issues. A useful approach for addressing these is institutional design (ID).

Twenty years ago Judith Innes (1995) said: "Planning is institutional design", and while I would not go so far[1], seeing planning as ID is how these aspects of repositioning public responsibility can be confronted. A brief introduction to ID explains what ID is, who does it and where. How ID is done raises the issues of knowledge, methods and experience.

The relationship between planning, ID and public values is explored. Planning involves public values through its remit to represent the public interest. I will show how planning as ID can promote public values, and how ID is important in mediating conflict between opposing interests espousing different public values.

Public responsibility in the structural sense conventionally refers to the public sector: state and government. Here "repositioning" means sharing responsibility with others: private actors and the market, NGOs and civil society. ID explores repositioning alternatives of non-traditional forms of governance and service delivery: public-private partnerships, outsourcing and privatization.

Selected cases show ID applications relevant for each of these aspects of public responsibility. Cases involving public values include regulating strategic installations in the UK, EU institutions, metro-regional planning in New York and Queensland, Australia, and closing military bases in the USA. Structural repositioning cases include major infrastructure planning and delivery, new towns and planned communities in the US and the UK, and groundwater allocation in Apulia. The discussion and cases show how ID can help planners to effectively reposition public responsibility.

## 2. Institutional Design

*2.1 What is institutional design*

To understand institutional design, we have to define institutions. Institutions are:

> "the rules of the game in society…the humanly devised constraints that shape human interaction…complexes of norms and technologies that persist over time by serving collectively valued purposes…some have an organizational form, others exist as pervasive influences on behavior." (North, 1990, p. 3).

*Institutional design*, then, means designing institutions: devising and realizing rules, procedures and organizational structures to enable and constrain behavior and action and conform them to held values, achieve desired objectives or execute given tasks (Alexander, 2006: 4).

Many aspects of planning demand ID. There is the planning process itself, which becomes problematic when existing planning systems are flawed or inadequate. If a plan or policy includes new programs or projects, ID must say how these will be organized and implemented. When policy or plan implementation demands new organization or reorganization, legislation, regulation or new routines and procedures, ID will be needed.

*2.2 Institutional Design – where and who?*

Three “levels” are associated with different types of institutional design:

At the highest level institutional design is applied to whole societies or addresses significant macro-societal processes and institutions. This is sometimes called “constitution writing” (e.g. the U.S. Constitution and the EU and its institutions). But it also includes major national reorganizations and innovative strategic political-administrative programs, from the Justinian legal code to Roosevelt’s New Deal. The people engaged here are statesmen (if they succeed) and politicians (if they do not) and their advisors, usually administrators and lawyers.

The next level involves policy, planning and implementation structures and processes. This includes establishing and operating interorganizational networks, creating new organizations and transforming existing ones, and devising and applying incentives and constraints in the form of laws, regulations and resource deployment to develop and implement policies, programs, projects and plans. This is the level associated with planning, policy and program fields: economic development, energy, land-use planning and development control, housing, transportation and infrastructure, environmental policy, education, health and other social and human services.

At the lowest level we find intra-organizational institutional design, addressing organizational sub-units and small semi-formal or informal social units and processes: committees, teams, task forces, work groups etc. This occurs in every field, from the global corporation's "matrix" organization to the weekly poker club in Brady's Bar. Intended to ensure effective and timely task performance, this level engages anyone involved in initiating and managing an activity or process in an administrative-managerial role.

*2.3 Knowledge and practice*

Applying theoretical knowledge to institutional design is problematic, for four reasons. 1) Ignorance: because institutional design is a relatively new concept, it can only have a limited and eclectic knowledge-base. 2) The intrinsic nature of design, for which abstract scientific models or simple technologies are useless. 3) The ecological fallacy, which makes mechanical application of universal abstract knowledge problematic. 4) The multi-party nature of institutional design: often the first challenge is to get all the involved actors to agree on their common purposes. For these reasons and others the "Handbook of Institutional Design" will never be written, and it will be useless if it is.

Nevertheless, there are some concepts and areas of knowledge that may be helpful to the practitioner. One concept is governance, where institutional economics can be a useful tool for institutional analysis. Williamson's (1985, 1995) transaction cost theory offers a repertoire of forms of governance that reflect transaction related adaptations of the "perfect" market (Alexander, 2001). At the meso-level the concept of interorganizational coordination structures (Alexander, 1995) also presents some institutional design options. At the intra-organizational micro-level, agency theory (Miller, 1992) provides concepts and models that are essential for informed intra-organizational institutional design (Alexander, 2006, pp. 8-12).

The only conscious and deliberate effort to develop a systematic method for institutional analysis and design is Ostrom's IAD (Instititional Analysis and Development) framework, which is an indispensable source for the informed practitioner. Originating in her work on common resource pool associations (Ostrom, 1990), the IAD was subsequently extended and generalized (Ostrom, 2005) to enable its application to most types of institutions.

Another model offered (more implicitly) for institutional analysis and design is the ICD (Institutional Capacity Development) framework, which its authors (De Magalhaes, Healey and Madanipour, 2002; Healey, De Magalhaes and Pendelbury, 2003) developed for their studies of local governance transformation. Recently this model was applied to the case of Government (Federal) to Government (Indigenous) planning in Coastal British Columbia (Barry, 2012).

Institutional design is a relatively new concept: hence the paradoxical contrast between limited theoretical knowledge (discussed above) and the wealth of applied institutional design experience. The practitioner can share some of this experience through relevant case-studies (Alexander, 2006, pp. 12-24).

## 3. Planning and Institutional Design: the Public Interest and Public Values[2]

*The Public Interest* has always been important for planning, where it takes several forms. One is as a norm legitimating state-led land-use planning and development control. Another is as a professional

foundational principle and an ethical rule for professional practice, which is the form that applies to our discussion.

Planners in particular are required to advocate and promote the public interest, while the Public Interest is an acknowledged objective of state policy and action. In public administration it is associated with sound government and prescribed for state officials. In the judiciary, courts invoke the Public Interest as a decision criterion in private and administrative law[3]. There are various concepts of the Public Interest (Alexander, 2002.a).

For our purposes, the relevant ones involve dialogic-discursive applications. These include procedural concepts: a deontic approach is applied in legal adjudication, when courts define the Public Interest as compatibility with individual procedural rights; the dialogical approach is applied in the political arena when a specific substantive Public Interest is defined and operationalized for a particular case or issue, as policies develop through political discourse. A deontic approach can also combine a substantive focus with dialogic application, when administrative or legal review bodies judge a proposal's compatibility with acknowledged substantive rights[4].

Bozeman (2007) used the Public Interest to introduce *Public Values* into political discourse and policy debate, as an alternative to neo-liberalism limited to economic considerations. Public values, such as justice and equity, democracy and solidarity, transparency, accountability, and effectiveness, are counter posed to private value and utilitarian efficiency. But Bozeman goes into little detail on how the Public Interest actually inserts public values into political and policy agendas.

Detailed review of different concepts of the Public Interest suggests how its applications work to introduce public values into collective decisions and actions. In the dialogic process of identifying or determining what is in the public interest in a specific context, case, or issue, the participating actors express their particular interests (which may become subjects for bargaining and debate) and justify them by appeal to their basic values, which may also be contested. These may include general public values to which various parties may give different priorities (e.g. effectiveness vs equity or accountability) and instrumental values that relate to their interests and goals for the issue at hand.

For example, in the UK National Infrastructure Commission's deliberations on approval of major strategic facilities (e.g. power stations, LNG terminals) proponents of projects cited the need for efficient energy supply to meet rising demand and support the national economy, while opponents ("greens" and local interests) countered with the public values of conservation – of natural resources and the environment – and sustainability (linked to alternative energy sources that would inhibit global warming) that would be promoted by denying the application (McKay, Murray and Macintyre, 2012).
How important the link is between Public Values and the Public Interest becomes clear when we consider how many arenas there are for dialogic development of an agreed-upon Public Interest, and how often this happens. Administrative-managerial deliberation on adopting possible policies, programs or projects, administrative-regulatory review of projects submitted for permission or approval, and judicial review of disputed proposals take place almost everywhere and are happening almost all the time. This is true for the public and private sectors, and especially so for the interface between them, and applies in most societies – all those with democratic regimes that observe the rule-of-law.

When are institutions involved in these dialogic applications of the Public Interest? Their most important role is framing these discourses: all the arenas itemized above essentially serve as the institutional environment and context for the dialogic processes they host. This is clear from our examples: the corporation's management executive encapsulating private enterprise, the municipality's

budget committee and the County Planning Commission – the institution of government, and the District Circuit Court representing the legal system. Institutions also participate in the dialogic process itself, sometimes as social groupings such as economic sectors or interests, movements (e.g. "greens" or property-rights advocates) or as organizations-agencies. Institutional design, then, offers a way of effectuating public values through the institutions that channel them into collective discourse and action.

## 4. Sharing public responsibility: the role of institutional design

Conventional socio-economic and planning theories juxtapose planning and markets in dichotomous opposition, and most institutional analysis sees the "free" market as the default alternative. But the opposite applies to public responsibility, which is associated with public institutions – the state, government and public agencies - rather than non-state or private bodies. Repositioning public responsibility, then, must mean devolution of authority and power to act from traditional governments and public agencies, and sharing "public" responsibility with civil society and private organizations and institutions: associations, households, families and firms.

This is one of the "bread-and-butter" concerns in many of the issues and cases that involve ID in developing policies and plans, and designing, delivering and implementing programs and projects. At the highest "level", ID is engaged in shaping and reshaping institutions of countries in transitions. One such transition is from conventional-modern government to postmodern governance and "reshaping" representative to participative democracy (Dryzek, 1996). Another is the transformation of political-economic institutions in Eastern Europe from state controlled socio-economies to advanced social democracies (Offe, 1996).

In broad-scale social policy planning and related program design, ID is often invoked to meet this challenge. The ID and evolution of the UK welfare state, and the NHS in particular (Klein, 1996), is a prominent case in point. On the issue of national health services and related insurance and delivery programs comparison and evaluation of IDs between the UK, Canada, Scandinavia and the US is revealing[5]. The ID of social policies and programs focuses on the allocation of responsibilities in ways that reconcile effectiveness with accountability. This means looking at alternative assignments of planning, management and monitoring responsibilities, funding or financing sources, and in-field delivery functions between the various public agencies, NGOs, and private actors that make up the relevant policy-issue system, to assess and evaluate their implications.

Policies, programs and projects in planning-related areas - housing, urban revitalization and community development, settlement planning and regional development, and environmental planning and management – offer instructive cases that show how ID repositions public responsibility. One example is the varying and changing (over time) ID of public, social and affordable housing policies and programs between countries and socio-political cultures, e.g. the UK (with its "council housing"), the Netherlands and Scandinavia (with their active housing associations), Israel (declining state-led) and the US (federally funded decentralized and privatized) and their relative effectiveness[6]. Other examples are different IDs for regional development, new towns and planned communities, urban renewal and revitalization programs[7], and river basin management in Europe and the USA (Alexander, 1995).

In project planning and design, conventional approaches to "sharing public responsibility" reduce the question to the common dispute for or against privatization. A more sophisticated approach disaggregates the project planning and delivery process, to explore the consequences of private vs.

public provision of its relevant constituent elements, including their respective transaction costs. One main issue is *procurement*: public, private or a combination – public-private partnerships (PPPs) in various forms. These can involve alternative procurement structures and processes from design-build to design-build- finance-operate-maintain. Another is *financing:* public vs. private; here again PPPs are possible. Public or private financing raises the question of value capture – another way of repositioning public responsibility for funding – and alternative IDs for value capture , e.g. special assessments, special Districts, or PPPs based on land sequestration (Alexander, 2015.b).

## 5. Public Values in ID: Cases[8]

*5.1 The EU and its Institutions*

The painful emergence of agreed-upon institutional responses to the possible collapse of the Euro and the depression of EU economies illustrates how the dynamics of competing proposals reflect their proponents' public values – linked to their particular values and interests. Thus rival configurations and rules for the ECB's (European Central Bank) credit and support for EU banks and financial instruments, and emerging EU institutions to ensure member nations' fiscal responsibility[9], respond to member states' conflicting respective demands.

On the one hand austerity – reflecting the public values of economic discipline, independence and responsibility (effectuated through fiscal control from Brussels) is Germany's demand, endorsed by some of the northern EU members. On the other hand "growth" (supported by ECB credit and funding, and ultimately by mutualizing part of member states' debts) – reflecting the public values of solidarity and mutual support – is advocated by France, Italy and Spain, supported by the EU southern and eastern periphery.

Over the longer run, the design and evolution of EU institutions and their roles in developing and implementing EU policies illustrate the interplay between national interests and particular values and supranational European "community" interests in two alternative models. The intergovernmental model assigns primacy to national institutions and interests and prioritizes the public values of state sovereignty and independence. Here EU institutions are limited to a mediating role between national interests and values.

The "communautarian" model emphasizes the supranational aspect of EU institutions and prioritizes the values of community and solidarity linked with the value of economic efficiency, which was the incentive for the original European Common Market. EU institutions promote this model, seeing progress as ever increasing integration and evolution toward a federal state. These models explain European integration as a form of "dialectic structuralism" alternating "communautarian" periods of accelerated integration with slower intergovernmental intervals.

*5.2 Metropolitan-Regional Planning in New York and Queensland*[10]

Comparing the institutions that were set up for planning the metropolitan regions of New York (USA) and Queensland (Australia) offers some enlightening lessons in ID. The subjects of this comparison are the Committee on the Regional Plan of New York's development of the 1929 *Regional Plan of New York and its Environs*, and the institution and operation of a complex intergovernmental structure for the SEQ 2001 Project: preparing and implementing a plan for the metropolitan region of South East Queensland.

*New York:* In the first case, the personal initiative of a prominent banker led to the establishment of the Committee on the Regional Plan of New York to develop a plan for the metropolitan region. The Committee was an extra-governmental body representing primarily business and financial interests. It was supported by a professional (planner) head with a small (foundation funded) staff who applied the rational planning model to develop its plan. The Committee's isolation from its relevant social and institutional environment is the most striking thing about it. All its interactions with outside bodies were informal, limited to consultation and information exchange between officials and staffs. Consequently, rather than the Committee's emergent proposals influencing other planning in progress, outside plans and projects modified its metro-regional plan. The resulting plan was more a collage of existing proposals than an integrated vision of its own. In retrospect, the failure of the plan to realize its sponsors' aims can be attributed to the flaws in the institutional design of the planning process and its agents.

*Queensland*: The SEQ2001 project shows a successful application of ID, in a planning process that resolved the multiple actors' concerns about the distribution of power through a "cooperative partnership". The founding conference included 20 local governments, the existing regional organization, State and Commonwealth government agencies, and community and business groups.

The ID was a complex (but effective) planning process structured through several interlocking organizations. Its overall governance and policy direction was by an interorganizational group established by State government, the Regional Planning Advisory Group (RPAG), representing all the primary stakeholders, backed up by a more broadly-based Advisory Council. The RPAG was really a new planning organization with its own professional staff seconded from participating agencies. Overlapping the RPAG was the S.E. Queensland Organization of Councils (SEQROC) – a formal association of all the region's local governments – and its sub-regional affiliates. These provided the local government input to the regional planning process, the "bottom-up" component complementing the RPAG's "top-down" integration of the planning process.

Plan development was an interactive process over several years, ultimately producing the final plan SEQ2001 that was formally adopted by all the relevant governments through a binding Memorandum of Agreement. The evidence of the success of this ID is the outcome: an adopted regional plan with the same powers as a statutory plan, but its implementation is by agreement and contract, instead of law.

*- Comparison and discussion:* These two institutional designs of metropolitan-regional planning processes were driven by very different public values, which resembled each other only in their common procedural, rather than substantive, orientation. The New York case reflected its principal actors' values of scientific-technocratic rationality, while the values driving the Queensland case were very different, reflecting different actors in a different time.

The SEQ2001 project effectuated the espoused value of democratic participation in the institutional design of the planning process and its organizational structure. At the same time the ID served another public value that was equally important - effectiveness in goal-achievement - since no plan could be implemented that was not the product of all the stakeholders' participation in the planning process.

*5.3 Military base closing in the U.S .Congress*

For decades, closing major military bases in the USA was a problem, due to Congress' control over administration proposed budgets and expenditures. As a result, any proposed base closures were

deleted in the congressional oversight committees, whose senior members had a vested interest in keeping these bases in their constituencies. To solve this problem Congress had to find a face-saving way to allow the members of the powerful Armed Services Committees to make the base closure decisions to which they were entitled, while forcing them to decide to close some bases. A congressional commission developed a new three-stage decision-making process that was adopted by the appropriations committees.

In the first stage the Dept. of Defense presented a list of all the bases it wanted to close. In the second stage the committee set its agenda: a list of bases that were its own candidates for closing, by rigorously applying a set of criteria developed by the commission that included physical and operational considerations, "need" factors and cost saving potential. The final stage was voting, when committee members ranked all the bases on their list by priority for closing. Depending on the savings generated by each closure, this procedure always yielded a collective committee decision on how many and which bases to close to meet the framework budget.

This case illustrates how ID effectuates public values: here the congressional commission successfully reconciled two public values that often conflict. One is democracy, manifested in due process of the U.S. Congress and federal government. The other is effectiveness: deciding on feasible actions to achieve defined goals. The goal in this case is also a public value - fiscal discipline - and the new military base closure process was a reformed institutional framework to effectuate this public value.

## 6. Repositioning public responsibility: Cases

*6.1 New towns and planned communities*[11]

There have been striking changes over time in positioning public responsibility for planning and constructing new towns and planned communities. Up to the mid-1960's this was essentially undertaken by central government; later ID of public-sponsored new-settlement programs had increasing devolution to and participation by local governments, civil society (voluntary associations) and the private sector (developers and land development corporations)[12]. This is shown in the US Greenbelt and New Communities Development programs and the UK New Towns program.

The centralized model – conventional government-public planning and delivery, with varying IDs – applies to the earlier programs. The US Greenbelt program of the 1930s (part of Roosevelt's "New Deal" addressing the problems of the great Depression) was run by a new agency which was a subunit of the federal Resettlement Administration. The federal government was the public developer, doing the planning, land acquisition and development, construction and management of the three new towns it built, and funding the whole program. The government remained the landowner-administrator until the properties were sold to the residents[13] in the mid-1940s. The only exception to this centralization was in planning, which was done in coordination with existing State and municipal planning powers.

The UK New Towns program (which began in the late 1940s and continued into the 1970s) also followed this model, though with some important modifications over time. The government created a new agency as the public developer, a New Town Corporation, for each new town, immediately upon deciding on its general configuration and location. These Corporations were like private development corporations with two exceptions. Their funding was advanced by the Treasury, and they enjoyed planning powers that were preempted from their areas' local authorities. The early generations of New Towns were planned, developed, constructed and administered directly by their Corporations, which exercised close control over their development through most of the stages of their growth. Later

generations saw gradual relaxation of control with outsourcing of subarea planning and detailed planning and design to private developers who acquired large tracts of land[14]. These also saw much more public participation in planning their growth and much quicker devolution of political-administrative authority to the communities' newly constituted local authorities.

*6.2 Groundwater conservation in Apulia*

At a contrasting scale to the last cases, all national programs, this is an example of proposed ID to reposition public responsibility at the most local level, from a quasi-governmental district agency to specific areas' farmers. This exercise grew out of a critical review of Bruschetta and Giordano's (2015) analysis of problems in implementing groundwater protection policy in Apulia. Their description of the policy-action arena identified three relevant actors: the regional authority (regulator), the irrigation management consortium (water allocator-distributor) and the region's farmers (users)[15]. The problem was the failure to implement groundwater conservation policy through the consortium's price-setting, when farmers did not reduce their water consumption in response to higher water cost, but converted to more profitable (but more water-intensive) crops.

This is a classic ID problem: the irrigation management consortium should be a common resource pool association (Ostrom, 1990). Institutional analysis would show its present shortcomings, which are the source of the current problems. The most likely cause of the consortium's policy failure is flaws in its structure and governance, in particular its disconnection from the farmers who are the relevant users of the common resource. A secondary factor is the consortium's present simple water pricing and policy goal ("guarantee equal water distribution") which is inadequate to address the farmer-users' predictable strategic behavior.

A new ID would change the structure and governance of the irrigation management consortium to turn it into a common resource pool association. Following Ostrom's principles[16], these changes would restructure the organization to integrate the (now separate) farmers and "consortium" through a newly designed framework for collective governance and decision making. The new consortium could ration the available groundwater proportionally to use-benefit, by developing an irrigation water allocation model that would be run each year or season to arrive at a price schedule for irrigation water that is agreed-upon by the suppliers and the farmer-users. This model could be applied to vary between subareas, so that it would be administered collectively by the farmers in that subarea, which would ensure effective policy implementation.

## 7. Discussion

Above we see how practicing planning as ID can address two important aspects of "repositioning public responsibility". One relates to public values; the other involves structural devolution of public responsibility.

First, "repositioning" implies changing priorities between values, which leads to the links between planning, ID and public values. Public values concern planning because planning is charged with representing and promoting the public interest. Dialogic concepts of the Public Interest involve agreement on a case-specific public interest; this occurs whenever public agencies deliberate on adopting policies, programs or projects, or review projects submitted for permission or approval, and courts review disputed proposals. These are important channels and arenas for effectuating public values, and our cases show how ID of relevant processes and institutions can reposition public responsibility.

Next, "repositioning" can mean moving the locus of traditionally "public" responsibility; this is a classic challenge for ID at every level and in many fields. At the macro-level it can involve evolutionary "constitution writing" for socio-economic regimes (as in our cases of EU institutions and democratizing East European countries), but this concerns us less. The "meso"-level of ID is of more interest for planning, involving policy-making and planning with plan, program and project design and implementation. Relevant fields range from broad social policy and human services through strategic infrastructure planning and delivery, to multi-scale planning: from metro-regional to neighborhood-level community development.

ID alternatives to conventional public planning and regulation and program-project design and delivery include the common resource pool association (as in the Apulia groundwater case), inter-organizational collaborative planning (as in the SEQ2100 case), and PPPs in various configurations for infrastructure, settlement planning and land development, urban revitalization and community development – shown in other cases above.

Planning can reposition public responsibility through ID. Institutions can be designed to effectuate appropriate public values, such as democracy, transparency, and accountability. Through alternative ID planning can restructure institutions to devolve public responsibility from state agencies and share it with private actors and civil society.

## Notes

[1] All planning is not ID; many planning practices and activities do not involve ID at all.

[2] Much of this section is from Alexander (2015.a).

[3] For example, to void otherwise valid contracts in private law, and in U.S. anti-trust actions.

[4] These exist (usually) as institutional rights in various fields, e.g. health care, welfare, education etc. In planning they are called "planning rights" – for more detail see Alexander (2002.b)

[5] The literature on this is too extensive to cite here.

[6] This is a whole field of research and study in itself.

[7] See cases below.

[8] Condensed from Alexander (2015.a).

[9] Limitations of time and space prohibit going into any detail here.

[10] This case is based on Abbott (2009) and Alexander (2009).

[11] For sources, see Alexander (1995).

[12] Scandinavia is an exception: Sweden's new towns planning and development (1950s-70s) heavily involved local government (especially Stockholm municipality) while Finland's also engaged Helsinki city government and national housing associations.

[13] Previously their tenancy was by leasehold.

[14] This trend reached its climax in Milton Keynes, where the Corporation's planning and development responsibility was limited to the town's major infrastructure grid that framed its neighborhoods.

[15] Applying ambiguity analysis to this problem, the authors gave no information on these actors' institutional characteristics, and whether/how farmers are represented in the irrigation management consortium and participate in its governance.

# THE CODING TURN IN URBAN AND REGIONAL PLANNING: THE ROLE OF PLANNING INSTITUTIONS

Nurit Alfasi[1]

[1]Ben-Gurion University of the Negev, nurital@bgu.ac.il

Keywords (maximum 3): Planning Codes, Complexity, planning and democracy

**Abstract**

The paper deals with the growing tendency to articulate planning policies in principles and codes discussed in recent planning theory and reflected in planning practices. While this tool arouses interest and enthusiasm, very little attention is given to the way it affects planning thought and impacts – or should impact – the act of planning and the institutions involved. After discussing historical decision-making frameworks that applied planning codes, the paper turns to the decision-making frameworks designed to operate comprehensive land-use plans in regulatory planning systems, and to the problematics of zoning and outline plans as a regulatory device. It then discusses the meaning of the transition to planning codes and elaborates on the conditions to turn it into the dawn of a new, liberal and democratic planning framework for planning legislation.

## 1. Introduction: the long history of planning codes

Throughout the history of mankind, the development of the built environment was subjected to abstract principles and codes deduced from religious, cultural and political conducts. Alongside the construction of mega-sites by rulers and religious leaders, the development of cities and settlements was the mutual product of groups and individuals operating for their best interest subjected to social and environmental stipulations. For most of the time people shared and obeyed unwritten principles regarding the characteristics of built elements and the relations between them. Occasionally, codes and rules were explicitly articulated, specifying spatial demands.

This was the case, for example, with respect to the history of Mediterranean urbanism, described by Hakim (2001, 2008, 2014). In an early research, Hakim (2001) analyzes a treatise written in Ascalon, Palestine, in the years 531-533, delineating spatial relations between elements of the built environment. This treatise was later included in books of law published in the Balkans, Greece and in Slavic areas and has affected planning and building there until the first decades of the twentieth century. His later research (Hakim, 2014) related to Greece, Italy and Spain and covers more than two millennia of urban development according to codes and abstract principles. Akbar's (1988) research reveals similar conditions with respect to Middle Eastern, mostly Muslim cities, exposing un-written principles arranging the relation between the three basic associations to urban elements: ownership, control and use. These principles stemmed from Muslim point of view, according to Akbar (ibid.), and created a powerful set of rules directing the creation and management of the built environment. To his claim, these principles operated for centuries, until the late nineteen century and the intervention of modern states in issues of planning.

Abstract principles directed the production of the built environment in other parts of the world as well. Ashmore's (1981, 1991) researches reveal what she terms as "spatial patterning" governing the development of Mayan cities. While these archeological researches (see also: Willey and Bullard, 1965; Hutson, Magnoni, Mazeau & Stanton, 2006) do not present documented rules that relate to planning and building, the patterning is reflected from the spatial analysis of sites. Ashmore and Sabloff (2002, 202) deduce that the patterns express Maya beliefs regarding the positioning of elements and their directions, as well as "political affiliation through emulation of civic architecture at more revered or powerful places".

Needless to say, abstract principles and codes were responsible for most of the historical development of European cities. Logan (1976) describes building and planning codes that developed in German cities from the medieval period till the dawn of the twentieth century. Talen (2009) lists a long tradition of none-mapped (none-specific) regulations that affected the development of cities in Britain, France, The Netherlands, Germany, and throughout the Prussian empire. And so on.

**2. Modern planning and the dissipation of coding**

This long tradition of following abstract, formal and informal guidelines between elements of the built environment has abruptly changed with the spread of modern planning ideas. Particularly since the 1950s, urban planning is conducted by national and municipal institutions generating organized, top-to-bottom planning regulations meaning to plan the details of the built environment and to oversee the implementation. A plan-led regulatory planning (as opposed to the code- or principle-led planning of the past) is operating in most EU countries as well as the US, Japan and Australia. It is centered on zoning and statutory land-use plans both as the means to set an official visionary image of urban districts and as a major regulatory device. Against the qualitative and abstract rules that directed the slow-pace development of cultural spaces, Land-use plans were – and in many cases still are – meant to dictate *what* to build and *where* to build. As observed by Moroni (2010), the prevalent plan-led machinery is an end-state control-device aiming at *ordering* the actions of private people—as opposed to simply *regulating* them.

**3. The effect on the built environment: Between *an ordered* and *an organized* city**

Urbanists, planners and theoreticians relate to the differences between the *order* of built environments developing under pre-modern (i.e. code-led) and modern (i.e. plan-led) regulations. Resembling Jane Jacobs' (1961) understanding of the complexity and emergent order typifying free development of the built environment, Christopher Alexander (1965, 58) stated: "I want to call those cities which have arisen more or less spontaneously over many, many years *natural cities*. And I shall call those cities and parts of cities which have been deliberately created by designers and planners *artificial cities*". In fact, Alexander (1965, 1975, 1977, 1979) invested his career dealing with the question of order in planned – as opposed to "natural" – cities. He named the order of natural cities as "the quality without a name" (Alexander, 1979, xi) and claimed that "this quality […] cannot be made, but only generated, indirectly, by the actions of the people". In Alexander's work, the abstract codes and principles that regulate the emergence of this quality were named "patterns", and he defined the shared knowledge of the people engaged in creating the city "a pattern language". Very much like Jane Jacobs (1961), Alexander (ibid.) also spoke of places that are alive, and of living patters.

The idea of abstract codes – as opposed to specific land-use statutory plans – for enabling the emergence of *spontaneous order* in the built environment and the creation of living places was further elaborated by Portugali (1999, 2011), Alfasi and Portugali (2004, 2007, 2009), and Moroni (2007, 2010, 2014). The main claim of these writers is that for the planning machinery to acknowledge the complexity of the built environment, it should base on qualitative guidelines, codes, or rules, and that "such rules should equally apply to all the elements planned to be built in the city, including dwellings, businesses, industry, public buildings, and infrastructures" (Alfasi and Portugali, 2007, 170).

**4. Some problematic aspects of statutory land-use plans**

Today, the dis-functioning of top-to-bottom, organized, comprehensive planning is a shared knowledge among scholars. This is mainly due to the vast disappointment from land-use plans as the means of controlling the qualities of the built environment. Recent researches relate to the changing image of *flexibility* in planning: resulting from the expectation to sheer top-down development,

flexibility was considered as a problematic quality of land-use plan. In time, however, it became clear that comprehensive planning is incompatible with the actual dynamics of the built environment, and flexibility was interpreted as a positive and necessary quality (Tasan-Kok, 2008). In practice, flexibility was often achieved by circumventing, coercing, and amending land-use plans according to local and ad-hok circumstances (Cullingworth, 1994; Berry, 2001; Alfasi, 2006; Buitelaar & Sorel, 2010; Buitelaar, Galle & Sorel, 2011; Charney, 2013). Recent researches show that land-use and zoning maps are ineffective when it comes to achieving the basic purposes they were intended to achieve, as preventing sprawl and safeguarding open spaces from new development (Bramley & Kirk, 2005; Tian & Shen, 2011; Alfasi, Almagor & Benenson, 2012; Zhong, Mitchell, & Huang, 2014; York, Tuccillo, Boone, Bolin, Gentile, Schoon & Kane, 2014; Wang, Han & Lai, 2014Y; unos, Johar, & Sabri, 2015).

Another bothering fact stemming from the application of top-to-bottom statutory planning relates to the idea of *the rule of law*. In line with the poor performance of comprehensive land use plans, research reveals that in many places, the dominance of the statutory land use plan remains in the law books, while local amendments and spot-planning shape the actual development of the built environment (for example: Cullingworth, 1994; Alfasi, 2006; Buitelaar, Galle & Sorel, 2011). The authorization to perform such local amendments to the comprehensive plan usually remains in the hands of the same planning authority that fixed the initial land-use plan. This means that in many places, planning is conducted in a case-by-case manner without the leading power of an accepted, publicly articulated, and equal set of rules. Clearly, this conduct is also diverting the emergence of a spontaneous spatial order.

Moroni's (2007) claim is that zoning ordinances and master planning as means of regulation violate the liberal ideal of the rule of law. Specifically, to his claim, this practice contradicts principles as *impartiality* (i.e., that the law should apply equally to all), *stability* (i.e., that rules should enables citizens to have reliable expectations with regard to the actions of others, including the state itself), *Publicity* (i.e.. that laws are known and adequately publicised), and *non-retroactivity* (i.e., that laws are prospective and never retrospective). He further (Moroni, 2010) links planning regulation by means of abstract codes to the notion of *nomocracy*, while *teleocracy* is linked to authoritative regulation stemming from specific, end-purpose plan. Although both ways may be lawful and democratic, *nomocracy* is linked by Moroni (ibid.) to an indirect way of regulation that enables free action and complex result, subjected to clear yet abstract rules. At the same time, *teleocracy* is described as a direct approach, in which purpose-dependent directives are operated and simple end-solutions are created.

**5. Indications to a recent change**

In the last decade, the modern top-to-bottom planning practice is facing a gradual change. Inspired by principles of New Urbanism, there is an increasing interest in the role of codes and qualitative principles in urban planning. This interest is now affecting both planning theory and practice. Thus, in line with the ongoing entrenchment of American Form-Based Codes (Talen, 2009), and the recent consolidation of British Planning Policy Statements and Planning Policy Guidelines into the National Planning Policy Framework, there is evidence to planning in other countries gradually adopting a code- or principle-based approach to planning regulation. In addition, scholars show greater interest in past experiences with planning codes (Talen, 2011; Ben Joseph, 2005; Carmona, Marshall & Stevens, 2006). And, additional thought is given to the possibility of advancing the codes to general and abstract rules in a way that fits with the complexity of the built environment and the evolution of a spontaneous spatial order (Moroni, 2014).

**6. A new look on past coding traditions and the way they were implemented**

Still, if we want to see planning machineries that acknowledges the quality of complexity of the built environment, and if we want to provide the terms for spontaneous urban orders to emerge and enhance the development of cities, renewal of codes as means of regulation is not enough. We have to look at the way codes are used, how they are developed and determined and pay attention to the way they guide decision-making with respect to transitions in the built environment. In the past, the emergence of spatial spontaneous order in cities and places leaned on the fact that all parties involved – private people, craftsmen, salesmen, institutions etc. – shared the same "pattern language" and followed a collective set of codes. Alexander (1979, xiv), for example, expects that sharing of rules would lead people to act within their framework hence create a sufficient mechanism of planning and building, saying: "within the framework of a common language, millions of individual acts on buildings will together generate a town which is a live, and whole, and unpredictable, without control" (my underline). And, "it is a process which brings order out of nothing but ourselves; it cannot be attained, but it will happen of its own accord, if we only let it" (ibid.).

In line with Alexander's views, researchers relate to Middle Eastern urbanism as emerging without the precedence of comprehensive plans and the stemming control devices. Writers as Costello (1977), Grabar (1979) and Bianca (2000) enlarge on the effect of the socio-cultural code of Middle Eastern societies on the built environment. Their analysis refers mainly to the demand to preserve the privacy of dwellings and the integrity of the family but also to values like allowing accessibility to water resources and granting mutual rights of pre-emption for neighbors.

A clear reference to the decision-making procedure preceding planning and building is provided by Akbar (1988) who describes the habit of reaching an (often implicit) agreement between the owners, the adjacent neighbors and those controlling the land or building regarding the amendment or construction of urban elements. With the spatial code at the backdrop, the involved parties shared a safe ground for negotiating the development of the built environment and for understanding the consequences of their agreements. Similar terms – i.e. mutual agreements between neighbors who share the same set of abstract rules – were responsible to the magnificent urban order that developed in Paris, during and after Haussmann's massive transformation of the city's form and structure, in 1850-1870 (see: Hall, 1998; Pinon, 1999). Jordan (2004) claims that "The architects of the day shared a common vocabulary and needed no additional coercion to produce a homogeneous cityscape". He cites Pinon (1999, 218-9) regarding Boulevard Saint-Germain, where "owners and their neighbors should arrange between themselves to have, in each construction *îlot*, the same height for each floor in order to continue the principal lines of the façades and to make the entire *îlot* a single architectural ensemble".

Modern planning, however, interfered with the simple, horizontal manner of regulation operating in Paris as it did with the one operating in Middle Eastern cities. Modern planning institutions were designed in a top-to-bottom structure. As a result of differences in juridical systems and the administrative structure of states, a great variety of planning administrations and planning tools actually exists. Despite the diverse forms and methods of regulation, according to Akbar (1988, 142) a shared trait is the essence of what he observes as the problematic result of this intervention: "Contemporary regulations have one thing in common: control of the built environment by a central authority". In fact, the "Crisis in the Built Environment", as the title of Akbar's (1988) book, relates to the dramatic change in what he terms as "the model of responsibility" (141). That is, replacing the method of mutual agreement with control by means of precise plans and prescriptive regulation. By putting the responsibility and authority in the hands of a supervised agency, the variety of modern methods eliminated, each in its unique way, the language, the code, the essence of order in the built environment.

**7. Current planning institutions and the necessary terms for implementing codes: a model**

Since codes are abstract, implementing them in the built environment necessitates a case-by-case interpretation of meaning and impact. In ancient societies, the habit of mutual agreement provided a mechanism for discrete decision-making which is highly sensitive to the code. As numerous actors were operating to interpret the code according to local and unique circumstances, the order of the built environment emerged spontaneously, without the control of a plan. Moreover, the code itself was alive and changing—again without control and supervision—along the lines of social and religious values, cultural changes and technological developments.

In the modern built environment, typified by multiculturalism and a huge hierarchy of powers and interests, the terms of mutual agreement no longer exist. A different method of case-by-case decision-making is needed, to ensure that interpretation of the code continues and that the code itself is free to evolve and adjust to cultural and environmental changes. The order of the built environment depends on this, and as discussed above, the loss of this order is burdening society and space. The very use of codes is therefore not enough, and designing the structure and performance of modern planning institutions is an important complementary task.

The essence of the framework highlighted here was presented in Alfasi and Portugali (2004, 2007, 2009) and Portugali (1999, 2008). It leans on the principles of liberal democracy, the central being the separation of powers. Consistent with the description of this principle by Hayek (1955/1978, 210), it suggest that "the laying-down of new general rules" must be separate from "their application to particular cases" also in the field of planning. Currently, planning is far from accepting this idea, since generally speaking – and despite the tremendous differences between planning institutions in various places – planning policy and planning decision-making is conducted under the auspice of a single entity/authority. As a result, the adoption of planning code as a the source of planning regulation often means that the interpretation of the planning code is done on case-by-case manner by the same body—sometimes the same people—that articulated the abstract rule at the first place. The necessary boundary between the abstract and the specific is thus being blurred. And, since every case is a unique mutation of the codes, we face the danger of the specific avoiding the abstract and circumventing it. In the model presented in figure 1 we suggest that these two functions – the articulation of abstract code and its specific interpretation are "performed separately by two coordinated bodies before it can be determined whether coercion is to be used in a particular case" (ibid.), to match with the principles of the libertarian ideal.

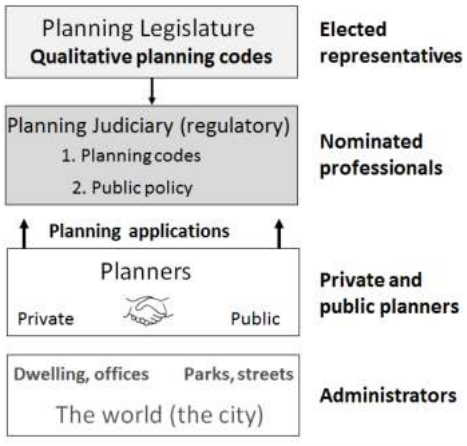

Figure 1: The decision-making process compatible with the coding turn in urban and regional planning

# The Art of Creating Consistency: Planning Strategies in the Age of Active Citizenship

*Paper to be presented at the AESOP Annual Congress, Prague, 13-16 July 2015*
** The Netherlands Organisation for Applied Scientific Research (TNO), Delft, The Netherlands and Department of Human Geography and Urban and Regional Planning, Utrecht University, Utrecht, The Netherlands*

Abstract

This paper addresses the emerging practice of civic initiatives in urban development, and the struggles professional planners and governments face in finding adequate strategies in dealing with this form of 'active citizenship' – strategies that reach beyond the inclusionary and disciplinary confines of participatory planning approaches. Based on empirical studies of 14 civic initiatives in Denmark, the Netherlands and England, and a theoretical hybrid of complexity theory (self-organization), actor-network theory (translation) assemblage theory (individuation), and recently developed post-structuralist planning theories, this paper argues towards a planning strategy that *does* fit the age of active citizenship. The paper argues that planners should no longer focus on organizing involvement in formal planning processes or setting up frameworks to counter fragmentation. Instead, planners should focus on *creating consistency* between a redundancy of spatial interventions and planning strategies that evolve from active citizenship. Creating consistency is based on three lines of thought: the need for conditions that do not constrain, but rather *open up* possibility spaces, the need for a facilitating planner who does not mediate but rather *navigates* between planning initiatives, and most importantly, a *flat ontology* of planning strategy. This flat ontology states that there is no a priori or ontological difference between the intentions and performed behavior of planning actors (including civic initiatives). By opening the spectrum for many others, navigating between these emerging others, and being able to empathize with the behaviors and strategies of these many others, potentials for consistency can be recognized and acted upon.

## 1. The Challenge of Civic Initiatives in Spatial Planning

Civic initiatives in spatial development are on the rise. Whereas for a long time civic initiatives were seen as just a fringe movement, perhaps enlivening space but mostly in the way of planned urban development, they now emerge as valuable strategies for urban development in their own right. The spatial planning community brooding over a new planning practice, the *Vogue* identified "initiatives based on the strength of community" as a major upcoming trend (Vogue NL, 2012: 192), and governments speak eagerly of "active citizenship" and "participatory society." These terms made their first entry in Dutch governmental policy during the late 1990s, addressing citizens who were involved in civic initiatives in their neighborhoods and in public policymaking (Hurenkamp & Tonkens, 2011; Hurenkamp et al., 2011; ROB, 2012), and from that moment, political and policy attention for civil society and civic initiatives only increased (Dekker et al., 2007; Van de Wijdeven et al., 2013; Veldheer et al., 2012; VROM Raad, 2004; WRR, 2005; 2010). Nowadays, Dutch national government and advisory boards speak of "a Do-Democracy," "active citizenship," "a vital society," "participatory society," "civic strength," "self-strength," "the energetic society," "self-reliance" and "shared-reliance," "self-guidance," "self-organizing capacities," "do-it-yourself" and "do-it-together society," "civic initiatives," "participatory governments," and so on (BZK 2013, ROB 2012, WRR 2012). All these terms, in one way or another, address civil society: the sum of voluntary organizations and associations, initiatives, movements, and networks in a social space, with a primary focus on specific partnership interests and social struggle for hegemony, characterized by non-violence, discourse, self-organization, and a recognition of plurality ((Gosewinkel & Kocka, 2006; Swyngedouw, 2005).

The Dutch government and Dutch policymakers are not alone in paying attention to civil society. Under the influence of the depreciated dichotomy between state and market, "Third Way" thinking and the European breakup of welfare states (Giddens, 1998; Hirst & Bader, 2001), interest in civil society has increased in recent years in a number of western European countries, for example, Ireland, Sweden (Powell, 2013), Germany (Keane, 2006), Denmark (Lund & Meyer, 2011), and of course the United Kingdom with their "Big Society." (Cameron & Clegg, 2010; Blond, 2010) Even the European Union is showing an increased interest in civil society (Curtin, 2003), using the term "social innovation" to address civic initiatives that try to solve societal challenges that state and market actors are unable to address (European Commission, 2013; Moulaert et al., 2013). The concern for active citizenship exists in a number of domains, domains in which national governments traditionally held strong positions, including spatial development (Veldheer et al., 2012; Ossenwaarde, 2006; Van de Wijdeven et al., 2013; Van der Heijden et al., 2011). It is hoped that, by decentralizing state powers to a more local and individual level (Van de Wijdeven & Hendriks, 2010; Van de Wijdeven, 2012), and creating a society in which government is supportive toward personal responsibility, self-reliance, self-motivation, and voluntary work (MinAZ, 2007; Dekker et al., 2007; RMO, 2013), citizens will be stimulated to take not only personal responsibility, but also responsibility in these domains and for the common good in general (Van de Wijdeven et al., 2013; Veldheer et al., 2012; Ossenwaarde, 2006; Van der Heijden et al., 2011). Active citizenship implies that individual citizens participate in public policy processes through "citizen involvement" and that they promote and participate in "civic initiatives." Civic initiatives are issue-oriented projects that have an assignable social and geographical origin, often in loose and informal structures, serving a

specific community interest that can change while the project expands socially and geographically (Gosewinkel & Kocka, 2006; Van Meerkerk, 2014). Civil initiatives differ from initiatives in the private sphere (individuals), public sphere (governmental initiatives with a primary focus on representational vote-winning), and business sphere (with a primary focus on profit-making) (Gosewinkel & Kocka, 2006; Swyngedouw, 2005; Boelens, 2009). Civic initiatives are, however, not limited to residents, but can also be undertaken by entrepreneurs, artists, etc., as long at the initiative pursues a community purpose and not a direct business purpose.

However, until now, planners have been mainly focused on strategies for citizen involvement through participatory planning, a planning strategy that has developed profoundly over recent decades. However, participatory planning addresses only one side of "active citizenship," and moreover, constrains citizens with an inclusionary and disciplinary tendency. In citizen involvement through participatory planning, citizens can exert influence on goals set by governmental agencies, through procedures and frameworks that are set by the same governments and planners, resulting in disciplinary processes of thematic, procedural, and geographical inclusion. A strange situation thus arises: Although the legitimacy of unilateral government actions in planning has decreased and governments seek citizen involvement and shared responsibility, governments hold on to instruments that keep them in central and disciplinary positions (Boonstra & Boelens, 2011). As such, participatory planning has a hard time dealing with and benefiting from initiatives that emerge from civil society spontaneously, as these are often too complex, unpredictable, dynamic, and multiplicit to fit within the constraints of participatory planning. Even though planning strategies that propose to move as close as possible to citizens' life world (Hillier & Van Wezemael, 2012), to provide frameworks delineating the freedom in which civic initiatives can create their projects (Hajer, 2011; Urhahn Urban Design, 2010; Uitermark, 2012; Rauws et al., 2014), or enable civic initiatives through governmental budgets (Tonkens & Kroese, 2009; Tonkens & Verhoeven, 2011; Lerner & Secondo, 2012; Allegretti & Herzberg, 2004), all seem to be in line with the ideas of active citizenship, also stay within the premise a disciplinary role of government and planners. Civic initiatives are thus challenging spatial planning to its core, and planning strategies that answer to the dynamics of civic initiatives, and are able to meet the complexity of the age of active citizenship, have so far been seriously underdeveloped.

This paper addresses the emerging practice of civic initiatives in urban development, and the struggles professional planners and governments face in finding adequate strategies in dealing with this form of 'active citizenship' – strategies that reach beyond the inclusionary and disciplinary confines of participatory planning approaches. Therefore, this paper proposes a perspective in which the actual becoming of civic initiatives in spatial development is leading (cf. Boelens, 2009; Specht, 2012). To operationalize this civic initiative's perspective on planning strategy, the notion of self-organization is used. Coming from complexity theory, self-organization stands for the spontaneous emergence of order out of unordered beginnings. When translated to urban development, self-organization can be understood as the emergence of initiatives for spatial interventions from intrinsically driven, community-based networks of citizens and entrepreneurs. Understanding civic initiatives as a form of self-organization puts the emphasis on internal and local drivers, and the lack of centralized control. Internal drivers, as the incentives for the initiative come from within the network itself, the initiators are the intended end-users and eventual profeteers of the initiative, and are thus driven by self-interest and self-motivation. Local drivers, as civic initiatives are often a

reaction to local events or interactions, or events or conditions that generate local meaning and thus become localized. Lack of centralized control, as decision-making, knowledge, information, and other resources are not located at one central actor summoning others to take action, but are dispersed among many actors. In other words, civic initiatives are complex constitutions: Internally driven but with boundaries open wide, toward their environment, and to other actors and their resources. Self-organization is thus understood as the emergence of actor-networks, and seen as individual, performative, interventionary, and seeking to make a difference in the world operating upon them, creatively transforming their environments. Instead of trying to seize the grand narrative and promises of "active citizenship," the notion of self-organization enables to focus on the diversity of strategies that are developed within the actual practice of civic initiatives.

Empirical insights are gathered by looking at actual civic initiatives in three different contexts, acknowledging that, despite their internal drivers, these initiatives still take place in an institutional environment. 14 civic initiatives in Denmark, the Netherlands and England were followed, traced and analyzes with a theoretical hybrid of the ontologically related Complexity Theory (self-organization) (Luhmann, 1996; Cillier, 1998; Heylighen, 2001), Actor-Network Theory (translation) (Callon, 1986; Thrift, 2000; Latour, 2004), and Assemblage Theory (individuation) (DeLanda, 2002; 2006). Building upon the outcomes of these analyses, and various contemporary post-structuralist planning theories (Boelens, 2009; 2010; Hillier, 2007; Van Wezemael, 2010; 2012; Boelens & De Roo, 2014), this paper moves towards a planning strategy that *does* fit the age of active citizenship. It is argued that planners should no longer focus on organizing involvement in formal planning processes or setting up frameworks to counter fragmentation. Instead, planners should focus on *creating consistency* between a redundancy of spatial interventions and planning strategies that evolve from active citizenship. Creating consistency is based on three lines of thought: the need for conditions that do not constrain, but rather *open up* possibility spaces, the need for a facilitating planner who does not mediate but rather *navigates* between planning initiatives, and most importantly, a *flat ontology* of planning strategy. This flat ontology states that there is no a priori or ontological difference between the intentions and performed behavior of planning actors (including civic initiatives). By opening the spectrum for many others, navigating between these emerging others, and being able to empathize with the behaviors and strategies of these many others, potentials for consistency can be recognized and acted upon.

## 2. Conditions that "open up"

*The first planning strategy in the age of active citizenship this paper presents concerns the creation of conditions that do not constrain, but rather open up possibility spaces for civic initiatives. This planning strategy builds upon the questions governments and planners have on* what the "right" conditions would be that allow civic initiatives to emerge (WRR, 2012; BZK, 2013). In order to accomplish ambitions for a "participatory society" and "active citizenship," governments feel the responsibility to create such "right" conditions. Conditions are then seen as a requirement or requisite, as external influences that do not predefine initiatives, but that will increase the likelihood that specific processes will happen spontaneously (Rauws, 2015). Hajer (2011), Urhahn Urban Design

(2012), and Uitermark (2012), claim that conditions for civic initiatives consist of governments that set out frameworks in which freedom is found and ideas can be developed. Also Rauws et al. (2014) state that regulatory structures, such as development plans, are a precondition for self-organization as they set limits and define spaces that allow freedom of action. Framework conditions that consist of physical structures or reservations for specific land uses (Rauws et al., 2014; Urhahn Urban Design, 2012) focus mostly on the actual, the physical environment and other practical things an initiative needs in order to materialize. Such conditions aim to let the initiative in its individuation process "land" within the frames of the actual. However, such frameworks are not so different from the disciplining and inclusionary constraints of participatory planning: they still guide participants along predefined formal-organizational procedures toward all-inclusive plans (Boonstra & Boelens, 2011; Loepfe, 2014). Civic initiatives that do not fit into these self-referential conditions they remain to be overlooked (Van der Stoep, 2014: 34), or merely streamlined toward this governmental self-referentiality (cf. Swyngedouw, 2005). Whether such conditions are indeed the "right" ones, remains thus to be seen.

First, a distinction needs to be made between conditions that set initiatives in motion, and conditions that allowed initiatives to become and materialize. Conditions that set the initiatives in motion were often the intrinsic drivers of the initiators to take matters in their own hand. In the cases studied, such conditions were for instance specific housing demands that could not be fulfilled by the regular housing stock, concerns for the spatial quality of a neighborhood, a lack of certain amenities, or urban plans causing resistance among local communities and challenging citizens to come with alternatives. More than often, the civic initiatives were triggered by local, situational conditions that motivated them to change a situation and gain influence to do so, sometimes in response to an invitation or event. Such conditions are highly situational, and certainly not intentionally created, let alone with the purpose to stimulate civic initiatives.

Conditions that allowed the initiatives to become and materialize have more to do with the environment of the initiatives, and whether this environment is receptive to the initiatives or not. Such conditions can be non-situational and unintentional, such as elements in the planning system that allow for a certain degree of flexibility and negotiation or the traditional legal frameworks for collective action. These conditions give internal stability to the initiatives, and create a better understanding between initiatives and public authorities. But despite their importance, also such conditions are unintentionally created, and can thus not be regarded as a planning strategy to create conditions for active citizenship.

Intentionally created conditions to stimulate civic initiatives, on the contrary, can be regarded as a planning strategy. When non-situational, these conditions can for instance be legal frameworks for collective action intentionally created to stimulate civic initiatives, or knowledge exchange and capacity building programs. The availability of lessons learned and best practices makes initiators well prepared, experienced, and educated, offered inspiration and made initiators and other stakeholders believe they could be successful. When situational and intentionally created for the sake of active citizenship, such conditions can for instance be invitations from local municipalities to citizens to come with their own ideas or to formalize self-management, and consciously created learning programs around encounters with civic initiatives in order to smoothen the interaction in the future, were all intentionally created. What also appeared to be important, are conditions that

gave actors a reason to form associations around the emerging civic initiatives, and allow civic, public and sometimes even private actors to join around projects that address an interest for them all. Such conditions can be stagnated local planning conditions and undeveloped land, a desire to make actual physical improvements in a neighborhood. These conditions created a willingness to experiment, and a willingness to learn from the encounters with civic initiatives. Most of the time short term projects and temporary partnerships (though the interventions themselves are durable and last).

*Figure 1 Overview of conditions found in the cases.*

| | ***Unintentional*** | ***Intentional*** |
|---|---|---|
| ***Non-situational*** | Frameworks for collective action<br>Features of planning legislation | Policy for active citizenship |
| ***Situational*** | Decoding of the initiators | The ability to recognize potentials for opening up, and to move along with the initiatives and its possibilities (co-evolution). |

What all of the above mentioned conditions have in common, is that they created agency and provoked a creative "opening up" of possibilities (cf. Van Wezemael, 2008). This is in line with Jean Hillier's plea for a planning ethos oriented toward experimentation, the emergence of the new, and of opening up potentialities and connections (Hillier, 2007). The challenge for planning practice in the age of active citizenship is therefore to create conditions that "open up," that provoke agency, that go beyond an instrumental thinking, and reach beyond the logic of control (Loepfe, 2014: 211).

When non-situational, such conditions are virtual: They exist, but in a formless way (Van Wezemael, 2008: 173). They merely create a potential, are not obligatory to be exercised (Van Wezemael, 2012), and they only become actual when used and deployed by a civic initiative, on behalf and when desired by the initiative itself. This in contrast to the more actual framework conditions mentioned above.

When situational, it concerns the awareness of actors of the potentials of opening up (cf. Loepfe, 2014). This last form of conditions is always situational and intentional. All cases show how important it is to find like-minded people and planning authorities who are willing to form associations around the changes envisioned by the initiative, to find others who are willing to turn away from the usual ways of doing. Finding those associations proves to be even more important and effective than to spend time convincing those that regard the initiative as threatening anyway. With regard to existing planning legislations and legal frameworks, the challenge is, time and again, to use, deploy, and refold them according to the interest of those involved. The ability to do so, however, depends largely on the resourcefulness of the initiators, their know-how and capacities,

and on the ability of the municipal officials. Municipal officials should know the extensibility of their own frameworks, the room for maneuver to interpret them creatively, and the possibility of changing or deviating from these frameworks, when considered opportune.

The planning strategy of creating conditions that "open up" and recognizing the possibilities to open up, answers to two aspects of assemblage thinking in planning: Provoking spaces of possibility and experiment in existing assemblages, and changing assemblages from an inactive, non-directional state to a space of agencement (Hillier & Van Wezemael, 2012: 316-318). Talking of "conditions" however, seems to create a distance between the condition maker and the condition user, between public authorities and self-organized initiatives. One very important condition that has been only touch on in this paragraph, is a condition that overcomes this distance. This specific condition answers to the third aspect of assemblage thinking in planning: The active creation of assemblages. This can be done through an intercession, a "going in between," the production of creative interference, as a way of generating agencement (Hillier & Van Wezemael, 2012: 327). This is explained by the following, second planning strategies in the age of active citizenship.

## 3. The need for navigators

The second planning strategy presented in this paper, addresses the period after a civic initiative has been set in motion, when the civic initiatives is gaining robustness and resilience over time. The trajectory of an initiative over time can be seen as the establishment of a new assemblage, and as a transition from the virtual to the actual. That this establishment of new assemblages is a core activity for planners, is affirmed in Post-structuralist planning. Assemblages are maintained by planners (Hillier & Van Wezemael, 2012: 313), but planners also play a pro-active role in creating them (Van Wezemael, 2012: 93). The actor-relational approach of Boelens can be seen as an operationalization of this pro-active creation of assemblages. Boelens uses the notion of translation for this pro-active engagement of planners in the forming actor-networks around spatial interventions (Boelens, 2009: 192; Webb, 2011: 274). Especially human actors have a role in forming these actor-networks, as within planning, according to Boelens, objects cannot be seen as self-acting, but are rather "mediated factors of importance," which only act through human representatives who put value to these objects due to their own self-interest (Boelens, 2009: 193; Balducci et al., 2011: 492). The forming of actor-networks then takes place through several steps, that imply the gathering around a certain matter of concern, the collection of resources, and the institutional anchoring of a certain solution (Boelens, 2009). This second planning strategy focusses on the specific role various actors take on in this gaining of robustness and resilience, and claims that "navigators" have a central position in this process.

As civic initiatives usually do not have all the resources available they need to materialize their initiative, they need to spend a considerable effort in collecting them, such as land, property, knowledge, procedural and legal competences, funding, investment capital, authority, and key positions within networks. These resources are spread among various actors, and in order to collect them, institutional barriers often need to be taken. In the cases, more than one actor was involved in

collecting the resources necessary to establish the initiative and actualize it toward a materialization in space, and more than one actor was engaged in setting up new projects and partnerships as part of the initiative. And although the actors who played a role in the move from expansion, contraction toward coding, were different in each and every case, in general it can be said that there were three main actor-groups: The case initiators or the spokespersons of the civic initiatives with their civic background, the governmental officials those who work in close distance to civic initiatives, or are the first entry points for municipal organizations with their public background, and connecting agencies who have a commercial or not-for-profit interest to support civic initiatives.

From the cases it becomes evident that the actors who contribute greatly to the collection of resources, the institutional embedding of the initiative, and its increased robustness and resilience, are most of the time people who are able to establish connections. They know their self-interest and perspective very well (as initiator, municipal official or third party), but are also very well capable of relating that self-interest to other actors and organizations. A vast amount of literature within management studies, policy sciences, public administration etc. has over the years given attention to this connecting role (Van der Stoep, 2013, Specht, 2012). These persons have been given many names, including knowledge and innovation brokers (Winch & Courtney, 2007; Klerkx & Leeuwis 2009), bricoleurs (Levi-Strauss, 1966; Cleaver, 2002; Padt, 2007), boundary spanners (Noble & Jones, 2006; Williams, 2002; Van Meerkerk, 2014), policy entrepreneurs (Kingdon, 2003; Zahariadis, 2007), street level bureaucrats (Lipsky, 2010), reflexive practitioner (Schon, 1983), deliberative practioner (Forester, 1999), everyday maker (Bang & Sorensen, 1999), everyday fixer (Hendriks & Tops, 2005), civic entrepeneur (Durose, 2009) or frontline workers (Maynard-Moody & Musheno, 2003; Hartman & Tops, 2005).

In the context of civic initiatives, boundary spanners are individuals who are able to make connections between the spheres of public, private, and civic actors (e.g. Alter & Hage, 1993; Williams, 2002; Van Meerkerk, 2014). According to Van Meerkerk (2014), boundary spanners are able to think beyond the boundaries of the organization they work for and represent, they are able to empathize with actors on the other side of organizational boundaries, build, and maintain sustainable relationships, organize a mutual exchange of information, and search for shared meanings. This enables them to understand the coding schemes and needs of existing institutional structures in relation to the emerging structure of a civic initiative, and negotiate a fit between an initiative and its environment (Van Meerkerk, 2014). Their role as active listeners and translators of needs enables them to establish durable relationships (Specht, 2012). As such, these boundary spanners bring in connections and legitimacy for the initiative. Additionally, both Specht (2012) and Van Meerkerk (2012) emphasizes the knowledge, capacities, and acquaintances (often from their own professional background) these boundary spanners bring in both to the civic initiatives that often lack specific knowledge, as the capacity for institutional actors to be flexible and move along with the dynamics of a civic initiative.

So far however, boundary spanners are described rather non-directional: they have to listen, empathize, and translate, but without necessarily taking or choosing direction. However, according to Van der Stoep (2014), civic initiatives also need mobilizing action, in order to overcome institutional resistance to change. They need clear and stable ambitions, that are relevant to other as well. The people who create this direction, have the same characteristics as the boundary

spanners: the ability to empathize and listen, and attentiveness to events, circumstances, and context. But what is more, according to Van der Stoep, these people are able to "sell" ideas, getting attention, and navigate targeted supporters' self-referentiality (tweak their conceptions in favour of the initiative). With this, Van der Stoep adds a certain notion of "direction" to the work of boundary spanners (Van der Stoep, 2014). This notion of direction is very much in line with what Hillier (2010, 2011) calls "strategic navigation." Navigation implies an embarkation point, a journey and a goal "to reach land," but without knowing the specific destination: "Trajectories are followed rather than specific end points." (Hillier, 2011: 90) In the context of civic initiatives (a practice which Hillier hardly addresses), strategic navigation can be seen as an ongoing experimentation toward possible futures, led by the "people on the raft," those people that are part of a civic initiative. They wonder whether anyone on board can tweak conditions so that outcomes (reaching land) become more favorable, they establish conditions for a safe journey while being underway, sometimes just looking for the path of the least resistance, constructing stories in fluid forms that retain the ability to change (Hillier, 2011: 87). At the same time, the people on the raft look for other rafts or ships heading in the same direction to become connected or coded to, ask people to join the raft, all in order to create the necessary stability for a save journey and reach land in the end. Just like boundary spanning, Hillier emphasizes that this practice is not possible without a constant transgression of boundaries. Moreover, strategic navigation is a performance of risk-taking, of not being in total control, of transcending the technicalities of planning practice, and to allow possibilities for something new to emerge (Hillier, 2011: 14).

As said, the notion of "navigation" adds a direction to "boundary spanning," but still with a flexibility to change and without a fixed and known endpoint. Whereas "boundary spanning" itself seems to relate mostly to the behavior of expansion and contraction, and sometimes coding, "navigation" relates back to the decoding of the initiators and other actors as their embarkation points and possible (though of) futures. Navigators are certainly not intermediaries that do not transform anything in transporting the course of action, but they are also not mere mediators (cf. Latour, 2005) like boundary spanners are, as there is a clear self-interest and thus direction involved in their actions as well. Therefore, this activity of connecting, seen in all the cases discussed in this thesis, as further discussed as "navigation," the main performers of this activity "navigators," and the second planning strategy that fits the age of active citizenship as "be a navigator."

However, navigators did not receive so much attention for nothing, as their role time and again proves to be as challenging as it is crucial. Navigators are like the outposts of organizations, and they neither belong to the environment nor to the official organization they represent. They will always be *in the middle*. This means that their performance often implies a critical reflection on the functioning and the ideas of their own organizations, that they more than often show inappropriate than appropriate behavior, that they can encounter forces of resistance or of institutional rigidity, easily become isolated, and most of all feel a tension between what their "home organization" expects from them and what emerges within the group of the civic initiative (cf. Peeters et al., 2010 in Van Meerkerk, 2014). Governmental navigators can be confronted with the institutional logic of their organizations, the accountability mechanisms of representative democracy, the pressure to follow internal guidelines and routines, a culture of project management in which projects have tight boundaries, and a sector structure of the governmental organization. These internal structures and mechanisms often do not match with the complexity and dynamics of contemporary governance

issues, nor with the dynamics of dealing with civic initiatives and can thus withhold the navigators from performing their activities (Van Meerkerk, 2014).

The empirical findings in the cases of this thesis however show, that the activity of navigation does not have to cause any problems. The role of the "governmental" navigator could be legitimized by the organizational structure (as a specific function), by regular planning legislation, or by acting in targeted and temporary partnerships around specific projects, in which they unambiguously serve the aim of their own organization. The role of the navigator can become problematic and challenging though, when no match can be found around specific projects or partnerships, or when the individual navigator empathizes with the initiative but is not able to find any anchor points within the organization. Then, navigators can become stuck between the interests of initiative and those of the municipality. For "civic" navigators, challenges are comparable, as they too function as outposts of the initiatives they represent, getting and keeping a group together during a very dynamic process of finding locations, setting up a legal plan, choosing financial schemes etc. They have to justifying their actions to be in the interest of the individual members of the initiative as well. When the group around the civic initiatives is more volatile, less effort is made in keeping a group together and legitimizing actions. However, sometimes questions are asked (by the municipality or by fellow residents) who these leading initiators actually represent. For the "commercial" or "not-for-profit" navigators, not many challenges are found, as the activity of navigation belongs to the core of their professional work, and they are only involved in the cases temporarily. The only risk they face is a financial one, when sometimes the facilitation of an initiative group demands so much more time and effort than foreseen.

Navigators need to be internally and externally connected, and need legitimacy within their own organization to do their job. When laying connections is their main professional and institutionally embedded task, the cases show that the challenges navigators face are mainly limited to practical issues around specific projects or issues. However, questionsmarks can be placed at whether any specific organizational structure will be the "right" one to led navigators do their work. Perhaps of more importance is whether an organization offers room for maneouvre and discretion, for improvisation and experiment (Specht, 2012), and whether recurring bottlenecks can be addressed and discussed, and whether a navigator is equipped by his organization with sufficient knowledge, skills, and information. This relates strongly to the conditions for opening up and being able to recognize the potentials for opening up. For governments this means they have to perform a double role. On one hand they need to fulfill their traditional role of representatives of the public, providing security, equity, and regulation by law, and living up to representation, entitlement, and status, accountability, legitimacy, scale, and order of governance (Swyngedouw 2005). And on the other hand they must facilitate the role of navigator within their organization. This challenge lies not so much in the preparation of plans, guidelines or procedures that make navigation possible, but rather in creating methods which with the navigators can legitimately move along with the dynamics of citizens' initiatives. But as navigation is rather an activity practiced by individuals than a specific institutional role, and therefore very performative, attention should also be given to the connective and relational capabilities, competencies, capacities and experience these navigators have (Van Meerkerk, 2014).

## 4. The flat ontology of planning strategy

***(Re-)Understanding planning***

Whereas the first planning strategy on creating conditions also still had a role for professional planners in mind, the second planning strategy that elaborated on the importance for navigators within professional organizations and within civic initiatives already suggested a certain symmetry between the professional world and the world of civic initiatives. The third conclusion goes even one step further, and reflects on processes of becoming, and self-organization as emerging assemblages as an *equivalent of planning*.

Renowned planning theorists stress as the core of spatial planning, the (collaborative) development of strategies (Hillier, 2011), creation of collective awareness around spatial issues (Forester, 1989), designation of collective concerns and ideas about physical environments (Healey, 2007), and an operationalization these ideas with vision, coherent actions and means for implementation (Albrecht, 2006: 1491, also in Loepfe, 2014; Van der Stoep, 2014). Additionally, some Dutch practitioners have explained planning as the interaction between a given situation and a new program (Frieling, 2007), or as the shaping of the best reciprocal interaction between space and society, such for the sake of society (Cie Van Veen, Den Haag 1972 in Boelens, 2005; Vermeersch 1994 in Leinfelder, 2007). Without explicitly stating so, these theorists and practitioners clearly have a professional planner in mind, more than often working on behalf of public government. A post-structuralist understanding of spatial planning opens up to the idea that "*all* actants are engaged with some form of spatial planning and that decision-making is the emergent outcome of the interplay between this multiplicity of activities" (Hillier, 2007: 271), and that governments and their agencies are not the only nor the most prominent actors in space, but that various actors in business and civic society are as important (Kreukels, 1985; Boelens et al., 2006). However, planning strategies that follow from this post-structuralist understanding still seem to have a hard time to think beyond the idea of a professional spatial planner.

Therefore, a short look is taken at how "planning" is defined outside the field of *spatial* planning, within psychology and organizational studies. By doing so, the intriguing view of Portugali is followed, who sees planning more as a basic cognitive capability of humans than as a pure professional activity (Portugali, 2011). In psychology, planning is defined as thinking of a way to achieve a certain goal or desired action (Morris & Ward, 2005), and the ability to bring these thoughts about a desired goal to actualization through organizing activities and taking actions (Ajzen, 1991). This understanding of planning is also found with the organizational studies of Mintzberg (1994), who sees planning as a thinking about the future, and a consideration how such a future might be brought about through actions, that are embedded in collective decisionmaking and a societal context (Dror, 1971; Mintzberg, 1994). This view corresponds with the idealism that De Roo et al. (2012) sees as an instrinsic mind-set within planning practice. According to De Roo et al. (2012: 7), planners compose and suggest desired outcomes to tackle difficulties faced at a particular time and place. These ideas about what would be better are mental pictures about "reals-to-come," ideas on how to improve things. Plans, in this perspective, are expressions of such intentions (Mintzberg, 1994) and are made everywhere, at all times, in various spatial and time scales, comprehensive, specific, initiated by public, business, and civic actors. But despite their diversity, all plans head in the

same direction: Toward the future, and an envisioned and desired spatial change. It is the ability to express such intentions and put them to action is what turns people into spatial planners.

However, the distinction between intended and unintended behavior or action is often difficult to make (Ajzen, 1991; Wildavsky, 1973). Again, then, Mintzberg provides perspective by introducing the term "strategy," as a certain consistency, or pattern in behavior over time (Mintzberg, 1994). This pattern in behavior can then either be intended and deliberate with an overall goal in mind, but also be emergent out of a chain of little ideas or initiatives (Mintzberg, 1994). This view on planning as a mix between intentionalities and behavior (cf. Ajzen, 1991) brings into perspective the equivalence of planning and self-organization, as the process of organizing (activities, behavior) the actualization of a self (intentions, intentionalities). It also softens the relation between the term planning and the formalized procedures, rationality, integrated system of decisions and formalized documents it is often associated with (Mintzberg, 1994). By seeing planning as behavior, planning becomes performative, a consistency of behavior and intentions as part of the virtual, and individual actions, organization of, and interventions in space as part of the actual world (Hillier, 2007). In this line, the term "planning strategy" (not to be confused with strategic planning), addresses deliberate or emergent patterns of behaviors to achieve a certain goal within a world full of other intentionalities and behaviors and (with a wink to Mintzberg) formalized procedures.

"Translation" as derived from actor-network theory concerns the process of making connections between things that gain consistency along the way. This process of ordering can be seen as an equivalent of self-organization as the emergence of networks. In the literature concerning translation, it is described how translations can be collateral and unintentional, but also how translations can be the result of purposeful and deliberate action. Collateral translations happen incidentally, along the way, unintentionally, and they often remain quiet and uncontested. They happen for instance when actors accidently encounter in space, or when a person without intention provides orderings of situations at hand by telling others how to see things (Law, 2009a). Purposeful and deliberate translations happen pro-active and intentional, aim at establishing something envisioned, and are a performative process of network building, of creating links between actors and factors that were not linked before (Law, 2009b; Latour, 2004; Mol, 2002a). Both views on translation are possible. Full collateral translation is hard to make, as actions by individuals will always to a certain extend be intentional. Intentional translation, on the other hand, is often partial, incomplete, more or less local and implicit. Even the most intentional practices are still surrounded by a world which is "messy, multiple, heterogeneous, constantly escaping the precarious orderings of even the most determined." (Law, 2009b: 11) In the case of civic initiatives, this mix between collateral and purposeful translations, can be described as quasi-intentionality. For civic initiatives, the eventual physical intervention might not have been entirely envisioned beforehand along a prefixed plan, and people in the initiative might not know exactly where and how they will end up, and what the spin-off of their initiative might be, as many collaterals happen during its process of becoming. But still, civic initiatives always contain a certain degree of intentionality. Regardless whether they have an idealistic motive or a personal, individual interest, there is always a reason why they start organizing something new, by themselves.

***Twelve archetypical planning strategies***

So what behaviors and intentionalities can be found in civic initiatives, in order to improve things and actualize the desired "reals-to-come"? Firstly, three intentionalities are distinguished in translation, that are not sequential, but rather relate to their intensity, degree of activity, and interaction with their environment. All three intentionalities have collateral features as well.

1) The first intentionality is *interfering for change.* This intentionality is based on the understanding of translation by Mol (2002a, b), that focusses on how things have been made better, according to the actors involved. What is better, is of course no pre-given truth or fixed optimum, but rather something that is normative, situated, contextual, and thus constructed as entity within the network (Mol, 2002a). Interferences for change that come from that normative, situated, and contextual perspective, aim at shifting the object of treatment, in order to counter deviances that are felt or considered as incommodious to the translation of the network. There is no question on what the best interference might be, but only the question of whether it effectively solves a certain problem or addresses a certain need within particular circumstances, according to those involved (Mol, 2002b; Law, 2009b). With this emphasize on interference, the urban environment is no longer a "single passive object in the middle" (Mol, 2002a: 5), but it is talked upon, and the delineation of problems in the environment is followed quickly by foregrounding practicalities, materialities, the pro-active creation of events that not only aim at changing the understanding of the physicality, but also aim at changing the physicality itself (Mol, 2002a: 12). Space is being re-done (cf. Metzger, 2011) according to the potentialities the initiators see. Interferences for change are thus very situated actions in time and space, with a high intensity directed not so much toward the self of the initiative but rather at changing its environment. In civic initiatives, interference for change, the initiative may be short term, very issue based and materialize in a temporary event, a small scale intervention, for instance an art project or a temporary redecoration of a street. The intervention then for instance focused on creating awareness, or a new understanding of a certain place.

2) The second intentionality is *networking for a fit*. In this intentionality, a network is gradually strengthened, expanded, and made thicker. Events and networks are knit together around new and emerging meanings, and creating a context around an idea (Latour, 1996: 119, 133). Grouping around meaning concerns how unity, a common world, and a common good are established among the components of the emerging network through the reassembling of facts and values, a movement toward potential unification (Latour, 2004). In spatial planning, this intentionality refers to the collection of resources needed for the realization of a spatial intervention (Boelens, 2009). Spatial planning itself can be seen as a process of network-building, in which entities of various kinds are assembled in ways that allow the network to undertake certain functions. It is a process in which actors with a certain interest and willingness to invest in their local environment out of more or less self-interest, engage in organizing and networking meaningful spatial connections, and the means, such as land, finances, buildings, permits etc., to achieve their goals (Boelens, 2009; 2010). Compared to *interfering for change*, the intentionality of *networking for a fit* happens in a more continuous way, and with a slightly lower intensity. Its relation with its environment is one of mutual influence, compliance, and fluidity, and its goal is to achieve an optimal fit

between the idea and the physical environment, so that this idea can materialize into an actual physical project. The main focus is on trying to find a fit between the internal world of the initiative and the external environment, in a process of mutual reconstitution, and its aim is a gradual strengthening of a network by collecting resources and knitting together events and interests. The civic initiative aims at materializing a project that is meant to be there to stay. What the initiative is looking for, is the right environment to realize their idea in, that fits best to their ideas.

3) The third intentionality is assemble to maintain, an intentionality that is found in more or less stable networks focused on maintenance, homogeneity, and coherence (Thrift, 1996; Hillier, 2007). It concerns strong and tight networks that, despite their heterogeneity, work in unison. These networks provide resources for their components but restrain them as well. They work as sorting machines in favor of their own emergence and maintenance (Van Wezemael, 2010: 290). In this intentionality, "translation" concerns the continuous effort to maintain coherence, homogeneity and effectivity, a consolidation of goals, and providing a base for security and stability (Hillier, 2009; Latour, 2004; Thrift, 1999). Assembling to maintain is continuous in time and space, its intensity is much lower, and its relation with the environment concerns not so much the environment itself but rather the maintenance of the self within that environment. The assemblage is more internally oriented compared to the other intentionalities, and can sometimes even be a little constraining. When this intentionality is dominant in a civic initiative, the initiative aims for creating a stable community and improving parts within that community.

Secondly, the theoretical hybrid of complexity and self-organization (Luhmann, 1996; Cillier, 1998; Heylighen, 2001), actor-network theory and translation (Callon, 1986; Thrift, 2000; Latour, 2004), and assemblage theory and individuation (DeLanda, 2002; 2006), allows to distinguish four forms of behavior in emerging civic initiatives.

1) The first behavior is decoding, which refers to a disassociation from the usual, the desire to try something new, the will to change certain conditions, to step out of usual ways of working, to disassociate from existing schemes, and the articulation of a new direction to be taken. This behavior builds upon the notions of de-coding from Assemblage Theory, bifurcations from Complexity Theory, and problematization and perplexity from Actor-Network Theory. In a civic initiative, decoding reveals the conditions the initiative aims to change or leave behind, and why other actors are willing to leave behind their routines and associate to the initiative as well.

2) The second behavior is expansion, which refers to a widening orientation, open boundaries, exposure, exploration of new content, possible resources, and new actors in new constellations. It is about creating diversity, connectivity and redundancy of plans, ideas, content and actors – trying to be as broad, informed and open for new and different options and actors as possible (Van Meerkerk et al., 2013). This behavior builds upon the notions of dissipation from Complexity Theory, interessement from Actor-Network Theory and de-territorialization from Assemblage Theory. In a civic initiatives, expansion explains how the

initiative becomes embedded in a wider context, increases in scale and acquires relevance. It tells about who is consulted, what new actors are included, what different options for the initiative are assessed along the way, how the focus of the initiative broadens, what exposure is made or given to the initiative – all in order to make the trajectory of the initiative evolve further over time.

3) The third behavior is contraction, which refers to a closing off or narrowing down through selection, explication, a consolidation of content and resources, a stabilization of actor constellations. The behavior concerns self-reproduction, a strengthening and articulation of boundaries, exclusion of otherness, and the setting of internal hierarchy and order. A variety and redundancy of plans, content and actors is countered in a selection and sorting process (Van Meerkerk et al., 2013). This behavior builds upon the notions of autopoiesis from Complexity Theory, enrollment from Actor-Network Theory and Territorialization from Assemblage Theory. In a civic initiative, contraction explains how the 'self' is internally stabilized, what choices were made, how the identity, binding principle, and boundaries are maintained, and what organizational form was chosen.

4) The fourth behavior is coding, which refers to the elements that turn the initiative into a black box, but also into something familiar, something obvious, something common that fits existing schemes in the outside world. With coding, the initiative grows heavy with externally recognized norms, that make it stable, fixed and strong. This behavior is build upon the notions of coding from Assemblage Theory, mobilization of Actor-Network Theory and equilibrium from Complexity Theory. In civic initiatives, coding reveals how the trajectory of the initiative is smoothened by following already existing codes, by developing new codes of its own, what was learned from the case and turned into something 'normal' and 'repeatable' and how the initiative eventually materializes in space.

The four forms of behavior are of course interrelated. Decoding individualizes, whereas coding de-individualizes into something common. Expansion creates external robustness as it enlarges the network of the initiative, contraction creates internal robustness as is strengthens the internal cohesion. An emerging civic initiative should thus not put too much emphasize on either one: too much coding might alienate the initiative from its self, too much decoding might alienate the initiative from its environment, too much expansion could disintegrate the initiative internally and too much contraction could disintegrate the initiative externally. As none of them forms an independent self-organization process, the initiative should thus cautiously showcase all four behaviors, not sequential but simultaneously. Also the three intentionalities presuppose each other. An interference for change presupposes a network that is able to interfere. And this network has to "become", before it can be, find a fit with its environment, and is actually able to maintain itself. So even though interference for change, networking for a fit, and assembling to maintain are different forms of intentionalities, they cannot exist without each other. When drawing up a schedule with decoding, expansion, contraction, and coding on the horizontal axis, and these three intentionalities on the vertical axis, twelve ontological archetypical planning strategies show up.

*< Figure 3 Twelve archetypical planning strategies. >*

| | **Decoding** | **Expansion** | **Contraction** | **Coding** |
|---|---|---|---|---|
| Interfering for change | *Showing what should be changed in order to point out the need for a new direction.* | *Exploring different options and opinions in order to point out possible futures.* | *Emphasizing the like-mindedness and common grounds in order to create support for a new direction.* | *Setting up rules and regulations in order to make a change happen.* |
| Networking for a fit | *Changing things and leaving behind old practices in order to move along and find a fit with the environment.* | *Exploring different options and opinions in order to move along and find a fit between the initiative and an environment.* | *Creating like-mindedness and common grounds between the initiative and its environment.* | *Using exitsing and new rules and regulations (and sometimes tweaking them) in order to find a fit between the initiative and its environment.* |
| Assembling to maintain | *Defining what should be changed in order to maintain the quality and stability of the assemblage.* | *Disseminating and exploring different possibilities of and for the assemblage, in order to strengthen its stability and legitimacy.* | *Defining like-mindedness and common grounds in order to maintain the stability and strengthen the durability of the assemblage.* | *Upholding rules and regulations in order to maintain the security and stability of the assemblage.* |

This overview of twelve ontological archetypical planning strategies, all enacted within civic initiatives, show how diverse planning strategies deployed by, and in response to civic initiatives, can be. Some civic initiatives perhaps focus a bit more on “assembling to maintain”, when a community already exists but want to become more pro-active. Some civic initiatives focus a bit more on “networking for a fit”, when it is a specific project thy want to realize. And some civic initiatives focus more on “interfering for change”, when their main aim is address a certain need or envisioned change. With the overall aim of materializing a civic initiative, the four forms of behavior more or less explain how the initiators deal with the interaction between their selves and the environment. The three intentionalities more or less explain the intrinsic drivers of the initiative and how the initiative aims at making a difference in its environment. However, various planning strategies can be present in one case simultaneously, through the involvement of various actors, and because actors can also apply multiple strategies simultaneously, and even switch between strategies. These twelve archetypical planning strategies thus never stand alone, and there is a certain need for diversity in planning strategies to materialize civic initiatives and their projects. This overview of planning strategies is therefore not an attempt to provide an overall structure to categorize initiatives and their planners, but is rather a method that can help in creating understanding of difference and diversity of planning strategies, and moreover, the need for that diversity and difference. The resulting strategies are not strategies that head for a specific and well delineated end point, but are rather ways of navigating in a certain direction while retaining the flexibility for change and without a fixed and known endpoint.

***Planning strategy as a flat ontology***

What is remarkable though, is that when various cases of civic initiatives and the behavior and intentionalities of all actors involved are plotted on this scheme of planning strategy, it becomes evident that there is no significant difference between the planning strategies performed professional, public or formal planners on one hand, and civic, lay or informal planners on the other hand (apart from a little more presence of public actors in the fields of coding). Of course, resource interdependence is a bit more pressing among civic actors, as civic actors often do not possess a significant set of means like public or business actors often already do. In line with "assemblage planning", everyone who plays a pro-active role in the creation of assemblages can be regarded as a planner - even though their "assemblage of concern" can differ among civic, business, and public actors (an individual interest, an community initiative, a commercial project, a neighborhood or city, society as a whole)..

This symmetry between professional and lay (Specht, 2012), public and civic (Boelens, 2009), formal and informal planners (Portugali, 2011) is reminiscent of what Latour (2005) and DeLanda (2002) call a "flat ontology". In a flat ontology, no transcendent principles or essences exist, but only unique, singular individuals who can differ in spatio-temporal scale but not in ontological status (DeLanda, 2002). This flat ontology is for instance found in the symmetry human and non-human actors in Actor-Network Theory. Even though within planning, non-humans cannot act as proactive normative agents the way in which planners act, and can thus only act in decision making processes when represented by humans (Boelens, 2009), the ontological status does not differ between human and non-human actors. A flat ontology for planning strategy, implies a rejection of all a priori existing scales or hierarchies, and sees organization – and thus scale and hierarchy – as the outcome of interactions between particular, historically locatable entities (DeLanda, 2002). The difference between planning actors lies within the training on certain skills and employment to serve the common good of professional, public and formal planners, and the specific self-interest, and presupposed inability to think beyond that self- interest of lay, civic and informal planners. The hierarchy that evolves from this difference (professional is better than lay, public is better than civic, formal is better than informal) does not exists a priori, but has evolved from the interactions between planning actors and processes of urban development *over time*. Civic and public, lay and professional, informal and formal planners differ in scale and hierarchy, but as the above overview of ontological archetypical planning strategies shows, they do not differ in ontological status. The way in which civic initiatives emerge, define their goals, and materialize their intentions toward actual physical interventions in space, does not differ that much from the way in which public authorities plan, or the way in which planning agencies work.

Introducing a flat ontology of planning strategy serves a specific goal: "Action is possible only in a territory that has been opened up, flattened down, and cut down in size in a place where formats, structures, globalization, and totalities circulate inside tiny conduits, and where for each of their applications they need to rely on masses of hidden potentialities." (Latour, 2005: 252). When one primarily looks at the ontological status (intentionality met with behavior) of planning strategy, the flat ontology can help overcome any dichotomies and paradoxes that exist in planning and civic initiatives in spatial development. Now it shows, how civic initiatives neither follow from the planning system a priori nor are obstructed by the planning system per se, but rather how the planning system becomes alive, and is performed *through* these civic initiatives.

In a flat ontology of planning strategy, planning is seen as a performance that does not differentiate between professional or lay, public or civic, formal or informal actors. The flat ontology should enable all planners, including professional ones, to empathize and understand different kinds of behavior, intentionalities, and planning strategies performed by other planning actors encountered, including civic ones. By taking the various archetypical planning strategies in consideration, the professional planner should be able to not solely react on the behavior shown in the cases, but is able to discern the intentionalities of the initiatives.

## 5. The art of creating consistency

The flat ontology of planning strategy does not mean however, that professional planners have become obsolete in the age of active citizenship. So far, all the planning strategies mentioned in this paper, took individual civic initiatives as starting point, and focused planning strategies developed and applied within and in close interaction with these individual cases. Now, at the end of this paper, time has come to transcend this individual level and to consider the consequences of the emergence of a multitude of planning actors and initiatives within a certain territorial environment. Not in the sense of cities as self-organizing systems upon which the planner acts as an external force by introducing new planning policies (Portugali, 2011), as this view would not enable the planner to move beyond the safe confines of a governmental-led, disciplining, and inclusionary planning practice with frameworks and procedures. Instead, this paper argues that even professional planners who work with a multitude of civic initiatives, should not only focus on their spatial outcomes, but should continue to reason from every individual emerging civic initiatives itself. After all, "each urban agent is a planner – be it a single individual, a firm or the city's planning team – and the city comes into being out of the interaction between the many agents *and their plans*." (Portugali, 2011: 288, original emphasize). This approach to self-organization refers to the idea that various actors plan and take initiatives at the same time, in a distributed fashion, and in networked, open, and dynamic ways. Complexity exists because no single actor can oversee all the dynamics of these self-organizations simultaneously taking place, can neither predict the starting points for such new ideas, nore control the dynamics that occur after initiation, or allocate these outcomes to an individual initiating actor, making spatial developments in principle unpredictable and uncertain (Rauws & De Roo, 2011:272).

Researchers and planning professionals are very much struggling with this complexity, as it is difficult for *any* actor to fulfil the seemingly endless and conflicting needs and demands of society, to deal with the multitude of self-organizing actors in processes of governance and spatial becoming, interferences of external events, unforeseen coincidences, and unexpected changes in what actors do and say (Boons et al. 2009: 249). Such complexity cannot be managed solely by traditional comprehensive approaches with a focus on command and control, by strategies that build on collaborative and communicative planning approaches (Rauws & De Roo, 2011:272). But still, professional planners *do* have a meaningful and active role in the management of change. Not for the sake of change itself, as for instance transition management argues (Rotmans et al., 2012), but change for a better reciprocal relationship between space and society, such for the sake of society and the promotion of a sustainable development of places (Boelens, 2009; 2013).

What self-organized trajectories have in common, is that they move toward self-desired futures, mutually affecting each other *without losing their selves*. This is important, as within all the opening up, navigation, and empathizing in the age of active citizenship, one can easily become footloose and empty when loosing sight of one's own self. Therefore, a strong awareness of the self of a civic initiative, even if this self is normative, situated, contextual, and constructed along the way, is crucial in its process of becoming. A clear direction, but with the flexibility for change and without a fixed endpoint, is of utmost importance for civic initiatives in order to connect, align, and respond at all. This is not only important for civic initiatives, but for everyone who is entangled in heterogeneous processes of spatial becoming. Also professional spatial planning "takes part in an ongoing struggle against those whose 'reading in space' could take priority, and could better be attached to new meaningful interrelations and therefore possible manage identities." (Boelens, 2009: 31) Within a multitude of emerging networks, each individual planner has a self, a frame, a vision on how to improve things and goals to achieve. Awareness of such selves is especially needed in moments of uncertainty, as they can provide a feeling of consistency. Without that feeling, "quick closures" become very probable (Loepfe, 2014: 209-210).

And quick closure are not what the age of active citizenship asks for. Instead of closing down the opportunities civic initiatives offer for the viability of spaces, and the social, economic, political, and spatial benefits they bring, their diversity and creativity should not be frustrated and superseded by the inclusionary and disciplining practices that so often prevail in planning. Instead, the age of active citizenship asks for dynamism, diversity, openness, experiment, flexibility, navigations etc. Moreover, the age of active citizenship asks for a baroque harmony, in which different and independent voices are brought together through a web of reciprocal reference, interacting with each other and harmonically interdependent, but never loosing ones individuality and independency in rhythm and contour (cf. Kwa 2002). The age of active citizenship asks for co-evolution, in which various trajectories and their environment are seen as interdependent (Gerrits, 2012), and adapt to each other in a non-linear ways (Teisman et al., 2009). Spatial co-evolution as spatial developments resulting from interactions between multiple scales, at various localities, or from various perspectives (Rauws & De Roo, 2011). Institutional co-evolution as a transformation of existing institutionalized practices, organizational changes, and mutual adaptation of roles (Morçöl, 2005; Van Meerkerk, 2014). Such co-evolution, in which multiple trajectories move forward to their self-desired futures, affecting each other without losing their selves, with reflective insight in their own and other's selves, can very well happen collateral and unintentionally. But co-evolution can also be deliberately enhanced, which brings in to the final planning strategy in the age of active citizenship: The art of creating consistency.

***The art of creating consistency***

Baroque harmony, in which different and independent voices are brought together in reciprocal reference without losing their independency in rhythm and contour, corresponds to the heterogeneous processes of spatial becoming post-structuralist planning approaches speak of. In these processes, or in this baroque harmony of planning, professional planners are certainly "not the director, nor store manager, let alone an orchestra leader." (cf. Boelens, 2009: 31) Professional planners are just one of the many voices, one of the many performers. The harmony they can create does not follow from disciplinary frameworks or inclusionary procedures, but much more from their

ability to relate, to empathize, to build upon the performances of others (the twelve archetypical planning strategies can be instrumental in this), and to "create consistency." Consistency not in the actual sense of coherence and sameness in the appearance of spatial performances planners engage in, nor in the sense of genuine discussion and undistorted consensus. Consistency rather in the Deleuzian, virtual sense, in the sense of moving in the same direction, not because of frameworks telling to do so, but by actively empathizing with the emerging selves, by knowing and supporting their and one's own intentionality, and by making strategies as open and known as possible. The flat ontology of planning strategy was about recognizing consistency in intentional behavior within an individual initiative. Now the challenge is to recognize consistency, but also the inconsistencies and potentials for improved consistency in actual urban developments, and to pay attention to the non-intended non-individual forms of emergent spatial strategies (Loepfe, 2014: 128).

The art of creating consistency comprises that planners are able to recognize the potentials of specific and detailed projects of civic initiatives for longer-term futures, and that planners are able to strengthened these initiatives by new and additional specific and detailed plans that move in that same direction. Such planning allows immediate actions and adaptations, and simultaneously allows for the building robust associations and visions along the way (Balducci et al., 2011). To achieve such a planning, the proposition would be to scan the various becoming selves and explore what potentials there are for consistency between them. This consistency can be created by affecting the internal dynamics of self-organization without controlling the behavior of individual citizens or by imposing blueprints (Rauws, 2015). Creating consistency should then be a task for professional planners, a task that concerns: Relating civic initiatives and other spatial interventions to each other, considering measures to increase the robustness, resilience, and sustainability of the outcomes of civic initiatives; think on how civic, public, and private interventions in space can add up to each other, and what areas could benefit from additional impulses for and by civic initiatives.

The first move for the professional planner is then to be aware of any emerging consistencies and inconsistencies. The ultimate goal of creating consistency for professional planners is of course the development of qualitative and sustainable places, resilient and robust cities. Professional planners can for instance be concerned about the influence initiatives have on socially and environmentally "just" form, and be leading in the potential consequences of certain interventions for different actants (Hillier, 2011). Professional planners can also be concerned about inconsistencies that emerge out of a fragmented development within a certain territorial environment, due to the various autonomous drivers affecting areas (Rauws & De Roo, 2011: 280-1, see also Rauws & Van Dijk, 2013). The second move is to actually act upon the potentials for consistency. Connect fragmented developments and turn them into clustered patterns in order to make the area benefit these drivers (Rauws & De Roo, 2011: 280-1, see also Rauws & Van Dijk, 2013). Suggest alternative ways or trying to activate other actors that can add to the consistency in which a certain area is moving (cf. Van Wezemael, 2012; Boelens, 2009). The notion of strategic navigation introduced in conclusion two, can be instrumental in this. But now navigation not just between an individual initiative and its environment, but between many initiatives emerging at the same time. Navigation as the art of finding viable paths into the future, negotiating unknown terrain and unprecedented complexity, creating links between places that do not belong to the same world.

When this “art of creating consistency” is mastered by planners, a planning practice can grow in which heterogeneous processes of spatial becomings can evolve in synergy and consistency with each other. Planning “from and with, instead of against, differences, fragmentations, uncertainties, complexity […],constitutionally interrelated, plural, heterogeneous and always ‘becoming’, instead of pre-determined, structured and/or locked into itself.” (Boelens, 2009: 555). A planning practice in which civic initiatives can thrive, and that enables society to take the full benefits of the age of active citizenship.

# PLANNING'S 'FAILURE' TO ENSURE EFFICIENT MARKET DELIVERY: A LACANIAN DECONSTRUCTION OF THIS NEO-LIBERAL SCAPEGOATING FANTASY

Michael Gunder

University of Auckland
m.gunder@auckland.ac.nz

Keywords: ideology, enjoyment, governance

*Our contemporary neo-liberal governance model often places a heavy burden on planning to take the 'responsibility' for the failure of market-lead governance to successfully deliver its policy promises of betterment, security and, consequently, future enjoyment. These include promised, but often unachievable policies, such as those of increased global competitiveness even for areas of structural economic and population decline; or housing affordability in areas of significant population growth and constrained land availability. Resultant policy failures then tend to result in a scapegoating response where planning is held responsible. Examples include that economic development, or housing affordability, is directly obstructed as a consequence of planning impediments, such as unnecessary regulatory controls or process delays. All of which are claimed to hamper efficient market delivery, hence 'planning' is to blame.*

*To deconstruct this neo-liberal fantasy that planning often impedes, or fails, in its responsibility to ensure policies for market-lead success, the paper will first document several exemplars of this scapegoating process. It will then briefly explore the role of fantasy and ideology in governance policy formulation and, from a Lacanian perspective, the theorisation that underlies this process. Having laid the necessary foundation, it will then investigating the role of the 'scapegoat' in ideological fantasy formation for public policy facilitation so as to explain why planning is often placed in this role, and why this role is often ideologically necessary, at least for neo-liberal governance, when planning undertaking its statutory responsibility of facilitating the public interest.*

## 1. Introduction

In numerous countries, especially since the 2008 world recession, planning has been placed in the role of scapegoat for neo-liberal governance policy failure. Indeed, since at least Van Hayek's (1962 [1944]) arguments that bureaucratically directed state planning must be inherently inefficient in comparison to the steering mechanism of the 'invisible hand' of the market, planning has been repeatedly castigated as an impediment to human freedom and unfettered growth. This is particularly the case in our contemporary world constituted by a hegemonic ideology of neo-liberal globalisation where consumer choice, competition and the market is enshrined as supreme; furthermore, this ideological perspective also largely underpins and frames contemporary planning (Gunder, 2010; Metzger et al, 2014; Taşan-Kok and Baeten, 2011).

Yet, even in our neoliberal world there is still a recognition for the need of governance regulation on matters of conflicting landuse, public safety and environmental protection, as well as a need for strategic planning to give spatial governance expression to the future co-ordination of the economic, social, ecological and cultural dimensions of a geographically defined polity, especially for infrastructure and related public policy interventions (Sager, 2013). However, this often positions planning in the frame as an impediment to the effective workings of the market. Here, planning can become a readily-to-hand scapegoat for contemporary governance policy failure when it is asserted

that planning policy and processes are impeding or distorting an efficient and hence competitive market place (Allmendinger and Haughton, 2014). This paper will explore the role of planning in this light from the perspective of ideological fantasy formation.

This exploration is important because it sheds light on a necessary responsibility of planning to often act as a key statutory check and balance against negative market externalities and even outright market failure. Yet, this is a responsibility that often positions planning as the 'scapegoat' impediment in opposition to popular aspirations for a superficially better entrepreneurial world without regard to the consequences, such as those created by unfettered growth. This paper argues that planning, when undertaking its statutory empowered responsibility of looking after the public interest, also often provides additional value-added to society, or at least factions within that society, by providing governance with a justification, or scapegoat, as to why its policies and the promises that they make are failing. Further, this justification as to why a policy, such as the provision of accordable housing, is being impeded, by the identified 'villainous' agency of planning, actually helps to sustain popular believe that the fantasy promised, such as affordable housing for all, will eventually be fulfilled, once this scapegoat is appropriately dealt with. But, of course, the latter never somehow occurs, since planning actually performs a necessary and important regulatory function and, as this paper will discuss, the actual impediments to policy success are generally more fundamental and have little correlation with planning agency.

Moreover and essentially, the initial promised fulfilment of generally any policy that contains 'feel-good' utopian values, of easy liveability, affordability or global economic or other similar desirable success, is eventually displaced and supplanted by new desirable policy promises (Gunder and Hillier, 2009). These subsequent promises provide resolution of more recently emerged issues requiring address, so as to engage with these newly emerged 'pressing' problems and fulfil a polity's resultant newly constituted 'most important' desires. At least that is, until the policy circle continues into its next evolutionary cycle of promises and subsequent impediments to their resolution (Gunder, 2015). With planning often playing important, if diverse, roles including that of policy implementer and sometimes that of policy impediment, at various stages of this evolving governance process, with the popular media also often contributing an important role in disseminating information and shaping ideological attention about the policy process and why it is, or is not, succeeding (Clifford, 2006; Gunder, 2011, 2015).

An understanding of the ideological fantasy dimensions that underlie this process is important for both planning theorists and practitioners, as it will better assist both groups with their academic or professional practice in the wider social world. Further, this understanding, at least as developed in this paper, is very much at odds with the dominant neo-liberal worldview and its simplified utilitarian economic underpinnings. This is because 'economics ignores the role of the unconscious and fantasy in market behaviour'; in contrast, the psychoanalytically derived philosophical approach drawn on in this paper 'is determined to bring such forces to the limelight', for 'psychoanalysis and economic reflection are no strangers' in the works of both Freud and Lacan from which this perspective is derived (Stavrakakis, 2012, p.2293). Further, one 'can summarize two steps [that] the analytical and critical benefits of focusing on fantasy [provides]… how fantasy may serve to bolster certain ideas that are not only contestable but also normatively suspect [and]… it reveals how a subject can get hooked into its logic, in the sense that the subject becomes strongly attached to or gripped by it' (Glynos, 2012, p.2406).

In understanding the ideological dimensions of public policy implementation, Stavrakakis (2007, p.180) argues that a traditional scientific focus on knowledge and rational textual argument is inadequate, rather he contends that 'we need to shift our attention from knowledge and consciousness

to another level, to the level of an often unconscious enjoyment'. In this regard, this Lacanian derived approach supplements discourse theory by adding an extra-discursive element to the conceptual framework, which is the subject's conscious and unconscious relationship to desire and enjoyment (Žižek, 1989, p.125). Importantly, 'the Lacanian concept of enjoyment is necessary to explain why some discourses', even though they are internally illogical and 'incoherent are preserved and maintained over time' and may even constitute dominant public policy narratives (Engelken-Jorge, 2010, p.77).

In this regard, failing fantasy narratives are 'commonly sustained through positing scapegoats, and in the case of neoliberalism the chief scapegoat is the opposition of free trade, namely socialism—or rather, the "paranoid construction" of a caricatures and stereotyped socialism ostensibly corrupting the capitalist system' (Fletcher, 2013, p.806). And is not the term 'planning', perhaps with the words 'state' and 'central' removed and perhaps 'spatial' added, not the main bureaucratic apparatus of this chief scapegoat remaining under contemporary neo-liberal governance, especially after the demise of socialism across much of Europe and the rest of the world (Allmendinger and Haughton, 2010)? Accordingly, does this not rather sets up spatial, or other, 'planning' as the chief remaining scapegoat of neoliberal governance, even though society needs this important regulatory apparatus of spatial planning for governance to function, especially at the local area level, as even Margret Thatcher was forced to implicitly acknowledged some thirty years ago (Allmendinger, 1997)? Indeed, Fletcher (2013, p.806) asserts that 'socialism (in the guise of state regulation) serves just this role within the fantasy space of neoliberal discourse'.

To deconstruct this neo-liberal fantasy which asserts that planning often impedes, or appears to fail, in its responsibility to ensure policies for market-lead success, the paper, after first documenting examples of this scapegoating process, will introduce an outline of the basic Lacanian theoretical conceptions of the subject, fantasy and desire. It will then briefly explore the role of ideological fantasy in governance theory (Gunder, 2015), prior to investigating the role of the 'scapegoat' in ideological fantasy formation for public policy facilitation, so as to explain why planning is often placed in this role.

Prior to beginning this important exploration, it is important to establish that the concept of an ideological fantasy is not just the illusion attributed by Marx as false consciousness, 'which pits "misrecognition"… against a "true objective knowledge"', even though there are dimensions of illusion often embedded in ideological fantasy, as will be discussed in the following sections (Glynos, 2001, p.193). Indeed, scholars 'have for a long time recognized that the issue of contested realities goes much deeper than a "false-consciousness" picture of the world suggests' (Glynos, 2014a, p.185). Rather than differentiating between a dichotomy of either an objective social reality somehow knowable via representation through rigorous scientific enquiry versus an alternative of delusional fantasy, this paper's psychoanalytical constructivist understanding positions fantasy, 'animated by logics of desire and enjoyment', covariant with one's discursive interests and principles, which are constituted by normative justification and epistemological scientific validation, as **both** facilitating the organisation of a subject's social reality and, where collectively shared, that of a subject's wider culture (Glynos, 2014a, p.185). In doing so, fantasy's contribution simplifies society's anxiety provoking complexity as well as its many inconsistencies and uncertainties, resulting in an apparent social reality that appears as a coherently materialised, yet simplified, whole (Gunder, 2011a, p.333). From this perspective, any society's shared social reality is, and will always remain, highly ideological and any resultant dominant consensual worldview is hegemonically successful largely through its promises of security, harmony and future enjoyment, even though, in actuality, this ideological framing, 'shaped by narratives and the media in democratic polities', may be often contrary to the interests of the majority of its citizens (Glynos, 2014a, p.188).

## 2. The role of planning as scapegoat in contemporary neo-liberal governance

Planning is often blamed for the failings of contemporary neoliberal governance and those of wider society. Allmendinger and Haughton (2014, p.29) go so far as to assert that in the UK, 'neo-liberal discourse seems to require a demonization of planners and planning as a bureaucratic, anti-enterprise form of social engineering that is forever "locking up jobs in filing cabinets"'. In my own country of New Zealand, the Minister of Finance and Deputy Prime Minister Bill English has recently pointed his 'finger at local government planning rules, saying they are a major cause of poverty and inequality because they drive up the price of houses' (Small, 2014, np). The current UK Chancellor (at time of writing) stated in a commentary in the Financial Times:

> In a global economy, where skills and capital are more mobile than ever, our planning system is a deterrent to international investment, and a barrier to the expansion of home-grown enterprise.
>
> When planning acts as a brake on growth, and on the much needed new jobs and new businesses, reform is imperative… Reforming a slow and inefficient planning system will be good news for the small business looking to expand; for the young family hoping for more affordable house prices; and for the community wanting to decide on their own future. (Pickle and Osborne, 2011, np)

The UK Guardian Newspaper observed that '[d]esperate for someone to blame for the lack of growth, David Cameron has fallen back on the Margaret Thatcher's old bogey, local government, and the bugbear of planning control' (Jenkins, 2012, np). Indeed, a recent UK planning professional trade publication has reported a headline that: "The planning system is to blame for Britain's overpriced housing and struggling retail sector, according to research by a think-tank" (Webb, 2014). Similarly, a US think tank of acknowledged right-wing perspective went so far as to blame urban planning for the 2008 world recession:

> big government not only let the crisis happen, it caused it… it all started with the [housing] bubble. But what caused the bubble? The answer is clear: excessive land-use regulation… It almost exclusively struck states and regions that were heavily regulating land and housing.
>
> The key to making a housing bubble is to give cities control over… "growth-management planning." If they have such control, they will restrict such development in the name of stopping "urban sprawl" – an imaginary problem – while their real goal is to keep development and its associated tax revenues within their borders. Once they have limited rural development, they will impose all sorts of conditions and fees on developers, often prolonging the permitting process by several years. This makes it impossible for developers to respond to increased housing demand by stepping up production. (O'Toole, 2008, np)

It does not take much effort to find similar evidence from other right-of-centre neoliberal regimes and their voice-pieces that planning is often asserted as the cause for many of their country's problems. Further, considerable criticism has been made by academics of planners and their professional institutions for not better defending planning against these ideological attacks and the resultant negative imagery of planning consequentially projected in the popular media (Clifford, 2006; Gunder, 2011a; Tewdwr-Jones, 1999). As Allmendinger and Haughton (2014, p.30) observe in regard to

planning's lack of development of a robust defence against its scapegoating, at least in the UK, a 'more compliant scapegoat for neoliberal ideologues and scaremongers could scarcely be imagined, so naturally like all bullies they keep coming back'. To begin to theorise how and why this process works in ideological formation and contemporary society, a brief précis of the Lacanian subject and its relation to fantasy formulation is necessary, as developed in the following section.

## 3. The Lacanian subject, fantasy and desire

For Lacan (2006), it is a fundamental 'lack' that constitutes both the subject and the subject's engagement with fantasy. This 'lack', (and *jouissance* – enjoyment – which will be discussed in detail shortly) relates back to our initial infantile relationship with our first caregiver – Mum – and the fictional sense of post-natal wholeness that this relationship created for the new born. It is the growing infant's emergences from a relatively simple state of biological existence into the symbolic order of language and culture that creates a traumatic separation from this primordial Other. This lack 'results in deep loss (of enjoyment), a loss we are never able to forget', so we constantly seek to duplicate this primordial fulfilment, but without success, only generating dissatisfaction, as this 'enjoyment is always deferred, with the result that we continuously miss our goal, yet keep coming back for more' (Kapoor, 2014, p.1128). Moreover, this:

> "lost object" is primordial in the sense that it is something we never had – and for this reason impossible to recover. Nevertheless, it is said that this lost object structures the desire and being of the subject. So enjoyment is linked to impossibility and its fantasized outcomes. (Glynos, 2012, p.2404).

In other words, our very 'subjectivity is a function of being interpellated into the symbolic order', which Lacan calls the 'big Other', where we 'henceforth experience ourselves as fundamentally lacking' and our attempts to forever replicate this misleading primordial fantasy derived from 'our unconscious conviction that we were once whole and completely satisfied' are forever without success (Ruti, 2014, pp.304-305). Accordingly, subsequent new fantasies then play on the subject's mechanism of perpetual hope – desire – that this primordial fantasy of wholeness and complete satisfaction will someday return, even though it no way reflects the rather terrifying actual reality of our infantile pre-symbolic existence.

Lacan's triad registry of the Symbolic, Real and Imaginary is the basis on which this theorisation of our inter- and intra-psychic life is developed. Subjectivity and resultant human agency is fundamentally constituted by the inability of the subject to fully represent itself in the Symbolic order of words, knowledges, understandings, values, and beliefs, which, in aggregate, these signifier chains incompletely construct as society and social reality. For in the symbolic order 'the subject is never fully equal to itself, it is only constituted discursively via a signifier representing the subject for another signifier' resulting in the symbolised subject being fundamentally incomplete and lacking (de Vos, 2014, p.87). For 'once we (as human animals) enter language, we are thoroughly denaturalised' as 'we are unable to relate to the world directly any more, since it is always mediated by and through language' and 'because we are linguistic beings and the symbolic order is lacking, so are *we* lacking, always divided and alienated (from the world, from our own biological instincts)' (Kapoor, 2014, p.1122 – emphasis in original). Lacan (2006, p.678 – emphasis added) asserts that assimilation into language and resultant culture 'castrates' us from our biological instincts, that is '[t]he cut made by the signifying chain is the only cut that verifies the structure of the subject as a discontinuity in the <u>real</u>'.

The Lacanian concept of the 'Real' is simply a placeholder term for some noumenon (in contrast to an observable phenomenon) that somehow disrupts signification. But it is a noumenon in a non-Kantian

'sense' of the word, since it does not exist-in-itself, as it is 'nothing at all, just a void, an emptiness in a symbolic structure marking some central impossibility… a certain limit which is always missed' (Žižek, 1989, p.173). Indeed, the Real is 'the immanent obstacle, stumbling block, of the Symbolic order itself' (Žižek, 2008, p.319). This is especially apparent when we try and represent the Real in the Symbolic and, at best, can only signify some of the symptoms that it's inconsistencies produce as the Real's excessive impossibility overflows 'our illusions of order and coherence' undermining the 'Symbolic attempts to create coherence' (Fletcher, 2013, p.798). In doing so, 'the Lacanian [R]eal ruptures the complacency of the prevailing symbolic, rendering it less securely authoritative than it pretends to be' (Ruti, 2014, p.299).

The Imaginary is the third element of Lacan's triad, which embodies our attempt through fantasy to conceal this elemental disjuncture between the Symbolic and Real, which Žižek (1989, p.118) called the "screen concealing the gap". Fantasy plays an important role in concealing the Symbolic order's disruptive relationship with the impossibility of the Real. In this regard, 'fantasy denotes a framing device which subjects use to "protect" themselves from the anxiety associated with the idea that there is no ultimate guarantee or law underlying and guiding our social existence' (Glynos, 2012, p.2405). Fantasy allows us to meaningfully structure social 'reality, often in the least expected scenarios, ordering our emotional investment within a larger narrative of reconciliation and stability… fantasy is what attempts to conceal all fissures… turning our worldly experience into something coherent and appealing' (Bloom and Cederstrom, 2009, p.163). Accordingly, 'fantasy shades into reality in a myriad of subtle and not so subtle ways [so that social] reality is overdetermined by fantasy' (Glynos, 2014a, p.185). Indeed, in this regard, fantasy functions as 'a means for an ideology to take its own failure into account in advance' (Žižek, 1989, p.126 – emphasis in original).

'The essential kernel of fantasy is its capacity to organize' and sustain desire over time for the subject, 'not to represent [social] reality in a faithful way' (Glynos, 2014a, p.183). Lacan called the pursuit of desire: *jouissance*, which is 'a basic compulsion to enjoy; to achieve consummate satisfaction and therefore heal the gap, or "wound" in the order of being' (Žižek and Daly, 2004, p.3). But the fulfilment of desire – which would mean the loss of the 'lack' that constitutes the subject, is impossible – so *jouissance* has components of both enjoyment and pain in the pursuit of a satisfaction that can never be fully achieved. Or in the context of hegemonic ideology, '[j]ouissance is the paradoxical satisfaction in dissatisfaction that results from the repeated failure to obtain the full enjoyment subjects are promised in hegemonic discourses' and the fantasies that they propose (Müller, 2012, p.282). Indeed, '[j]ouissance elucidates why people become so attached to cultural values and socio-political systems, and why power can turn out to be so intractable, persistent and enduring' and explains why an individual or society 'has trouble giving up such things as racism, materialism, sexism or religious fundamentalism because one enjoys them; they give one a certain sense of stability and fulfilment, despite the fact that (and sometimes because) one may well know they can be pernicious and cruel' (Kapoor, 2014, p.1129 – emphasis in original).

Accordingly, '[i]n the fantasy-scene desire is not fulfilled, "satisfied," but constituted' (Žižek, 1989, p.118). Moreover, 'through fantasy, *jouissance* is domesticated' (Žižek, 1989, p.123). In other words, 'the aim of fantasy is not to satisfy our desire, something that is ultimately impossible'; rather its aim is 'to construct it and support it as such: through fantasy we "learn" how to desire' (Stavrakakis, 2000, p.89). *Jouissance* often concerns 'the excessive satisfaction or kick we get from doing something transgressive, irrational or even wrong', it often 'involves the intense pleasure taken from pain, a kind of idiotic stupor that often makes us ask for more even though we well know the risks' (Kapoor, 2014, p.1128). Indeed, fantasy 'relies on the dialectic of the promise of enjoyment on the one hand and the *jouissance* that subjects procure from failing to obtain this enjoyment on the other hand' (Müller, 2012, p.282). Through this process, 'fantasy's promise to deliver the desired satisfaction at some future point

conceals the impossibility of this promise, the Real-Symbolic gap it obscures, and the symptoms that signal this disjunction as well' (Fletcher, 2013, p.799).

We can understand and reflexively engage with 'the content of fantasy by exploring, for example, its ideals, the obstacles to achieving such ideals, the way challenges can be overcome, the vision of a successful outcome, and the imagined consequences of failure' (Glynos, 2012, p.2405). In doing so, 'while there is something important we need to hold on to about the force of enjoyment that is distinct from the specificity of normative content, we should also acknowledge how fantasmatic content, animated by logics of desire and enjoyment, can hook up with normative content in multiple overdetermined ways' (Glynos, 2014a, p.185). In this regard, 'Lacan (2006) helps us to comprehend how fantasy bridges our psychic life (the Imaginary) with socially constructed reality (the Symbolic) and prevents us from encountering, what Lacan calls, the Real', that 'which is outside everything that can be (legitimately) symbolized, is literally too terrifying and must be avoided at all costs' (Fotaki, 2010, p.641).

## 4. Fantasy and Scapegoats

Ideology helps to obscure the terrifying contingency of the Real that defies the symbolic order by typically proposing 'some utopian horizon which explicitly or implicitly promises some fullness to come, and it does this through fantasy' (Engelken-Jorge, 2010, p.75). From a psychoanalytical perspective, 'fantasies are not designed to allow us to flee an unsatisfactory world, but rather to render the world satisfactory by reassuring us that the Other – the social environment within which we struggle to find our bearings – possesses the correct, calming, or consoling answers to our most pressing questions' (Ruti, 2010, p.2). For planning and governance, these are questions of how to assure the subject a good life and a good city, perhaps by making our cities more liveable, sustainable, 'world class', or such like (Gunder and Hillier, 2009).

Yet, in most cases, policy responses to these broad questions can seldom deliver actual success. Or even if they do for some, this is not without cost for others. My city of Auckland's Council promises Aucklanders that the Council will make Auckland 'the most liveable city in the world', yet up to 89 percent of the population of some wards in the south of Auckland continue to live in areas of high urban deprivation (Auckland Council, 2012, p.92). Moreover, the same Council is not prepared to fund its own identified policy initiative necessary to overcome this identified deprivation, simply because 'not all local [community] boards [of the Auckland Council] backed the project' (Baker-Wilson, 2014, np). Consequently, to 'retain its grip, every hegemonic ideology needs to take into account in advance its own failure and to condition its own transgression' (Stavrakakis, 2010, p.15). In this regard, 'fantasy is understood to operate at different phases of the policy process, for example, formulation, public justification, as well as implementation' (Glynos, 2012, p.2383).

Where the ideological potential is failing to be achieved, the 'fantasy locates the object of satisfaction as somehow *still in the picture* – still there, *not yet lost'*, so that the fantasy constructively shapes social '"reality" by guiding the way the subject historically weaves (and symptomatically distorts) the denials of loss into the fabric of its "reality"' (MacCannell, 2007, p.171, emphasis in original). Here the 'failure to achieve happiness in the present can even extend one's investment in a certain path of action: if the more one waits, *the more one gives up, then the more one waits, the harder it is to give up*' (Ruti, 2014, p.303 – emphasis in original).

Indeed, 'the more invested we are in the guarantee that fantasy conjures, the more susceptible we become to what we could call the "theft of enjoyment" temptation', which 'involves projecting the inherent impossibility linked to subjectivity as such—the idea of a split subjectivity—onto an external

figure who is then treated as an obstacle to the realization of our ideals: [perhaps] the inefficient or lazy public servant' (Glynos, 2012, p.2410). Moreover, once a governance policy fantasy becomes non-delivering – say for liveability – this failure often receives a further explanatory narrative as to why the desirous fantasy has failed, cannot be permitted, or is being prevented by some pernicious influence, or terrible Other. Significantly, this de-stabilizing fantasy is 'not benign in nature', rather it often is predisposed to 'be perpetrated by malicious forces aiming to destroy what an individual' believes as being most valuable, such as the right to an affordable dwelling unit or a decent job (Bloom and Cederstrom, 2009, p.165). In the case of South Auckland, accordingly to my Deputy Prime Minister Bill English, this malicious force is 'local government planning' that 'drive up the price of houses' causing 'poverty and inequality' (Small, 2014, np). Yet, this is the same local government that promises to make Auckland 'the most liveable city in the world' via a statutorily required spatial plan, legislated by the same current government in which English is the Deputy Leader (Auckland Council, 2012)!

Under the theft of enjoyment narrative, 'the concept of scapegoat plays an important fantasy role in suggesting that our enjoyment might be regained, but only as a state of future potential, if we maintain the prevailing ideology by being resolute against this "thieving" Other' (Gunder, 2011a, p.334). Further, fantasy facilitates the structuring of 'enjoyment embedded within scapegoating stories, an enjoyment which energizes a range of pre-emptive political logics… [so that scapegoats] embody an obstacle to an ideal which is [actually] preserved by the scapegoating process' (Glynos et al, 2012, p.312). Moreover, the role of scapegoat provides support to a fantasy, as by erasing this 'disturbing excess… from the picture, the picture will be that of a harmonious Whole' (Žižek, 2014, p.324). Indeed, Stavrakakis (2007, p.241) contends that fantasy does not only act 'as a screen which promises to fill the lack in the Other, but also as what "produces" this lack'.

Consequently, fantasy acts as the crucial mechanism to hide the contradictions and fissures in social reality. In doing so fantasy constitutes the frame that enables desire for something, but then does not fulfil the desire. Indeed, the promise of fantasy to supply the desired fulfilment at an unspecified future time obscures the very impossibility of the promise to deliver, often through deploying a process that evokes a scapegoat as to why the fantasy is failing to satisfy its desired promise. This results in 'the disjunction between the Real and the Symbolic' being 'further sutured by positing the infiltration of' some kind of evil Other (Fletcher, 2013, p.799). This is "an external element, a foreign body introducing corruption into the sound social fabric"' (Žižek, 1989, p.126). Hence, 'what is excluded from the Symbolic… returns in the [R]eal as a paranoid construction of' the culprit that has been repressed' (Žižek, 1989, p.127).

Here the neoliberal governance policy outcome might be for affordable housing for all, which the fantasy promises, but the planners impede through their needlessly restrictive landuse controls which drive up the cost of land and whose time consuming approval processes add further needless additional expense to the selfless developer. In this example, the planners are the scapegoats that prevent the market and its efficiency from doing its 'thing' and providing affordable housing for all. Yet, in this situation the 'planners' function as 'nothing but a fetishistic embodiment of a certain fundamental blockage' (Žižek, 1989, p.127). Further, by identifying 'planners' as this blockage, they provide veracity to the policy fantasy's future promise of affordable housing, by implying that this will still occur, only once these dreadful planners are dealt with by the necessary change of legislation, or however the resolution is proposed. Yet, somehow this resolution never seems to quite occur, or work out!

Of course, it is not the planners that cause this blockage of housing affordability. Rather the cause is the very nature of neoliberal capitalism to bid up land rents and housing costs to the highest exchange

value that a society can sustain. That is, at least until the next capitalist crisis and resultant market contraction. This inherently produces housing costs that largely exclude entry for those on the margins, high risk sub-prime lending aside, while benefiting both established affluent home owners and their lending and related institutions with their capitalist gains, at least until the next recession, or worse, occurs (Aalbers and Christophers, 2014; Dean, 2013; Harvey; 2014).

Žižek (1989, p.127) attributes this scapegoating process 'to identification with a symptom'. In this case, the need for neoliberal government/governance to require a planning regulatory function, which generally has a statutory responsibility to regulate built development, much of it profit driven, so as to protect the public interest by ensuring a minimally acceptable build quality that curtails adverse safety, amenity and environmental effects, at least to a societally set acceptable standard. That there is a need to regulate property development in this regard, especially where it is concerned with profit maximisation, is 'clearly a social symptom: the point at which the immanent social antagonism assumes a positive form, erupts on the social surface, the point at which it becomes obvious that [neoliberal] society [and its market logics] "doesn't work", that the social mechanisms "creaks"' (Žižek, 1989, pp.127-128). Perhaps best put into context by Dean (2013, p.144), who contends that in the lead up to and aftermath of the 2008 recession's speculative American housing bubble and the sub-prime loan transference of debt to those 'seemingly furthest from Wall Street', 'the increase in the number of poor people isn't a social problem, it's an investment opportunity', where the neoliberal capitalist 'system turns in on itself and feeds on its own excesses'.

Accordingly, 'one of the ideological strategies is to fully admit the threatening character of a dysfunction, and to treat it as an external intrusion, not as the necessary result of the system's inner dynamic' (Žižek, 2008, pp.388-389). Consequently, resolution is achieved by producing the scapegoat 'to cover up, and divert attention away from, the [polity's] internal troubles (the Real)', so that 'once the scapegoat is removed or eliminated, the [polity and capitalism] will recover its (impossible) harmony' (Kapoor, 2014, p.1133).

**5. Disavowal, Repression and Primal Dependency**

Generally 'markets are treated as a neutral means of coordinating supply and demand in a way that achieves a set of substantive aims' (Glynos, 2012, p.2384). Yet, 'the critique of market capitalism often becomes coterminous with a critique of those logics of fantasmatic desire and enjoyment that buoy up everyday consumptive patterns' (Glynos, 2012, p.2379). Neoliberalism, like any 'ideological system binds people to it by seducing them (through *jouissance*); it creates a series of lacks, and through a cycle of satisfaction-disappointment (and hence postponement) is able to endlessly stimulate and redirect our desires (for consumption, wealth, jobs, etc)' (Kapoor, 2014, p.1134). At the same time the neo-liberal fantasy has to disavowal and conceal its contradictions, be they devastating Gini coefficients that symbolise exploited labour and resultant marginalised home-owners and renters; or, the global ecological crisis and the loss of bio-diversity and climate change that unconstrained global capital consumption induces (Gunder and Hillier, 2009; Harvey, 2014). As a consequence, every hegemonic ideology, including neo-liberalism,

> needs to take into account in advance its own failure, its own limits, and to condition its own (partial) transgression. Here, we see the lacking "other'" an incomplete power structure, indirectly acknowledging this lack, allowing a certain degree of dis-identification, providing a breathing space for its subjects, on the condition, of course, that this remains under control: 'Ideology is effective precisely by constructing a place of false disidentification.' (Stavrakakis, 2012, pp.2297-2298 – emphasis in original)

In this regard, 'neoliberal analysts tend to engage in a sort of "fetishistic disavowal" (Žižek, 1989, 2008)—a simultaneous admission and denial—often superficially acknowledging yet ultimately dismissing for the most part potential critiques concerning the presence of essential contradictions in the performance of neoliberal mechanisms… something generally known yet rarely openly voiced' (Fletcher, 2013, p.797). This ideological disavowal is what permits ideology to work, even in the planning office, and not just for wider society (Gunder, 2014). This keeping quite and dismissing contentious issues is also called repression.

Repression occurs at both the conscious and unconscious level and our observable material actions – agency – is driven by both levels of mind. We all have ideas that are inappropriate, unseemly, dangerous, or unrealistic, or simply in contrast to the objectives of important others, such as our employer, and these ideas are likely to generate disapproval, or even punishment (Gunder, 2014). So we intentionally try and shelter ourselves from the penalties of considering or even acting on these thoughts and desires by simply forgetting them, pretending to not be aware of these thoughts, literally by pushing them from our consciousness. But, of cause these repressed thoughts still reside in our unconscious, and these repressed desires, even though out of conscious consideration, still continue to drive aspects of our agency, which may result in our developing and undertaking actions that achieve the fulfilment of often unseemly, dangerous or unrealistic aims. But we tend to be unaware of these unconscious desires and how they may still dominate our individual actions.

Indeed, the task of the clinical psychoanalyst is to bring this unconscious repression into consciousness for the analysand. So that the troubled patient seeking help is enabled to understand the fundamental Thing that is shaping and motivating their desire and the resultant often repetitious suffering it tends to induce in their actions. Psychoanalysis has the clinical objective to facilitate the analysand's ability to say: 'Enough!' or at least mitigate these repressed thoughts and desires' most painful dimensions by loosening their grip on the subject's compulsion (Ruti, 2014, p.304).

There are two types, or levels, of repression for Lacan. The first is fundamental or primal repression that constitutes, or accompanies, subject formation for the young child and which constitutes our most fundamental desires (as discussed in a prior section) and the second is symbolic or surplus repression (after Marcuse) that is constituted in the social pressure that forces compliance to the moral codes, norms and standards of the symbolic order – society – and/or the demands of the 'big Other' (Ruti, 2014, p.308). The latter, might be said to correspond to Foucault's normalisation, or Butler's performativity. This symbolic repression is shaped by our inherent socialisation, our desire to be wanted and be considered a 'good' person by others, once assimilated within the discourses of culture and society (Gunder, 2011b).

Neoliberalism has produced a 'traumatic reality of intensified vulnerability that has been created by governmental and corporate abandonment of most of the citizenry', which has occurred through the dismantling of the welfare state and its replaced by an autonomous model of individual competition, where success accrues to the few and results in an extensive symbolic repression, or perhaps more correctly, after Freud, a disavowal, maintained by a fetish structure oscillating between two contradicting fantasies (Layton, 2014, p.171). The first is a fantasy of mastery and independence that we either are, or, at least for most of us, that one-day we will be, competitively successful in our neoliberal social reality (Glynos, 2014b, p.8). The second is a fantasy of dependence that we are somehow still loved and protected by the symbolic order, Lacan's 'big Other', or perhaps better phrased: 'Caring Other', acting as a metaphorical sublimation of our desire to return to our primordial fiction of wholeness with our primordial caregiver (Glynos, 2014b, p.9). Yet the 'fantasies endemic to narcissistic neoliberal subject formation are produced in part by the radical split between autonomy and connection… in the autonomy fantasy, we imagine ourselves self-sufficient and omnipotent,

needing no one (the entrepreneurial self); in the fantasy marked by neoliberalism's degraded state of dependency, we fantasize that we will be loved and taken care of without having to make any effort' (Layton, 2014, p.171).

In looking after the public interest, planning is aligned with the weaker second fantasy of dependency, which is that social reality, as materialised traditionally in the role of the state, will somehow still care and look after you, by protecting you from the non-Caring Other, say 'big business'. But this latter fantasy is a negative one of failure under the dominant neoliberal discourse, where one is lacking competitive success due 'to failures of *individual* choice and responsibility', which makes you both weak and dependent on the Other for your own wellbeing (Hamman, 2009, p.50 – emphasis in original). Accordingly, this weaker fantasy's alignment with planning's agency for the common good tends to alienate popular support for it. This is because alignment with the dependency fantasy, at least under neo-liberal values – makes you a societal looser and failure!

Rather, an alignment with the stronger neo-liberal fantasy of the 'omnipotent solution resolves', at least at a superficial level, many of 'the problems of abandonment, danger and helplessness' that largely pertains to the fundamental trauma underlying the weaker fantasy's basic premise of dependency. While the sublimation of the fundamental desire for a return of primordial Mum with her promises of completeness and comfort is no less needed, an alignment with the omnipotence fantasy allows more 'psychic room' for new sublimations for alternative fantasies. These might be dependency fantasies of a more personal, or market base provision, ones that are less dependent on neo-liberal governance/government for their fulfilment, even if no more able to sate the underlying desire propagating them (Layton, 2010, p.307).

Yet our fantasy aspirations inherently leave us both individually and collectively open to manipulation, be it through mechanisms of governance, the market, or simply traditional political promise (Gunder and Hillier, 2009). Glynos (2014b, p.10) understandably raises the concern of being over-attached to our fantasies, say perhaps that we will soon have that better job or affordable house, and when this is not forthcoming we are then susceptible to being directed to projecting this attachment 'onto an external figure… who is then treated as an obstacle to the realisation of our ideals'. Here, perhaps, the politician's scapegoating statement is most effective. In this type of situation, a key dimension of ideology again works through repression and disavowal, when the actual truth of our situation hurts, such that you may never have that better job or your own home, it is often easier, and less painful, to align with the dominant promises, even if told by a politician you inherently may not trust! Consequently, it may be easiest to simply blame one's misfortune on those socialist planners!

Regardless of the ethics involved in its deployment, or the often obscenities of scapegoating's historical global precedents, scapegoating provides any governance regime, neo-liberal or otherwise, an effective mechanism for its diversion of faults and policy failures. In the exemplars of planning discussed in this paper, the scapegoating process used is one that builds on and re-enforces neo-liberalism's central normative values of individual independence, self-determination and entrepreneurial success, while downplaying the contradicting values of independence, social justice and care of the other (Harvey, 2005, 2014). Indeed, as René Girard's (1987) mimetic theory develops, it is through 'the sacrificial violence of scapegoating' that 'the mechanism central to the construction and maintenance of order' is maintained and this is 'a process able to channel the violence of all against all into the violence of all against one', so as to obscure, in this case, the inherent contradictions imbedded in the contemporary neo-liberal capitalist global order (Brighi and Cerella, 2015, p.19). This includes neo-liberal governance's scapegoating of its own necessary functionary: planning, so as to obscure its fundamental policy contradictions when predicated in the pursuit of

capitalistic wealth creation for the few that merit such reward and to facilitate the exclusion of the vast majority that lack the necessary worth.

Fundamentally, we are constantly driven by our desired seeking of that impossible Thing that we can never find, at best, we can achieve 'only its pleasurable associations' (Lacan, 1997, p.52). Metaphorically, these are associations that governance and its planning agency attempts to promise and even occasionally provides in its spatial policy delivery (Gunder and Hillier, 2009), yet this common good often sits at odds with neo-liberal's fantasy promise of independence, omnipotence and competitive success for the few that are 'truly worthy'. According, a scapegoating process is often deployed that allows governance to channel public dissatisfaction into just one dimension of its failing governance function, which can then be disavowed. Further, this fantasy deconstruction explains one dimension as to why subjects can first develop and then 'enjoy their hatred of big government' as well as how 'this enjoyment blinds them to their "real" interests', while facilitating the interests of neoliberal governance, as this governance process further depoliticises and dis-enfranchises the 'non-worthy' majority from the achievement of their own desires (Glynos, 2014a, p.181 – emphasis in original).

## 6. Conclusion

> What is so powerful about Lacan's ethics of psychoanalysis as an antidote to the master's service of goods is that it asks, quite simply, that we cease to care about what the big Other wants – that we reject the legitimacy of the Other's desire so as to create space for the truth of our own. (Ruti, 2014, p.313).

This paper has deconstructed the neo-liberal scapegoat fantasy that asserts that planning often impedes, or fails, in its responsibility to ensure policies for market-lead success. It first documented several exemplars of this neoliberal scapegoating process by politicians and their voice-pieces. It then briefly explored the role of fantasy and ideology in governance policy formulation and, from a Lacanian perspective, the theorisation that underlies this process. Having laid the necessary foundation, it then investigated the role of the 'scapegoat' in ideological fantasy formation for public policy facilitation so as to explain why planning is often placed in this role, and why this role is often ideologically necessary, at least for neo-liberal governance, when planning undertaking its statutory responsibility of facilitating the 'common good' and/or public interest. Further, from Lacan's (1997, p.321) ethical perspective, planning in allowing itself to be placed repeatedly in the role of scapegoat, while still attempting to retain and facilitate the attainment of its core values (desires) of protecting the wider public interest, actually makes the profession heroic!

The paper concluded that one thing that fantasies generally 'have in common, including fantasies of independence and fantasies of dependence, namely: the potential of fantasmatic over-investment that springs from the promise of a guarantee, or, to put it in more Lacanian terms, the promise of subjective suture', that is the promise that 'the uncertainties, ambiguities, and ambivalences of [social] *interdependence*' constituting a society will somehow be overcome (Glynos, 2014b, p.10 – emphasis in original). This is a key insight as to how ideology works. The paper has illustrated how the role of the scapegoat helps to facilitate and sustain this suture, by helping to insure faith that the governance policy guarantee will somehow prevail, even when the evidence appears contrary to this success, by identifying, correctly or not, who is impeding this promise. Planning is often socially useful in this role, at least for ideologically driven neo-liberal governance, even if it may be rather frustrating for the planners that are simply doing their heroic best to do their jobs in fulfilling the public interest.

# Beyond resilience: The role of leadership in progressive planning

**Robin Hambleton, University of the West of England, Bristol**

**Key words:** Resilience; Leadership; Sustainable development; Urban politics

## Abstract

Resilience has become an influential concept in planning theory and, to some extent, in planning practice. This paper, by drawing on research on the role of place-based leadership in promoting progressive planning and urban innovation in cities in fourteen countries, will suggest that resilience is a concept with serious limitations. On the plus side, the concept has proved itself to be valuable in enhancing understanding of the ability of an ecological system to absorb disturbances and recover from shocks and stresses. But the meaning of the word is now being stretched and applied in an inappropriate way to socio-political systems. The growing misuse of the term is eroding its usefulness in relation to pressing public policy debates. The evidence suggests that, as with the term sustainable development, powerful interests appear to be using the word resilience to promote a depoliticised, or managerial, view of city politics and planning. In much of the recent literature on resilience fundamental social conflicts are downplayed, power structures are neglected, and major challenges facing cities, particularly growing inequality in societies, are overlooked. Research for a new book, *Leading the Inclusive City,* suggests that paying attention to leadership, and particularly various forms of place-based leadership, can provide helpful insights on how to tackle social and environmental ills. The paper suggests that it may be possible to strengthen resilience theory and practice, certainly as it relates to urban and regional governance, by injecting ideas drawn from the study of place-based leadership.

## Introduction

In recent years resilience is a concept that has gained popularity in planning theory and, to some extent, planning practice. The literature on resilience has expanded rapidly in recent years (Monahan 2012; Lewis and Conaty 2012; Newman et al 2009; Pearson et al 2014; Rodin 2015). In this paper I seek to raise some concerns about both the concept of resilience, as it applies to socio-political systems, and the way it is being applied in some cities and city regions.

Concepts are important. They can help us make sense of our complex world and, if they gain acceptance in political and policy circles, concepts can come to have a marked influence on practice – and on society as a whole. As explained by Donald Schon, in his perspicacious book, *Beyond the Stable State,* concepts can move, sometimes quite swiftly, from the margins of scientific discourse to become 'ideas in good currency' (Schon 1971 p123). Resilience would appear to be an idea that is now, in some circles at least, regarded as an idea in good currency.

The rational, scientific model offers one way of explaining the rise of resilience thinking. From this point of view understanding of natural and social systems has been advanced over the years by sound research and analysis. As a result, scholars have discovered and developed this useful concept called resilience. Schon argues, however, that stakeholders may, wittingly or otherwise, collude in the creation of a scientific mythology. He suggests that governments appear to believe that they need to operate under an aura of rational, active work on what are taken to be public problems. He describes a need for a façade of progress and problem solving:

> 'This has the effect of inducing premature abandonment of issues. If we are not solving them, we must at least give the appearance of progress by moving to the next batch. It tends to be true of government, as of philosophy, that old questions are not answered – they only go out of fashion' (Schon 1971 p142)

In this paper I will explore whether Schon's analysis might help us explain the way resilience appears to be displacing sustainable development as an idea in good currency. Perhaps governments have found it too tough to implement effective approaches to sustainable development. On this interpretation resilience may be proving attractive to politicians and policy makers because it offers less of a challenge to established power relations than sustainable development. I will suggest that paying attention to the role of leadership, inspiring place-based leadership, is now important if we are to create just and sustainable communities.

The analysis unfolds in four parts. First, we consider, albeit briefly the notion of sustainable development. Over the years, various interested parties have chosen to redefine the concept to the point where, in some settings at least, it has become a virtually meaningless expression. We then turn to examine the

concept of urban resilience. Again our touch will be light because a substantial literature is available. In the third section three concerns about the concept of resilience are outlined. If this critique has merit, the concept would appear to have serious limitations, at least as it relates to urban and regional governance. A fourth section discusses the importance of focussing more attention on place-based leadership if we are to understand why progressive change takes place in localities and city regions. The commentary here draws on evidence presented in a new book on *Leading the Inclusive City* (Hambleton 2015). It will be suggested that it may be possible to strengthen resilience theory and practice, as it relates to urban and regional governance, by injecting ideas from the study of place-based leadership.

**1) The use and abuse of sustainable development**

The United Nations Conference on the Human Environment, held in Stockholm in 1972, stressed, in line with the 'limits to growth' argument set out by Meadows et al (1972), that any agenda for future development must include the creation of a healthy and productive environment for all human beings. And, more than a decade later, the World Commission on Environment and Development, chaired by Gro Harlem Brundtland, mapped out a framework for equitable development. Described, in the Brundtland Report, as 'sustainable development' this approach attempted to balance environmental, social and economic needs (WCED1987).

The work of all those involved in creating and developing the notion of sustainable development, and advocating its application in the public, private and non-profit sectors, is a spectacular achievement. The idea that companies should focus solely on the 'bottom line' and seek profits at all costs was challenged. And the last thirty years have seen important steps forward across the world in relation to sustainable planning, sustainable development and sustainable living. There is now widespread recognition that the resources of the planet are bounded.

A problem, however, is that powerful interested parties have chosen to redefine, and dilute the core messages of sustainable development to the point where, in some settings at least, it has become a virtually meaningless expression. This happened fairly quickly. For example, the goal of 'sustainable development' was endorsed by the leaders (including Prime Minister Thatcher of the UK and President Reagan of the USA) of the G7 group of industrialised nations at the Toronto summit of 1988. An attempt was made to disguise the conflicts between environmental protection and economic development: 'The term sustainable development appears like a magic wand to wave away such conflicts in a single unifying goal. We can have our cake and eat it, it seems to say' (Jacobs 1991 p59)

We can note, then, that over twenty years ago evidence was presented showing that economic growth and environmental conservation are uncomfortable bedfellows. Fears were expressed that sustainable development was likely to become 'a green cover for "business as usual"' (Jacobs 1991 p59). Others have criticised the way the term has been used:

'Sustainable development remains ambiguous, inexact, ill-defined, unbounded and unmeasurable' (Stewart and Collett 1998 p59). Nigel Taylor (2003) provides a particularly incisive analysis of the meaning of the term 'sustainable development' and shows that fudging together conflicting aspirations is intellectually dishonest.

It is important to go back to the Brundtland Commission definition of sustainable development. Please note that it contains **two sentences**, not one:

> 'Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains two key concepts: 1) the concept of 'needs', in particular the essential needs of the world's poor, **to which overriding priority should be given**; and 2) the idea of limitations imposed by the state of technology and social organisation on the environment's ability to meet present and future needs' (WCED 1987 p43, my emphasis)

The second sentence, with its strong commitment to addressing the needs of the world's poor, has vanished from view in many academic and policy debates. Some writers on sustainable development not only forget to include the second sentence, they pay no attention to poverty and unfairness in society at all.

This drift in focus away from dealing with inequality and poverty has not gone unnoticed. It is encouraging to be able to record the increased interest in planning circles in environmental justice (Anguelovski 2013). As Adebowale (2008) explains, adopting an environmental justice perspective to nature foregrounds the social dimension. It highlights the way society interacts with the environment not just in aggregate terms, but also in relation to the **distributional impacts** of planning and urban development policies and practices. Environmental 'goods' and 'bads' are very unevenly distributed in many societies and planning plays a key role in this process. It follows that the distributional effects of urban planning and development should be at the heart of sustainable development.

Unfortunately, much of the time, distributional effects are ignored. Dana Meadows and her colleagues, when they revisited their *Limits to Growth* analysis thirty years on, reinforce this point: 'Current modes of growth perpetuate poverty and increase the gap between the rich and the poor…. In the current system economic growth generally takes place in the already rich countries and flows disproportionately to the richest people within those countries' (Meadows et al 2005 pp 41-42).[i]

**2) The emergence of urban resilience**

In every day use the word resilience means springing back, or resuming an original shape after bending or stretching. The concept has been in use in the study of ecological systems for over forty years, although it's meaning has evolved and is, even within ecological debates, contested (Holling 1973;

Bulkeley 2013). In more recent times efforts have been made to make connections between ecological and planning resilience research (Nelson et al 2006). For our purposes it is sufficient to note that the term resilience is often used to refer to the ability of an urban system to withstand, and recover, from shocks. This is, for example, the way the phrase is used in the annual conferences on *Resilient Cities* organised by ICLEI, the international organisation of local governments dedicated to sustainable development.[ii]

The concept has enhanced understanding of urban vulnerability to disasters, like floods, storm surges or heat waves, and has been popularised by various writers (Lewis and Conaty 2012; Monaghan 2012; Newman et al 2009; Pearson et al 2014). Cathy Wilkinson (2012) explores the notion of socio-ecological resilience and suggests that planning theory should give more attention to ecological concerns. This is, in my view, a sound proposal.

In 2013, The Rockefeller Foundation launched a '100 Resilient Cities Challenge' to encourage cities to better address the increasing shocks and stresses of the 21st Century.[iii] Judith Rodin, President of the Rockefeller Foundation, has written a book, *The Resilience Dividend,* making the case for giving resilience more attention (Rodin 2015). It summarises many of the arguments currently being put forward in favour of 'resilience'. It provides, in my view, a reasonably up to date statement of the arguments used by those who believe resilience presents a sound way forward for localities, cities and city regions in the 21st Century.

Rodin defines resilience in the following way:

> 'Resilience is the capacity of an entity – an individual, a community, an organisation, or a natural system – to prepare for disruptions, to recover from shocks and stresses, and to adapt and grow from a disruptive experience' (Rodin 2015 p3)

This is, pretty much, a mainstream definition of the way the concept of resilience is now being used in public policy making in a number of cities and city regions around the world. By drawing on systems theory Rodin sets out some broad-brush ideas on how to build resilience. She identifies five characteristics of resilience (aware, diverse, integrated, self-regulation, adaptive) and explores three phases of resilience building (readiness, responsiveness, revitalisation).

Questions can be raised about the quality of the evidence Rodin marshals to support her argument. For example, a fair amount of the case study material presented in her book is drawn from the written applications cities made to become members of the 100 Resilient Cities Challenge. It goes without saying that cities bidding for the reputational gains and resources that flow from being awarded the status of a 'Rockefeller Resilient City' have a vested interest in presenting a case that fits well with the resilience narrative. Offering a critique of this particular book is not, however, my focus of interest in this paper. Rather I am spotlighting *The Resilience Dividend* as it provides

a helpful way of drawing attention to wider problems with what we might describe as the urban resilience discourse.

**3) A critique of urban resilience**

In my view scholars and practitioners interested in resilience should be asking much more penetrating questions about the distributional consequences of being resilient. It is important to ask: 'Resilience for whom?' Answering 'Resilient for everyone' is an unsatisfactory response because we know that steps taken in the name of the resilience agenda have distributional consequences.

For example, measures taken to make cities more resilient to the risk of flooding may involve displacing populations and it is often poor communities that tend to be disproportionately affected. The post-Katrina reshaping of New Orleans illustrates the argument – residents of public housing areas have lost out. Edward Goetz notes that the response to the hurricane has had distributional effects:

> 'Katrina provided the opportunity for a final push to close down public housing in the city and move toward redevelopment' (Goetz 2013 p 93)

The environmental justice dimensions of fostering resilience seem to be getting displaced onto the margins of scientific and public policy discourse. Equally worrying, there is a risk that resilience will come to replace sustainability as the next spray-on term that vested interests may try to use to support the status quo of socio-political power relations in the modern city. In the discussion below I separate out three inter-related criticisms of urban resilience theory and practice.

*i) Resilience is a significant step back from the progressive agenda originally set out for sustainable development*

As mentioned above, the definition of sustainable development provided by Gro Harlem Brundtland and her colleagues in 1987, was progressive. It provided a framework for equitable development. It stressed the importance of tackling poverty. Indeed, it made clear that giving attention to meeting the needs of the world's poor should be given 'overriding priority' (WCED 1987 p43). The United Nations Sustainable Development Solutions Network has stayed true to this agenda. Their recent report to the United Nations, advocating a separate urban goal for the Post-2015 Development Agenda, stresses the vital role of sustainable development in tackling poverty and bringing about social inclusion (UN-SDSN 2013).

This commitment to progressive possibilities is **not** centre stage in the narrative about resilience. On the contrary, definitions of resilience focus on process, not substantive outcomes. For example, the definition of resilience provided by Judith Rodin – see above - is devoid of social purpose. Dictators would be happy to sign up to this as a description of their approach to governing. They will agree that it is wise: '… to prepare for disruptions, to

recover from shocks and stresses, and to adapt and grow from disruptive experience' (Rodin 2015 p3). To be fair, Rodin's book does mention poverty, albeit only once. However, it is introduced to suggest that '… poverty is in decline' (Rodin 2015 p 91). The lack of awareness in this book of the growth of inequality in the modern world is startling, particularly when there is so much fine scholarship on this topic (Dorling 2014; Stiglitz 2012; Wilkinson and Pickett 2010). The growth of inequality is a critical feature of our time and resilience strategies that ignore it are unlikely to be effective.

In making this criticism of resilience thinking I am echoing the critique of planning theory set out by Susan Fainstein (2010). In her book, *The Just City,* Fainstein argues that much planning theory is obsessed with process – as a result it simply ignores the reality of structural inequalities and hierarchies of power in modern society. She argues that the substantive purposes of city planning should be central to planning theory, not some kind of afterthought. The same is true for resilience. The focus in much of the urban resilience literature is on process – substantive social purposes are neglected.

Allow me to press the point. The apartheid system in South Africa was clearly a resilient socio-political system if we accept Judith Rodin's definition of resilience. The National Party, the ruling party in South Africa from 1948, was able to curtail the rights of the majority of black inhabitants for almost half a century. It was so resilient it was able to imprison articulate, political opponents, including Nelson Mandela, for decades. Dictatorships across the world are, right now, demonstrating that they can be resilient in the face of legitimate political pressures for change. The governmental systems dictators steer in these countries seem to manage, much of the time, to adapt creatively to perceived threats and shut them down. Resilience, then, describes a quality of a given system. It is **not**, in and of itself, a desirable objective for a social system. It describes a process – the ability to adapt to changing circumstances. Progressive politics requires the overthrow of oppressive power systems. Frankly speaking, we don't want these unjust systems to bounce back.

*ii) Intellectual incoherence*

Perhaps because the substantive political purpose of resilience is rarely clearly expressed, writers on urban resilience appear, at times, to be confused about the objectives of resilience efforts. On the one hand, resilience implies an ability to 'bounce back' – to recover from shocks and stresses. In broad terms resilience appears to refer to the ability of an urban system to adapt in the face of change – to recover, to get back to where it was before. On the other hand, some writers on resilience appear to recognise that it is important not just to 'bounce back' – it might be important to move beyond resilience and consider how to transform the systems that limit socio-environmental possibilities (Pelling 2011).

This is a key point. Is the objective to bounce back? To recover from the disruption caused by a shock to the system? Or is it the opposite? That is, to **not** to return to a pre-existing situation, but to change into something else?

Some writers seem to be confused on this point. For example, Satterthwaite and Dodman (2013) exhibit a tendency to collapse together resilience and transformation in their discussion of urban change. This approach fails to recognise that these words have **different meanings**. Transformation means making a thorough and dramatic change in form and/or character. It is not about bouncing back, it is about changing into something else.

In her book Judith Rodin appears to recognise this distinction (Rodin 2015). But, because her definition of resilience lacks substantive content we are left wondering what political and social objectives she believes resilient policy makers should pursue. In the discussion below I suggest that effective civic leaders are not focussed on returning to the status quo – they strive to change things. They collaborate with diverse interests to develop a vision of the future and then work with stakeholders to bring about that vision. They are clearly in the business of transformation.

*iii) The neglect of power and politics*

My third concern about resilience, and it is a variation on my first criticism, is that it seems to pay little attention to power and politics in modern society. When it does show political awareness, it appears to be careful not to offend figures in the established power structure. This is unsatisfactory. There is now a helpful body of literature on the exercise of power in cities and city regions, but this literature on the struggles and conflicts encountered in every city does not feature that much in the urban resilience literature. Urban political scientists and sociologists have advanced our knowledge of who gains and who loses in the modern city. But authors like Fainstein (2010), Harvey (1973) and Stone (1989) seem to be rarely cited by academics studying urban resilience.

There is a deeper argument here about, what I call, the 'managerialisation of politics'. By this I mean the masking of socio-political conflicts by those powerful interests who prefer to define current political challenges within a managerialist paradigm. Erik Swyngedouw builds on and deepens this argument. He links the current populist discourse relating to climate change and sustainable development to the attempt, pursued by many in power, to adopt a 'post-political' approach to the public sphere. In this post-political world, so the argument goes, words are redefined or diluted in order to emasculate fundamental conflicts.

On this analysis it is no accident that sustainable development has become a relatively meaningless term because: 'Post-politics refers to a politics in which ideological struggles are replaced by techno-managerial planning, expert management and administration' (Swyngedouw 2010 p225). In making the link between post-politics and climate change he argues that many involved in green politics have moved from a position of contestation, organised action and radical disagreement, ten or twenty years ago, to one in which they have been co-opted into the service of neo-liberal aims and objectives. He argues that weak definitions of sustainable development, ones that attempt to

maximise consensus, stand in the way of clear thinking about what is actually going on. Perhaps the same can be said of resilience.

Judith Rodin gave a public lecture about her new book, *The Resilience Dividend,* at the University of Bristol on 16 January 2015. When asked by a member of the audience why she had said little or nothing about politics she asserted that there is no longer a right wing or a socialist way of bringing about change. She espoused a view that is clearly in line with the managerialisation of politics. Her book does not discuss power in modern society and says relatively little about the fundamental conflicts found in all cities, even so-called resilient cities.

Perhaps we need to ask some more fundamental questions about the use of the word 'resilience' in the urban context. Has the academic fashion for studying resilience led to the concept being used in an inappropriate way? Do we always want urban systems to bounce back to how they were? Does the concept of resilience embody an inherently conservative political stance?

**4) Can study of place-based leadership contribute?**

The critique of urban resilience set out above is not intended as an attack on the values that underpin authentic approaches to sustainable development, sustainable planning and sustainable living. Rather I am raising a few questions that could be given more attention by scholars and practitioners keen to understand and improve the quality of life in cities. In my own work I have found it helpful to focus on place-based leadership.

In my new book I suggest that those interested in progressive public policy making might find a notion that I describe as *New Civic Leadership (NCL)* to be helpful (Hambleton 2015). NCL involves strong, place-based leadership acting to co-create new solutions to public problems by drawing on the complementary strengths of civil society, the market and the state. If we are to understand effective, place-based leadership, we need a conceptual framework that highlights the role of local leaders in facilitating public service innovation. Here I provide a sketch of a possible framework.

**Figure 1** suggests that in any given locality there are likely to be five realms of place-based leadership reflecting different sources of legitimacy:

- **Political leadership** – referring to the work of those people elected to leadership positions by the citizenry

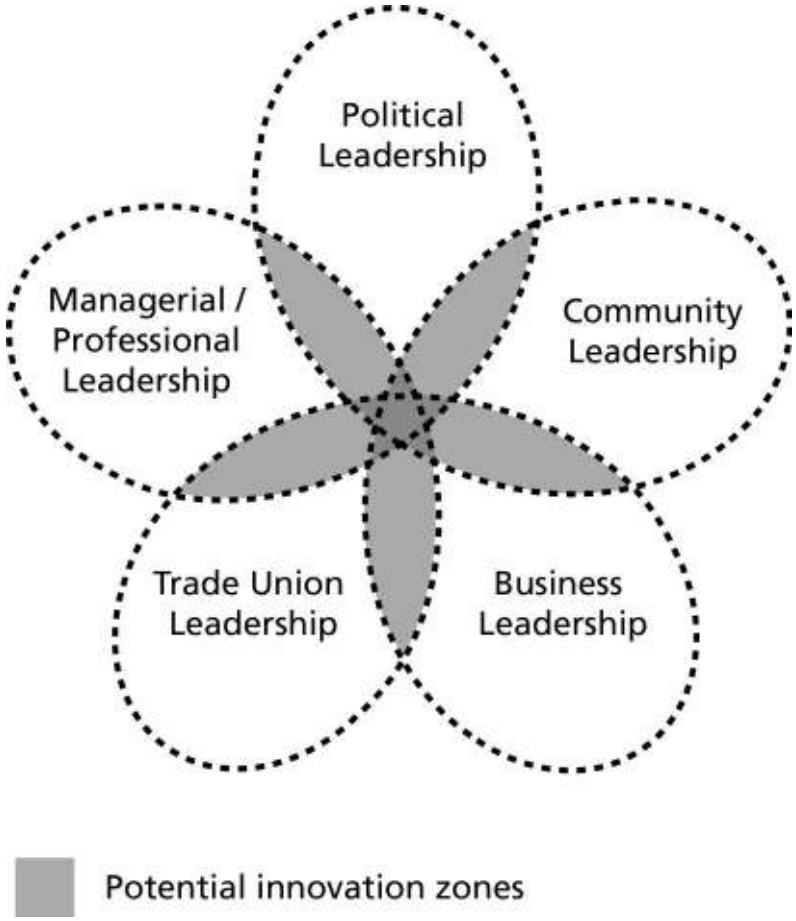
- **Public managerial/professional leadership** – referring to the work of public servants, including planners, appointed by local authorities, governments and third sector organisations to plan and manage public services, and promote community wellbeing

- **Community leadership** – referring to the many civic-minded people who give their time and energy to local leadership activities in a wide variety of ways

- **Business leadership** – referring to the contribution made by local business leaders and social entrepreneurs, who have a clear stake in the long-term prosperity of the locality

- **Trade union leadership** – referring to the efforts of trade union leaders striving to improve the pay and working conditions of employees

**Figure 1: The realms of place-based leadership**



These roles are all important in cultivating and encouraging public service innovation and, crucially, they overlap. I describe the areas of overlap as innovation zones – areas providing many opportunities for inventive behaviour. This is because different perspectives are brought together in these zones and this can enable active questioning of established approaches. It is fair to say the areas of overlap in **Figure 1** are often experienced as conflict zones, rather than innovation zones. These spaces do, of course, provide settings for power struggles between competing interests and values. Moreover, power is unequally distributed within these settings. This is precisely why place-based leadership matters. The evidence

from my research is that civic leadership is critical in ensuring that the innovation zones – sometimes referred to as the 'soft spaces' of planning (Illsley et al 2010) or 'space for dialogue' (Oliver and Pitt 2013, 198-99) – are orchestrated in a way that promotes a culture of listening that can, in turn, lead to innovation. Civic leaders are, of course, not just 'those at the top'. All kinds of people can exercise civic leadership and they may be inside or outside the state.

## Reflections and conclusions

Powerful forces shape the context within which place-based leadership is exercised. Influential place-less leaders – in globalised corporations, central governments and elsewhere – may care little about the quality of life of particular communities living in particular localities. However, cities and localities are not helpless victims in a global flow of events. A key challenge for place-based leaders is to understand how to use their local power to negotiate with place-less organisations to bring about desirable outcomes and enhance the power of local democracy. The analysis presented here suggests that place-based leadership can, even in heavily constrained situations, work to expand the amount of political space available to local communities. The obsession with markets and market values has done great damage to societies across the world (Sandel 2012). But many cities are, right now, pursuing progressive strategies that amplify the power of communities living in particular places to shape their own future.

Creating resilient communities capable of responding to modern urban challenges – growing inequality, feelings of social exclusion, climate change and so on – requires the development of effective, multi-level, place-based leadership. In my book I provide seventeen examples of inspirational civic leadership drawn from cities in all continents. The urban resilience literature has enhanced our understanding of ecology *in* cities as well as the ecology *of* cities. However, in this paper I have suggested that the word resilience is now being stretched and applied in an inappropriate way to socio-political systems. Perhaps the growing interest in place-based leadership – politically driven leadership working to create inclusive cities can offer a corrective.

Keywords: collective learning, planning, living labs

**Abstract**
*'Living labs' originate from an R&D environment, and intend to innovate commodities by experience-based knowledge, with a direct involvement of users. Meanwhile, the living labs approach has been shifting into a wider range of uses, and for instance also into the toolbox of actor- and action-oriented planners. The approach is (implicitly) promoted as a new and better way of combining capacities of different stakeholders by exploring and experimenting in real-world situations. In this paper, we attempt to critically discuss the use of the living lab approach. The first section explores the potential thereof for planning issues: How unanimous is the concept of Living Labs? How much do different interpretations and practices of Living Labs resemble in terms of actors involved, actions stimulated, processes promoted and criteria for good practices accepted? The exploration is based on the experience of two experimental living labs, which are compared to a range of international examples. The second section turns to a series of alternative approaches in spatial planning in Flanders: How do the aims and means of these collaborative learning experiences differ? What is the role of users and how important is experimentation? Which innovation is created in planning? How do the practices deal with path dependencies and uncertainties in complex multi-actor settings? We will answer these questions based on research seminars on 'collective learning', which are organized for the Policy Research Center Spatial Planning in Flanders, as a part of a work-package which focusses on methodologies for future explorations.*

## 1. Introduction: future explorations, collective learning and living labs in one scene

Imagining the future of cities and regions involves a complex and at time fuzzy set of actors, disciplines, fields of expertise, interests and voices. The exploration of probable, possible or desirable futures is a challenge to all participants in a planning process: imagining a different here and now urges actors to leave known comfort zones, yet at the same time to bring in their knowledge and experiences in order to assess the plausibility and feasibility of proposals on future development. Then also, imagining plausible alternative futures is no non-committal exercise: it presupposes engagement of professional and social knowledge, as well as taking responsibility within a planning process. We here investigate how establishing different types of 'living laboratories' can support in the reflection on business-as-usual, in the search for innovative practices in spatial planning as well as in setting up of conditions for the implementation of novel practices. In this, we see an important role for collective learning, since "Consensus without collective learning simply reproduces what is, and does not open up the possibility of transformational change" (Brown, Lambert, 2013, pp. 250).

Current contribution reflects on the potential of living labs for planning issues and on the value, conditions and limitations of collective learning in spatial planning. The reflection is based on the experiences from two experimental living labs, which are developed by the Policy Research Centre for Spatial Planning, as well as on the analysis of a wider range of actor- and action-oriented initiatives in spatial planning in Flanders, which is based on interviews with project leaders for the different initiatives and on a collective and transdisciplinary methodological research seminar with practitioners and academics. We intend to critically assess how different approaches and heuristics in future explorations and collective learning could possibly alter contemporary planning practices, and the governance thereof.

The paper starts (and ends) with a reflection on the merge of living labs with spatial planning. The point of departure sheds a light on combining living lab approaches with planning, starting from a brief legitimation and rational for this ambition. We then zoom in on the experiences with living labs in spatial planning in Flanders, and particularly on the development of guiding principles in setting up a shared methodology (i.e. 'How is the living labs concept altered when applied to planning?'). The conclusion of section two intends to anchor few insights on the remodelling of planning practices through the living lab approach, which can be described as a collective learning experience to develop transformational change in response to contemporary and future challenges. The section attempts to reflect on whether and how planning could be altered through the use of living labs, in account of earlier experiences with participatory practices. The next section then presents the results from an analysis of different collective learning initiatives. The threefold structure starts from an outline of the analytical frame to study collective learning initiatives. It then turns to the preliminary results from analysis. We also present the next steps (and tracks for a wider, future-oriented research agenda) in the analysis of collective learning for transformational changes in spatial planning. The conclusions then continue the reflection on merging living labs (and –by extension- also other collective learning initiatives) and spatial planning: How could this merge potentially remodel planning practices – if at all, considering an already quite rich and versatile tradition with regard to inclusive approaches? How can these practices and indeed also changed modes of governance be valorised? What is the importance of experiments in this? The reflection here adds another bandwagon in a train of related methodological reflections[1].

## 2. Living Labs and Spatial Planning: effects of a 'seemingly logical marriage'

Section 2 explores the potential of applying a Living Labs approach for spatial planning. The exploration is based on the experience of two experimental living labs, which are compared to a range of international examples. We here reflect on three consecutive questions: 'Does it make sense to match living labs and spatial planning? (Why?)', 'Does the concept of living labs alter when being applied to spatial planning? (How?)' and 'Can planning potentially alter through the development of living labs? (How?)'.

### 2.1 A *rationale* to introduce living labs in spatial planning

Generally speaking, a living lab is "a user-centric innovation milieu built on every-day practice and research, with an approach that facilitates user influence in open and distributed innovation processes engaging all relevant partners in real-life contexts, aiming to create sustainable values." (Bergvall-Kåreborn e.a., 2009, pp. 3). The concept of "user-centred environments for open innovation" (Schaffers e.a., 2010, pp.1) originates from R&D environments, i.e. to develop innovative technologies using rapid prototypes cycles. The main focus there is on "confronting the user with technology" (Veeckman e.a. 2013). Basic features of living labs can be summarised as follows:

- Different kinds of users are involved in an early stage, and on a continuous base, with the aim to result in a sustainable stakeholder partnership and agreements between partners.

[1] i.eon the role of designerly research in actor-oriented planning (community development and forming coalitions) (invited lecture by Jan Schreurs on occasion of the AESOP Heads of Schools Meeting 2014, on connecting academia and local communities, University of Lisbon, March 2014), on the development of a shared understanding on peri-urban developments (Schreurs, Kuhk, Dehaene, 2014), on the potential of developing and using boundary objects (Schreurs, Kuhk, 2014; Kuhk, Schreurs, 2015), on the ambitions and inclusiveness of living labs (contribution from A. Kuhk to a workshop at the Polytechnico di Milano on living labs as socio-digital environments), on the valorisation of living labs (contribution from A. Kuhk to the SASUI-workshop in Helsinki), on the potential of self-organisation in and the use of social media in spatial planning (Schreurs, Kuhk, 2015), on the development of guiding principles for living labs in spatial planning as well as on an analytical frame to study collective learning initiatives (internal methodological seminars), on the relevance of the living approach as an alternative heuristic in innovative planning practices (contribution from A. Kuhk to a roundtable at the CORP-conference, Ghent, 2015) and on the valorisation of collective learning initiatives (methodological research seminar with external partners).

- Living labs aim at open innovation (Chesbrough, 2006): there is a basic openness towards various possible solutions forwarded by different partners, innovation can come from external resources as well.
- A 'lab' is not merely a test bed for innovations that have been developed in a closed expert laboratory and desktop research setting, it rather is an incubator for innovation in collaboration with (end-)users.
- Innovation is expected to be the result of collaboration and co-creation, it can also be widened towards 'democratic innovation' (Von Hippel, 2005) with a larger audience participating.
- Innovations from living labs start from a real-world setting, and intend to alter a relatively local setting. However, it can also lead to changes on a more systemic level, which mostly require then accompanying policy innovations in order to transfer novel practices.

Even if there is a series of basic features that are commonly recognized to be central characteristics of living labs, there is no standardized, generic methodology[2] (Veeckman e.a., 2013). The notion refers to a range of possible approaches, such as a more business-oriented logic, a 'lead user' concept (cf. von Hippel, 2005) unto wide participatory approaches for 'crowdsourcing' (cf. Howe, 2008). The introduction of the living lab concept to spatial planning can therefore alter (or further stretch) the concept. Based on this broad definition of living labs, we could nevertheless discover three different possible entries to establish a relation between a rather generic approach of Living Labs and the specific environment to which we introduce the approach, namely spatial planning in Flanders. In fact, these entries can be read as legitimations to apply living lab approaches for spatial matters:

A first important link between living labs and spatial planning can be situated in the shared interest for adaptive, cyclical approaches -be it that the iterations and cycles in living labs are generally shorter than the ones in spatial planning-. As for the Living Lab concept, Chesbroughs description of 'open innovation' has been an important point of departure. 'Open innovation' assumes non-linear, cyclical innovation processes (cf. Chesbrough, 2003; Veeckman e.a., 2013) with iterations, feedback loops and hands-on, formative evaluations. Also planning practice and theory has become increasingly sensitive to these kind of processes, i.e. as a response to the complexity of socio-spatial systems and the wickedness of problems (cf. Bertolini, 2010). This sharpened sensitivity is equally reflected in the mushrooming of actor- and action oriented approaches[3], stressing the importance of collective learning. These initiatives are all attempts to deal with (rather than to reduce) the complexity of planning issues, the uncertainty over contextual factors or the multiplicity of actors involved, and therefore urge the development of similar approaches (cf. Boelens, 2009; Bertolini, 2010; Healey, 2006). For instance the Flemish administration has organised series of 'partner dialogues' and 'working groups' in the run-up to a white paper and Spatial Policy Plan. Then also, there are efforts to collaborate over so-called 'Territorial Development Projects' and for 'Strategic projects'. Other examples of collective learning experiences are the 'Labo XX'-collaboration with the Flemish 'bouwmeester'-, or the unique project of the 'Metropolitaan Kustlandschap 2100'.

These diverse collective learning initiatives vary in the level of abstraction, in the number and variety of actors involved and in the sense of urgency of the core issues. Then again, they all subscribe to a desire to explicitly involve a larger group of users, mostly already from the start of an initiative. Some of these practices fit in a tradition of participation, and a demand for more direct forms of democracy, some of which have their roots in the late 1960s. They may represent a plea for shifting from representative democracy towards participative democracy, as has been equally supported in the white paper on urban policies (Boudry e.a., 2005). The explicit emphasis place on the early involvement of a variety of users constitutes part of the potential relevance Living Labs may have for Spatial planning,

[2] The 'stretch' in the concept of living labs results in a wide variety of initiatives that deploy this nomination. Then again, there are also initiatives that fit with main characteristics of the Living Labs concept, without being identified as a 'Living Lab'.

[3] Whereas the different initiatives generally recognise the complexity of planning issues and the need to equally involve a multiplicity of actors, they deal differently with the need to build a more adaptive, cyclical planning approach.

as has been equally recognised by Veeckman: "The idea of investigating the user as a scientific research object links the roots of Living Lab activities to different disciplines such as the usability approach (e.g. participatory design), domestication approach, adoption diffusion paradigm and design thinking." (Veeckman e.a., 2013). The Living Lab approach does raise serious questions regarding the way in which actors are engaged. The emphasis seems functional and operational and seems less concerned with aspects of legitimacy, and political engagement. The adoption of Living Labs in spatial planning have the potential to help to articulate ongoing discussions regarding the distribution of roles between government, market and civic partners. They steer an ambiguous line between efforts to empower communities to regain control over resources and the construction of local capabilities on the one hand and the decollectivization of shared responsibilities or the offloading of public responsibilities on groups and individuals.

Thirdly, there is also a link between the Living Lab concept and designerly approaches – an integral part of the spatial planning approaches in Flanders - in a common focus on experiments (cf. Geldof, Janssens, 2007). The nature of a 'laboratory' is a systematic approach, yet also an open approach (cf. Chesbrough, 2003; Veeckman e.a., 2013). There is a set of rules, but the outcome is not known. A living lab creates an environment for 'guided imagery'[4] as a basis to articulate experiments. Also approaches of designerly research contribute to the creation of such a fundamental openness, e.g. in presenting and discussing potentiality maps, in fostering collective imagining through the co-creation of possible worlds, in depicting possibilities of creating shared value, in rendering abstract possibilities in a contextualized and specific manner and inviting stakeholder to take up concrete engagements, etc.

With these elements in mind, we see potential in matching a living labs approach to the domain of spatial planning. Given the search for iterative, evolutionary approaches with a fundamental openness for experiment and a thorough base in user-experiences, living labs can add a planning-heuristic that helps mediating between global or regional challenges and a common, 'ordinary' awareness of spatial misfits. A next question then would be whether a living labs approach would also be capable of introducing genuinely new ways of governing -instead of being old wine in new bottles-. Based on an analysis of examples in scientific journal databases, the Finnish researcher Sirkku Wallin identified three types of urban living labs (cf. Wallin, 2015, pp. 2). The first type is a series of technology-driven living labs, for instance leading to city-wide experiments or pilots to enhance local mobility services. Wallin notices that the role of the users remains very limited in this constellation. The second type of living labs produces urban artefacts, e.g. through the co-creation of public spaces. The third type of initiatives that were described as an 'urban living lab' focuses on vision-making, mutual learning, deliberation and new models of local governance. Whereas the typology clearly illustrates the stretch of the living lab concept in a merge with area-based logics, it remains silent as to whether and how planning can be altered with the introduction of living labs: "Planning work is not just about the substance or specific context of issues… It is also about how issues are discussed, and how problems are defined and strategies to address them articulated. Questions of process as a result are as important to local environmental planning as questions of substantive content" (Healey, 1997, pp. 85). In order to better apprehend the usefulness and potential impact of living labs in spatial planning, we therefore explore two 'living' cases.

### 2.2 Reinventing living labs in spatial planning: experiences from the Flemish fields

The Flemish Policy Research Centre for Spatial Planning is currently developing two experimental Living Labs, in order to test and to further explore innovative tools for collective learning. We focus on a suburban strip along the N16 regional road (i.e. connecting Temse to Willebroek Reinventing living labs in spatial planning: experiences from the Flemish fields, with vast industrial areas as well as polynucleated, spread residential fabrics and fragmented green, open spaces), and on the relatively dense Dender-valley at the West of Brussels (i.e. a river that flows into the river Scheld).

[4] The term of 'guided imagery' was coined in health sciences and psychology. It refers to techniques to pull participants out of their comfort zone, and to actively help imagine a different here and now.

*Figure 1: Schematic positioning of two living lab areas, in relation to the central axis between Antwerp and Brussels and Charleroi, (source of the basic map is the green paper for spatial planning Flanders, RV, 2012).*

**Structured research capacities**

Whereas the capacity to develop these living labs is rich and diverse in its qualities (e.g. joining knowledge on designerly enquiries, on future explorations and on planning and public policies), it is limited in its means. The Living Labs are developed in a cooperation with researchers from the University of Ghent and Leuven with in total a 60% research assignment for two years, yet also the input of different supervisors. The capacity is substantially broadened with the input from students in three design studios, which each last one term. The partners in Ghent executed and evaluated the interviews, organised the workshops and studios and developed potentiality maps (i.e. Marleen Goethals, Luuk Boelens, Michiel Dehaene, Martin Dumont). The contribution from the Leuven partners focuses mainly on the documentation of processes and on the participation to some of the meetings/workshops, as well as on the reflection and development of shared methodologies (i.e. Annette Kuhk and Jan Schreurs)[5].

For a more systematic documentation of the living labs, we develop a 'state-of-the-art'-text on the issue setting, which also illustrate the progressive insights on the shared problematisation[6], the articulation of project definitions, as well as the identification of actors, thresholds and limitations for the implementation. We also develop a 'logbook' to document the construction of a shared methodology[7]. Both accounts have been regularly also discussed at the 'curatorium', which is a scholarly reflection board for the living labs. This gathering of four professors and two senior assistants, recently also joint by an expert from the Flemish administration of spatial planning, was organised more or less every two months (i.e. the already mentioned researchers as well as Tom Coppens from the University of Antwerp and Liesl Vanautgaerden from the Flemish department of spatial planning).

[5] For reasons of textual clarity, the following paragraphs refer to the living lab researchers as one entity, as 'we'. The introduction to the cases made clear that specific tasks are executed by specific persons and/or research groups. Since the results are always also reflected upon in joint meetings, it seems reasonable to also refer to the project by use of an 'editorial we'.

[6] i.e. 'shared' between stakeholders, different local users and the research partners

[7] i.e. 'shared' between researchers with different backgrounds and disciplines.

| Guiding principles | Examples from different project proposals in the two living labs | References for the guiding principle |
|---|---|---|
| **User-orientation and iterations** | | |
| To (pro-)actively and continuously reflect on the building of a shared methodology | e.g. through systematic documentation in a logbook as well as a by the frequently organised feedback on the subject of concern as well as on methodologies in a 'curatorium' | with reference to designerly approaches, experiences with design processes |
| To consider a multiplicity and diversity of actor perspectives as of the beginning of the living labs: not only is innovation expected to emerge from co-creation, the development of novel coalitions can itself be an innovation in complex (spatial planning) issues | e.g. the building of novel coalitions on energetic woodsides with both local authorities (for supply); farmers (for maintenance); schools, a swimming pool and a hospital (as energy and heat consumers) and the setting up of a agro-maintenance group. | with reference to actor-relational approaches and Synoikos-workshops as well as to a shared understandings of living lab features |
| To develop the living labs as non-linear, cyclical innovation processes, with explicit attention for reiterations and moments of consolidation: in this, it is important to also identify gaps in the knowledge production, and to use progressive insights and/or the participation of other actors for a next iteration | e.g. with a methodological triangulation in the presentation of the 'state-of-the-art'-text to local partners, which was based on interviews with those partners (i.e. to test whether the interpretations would be shared). | with reference to evolutionary planning, cf. also literature on uncertainties and on wicked problems, which are defined and redefined instead of being 'solved' |
| To navigate through the complexity of spatial issues by means of tracing, mapping, diagramming and agencying | e.g. through sequences of document analysis and interviews to trace the current state, potentiality maps to show plausible alternatives and round tables to discuss responsibilities. | with reference to actor-relational approaches, based on Deleuze and Guattari, 1987 |
| To foster a reflection on more continuous, dynamic, strategic and inclusive planning processes | e.g. in bilateral meetings with the commissioning authorities (i.e. spatial planning Flanders) | with references to hybrid combinations of images and narratives, as can be found in scenarios and designerly approaches |
| **Systemic approaches and strategic development** | | |
| To reassess proposals for change with regard to effects in broader, dynamic socio-technical regimes and wide contextual changes (to avoid myopia on the local setting), and an assessment of the potential to innovate on a systemic level. | e.g. prepared in systematic documentation on the projects in living labs, in order to transfer information also on the conditions for alternative practices (e.g. driving forces such as demographic or economic conditions) | with reference to transition management as well as explorative scenarios and research-by-design (cf. Dehaene, Devree, 2014) |
| To particularly also consider actors from niches | e.g. novel practices in local energy production | cf. strategic alliances and transition management |
| To consider the potential of turning novel coalitions into strategic alliances | e.g. the scaling up of community supported agriculture projects into a broader logic of ecosystem-services and (urban) metabolisms. | in reference to the strategic alliances (i.e. proposed by the expertpanel for the Spatial Policy Plan Flanders; cf. Coppens, et al., 2014) |
| To study thresholds and path-dependencies for the development of novel practices | e.g. limits in economic feasibility in the exploitation of energetic woodsides | in reference to scenario-analysis and wider future explorations |

*Table 1: Guiding principles and shared methodologies for the development of Living Labs in Spatial Planning in Flanders (based on Kuhk, Schreurs, 2015).*

**Guiding principles 'on the go'**

Whereas there is no generic method for the development of living labs for spatial issues, we developed specific guiding principles for the area-based living labs. Table 1 provides an overview of these guiding principles, with examples of how these can be understood and/or realized as well as references to the inspirations, which served as a basis to formulate the guiding principles. The development of localised living labs for spatial planning in Flanders joins a wider array of experiences and methodologies, amongst which knowledge on actor-relational approaches (Boelens, 2009), experiences with future explorations and scenario-analysis (Kuhk e.a., 2011), reflections on evolutionary, cyclical or adaptive planning (cf. Bertolini, 2010), a view on transition management, systemic approaches and the need to build strategic territorial alliances (Coppens, Allaert, eds., 2014), knowledge on social innovation (Moulaert e.a., 2013) or on participant design- scenario workshops (Cox e.a., 2014) and dealing with uncertainties in research-by-design (Dehaene, De Vree, 2014). The link with actor-relational approaches and strategic territorial alliances have been explicit references as of the start of the area-based living labs, already in early negotiations with the commissioning authorities (i.e. the department of spatial planning in Flanders). The other frames of reference have been included only gradually and/or often more implicitly. It has been a process of progressively growing insights to develop a shared methodology for the two experimental area-based living labs. It is the result of negotiations, e.g. at the 'curatorium'. The 'logbook', in which the process of building living labs is documented and reflected upon, has provoked discussions on specific methodological issues, e.g. about the level of ambition of the living labs, on the openness and/or the level of inclusion of particular actors, the valorisation objectives of the living labs, and so on . Each member of the 'curatorium' contributed to the building of a shared methodology based on own experiences, knowledge, backgrounds and interests. The appendix shows how this collective learning and co-construction of knowledge on the functioning of living labs in spatial planning developed. It illustrates the process of developing a shared, yet tailor-made methodology.

**2.3 Living labs in planning: outlived subsidiarity and a challenging panarchy awaiting**

Even if there is no generic method for living labs, few common elements are identified to be necessary to qualify as a 'living lab' approach. These are (1) operating in a real-world setting, (2) creating an environment for open innovation (i.e. early involvement of users, openness towards different solutions and innovations as a result of co-creation) and (3) as such, giving a chance to develop an incubator for change. Living Labs are an attempt to work on local, tangible, actual issues with a diverse setting of relevant actors. With the two research-based living labs that are currently being developed for spatial planning issues along the N16 and in the valley of the Dender, we explicitly also reflected on methodologies and on the potentials of this approach in contemporary planning processes.

The operational 'real-world setting' in the living labs departs from the local perspectives of the N16 and the valley of the Dender , i.e. including initial hypotheses that are based in early observations and consultations as well on earlier research). This leads to negotiations with one or more municipalities, as well as regional agencies and administrations - relevant to frame a *problematique*-, local businesses and/or representatives from international enterprises in local plants, local inhabitants and a variety of users (e.g. for specific questions about open spaces, mobility, agriculture, recreation, etc.). The local perspective brings in tangible cases, where actors are challenged to show commitment. The local focus equally adds a sense of pragmatism, reality and urgency to the proposals, which could otherwise be perceived as a non-committal reflection (e.g. if developed as a future exploration on the regional scale). These two heuristics – i.e. a regional perspective to better estimate systemic impacts as well as local cases to identify particular valorisations and tangible path dependencies- are complementary, yet also dependent: living labs can hereby challenge existing hierarchies in planning, and induce a panarchy instead (cf. Gunderson, Holling, 2001). In this, the interrelations between regional and local developments in socio-spatial systems are stressed to be mutually interlinked and continuously evolving. It emphasises that planning has no end, both spatially and temporarily. The outside-in approach of living labs adds concreteness in the application of regional laws, visions and conditions, but also openness

through reinterpretation (and critical questioning): experiments on a local scale can be the trigger to also invest in a more generalised innovative practice.

In other words, inserting local living labs in regional planning structures requires accepting that principles of subsidiarity have outlived their rhetoric: changes are cross-scalar, and can crystallise from different nuclei. The addressing of complex transformational change requires some form of collective learning across scales in order to join different kinds of expertise and to confront different value positions. Wicked problems defy strategies which try to make direct linear links between problems and solutions. They require processes of collective learning in which both the current understanding of the problem (i.e. multi-causal and interdependent issues, with unforeseen consequences, instability and social complexities) as well as the variety of possible approaches and means at hand are simultaneously addressed and redefined. Such processes require some form of collective imagination in which a new space of possible problem-solution combinations is opened up.

Not all that glitters is gold though: in developing two different experimental living labs, we detected a perpetual ambiguity in their functioning. Whereas living labs envision openness towards different possible solutions, the situating in a real-world local setting and the emphasis on operational processes potentially also reduces the bandwidth of solutions. In this constellation, proposed practices can be a reinforcement of solutions that are locally already available with a constant tendency to come to some sort of premature consensus on appropriate resources (cf. Christensen, 1985). The consensus can be called 'premature' because it appears without critically studying (the desirability of) systemic changes that can follow from a unique case if applied as a more generalized practice. It is therefore highly important to accompany the operational search with a thorough reflection over values. This can (or rather: should) be the ambition of a collective learning process: to explicitly also focus on value settings in order to better legitimize solutions with a strong operational focus.

## 3. Collective learning and transformational changes in spatial planning

Section 3 presents evidence for a variety of collective learning challenges and experiments in different actor- and action oriented projects in spatial planning in Flanders. It equally discusses the valorisation potentials thereof, and adds few thoughts to the reflection on planning approaches. Before discussing the (intermediary) results from the analysis of different collective learning initiatives, we first briefly reconstruct and motivate the analytical frame to study these initiatives.

### 3.1 An analytical frame to study collective learning initiatives

The study of collective learning initiatives is part of a wider reflection on methodologies for future explorations in spatial planning. Typically, the examination of probable, possible and desirable futures for issues as complex as spatial planning, requires input and interactions from different actors. Ideally, these processes can develop as a win-win for all participants, i.e. create a situation within which participants capitalise each other's resources. In any case these processes generate at least new insights, and hopefully shared sense making and collective understanding. We study the orchestration of such processes, and particularly also their promises: what kind of direct and indirect valorisation is possible with collective learning initiatives?

In order to articulate these promises and valorisations, the analytical frame combines three foci:

- The first focus is based in public policy studies, where policy learning and change is conceptualised in different subsystem approaches (e.g. Kingdon's Multiple Streams Framework, 1995; the Punctuated Equilibrium Model of Agenda Change by Baumgartner and Jones, 1993 or the Advocacy Coalition Framework by Sabatier and Jenkins-Smith, 1993). A central question here is: What are the strategies to induce change? In the analysis of collective learning initiatives, we mainly focus on two actor resources, i.e. mobilisation and knowledge production (cf. typology of policy-relevant resources by Sabatier and Weible, 2007, pp. 201-203, applied in: Kuhk, 2013, pp. 67-71). The

development of social resources and of knowledge resources can equally announce different types of innovations, and as such also valorisations of collective learning initiatives. For instance, the direct valorisation can be assessed in the creation of novel coalitions or in the progressive insights on innovative practices.

- The second focus addresses the (im-)possibility of finding a common ground in diverse actor settings. We study how 'boundary objects' can help in multidisciplinary, heterogeneous settings (cf. Star, 2010) to cope with diversity and to cooperate without a need for consensus. In the analysis of collective learning initiatives, we broadened the initial definition of Star, and focus both on the development of shared understandings and problematisations (cf. Star & Griesemer, 1989, pp. 410-411) as well as on the development of shared methodologies (cf. Schreurs, Kuhk, 2014), and the role of future explorations and experiments in this. Both can contribute to the development of innovative practices and as such be a direct valorisation of collective learning initiatives.

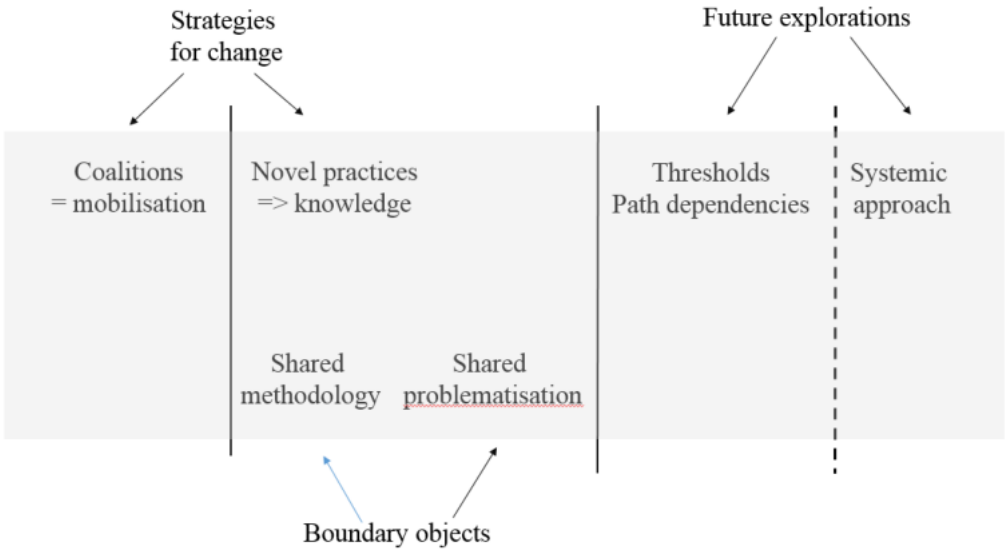

*Figure 2: Analytical frame for the study of Collective Learning Initiatives*

Whereas thinking about strategies for change, and also the reflection on building shared methodologies and shared problematisations are equally categories in the development of future explorations, the study of methodologies for future explorations has pointed at two more aspects that can be relevant to study collective learning initiatives for complex spatial planning matters (i.e. a third relevant analytical category). One question is whether the novel coalitions and practices experience lock-ins or path dependencies that limit the implementation or create a threshold to even have a single-case try-out (cf. Moulaert e.a., 2013). These can be legal constraints, values and political-institutional settings that hinder openness towards change, restrictions in financial means, or limitations in the cognitive creativity to develop a feasible experiment. Another question is whether the novel coalitions and practices can (or should) be generalised (cf. Checkland, 1990). It thus considered indirect forms of valorisation, beyond a specific initiative.

The analysis of collective learning initiatives attempts to better situate the conditions for such initiatives and evaluate the direct and indirect valorisation thereof. We[8] selected six cases for analysis in the first stage of this investigation. All cases focus on complex spatial issues with accordingly complex actor settings. In these, the design of multiple iterations is desirable and/or necessary to develop a shared

[8] The 'editorial we' is different than earlier in the paper: the analysis different collective learning initiatives is tied to work package 3/ Research on methodologies for future explorations with Annette Kuhk, Jan Schreurs, Michiel Dehaene and Martin Dumont. This is a relatively small team, which is fully comprised in the larger team for the living labs. Then again, the analysis of collective learning initiatives was enjoying vivid reaction too from the project leaders in the different initiatives that were studied.

understanding, to drill for innovative practices or to gather the necessary commitments to engage in implementations. With this in mind, we assumed that in all these cases, some kind of collective learning (i.e. capitalising on each other's resources) would develop to a higher or smaller degree.

### 3.2 Preliminary results from the analysis of Flemish cases

The Living Labs were one case. The other cases for now are: TOP Limburg, TOP Noordrand and Metropolitaan Kustlandschap 2100, that were all initiated by the Flemish administration for spatial planning, as well as an initiative from the city of Antwerp, i.e. Labo XX, and the Dutch study 'Brabantstad'[9]. The analysis is developed based on document analysis, participant observation and in-depth interviews with project leaders. The results from this analysis were then presented for methodological triangulation to the respondents, at a joined methodological research seminar[10]. The latter was an occasion to reconstruct and to expound the analytical frame (introduction), to refine and to complement the intermediary results (part 1) and to further develop the strategy for analysis (part 2).

#### Collective learning curves

Each participant was challenged to critically reflect on a series of methodological issues in the development of the collective learning initiatives which they know best, in order to also reflect on or to articulate spaces for improvement. It was emphasised that the objective of this analysis is explicitly *not* to compare the cases to produce a 'ranking of practice'. Instead, apart from methodological assessment and improvement, the aim is to design the methodological research seminar in itself also as a collective learning initiative, where participants can capitalise on each other's resources, i.e. to exchange their experiences in the orchestration of a *prospective* in a complex multi-actor settings (cf. Gaston Berger on 'La Prospective', 1960, cf. Durance, 2007). In that sense, the seminar was a kind of *analogon* for the initiatives analysed.

In the first part of the workshop, each respondent received a résumé of output from in-depth interviews. Each initiative was represented in a table with a brief summary of general conditions, novel coalitions, innovative practices (i.e. new insights and understandings, but also shared methodologies), thresholds and potentials for future valorisations. The discussion on valorisation and innovation potentials (i.e. how do *we* change? / novel coalitions, *how* do we change? / methodologies, '*what if*' we change? / novel practices, and 'what if' *it changes*? / contextual shifts) was prepared in the face-to-face interviews, then further explored in small group discussions with two project leaders and one moderator/reporter each, and finally discussed in a plenary session in order to identify a number of specific issues for further analysis.

We here briefly present a selection of examples that proved to be inspirational during the discussions:

- A relatively long 'stage zero' of the project 'Metropolitaan Kustlandschap 2100' (MKL 2100), which aimed at creating alternative imaginaries for the Belgian coastal area, was dedicated to designing a protocol for collaboration between the main parties (i.e. the Flemish administration of Spatial Planning, the division 'Labo Ruimte' with the 'Bouwmeester', and the Flemish administration of mobility). The formal signing of such protocol triggers more explicitly a reflection on the role and capacities of each of the participants (which can both be enabling or prohibiting in an early stage).
- As for the uniqueness of coalitions, there are multiple remarkable examples: Brabantstad created a broad platform with both elected officials and public servants from 5 cities, the province of Brabant and the 'agencies for water'. The TOP Noordrand – Territorial Development Project for Flemish sites at the densely populated Northern fringe of the Brussels-Capital Region- managed to set up a cross-regional collaboration with a directing role for the department of Spatial Planning. The MKL 2100 project actively promotes the involvement of authorities from different regions ánd scales, with federal, regional and municipal partners as well as participants from France and the Netherlands. The novelty in these coalitions –in a Belgian context- is the openness to involve across

[9] Online references to the different projects are provided in the bibliography.
[10] Referred to as 'MOS' (Methodologisch OnderzoeksSeminarie in Dutch).

political-institutional borders. Another type of innovative practice is realised in the living labs, where municipalities, organisations with a high energy demand, farmers and a agro-management group collaborate in a project of energetic woodsides; or the example of the Labo XX project, which explicitly also attracted sound expertise on financial conditions in the development of alternative urban renewal to redefine the 20th century belt around the city of Antwerp. The novelty in these two cases resides in the tailor-made combination of expertise (i.e. a 'novel coalition') to explore potentials of innovative practices.

- With regard to how the processes of change are orchestrated (i.e. shared methodologies), we already extensively explained the (process of formulating) guiding principles for the living labs. Another noteworthy example is the Labo XX project, within which steering and policy capacity as well as design capacity are to be developed simultaneously.
- There are numerous examples when it comes to innovative practices and experiments, e.g. the explicit multi-scalar perspective in the TOP Limburg project to combine local development with Flemish perspectives and European ambitions. When discussing novel practices in the in-depth interviews, the search for collective imaginaries seemed to come naturally to the foreground. Whether it is a description as a 'carpet', 'dispersed urbanity', 'landscape-metropolis' (cf. Brabantstad, TOP Limburg, TOP Noordrand), the focus on the 20st century 'belt' (cf. Labo XX), the focus on 'interfaces' and on development along both sides of a 'border' (cf. land-see relations in MKL2100 and cross-regional relations in TOP Noordrand), or the nomenclature of a 'plantation' that is used to indicate the experimental character of 'Living Labs', the here forwarded concepts all demonstrate a desire to better articulate the observed evolutions as well as the intended interventions.
- The thresholds and path dependencies that would keep from actually implementing the planned interventions, are versatile, with for instance a lack of political mandate, determining institutional-administrative frames, the conservative nature of existing discourses (i.e. 'worldviews'), limitations in physical structures, historically grown and relatively rigid interpretations and uses, the necessity to receive time-consuming feedback from other actors, the estimations about the potential impact on a systemic level, all kind of 'syrupy' processes, etc. (cf. Hendriks, Toonen, 1998). With many thresholds related to the slowness of mental ecologies, we specifically also searched for examples in which a liberating climate was created. For instance, a mental *terrain vague* can be formed with a wide temporary perspective (e.g. the coastal study, which calibrates its explorations on the year 2100). In this, another important artifice has been the explicit reference to a long history of the 'hold the line'-discourse with at the same time an increasingly rapid changing context in terms of climate conditions, demographic challenges or economic aspirations. As contradictory as it may sound, also a principle of limitation can create liberties and overcome mental barriers: with a framing of interventions as 'experiments', it is clear that a (temporary) commitment is asked for, whereas it remains open as to whether the experiment naturally would state an example and pilot for generalisation. The question of systemic changes and magnified transitions was rarely explicitly stated, although all collective learning initiatives regularly and/or implicitly refer to a wider context of changes and disruptions.

### 3.3 Next steps in the study of collective learning initiatives

One important outcome of the methodological research seminar is the *collective* decision to organise at least one more session of meta-learning in august 2015, as well as additional in-depth interviews (on known and new collective learning initiatives) to prepare this. The focus for the next session is provisionally fixed on the following issues:

- The representations of the collective learning initiatives are rich, but still too simplistic since the schemes do not show *relations* between different analytical categories: Can hindering factors (i.e. thresholds) be countered in a widened coalition? Would the exploration of future potentials add a substantial footnote to the proposed innovations? Can the current coalition – even if positively perceived – become a threshold for the implementation? Which methodologies are required to produce progressive insights and the support of a wider community of practice to innovative

practices? As with the previous session, the participants will again receive a scheme with the outcome of in-depth interviews for methodological triangulation.
- The session will also focus on few specific issues, such as the importance of consolidation and the cumulative knowledge in iterative processes of planning, conditions for the development of collective imaginaries, the role of authorities and different other participants in collective learning processes, the role of design and future exploration and opportunities for 'potentiality mapping' up to the possibilities and limitations of collective learning as a socio-*digital* environment.

Then also, the focus for further methodological reflections – which are the last stage in the research project of the Policy Research Centre for Spatial Planning- will concentrate more on the explanatory levels and on policy-relevance: whereas the analytical frame allows gaining rather detailed accounts on different collective learning initiatives in terms of direct and indirect innovative practices, the next steps would more closely also focus on qualifying the processes of collective learning as such. With this, we intend to move from the exploratory and more descriptive level of research to an explanatory level, i.e. to better explain the conditions for collective learning, to qualify the nature of collective learning processes, and to interpret the potential of different collective learning initiatives for future explorations on complex socio-spatial developments. The latter is central for the formulation of policy recommendations, i.e. to critically discuss planning approaches in the light of contemporary challenges.

## 4. Conclusions: Can living labs remodel planning approaches?

Based on the experiences with the two experimental living labs and the wider analysis of collective learning experiences in spatial planning in Flanders, we here want to forward few concluding reflections. These intend to feed the debate on how different approaches and heuristics in future explorations and collective learning could possibly alter contemporary planning practices, and the governance thereof.

Living Labs typically start from a real-world setting. The ambition of this approach is to create an environment for open innovation through early involvement of users and an open agenda. The merging of living labs with spatial planning can possibly bring new elements to a debate on participative practices that has been ongoing for almost six decades. Nevertheless: the so-stressed user involvement is a virtue of living labs, it is no novelty for spatial planning though. Then also, the explicit addressing of a specific location as a non-human actor is no novelty in planning practices: site visits, walkthroughs and the staging of a joint 'choreography' with different actors on site, the use of photographs and impressions,… all these elements as a form of situated learning have been included in design and planning practices for a long time already.

How then did the experience with research-based living labs for spatial planning and the reflection over different collective learning initiatives add to a discussion on remodelling planning approaches? The explicit focus on methodologies has led to discussions on for instance open agendas in planning, on the role and potential of explorations and of experiments, as well as on the consolidation of collective learning processes.

The condition of openness that is typical for living labs is potentially threatened in an area-based focus that departs from a local, tangible setting. In this, the myopia for ongoing, familiar practices can lead to premature consensus and potentially prevent from considering alternative positions. The challenge then is to purposefully create a kind of 'estrangement' (cf. Halse e.a., 2010, pp. 66). This can be achieved through different heuristics: we see a potential and value in using future explorations to question what is taken for granted, to open up agendas and to challenge deep core assumptions. Openness as a condition would also allow accommodating dissensus on spatial claims and in discourses on spatial issues, based in different expertises and interests. It is a quintessential condition for collective learning, since capitalising on each other's resources requires some sort of (accepted) complementarity.

At the same time, the living labs have the ambition to be an 'incubator for change'. The initial openness is therefore challenged with every articulation of proposals for innovative coalitions and practices. This

limitation and zoom-in is a precondition though to develop operational or strategic interventions. The focus on specific proposals rather than others (e.g. when selecting from a description of several 'experiments' to continue with 2 or 3 of these) is motivated in the commitment of partners, in estimations over the feasibility of a proposal as well as a reflection on the relevance of an intervention. The defining of a specific focus in living labs is *critical*. Then again, a more generalised practice of living labs in spatial planning – comparable to the regular developing of for instance neighbourhood projects in the Brussels-Capital Region- would allow a *series* of try-outs.

In this, the development of 'experiments' can possibly present a balance between 'strategic' proposals (i.e. proposals for interventions that are –as of the introduction- intended to lead to a generalised practice) and 'non-comittal' explorations. Whereas the proposing and the implementing of an experiment requires the commitment of specific, local actors, it is still labelled as an 'experiment'. Experiments are the natural answer to a situation in which uncertainty is high. In such settings experimentation may constitute a valuable way to recognize complexity, make it subject of a concrete sociocratic process, and resisting the temptation to trade complexity for concrete action, and a narrowed rhetoric of entrepreneurship. Even if these kind of interventions zoom in on a single project, there remains a fundamental openness with regard to the evaluation of results. Experimentation might be a way to maintain openness to dissenting views, and avoid the side-lining of parties that cannot or do not want to take up a practical engagement in the early stages of the project. An experiment can -but does not have to- lead to strategic changes. It is a try-out, and the evaluation of the results is part of an iterative process. An experiment allows rehearsing an alternative approach, and as such also rehearsing new roles or relations of actors.

In these iterations, it is important to actively define moments for 'fixation' in order to consolidate the processes of collective learning. 'Openness' and 'fixation' are complementary in this: whereas a *terrain vague* - or at least some form of questioning of familiar practices- paves the way for innovative practices, the articulation and indeed confirmation of earlier achievements, proposals or decisions is necessary to actively build a shared understanding and to move a step closer towards implementations.

In order to consolidate the collective learning processes, it is therefore vital to document these practices, which otherwise remain rather ephemeral. Documenting can take different forms, but it should look for some kind of triangulation (i.e. to close a loop in an iteration, to actively create a shared understanding). The interviews and methodological research seminar on different collective learning initiatives added to this practice but occurred so far in a policy making arena and should be expanded to include direct feedback-loops with all stakeholders.

With serious doubts over strictly instrumental 'one size fits all'-methodologies (e.g. as seems to be expressed in the 'living labs harmonization cube', Mulder e.a., 2008), we hereby attempted to document and elaborate tailor-made approaches of different collective learning initiatives for spatial planning. It is an attempt to build capacities for different possible 'orchestrations' of such processes. The analysis focuses on the direct valorisation in novel coalitions (i.e. 'rehearsing new roles') and on novel practices (i.e. 'rehearsing new futures'), with a reflection on thresholds (i.e. 'path dependencies') but also on the potential of future valorisations (i.e. 'rehearsing transitions'). The methodological research seminar is in itself also a moment of collective learning. The exchange with different project leaders and professors on methodologies was a novelty, which required an intensive time of preparation. The initiative has been and still is fragile though: it has been difficult to gather these high profiles, and it is equally difficult to transcend from a short-lived reflection to an ongoing and continued practice, also beyond the duration of the Policy Research Centre (i.e. to anchor explicit methodological reflections as a generalised practice in the spatial planning department). The required high levels of engagement (including the high mounting transaction cost and the needed time) also put in question the extent to which such initiatives can easily be replicated. Whereas the outcomes of this analysis are relevant in a reflection on planning practices in the light of uncertainties (i.e. dealing with wicked problems), the analysis does not reveal much (yet) on conditions for collective learning, apart from the discussion on the need for consolidation. This will be the subject and focus for the next steps in the analysis.

## 5. Acknowledgements

We want to thank Marleen Goethals, University Gent, Luuk Boelens, University Gent for their contribution to the Living Labs. We also want to thank Tom Coppens, University Antwerp and Liesl Van Autgaerden, Ruimte Vlaanderen, for multiple discussions, in- and outside the curatorium of the Living Lab. With regard to the broad variety of Flemish cases, we want to thank the participants to the methodological research seminar as well as the respondents in explorative interviews: Jan Zaman (Ruimte Vlaanderen), Geert Mertens (Projectteam for the Spatial Policy Plan), Liesl Vanautgaerden (Projectleader TOP Limburg), Charlotte Geldof (Projectleader Metropolitaan Kustlandschap 2100), Wiet Vandaele (TOP Noordrand), Michiel Dehaene (Labo XX), Joachim Declerq (Brabantstad), Roeland Dudal (Brabantstad), Francoise Vermeersch (Ruimte Vlaanderen),
We also want to thank colleagues and professionals who gave feedback on earlier versions of the methodological reflections on collective learning experiences: Frank Moulaert (University of Leuven), Mäntysalo Raine (University of Helsinki), Johan Wallin (Synocus Helsinki), Grazia Concilio (Polytechnico di Milano), Jaap Postma (Academie voor Bouwkunst Groningen), Sylvianne Van Butsele (Ruimte Vlaanderen) and Inge Penninckx (Ruimte Vlaanderen),

**Appendix:**
**Guiding principles for the Living Labs on spatial planning in Flanders**

**User-orientation and iterations**

The logbook served as a reminder to also situate the particular experiments in Flanders in a wider range of living lab experiences. In this, Chesbroughs description of 'open innovation' has been an important point of departure for the Living Lab concept. 'Open innovation' assumes non-linear, cyclical innovation processes (cf. Chesbrough, 2003; Veeckman e.a., 2013) with iterations, feedback loops and hands-on, formative evaluations. This can for instance be realised through 'open innovation platforms' (Feldman, 2007). The complexity of planning issues, the uncertainty over contextual factors or the multiplicity of actors involved urges the development of similar processes, which translate into a series of actor- and action-oriented approaches, stressing the importance of collective learning. This is equally emphasized in the publication "The Urban Connection, An actor-relational approach to urban planning" (Boelens, 2009), in which the author advocates for planning approaches that explicitly consider a multiplicity and diversity of actor perspectives. The reasoning and legitimation for such efforts is based in the observation that contemporary planning practices often experience path dependencies and lock-ins, whereas at the same time, alternative practices emerge as a response to a significantly revised social context. However, these novel practices often stand little chance to be implemented, valorised or transferred to a greater scale (cf. Boelens, 2009, pp. 8-9). Another argument to promote investing in multi-actor collective learning initiatives is the observation that scientific theories on spatial planning seem to develop at a large distance from daily practices (ibid., pp. 183-189). A series of case studies in the publication illustrates the relevance of the actor-relational approach (ARA): "Space is always relational (...), it is constantly co-structured by the reciprocal interaction between (leading) actors and their networks, e.g. strategies and (institutional) settings" (ibid.:11). The author concludes that the examples from practice are promising in order to develop a novel and more robust form of urban planning with flexibility and a strong practice orientation (Boelens, 2009: 197). Such an 'outside-in' approach that starts from stakeholders (as opposed to an 'inside-out' approach that starts from governments) could be developed in different stages (ibid., pp. 193-197), e.g. starting from a first inventory of actors and values, development of potentiality maps, bilateral talks and round tables, development of business cases or pilots, according coalitions and possibly also the widening of new practices. The use of maps is essential here since it enables to represent territories related to interpretations of different spatial uses, i.e. shaped (and shaping) actor relations to physical spaces. Mapping is one of four ways to navigate through the complexity of spatial planning issues (ibid., pp.

172-177, based on Deleuze and Guattari, 1980). The process of mapping is preceded, yet often also accompanied by an unravelling and a reconstruction of the existing, which is a process of 'tracing'. Then again, potentials cannot be realised unless matching partners can be found. The relevant structure to navigate through complexity here is a 'diagram', e.g. to represent relationships and transformations thereof. Last but not least, the realising of novel practices equally requires knowledge about a wide field of 'agencements' such as laws, regulations or institutions (and the potential to change these) to be able to estimate the likelihood of potential developments in spatial planning. The fourfold Deleuzian cartography –traces, (potentiality) maps, (actor) diagrams and 'agencements'- has become a shared fundament in the methodology for the experimental living labs.

Other references in the methodology of the experimental living labs have been experiences in research-by-design and particularly also the 'synoikos scenario workshops', e.g. in the European 'Thought for food'-project (T4F) with a case in Roeselare Hoogleden (cf. SPINDUS-project, Segers e.a., 2013). The aim here was to test 'participatory urban design' in a real-world setting, as a method for social innovation (i.e. approaches to enhance social interactions and basis needs for specific social groups). A significant resemblance to the actor-relational approaches is the starting point, which are, in both approaches, local actors. Then again, the SPINDUS project has an explicit focus on social innovation, which seems to be no sine qua non condition for the ARA approach. The observation of this difference with regard to taking an explicit normative position has equally been discussed in the 'curatorium'.
The 'architecture' for the T4F project is based on synoikos processes and on the 'Netzstadt' approach (cf. Oswald Baccini at ETH Zürich; Oswald, Baccini, 2003). The aim is to create strategies for development and to launch project ideas based on the contribution of a multiplicity of actors, similar to the ARA. The project started from a morphological and physiological research, which is partly comparable to a process of 'tracing'. The results of this were presented in a first workshop, which lead to 'scenarios' (comparable to the stage of 'mapping'). These are hypotheses about possible pathways for more sustainable spatial development over a period of 50 years, with an indication of the 'change agents' (similar to a process of 'Diagramming'). The experience from this participatory urban design approach as well as from a variety of research-by-design projects has been valuable in developing potentiality maps for the living labs. The multi-valence of such design-scenario hybrid, which integrates images and narratives, is expected to also contribute positively to a more continuous, dynamic, strategic and inclusive planning process (cfr. Schreurs & Kuhk, 2011, p. 346). Vandenbroeck agreed with the expectation of added value, but stresses the need to use strong boundary objects to integrate approaches from planners and designers, in order to also operationalize the use of both scenario analysis and designerly research in planning practices.
The T4F experience equally sharpened the focus on the importance of iterative and cyclical developments: building a shared understanding requires a methodology that structurally builds on reiterations. Neither the Deleuzian ways to navigate complexity (i.e. tracing-mapping-diagramming-agencying) nor the architecture of synoikos workshops (i.e. inventarising- scenarios and scanning directions for development – indicating change agents) should be read as linear processes: it requires many iterations with local and regional actors to sail across the complexity of spatial planning issues (cf. evolutionary planning, Bertolini, 2010).
The experiences from actor-relational approaches, participatory and designerly approaches (with their emphasis on future-orientation and on experiment), which are at times combined to scenario-thinking, are moulded into a methodology for two experimental area-based living labs on spatial planning in Flanders.

**Systemic approaches and strategic development**
Prior to the living labs, there has been another ad hoc, short term assignment at the Policy research Centre for Spatial Planning, i.e. the 'expertforum'. The group of experts accompanied the writing of the white paper on spatial policies during two years. In this, Coppens and Allaert pointed at a central dilemma in spatial planning: whereas several aspects in the business-as-usual are fiercely criticised for their negative impact on for instance traffic congestion, water management, bio diversity, food- and energy facilities or effects on health and environment (Coppens e.a., 2014: 40), it seems to be increasingly difficult to actively steer societal systems and as such also the development and the use of spaces. The members of the expertforum expected that transition management could potentially offer a

way out of this impasse. The starting point is an analysis of broader socio-technical regimes which focus on (1) tangible and intangible structures (e.g. network infrastructures or systems of regulation), (2) on the dominant images, values, paradigms and discourses (e.g. the importance of juridical stability, or the strong individualization in spatial development in Flanders), and (3) on routinely system behaviours (e.g. discrepancies between permits and enforcement). With a certain number of similarities to this approach, the analysis of dominant images or worldviews has also been the subject to explorative scenarios (cf. Kuhk e.a., 2011), as well as to the 'theories des cités' (Boltanski, Thevenot, 1991) or to subsystem approaches in public policies (cf. Kuhk, 2013, pp. 42-44).

A common assumption in the literature on transition management is that the measures to resolve systemic conflicts are generally conformist and only rarely innovative on a systemic level. Measures may temporarily appear to be functional, whereas they essentially reinforce an existing lock-in (which is, from a systems perspective, essentially a dysfunctional evolution, e.g. using breakdown lanes as a measure against congestion and/or other symptom control). Another example is the exuberant regulatory framework in spatial planning, which attempts to summarize even complex conflicts in high density areas in an encompassing regulatory context. In an attempt to adjust regulations for every combination and variation, the regulatory systems becomes rather dysfunctional than facilitating (e.g. creating 'exception decrees' and 'repair laws', ibid., p. 47). Transition management argues that socio-technical regimes have a persistent stability, with little possibility to actively steer the regime. In future explorations and scenario analysis, a closer analysis of thresholds and path-dependencies is expected to shed a light on these kind of syrupy processes (cf. Hendriks, Toonen, 1991).

At the same time, there have been also numerous examples of socio-technical regimes that change quite radically, often at relatively short notice and starting from small-scale innovations. Niche changes can, under certain conditions or so-called 'windows of opportunity', be applied on a larger scale. Transition management does not aim at steering towards one specific 'optimum', but it is primarily striving to accelerate the process of change in the direction that is more sustainable. Solutions are a priori not determined, but found in the course of the process (cf. Coppens e.a., 2014, p. 45).

The living labs depart from a similar logic: the issue setting (or 'problematisation') and the possible approaches (or 'solutions') are both defined by all relevant actors involved, from the beginning of the process. The expertforum expected innovations to develop in new and unexpected connections of actors, including actors from niche networks. The novelty then would be a result of unexpected linkages between actors who previously were in relatively separate worlds, e.g. social organizations with private operators, energy suppliers and food producers, hobby farmers with water companies, etc. If these innovative coalitions evolve into a system level, they can turn into 'strategic alliances' (ibid., p. 49). Innovative practices in space can then also result in a system-wide transition. There is an important flipside to this coin though: even if novel practices function well in particular niches and particular locations, the effect on a larger scale needs to be considered carefully. The reassessment of systemic levels both considers potentials as well as possible negative externalities with a generalised application of novel practices.

# Engaging action research with urban planning practice in identifying new courses of action for sustainable urban development

Majken Toftager Larsen

Roskilde University, Department of Environmental, Social and Spatial Change, matola@ruc.dk

Keywords: Sustainability, Action research

## Abstract

*New workable approaches to urban sustainability are often explored within temporary and interdisciplinary project structures located outside direct formal jurisdictional authorithy and every day planning practice. In this context multiple examples of cross-border collaboration can be identified where researchers engage with urban practitioners in knowledge production processes also popularly coined as modus 2 or action research. There is a great need for critical reflection on the methodologies applied in specific contexts of collaborative knowledge production in order to get a better understanding on how to arrive at actionable conceptions of urban sustainability. I take my point of departure in the Interreg project Urban Transition Øresund (2011-2014) involving urban planners from five municipalities and an interdisciplinary team of researchers from five research institutions all located in the Oresund region. The project has been set up with the ambition to develop models for collaboration and approaches to work more thoroughly with sustainability in urban planning processes. Based on my findings from being a research participant in the project I claim that action research can support the creation of inter-collegial spaces of social learning to discuss professional values, norms and challenges around sustainability. But what also has become apparent during the project is how the normative drive for enhancing democracy through collaborative knowledge production may be obscured by competing conceptions of participation based on the logics of the knowledge economy as well as they may be pervaded by internal conflicts of different knowledge interests among researchers and their partners.*

## 1. Introduction

It has been widely acknowledged that the urban scale represents an important governance arena for dealing with climate change as cities have a major impact on energy use, construction of buildings, waste and sewerage systems and transport infrastructure (Bulkeley, 2010; McCormick et al, 2013) By holding the formal authority to direct the physical development of the city urban planning definitely constitute an important field of action for a more sustainable development.

In a Scandinavian context many urban governments have for several years put forward visions for reductions in emissions and adaptions to climate change. Likewise visions of moving towards a more sustainable city have taken a prominent position on the urban agenda working as the collective name

for a broad range of policies. Within urban planning the practical experiences with integrating sustainability visions in new urban development and urban regeneration projects are still growing. Research and practice in the field note that in order accomplish higher degrees of sustainability there is a need for an integrated planning approach for addressing social, economic and environmental challenges in ways that in the same time remains sensitive to the needs of particular urban areas (Holden, 2012; McCormick et al 2013). Though experience show that a significant gap between visions and practice still remains as visions are far from effectively integrated across policy areas as well as it remains unclear how planners and politicians can deal with the conflicts that may arise between social, ecological and economic interests (Stanojcic og Hermelin, 2013; Nilsson, 2007).

### 1.2 Action research and knowledge production on urban sustainability

In order to arrive at more operational conceptions of sustainability and work more thoroughly with it in urban planning it can easily be argued that different types of actions need to be explored and levels of agency to be activated. Within the institutional structures of the local government administration a wide range professionals are employed with different dimensions of urban development ranging from ecological issues to citizens participation all relevant to further expand operational conceptions of sustainability. It is the scope of this research project to look into how the experiential knowledge of urban planners and their space of action ascribed to their professional practice can work as a platform for furthering a more sustainable urban development. More specifically this is explored within the framework of the cross-sectoral and interdisciplinary development project Urban Transition Øresund where urban planners and researchers have been working with different action research approaches.

New workable approaches to urban sustainability are often explored within temporary and interdisciplinary project structures located outside direct formal jurisdictional authority and every day planning practice (Bradbury, 2010; Laing et al, 2012). In this context multiple examples of cross-border collaboration can be identified where researchers engage with urban practitioners in knowledge production processes also popularly coined as modus 2 or action research (Trencher et al, 2013). Proponents of the modus 2 perspective claim that the collaboration between research and practice is necessary in order to contextualize knowledge production and link it more directly to changes in practice (Gibbons et al 1994). Critical stances within action research direct the attention to establishing alternative visions of sustainability to challenge the current systemic state of unsustainability (Nielsen and Nielsen 2006, Svensson et al 2009). This form of collaborative knowledge production in interactive research projects between practitioners and researchers still represents a relatively new phenomenon but experiences in the field are still growing (Svensson et al, 2009). My argument here is that there is a great need for critical reflection on the methodologies applied in specific contexts of collaborative knowledge production in order to evaluate to which degree that these ideals are actually achieved – or how they fail to be achieved. Towards this end I look into the differences of participants and how they try to deal with it, how the process of co-production is formed and point to impediments for forming more radical visions on sustainability.

### 1.3 Urban Transition Øresund

One of the many initiatives that have been set up to address the gap between the visions of sustainability and urban planning practice has been the project Urban Transition Øresund (2011-2014). The project that has been partly financed by EU's Interreg IV A Programme has involved five

municipalities[1] and five research institutions[2] across the Danish-Swedish border in the Oresund region. In the project an interdisciplinary team of urban planners and researchers have tried to identify new approaches and methods concerning ways of collaborating, organization of planning processes, building regulations and new forms of financing in urban planning. My Ph.D. has been partly funded by the project and the terms of my enrollment in the project has been to facilitate the ongoing process of knowledge production in the project together with a team of other researchers. Simultaneously and in a longer time perspective it has also been my role to follow the learning process of the collaboration between research and practice. During the project I have taken part in more than 50 meetings and workshops, conducted interviews with participants and held presentations. In this paper I will focus on just one of the working groups that explored new formats of collaborating on sustainable urban development.

The working group chose after some initial discussions to work with designing a sustainability board game as a way of building collaboration across different fields of knowledge and tasks among urban planners working in different administrative departments and achieve a broader understanding of sustainability in urban planning practice. The process of game development has been coordinated by two design researchers at Malmö Högskola and organized through a series of practical experiments and reflective workshops. In total more than 100 people took part in the experiments where as a smaller group of around 10 people have formed the core group.

The composition of participants in Urban Transition Øresund has been rather diverse spanning from those responsible for drawing up local district plans, representing either an architectural or social science background to social workers and communicators e.g. involved in urban renewal projects. In this sense they represent a typical case on how the roles and skills of urban planners are diversifying as they work with different tasks and within different organizational setups in urban development projects. This creates different frames for urban planners to organize and define specific actions for sustainability strategies.

### 1.4. Research interest

One of my initial motivations for engaging in the Urban Transition Øresund was that I saw this temporary and interdisciplinary organizational structure as a potential arena for social learning and collaborative reflection on working with urban sustainability (Nielsen & Nielsen 2006, Nolmark et al 2009). It has been my thesis that such an arena located outside the formal hierarchical structure of the urban administration could offer a reflexive space where urban planners with different professional backgrounds and working areas jointly could reflect on mapping the complexity and controversies involved in working with urban sustainability, entering into repeated cycles of experiments and reflection, which Schön has phrased ‘reflection on action’ (Schön, 1983). This was based on a thesis that when structuring problems and formulating visions participants can be stimulated to reflect on their everyday routines in order to reach a deeper understanding of the complexity of the problems at hand. Likewise an arena like this offers the opportunity to establish an inter-collegial space to discuss professional values and problems faced in everyday practice and to strengthen a common professional identity a quality that seems to be especially important when working within a volatile organizational structure as is the case of urban planning (Drewes, et al 2010).

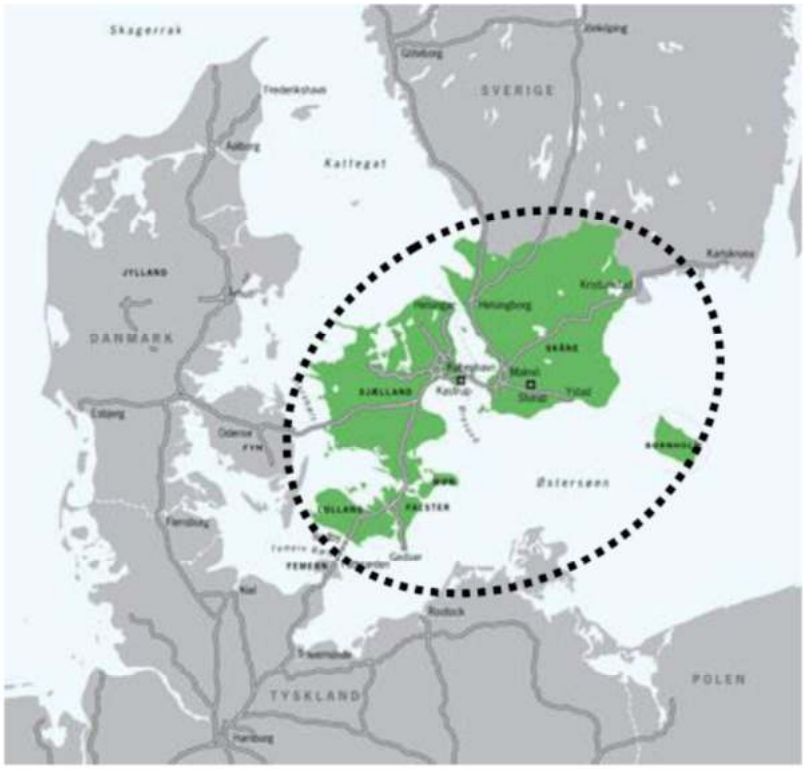
Admittedly the project has not produced much tangible outcomes as I as well as the other project participants initially hoped for. This has confronted me with the troublesome question if we failed to

[1] Copenhagen, Malmö, Lund, Roskilde and Ballerup
[2] Malmö Högskola, Aalborg University Cph, Lund University, SLU Alnarp and Roskilde University

learn? This does however present a rather gloomy perspective on the many efforts and resources that were put into the project. It does not do justice to the participants that kept engaged in the working groups and expressed content to have the option to have a platform were they could discuss operational ways to work with sustainability in practice. At the same time I find that the experiences from working in the project have raised important questions on how to use action research methodologies in meaningful ways to facilitate collaboration between researchers and urban planners and in exploring meaningful ways of operationalizing sustainability in urban planning practice. By exposing the ways of collaborating, visions and controversies that arose during the project it is my hope to contributing to a further discussion on methodological development when working in complex project constellations.

## Background: Urban planning in the Oresund Region

The Oresund region might represent one of the most well-known and widely published examples of regional and cross-border collaboration in the EU (Naewelaers et al, 2013). The construction of the Oresund Bridge that connects the capital region of Copenhagen located in eastern Denmark and the region of Skåne located in southern Sweden certainly represents a peak in a long history of collaboration across the borders. The bridge that opened in 2000 has worked as a catalyst for a functional integration of the two regions in terms of mobility and providing a potential ground for regional growth with closer links between businesses and labour markets.



**Figur 1 The Oresund Region (Naewelaers et al 2013:14)**

Taking an overall glance at the planning systems of Sweden and Denmark many similarities can be identified in terms of national regulation and administration. National planning regulations in both countries are based on a system of hierarchy where the physical regulations in plans produced on lower levels represented by regions and municipalities cannot contradict national legislation. On the other hand there is also a tradition of relatively strong local autonomy of the municipalities. The municipalities holds sovereignty when it comes to formulating legally binding detailed regulations on functions, uses and design for delimited urban areas and thus these represent an important level of intervention if a more sustainable urban planning is to succeed.

Across the strait of Oresund the notion of the urban planner is expanding from being mostly centered on architects and engineers to encompass more diverse fields. Urban planning in Swedish and Danish municipalities is to an increasing extent characterized by intermediate/strategic forms of planning. Accordingly urban planning is not just exercised by drawing up local district plans but is also supplemented by informal plans and area-based urban revitalization programs that aim to shape urban development through dialogue and negotiation with different stakeholders. In this sense there has been a general movement away from setting fixed requirements supported by legal claims to a more open planning process. These open planning processes works as a way to discuss opportunities for development for specific urban areas with citizens, businesses and developers before deciding on a more formal framework. The traditionally professionally/sectorial based administrations have been partly replaced by new forms of organization where values such as efficiency and democracy compete with values of professionalism. The change of planning towards new forms of project based and strategic planning in dynamic interaction with external actors increase the demand of urban planners to collaborate with others within the urban administration across different sectors and fields of expertise as well as they must collaborate with politicians, citizens and other actors in order to find the best solutions for urban development.

## 2. Methodological considerations for action research

The methodological landscape of action research and dialogical research is rather pluralistic and with the existence of many modus 2 inspired development projects the methodologies and approaches applied concerns theoretical as well as practical aspects and interests. In a Scandinavian context two trends of thought have attained significant influence: 1) The pragmatic one based on the dialogical tradition and 2) the critical theoretical trend represented by critical utopian action research (Nielsen and Nielsen, 2006). They differ in their conception of society and societal change, participation in knowledge production and learning (Nielsen and Nielsen, 2006; Trencher, 2013). In terms of understanding processes of co-production with urban planners I find both schools of thought to offer critical insights into the hopes and controversies arising when new courses of action towards sustainable urban development are explored and discussed. Working with action research on sustainable urban development on the level of urban planners requires methodologies that look into both the systemic challenges to further a sustainability approach as well as relational and dialogical aspect of co-production among partners in the research project.

One of the core ideas of action research and participatory research is to include partners as co-researchers. The democratic ideal consists in that researchers as well as their partners exercise power and share the control of the research process. Action research is concerned with the double aim of sparking changes as well as establishing theoretical and methodological platforms for reflection (Nielsen, 2001; Egmose, 2011). Through my engagement in Urban Transition Øresund my methodologies therefore have been organized in order to contribute to knowledge creation in an

academic context as well as supporting the learning and knowledge creation processes with the urban planners in the project.

As pointed out by Svensson et al 2009 modus 2 inspired development projects often fail to address the shortcomings of demand oriented research dictated by short termed economic interests and demands on solutions that can be easily implemented. Instead they argue that transition processes towards sustainability requires a long term perspective involving a broader set of societal values (Svensson et al, 2009). This suggests a more radical view on learning that does not only seek to identify pragmatic solutions within existing structures but only inspire to critical reflection and rethinking of those structures. Critical utopian action research based on critical theory propose radical view social learning where the aim is to develop utopian visions for a sustainable future and focusing on *what should be* rather than what already exists (Nielsen and Nielsen, 2006). In the process participants explore cracks in established social structures and practices and insofar they succeed to mobilize a greater public around their alternative visions opportunities to break with more unsustainable ways of acting.

The degree to which these ideals of democracy and participation are truly enacted in collaborative research projects remains debatable however as it also has been pointed out in much of the academic literature (e.g. Flyvbjerg, 2012; Phillips, 2011; Kristiansen and Poulsen, 2014). Relations of power between researchers and practitioners have often been neglected issues in the action research methodology that is based on critical theory where power is defined in political and economic terms (Kristiansen and Poulsen, 2014). Further Phillips 2011 notes that it often causes problems if collaborative development projects are organized and carried out from the assumption that the participants share interests (Phillips, 2011). It has led some researchers to point to that the future challenge for collaborative research is to focus on how power, conflict and differences can be dealt with and pay a little less attention to similarities and consensus (Shdaimah and Stahl, 2012; Phillips and Kristiansen, 2012) This points to a need to work with methodologies that make the differences between participants more explicit. In the same way analyses co-production processes should aim to uncover the complexities of relations established between participants and between the different forms of knowledge that are expressed and represented in the project (Bradbury, 2010). As the conception of urban sustainability is a highly ambiguous field representing a wide range of policy actions and competing agendas it seem quite evident that we must move beyond the discursively agreed norm of today's urban planning and look into how urban planners ascribe different meanings to the sustainability concept and how they imagine possible actions towards this end. Cross-border collaborations can also make tensions that arise from working with sustainability in urban planning practice more visible.

Doing collaborative research it is essential to keep in mind that research and practice are oriented towards different outcomes (Laing et al, 2012). Researchers can hold a normative position but final decisions are taken in the context practice (Bradbury, 2010)

Even though the researchers form their research design in order to ensure a high degree of participation of their professional partners it is far from evident that the professional partners have the wish to participate from the same ideals as assumed by the researchers. For instance it might be the case that professional partners do not have the interest of being a co-researcher but simply just want their problems solved and orientate themselves toward solutions that they use directly in practice. For researchers this raises a dilemma in which sense they should challenge their professional partners way of conceiving problems and working with finding solutions to them based on their own research ideals of participation and co-production and in which way the researchers should seek to adjust their methods and the outcomes that are created to the knowledge ideals that are considered to be of particularly legitimate within the context of practice they are operating within (Phillips and Kristiansen, 2012). Phillips and Kristiansen conclude that the level of participation in collaborative

projects must be openly negotiated among the participants. Otherwise the researchers run the risk that they despite good intentions of involving the professional partners end up making participation an instrument of dominance and power and thereby marginalizing important sources of knowledge.

Olesen 2014 highlights how shifting economic and political priorities and transformations have changed the conditions on co-production of knowledge. She points out how the institutionalization of the neoliberal discourse on the knowledge economy have a significant impact on what goals and rationalities govern projects that builds on collaborative projects (Olesen, 2014). In this context it is relevant to explore how frequent organizational restructuring, complex relations, demands on efficiency and flexibility (e.g. Sennett, 1998) affect the way researchers and their professional partners conceive and engage in collaborative projects. The action research idea of initiating democratically run processes of change has to compete with other agendas of innovation, demands for efficiency and institutional reorganization that run parallel with the work in the collaborative projects. It also leads to critical reflections on in which sense knowledge production should be contextualized and how useful knowledge it is not only confined to a higher degree of external steering (Egmose, 2011).

## 3. Methods

In this paper I exclusively focus on the process of the designing sustainability games even though the Urban Transition Øresund also consisted of other working groups. Consequently I only present the methods relevant for this process.

The process of designing a green game as a way to overcome problems with cross-sectoral collaboration on sustainable urban development was initiated around half a year after the project work had officially started. At that time the participants had started to express a certain frustration as they found it hard to find a common ground and drive the process forward. Additionally we as researchers were struggling to identify the urban planners in the municipalities who should be key participants and thereby make the specification of relevant sustainability issues to work on possible. On this background the two researchers holding the coordinative role managed to acquire additional funding to link a game consultancy company to the process. In the researchers view it was not the final game that was the most interesting but rather trying to develop a conceptual framework for understanding and communicating about complex systems. By involving the urban planners as co-designers it was the intention was that the process should help to highlight difficulties and dilemmas in planning practices and in the same time push the urban planners to make provisional decisions. The game designing was structured through a stepwise process where the participants experimented with different game mechanics to explore current models for organizing and setting up meetings with citizens as well as structuring cross departmental dialogue around planning issues. The principle of co-design implied that the urban planners was to be included in pointing out relevant issues, desired changes and in this way define the directions of future planning work on sustainable urban development. Additionally the urban planners were involved as co-constructors and evaluators of the experiments. While the urban planners and we as researchers agreed that it was needed to specify overall categories on how to understand urban sustainability the urban planners also pointed out that it was necessary to allow for adaptions to the particularities of individual cases. Accordingly each of the experiments involved the urban planners described the key considerations of the urban area to be developed.

Some of the experiments included:

- Providing input for further developing an overall plan for a large brown field development in a harbour area (North Harbour , Copenhagen) e.g. temporary uses of current infrastructures and facilities, urban space and greening
- Providing input for qualifying a developer proposal on a former railway area (Roskilde) e.g. green traffic solutions, reuse of historical buildings, cultural activities.
- Discussion on future initiatives for urban regeneration in a former hospital area to be a role model for green urban development (Segevång, Malmö) e.g. energy provision, urban gardening, use of public space
- Discussion on options to establish a local recycling centre as part of a new housing project (Västra Hamnen, Malmö)

While not holding the coordinative role in the process I have been engaged as a participant and observer in the practical experiments and reflective workshops. In this role I have discussed the experiments with the urban planners and other researchers and come up with my input to the design of the game. Along with this I have conducted individual interviews with 6 of the participating urban planners on their motivation for taking part in the process and their desired outcomes. Additionally I have facilitated an evaluation for 20 of the participants (urban planners and researchers) on how they have experienced the collaboration in the project.

## 4. Analysis

The project collaboration in Urban Transition Øresund early rendered visible that the urban planners had quite different conceptions of sustainability and how to operationalize it in urban planning projects. Likewise the fact that the municipalities had different conditions for planning for sustainability also hampered the process of identifying a common ground from which to work out guidelines for promoting sustainability in urban planning. For instance discussions in the group work and workshops pointed to how the municipalities operated under different legal frameworks regarding building code and well as they were to operate under different political priorities and administrative procedures in order to realize the vision of becoming more sustainable cities. These differences neither took the researchers nor the urban planners by utter surprise but merely demonstrated how sustainability remains a rather ambiguous concept. However the insights that the urban planners gained from each other's practices in the group discussions did cause many of them to abandon the initial project goal of formulating common guidelines for sustainability and standard methods to be applied. The discussion of different contexts and conditions for planning continued throughout the project. The evaluation of the project emphasized some variation in the perceptions of whether these more complex and nuanced views on sustainability in urban planning were valuable. Some of the urban planners expressed they found the complexity disengaging and regretted that the project had not provided them with a specific set of guidelines to use. Contrastingly others were of the opinion that the discussions had provided them with a more holistic view on sustainability crossing the confinements of their own work descriptions and professional competency. In tune with this some participants also expressed that the exchange of experiences had given them a better understanding of issues and processes important to translate sustainability visions into practice.

### 4.1. The dynamics of co-production

As mentioned earlier the game design process represented just one of the methodologies framing the co-production of knowledge in the project but will be one in which this analysis takes it point of departure. One of the virtues of the game design process was that it on the one side entailed a

combination of workshops with practical experiments in the setting of ongoing planning processes in which the urban planners were involved and on the other side where followed up by reflective workshops where the urban planners across the different municipalities collaboratively reflected on their experiences and challenges they saw when working with sustainability. None of the urban planners had any previous experience using games as ways to facilitate dialogues in planning processes. So their initial reactions were a mixture of curiousness to try out the method and timidity and skepticism on organizing meetings around a game design session inviting their colleagues, developers or citizens.

Different features of the process point to that an inter-collegial space for discussion of professional values centered on sustainability was in fact created. Several of the urban planners express content on the having a thorough debate on how to work with urban sustainability – an issue that they despite the political discourse found to receive stepmotherly treatment in daily planning practice. One of the urban planners found that playing the game with her co-workers served to establish 'game community' among them. Previously she had found it hard for the group to communicate and reach common decisions as the members represented different affiliations in the administration and thus different agendas. Using the game for framing the conversation the co-workers were forced to gain a better insight in each other's view points and negotiate on possible solutions. Similar experiences were expressed at the reflection workshops where there seemed to be a common agreement among the urban planners that the game situation established a more informal framework of discussion. In this setting important and difficult questions were neutralized where each participant were forced to look at solutions holistically instead of orienting themselves achieving their own ends.

In the perspective of a dialogical orientations within action research the practical experiments and reflective workshops suggest that the project succeeded in establishing a framework of co-production where the urban planners were involved forming the content and issues that they saw as important to address in order to deal more effectively with sustainability in urban planning. Likewise it seemed to be a constructive framework for establishing a discussion on a complex issue and include different perspectives on working with sustainability.

Concerning the ambition of critical utopian action research to point to systemic challenges for urban planners to work with sustainability and work out utopian visions on how practice should be organized differently the outcome was ambiguous. In the reflective workshops the urban planners voiced critiques on how they experienced the economic priorities of their departments to hamper projects on e.g. green areas, temporary uses of existing buildings and citizen involvement. They also expressed the frustration that when they tried to come up with suggestions on how to translate the politically formulated visions into specific planning projects they often found that they would be turned down by their superiors or shifting political decisions. Despite this the urban planners were hesitant to formulate alternative visions to challenge these systemic defaults. The way the game was designed to facilitate common decision making might also have been counterproductive in the sense to explicitly work with systemic critiques. One of the urban planners also noted that the fact that the consideration of economic viability was included in the discussion of more sustainable solutions delimited the possibility of radical learning.

### 4.2. Tensions and research practice roles and relations

In Urban Transition Øresund much time were spend on trying to form a good dialogue and relations of mutuality between participants. Personally I experienced how the roles between the researchers and the urban planners were formed, negotiated and learned through the interaction of organizing the

activities in the working groups. A source of dispute was that we as researchers expected the urban planners to take more initiative point the directions they wanted to take the project and making sure that more of their colleagues were involved in the experimental workshops. Likewise we hoped that they subsequently would work on implement what they learned around new forms of collaborating on sustainable development – e.g. the sustainability game – in their respective organizations. At many of the reflective workshops however we often experienced the attendance to be low. Also despite the expressed enthusiasm about the game design format the urban planners remained hesitant to use this as a way to facilitate meeting situations. On the other hand many of the urban planners expressed that they found that the level of abstraction was too high and some found that we as researchers did not provide them with enough knowledge that they could apply more directly in their practice. In this sense the team of researchers faced what Phillips and Kristiansen, 2012 and others point out to be a paradox of participation were the urban planners were reluctant about acting in the roles of co-researchers. Transforming our roles as action researchers to present the urban planners with readymade solutions for strengthening sustainability in planning practice would not only thwart our professional competences as action researchers. It also raises a more crucial dilemma for the researcher on how to maintain a position to spark critical reflection and not merely pointing to pragmatic solutions within the systemic structures of urban planning practice as pointed out by e.g. Nielsen and Nielsen, 2006; Egmose, 2011; Svensson et al, 2009. During the project Urban Transition Øresund this issue of conflicting expectations to process and outcome were discussed at several meetings between the researchers and participants. To some degree the researchers engagement in practical experiments and continued reference to those in the subsequent reflection workshops seemed to establish a stronger relation of mutuality. Discussions on expectations and roles were highlighted by the urban planners as crucial in the evaluation of the project. Several of them had also told in the personal interviews that the project represented their first experience of working closely together with researchers.

Additionally it can be argued that the collaboration and knowledge production in Urban Transition Øresund were challenged by the organizational framework of the project and the conditions under which the urban planners could take part in the project. The interdisciplinary multi-actor collaboration between different municipalities and research institutions posed a challenging task for organizing the development work. Likewise frequent processes of reorganization and job rotations within the municipalities most likely impeded the establishment of more robust guidelines on how to work with sustainability in urban planning practice. This seem to support the point made by e.g. Olesen that the popular discourse of establishing participative processes with professional practitioners easily gets outcompeted by a neoliberal discourse of greater efficiency and willingness to adapt.

## Conclusions

My argument has been that there is still a great need for critical reflection on the methodologies applied in specific contexts of collaborative knowledge production in order to evaluate to which degree that these ideals are actually achieved – or how they fail to be achieved. Working with action research on sustainable urban development on the level of urban planners requires methodologies that look into both the systemic challenges to further a sustainability approach as well as relational and dialogical aspect of co-production among partners in the research project. The project has been set up with the ambition to develop models for collaboration and approaches to work more thoroughly with sustainability in urban planning processes. Based on my findings from being a research participant in the project I claim that action research can support the creation of inter-collegial spaces of social learning to discuss professional values, norms and challenges around sustainability. But what also has become apparent during the process of designing a sustainability game is how the normative drive for

enhancing democracy through collaborative knowledge production may be obscured by competing conceptions of participation based on the logics of the knowledge economy as well as they may be pervaded by internal conflicts of different knowledge interests among researchers and their partners.

Keywords: scenario, strategic urban planning, storytelling

## Abstract

*The scenario work methodology has been well developed in the context of strategic business management. As the strategic approach has recently gained interest also in urban planning, there have been attempts to apply the scenario work methodology in this context, too. However, in order to do so, further development of the methodology is needed, especially regarding considerations on spatiality and the public sector perspective. In this paper, the scenario work methodology is studied with a focus on developing it into an instrument of strategic assessment in urban planning. The scenario work consists of first identifying and analyzing local potentialities, development trends and driving forces, and then generating imaginatively and synthetically normative and explorative scenarios for the future development of the planned area. It opens a window for longer term visionary possibilities, but also less desirable developments, commanding strategic awareness in assessing the impacts of the planning alternatives in preparation. In the paper, scenario work is developed into a strategic assessment tool and, further, a platform for adjusting different interests in urban planning, by examining it through a case of planning the Otaniemi area, in the city of Espoo neighbouring the capital city of Helsinki, Finland. The area hosts the main campus of Aalto University, which, together with the local government, has high ambitions of developing the area as a world class hub of research and innovation. However, this planning scheme has been challenged by the local residents' association and the university's student union, which have initiated their own schemes.*

## 1. Introduction

Recently, the so-called evidence-based knowledge has had an increasingly dominating role in societal decision-making. With the sustainability and climate change debates, and the related demands on impact assessments, its role has been heightened in spatial planning, too (e.g. Davoudi, 2012; Krizek et al., 2009) . However, in planning, the hegemony of evidence-based knowledge is problematic, as planning is largely about coping with the yet unknown future; that of which we cannot have evidence. This is especially true for strategic urban planning that incorporates the methods of scenario planning (Albrechts, 2005; Zegras & Rayle, 2012). The evidence-based approach addresses future as a continuation of the existing and known development paths. While, in scenario planning, there is indeed a need to project the future implications of the present development paths, we also need an ability to imagine such development trajectories of which we do not have evidence, yet, but which might emerge in the future. The future is conceived in terms of alternative *scenario stories.* According to Peter Schwartz (1991), scenario planning is not a science but an *art*.

Patsy Healey (2009) also recognizes the art dimension in strategic urban planning, in the form of design thinking. However, she claims that additional sensitivity is required that would surpass the limitations of both scientific analysis and design thinking. A degree of comprehension of the material and cultural history of the place or region is needed to enable one to perceive the potentiality and desirability of different development trajectories. According to Healey (2009), this kind of understanding builds *critical judgment skills* in assessing, how and to what extent positive resonance and transformative capacity can be gained among the actors to strategic initiatives. This entails experiential probing, as well as targeted analysis, imaginative learning as well as reliance on hard evidence.

In Healey's vein, it is thus a matter of critical judgment how scientific evidence and artistic creativity should be combined to gain wisdom and joint momentum towards a *desired* future. While alternative scenario stories would probe *possible* futures, building imaginatively and creatively on the evidence of existing development paths and local potentialities, critical judgment is about selecting the scenario that we value as desirable, and deciding on actions that are needed in striving for it.

So, with Healey's notion of critical judgment, we arrive to three distinct capacities that are essential in strategic urban planning:

- the capability to *provide scientific evidence* on that which *exists*;
- the capability to *create scenario stories*, stretching towards the *possible* future from that which exists;
- the capability to *critically judge*, which future scenario we value as *desirable*, and to *decide* on the actions to be taken in striving for it.

In this article, our intention is to elaborate on these capacities by drawing on Bent Flyvbjerg's (2004) reading on Aristotle's three 'intellectual virtues': *episteme*, *techne* and *phronesis*. We will start our account by first recalling the development of scenario planning and studying it as part of strategic urban planning. Then we will discuss how Aristotle's all three intellectual virtues can be distinguished as essential constituents of strategic urban planning. A case study in Espoo, Finland will illustrate the uses of the three intellectual virtues and the potential of scenario stories in assessing competing schemes of future land use.

## 2. Scenario planning

Scenario planning emerged during the Cold War as a method to contemplate over the "unthinkable", namely nuclear warfare. Herman Kahn, a military strategist, developed scenario planning to analyze the likely consequences of nuclear war and its survival techniques (Kahn, 1962). However, scenario planning did not become widely known until it was adapted to business with Royal Dutch Shell (Wack, 1985). In 1971, Pierre Wack started developing a more practical use of scenario planning with forecasts to guide strategies for Royal Dutch Shell. After the Oil Shock in 1973, scenario planning was welcomed in the commercial world, as a tool to include a spectrum of forecasts, also "unwanted" ones, in a business strategy. Still today, the scenario planning method thrives as a tool for looking into the future in the corporate world, being more popular than SWOT or Delphi (Konno et al., 2014) .

The method of scenario planning was not clearly defined until the 1980s. Until then it was dependent on the capabilities and imagination of the "scenario gurus" of the time (e.g. Kahn, Schwartz and Wack) (Ogilvy, 2005). A clear step by step process for novices was only published in Schwartz's 1991 book "The Art of the Long view", a key textbook for scenario planners, still relevant today. Urban planning as a field has been slow to incorporate all aspects of scenario planning (Chakraborty et al., 2011) . It is typically used by various public and private agencies to identify common regional issues and to formulate decisions that

serve multiple jurisdictions. The general goal of many such "vision documents" seems to be to develop large-scale regional or metropolitan visions and concurrent strategy directions. However, the practice is often still too focused on developing a single preferred scenario and it fails to adequately consider multiple uncertain futures (Chakraborty et al., 2011) .

The scenario planning method is about finding new opportunities, storytelling, questioning assumptions and pinning down the critical uncertainties. It includes a thorough analytical part for which an extensive amount of data is needed. This data includes recognizing global/local trends and drivers (social, technological, economic, environmental, political, value-related, spatial), identifying actors and their agendas (niches) and uncertainties. It is equally important to recognize the role of global forces as it is to determine the local forces to have, or willed to have, a key role in making each scenario happen. The related actors can range from individuals to businesses, organizations to public officials etc.

As a starting point, a central question for the area, a focal issue, is formulated. This can have quite a general form, as lack of vision, need of new functions, bad connectivity, etc. Additionally, a timespan is also decided, ranging usually from 5 to 50 years. A shorter timespan would make the outcome too predictable and a longer one usually makes the results too unpredictable. In terms of analysis, the scenario method assumes that there is never enough information on which to base such a decision that would require certainty about the future (Garreau, 1994; Ogilvy, 2005). Moreover, it assumes that the future is not predictable. If it were predictable, there would be no need for alternative scenarios, nor planners. Thus it emphasizes the necessity to prepare for multiple futures, not relying on deterministic predictability, because, as history has shown, we can rarely count on predictions.

> "*The fantasy of deterministic predictability lives on and lurks among the assumptions of those who regard scenario planning as insufficiently scientific. Connect these points together in any of several combinations and you will see that judging scenario planning against the standard of deterministic science is non-sensical, paradoxical, and ultimately absurd."* (Ogilvy, 2005, 337)

It can be said that the strength of scenario planning lies in its ability to talk also about undesirable futures - in the end, this motivated the whole origin of the method. It concentrates on the 'unthinkable' and searches for critical uncertainties that influence the outcome of the problem that is being tackled. A critical uncertainty is something that exists in every plan and it is very much related to all the elements we think are predetermined. We can find these aspects of uncertainty by questioning our assumptions about the predetermined elements or facts. For example, we know that the population is aging, the oil reserves will be exhausted, global warming will accelerate, new technologies like 3D printing and augmented reality are emerging, but what we do not know is the willingness of people to change their habits in the face of these developments - and if so, how. It forces us to imagine the extreme situations, to find coping mechanisms we would not be able to conceive in safe and comfortable contexts. It can also make us understand better the outcomes of our actions, or even illustrate what would happen, if no action were to be taken at all.

Another key aspect of the scenario planning method is that it enables us to tell each other *stories* about how the world might work (Garreau, 1994). A key element of a great scenario is its capacity to captivate you as if you were a great character in a novel. The character of a good scenario might be a villain or a hero, but nevertheless it has a familiarity and credibility to it. A scenario is not a linear, mechanistic, number driven process; it is rather about the story and the assumptions, perceptions and imaginations that underpin it (Garreau, 1994). Like a good history lesson, it concentrates on explaining the forces that influence the outcome of events, rather than plain numbers and names. In this way it is easier for people to react to the scenarios, choose a desirable future and start discussing how to make it happen. Being stories, the scenarios can be integrated with the tradition of stories in planning (Albrechts, 2005; Forester, 1999; Throgmorton, 1996).

## 2.1 Scenario planning as part of strategic urban planning

In strategic urban planning, the main focus is not on the long term urban plan to be produced, in the sense of blueprint. The focus is actually on the here and now: how can we gain broad and long term insights to make strategically wise decisions in our immediate activity horizon? As John Friedmann notes, in strategic urban planning the object "is not to produce 'plans' (not even strategic plans), but insights into prospective change to encourage and promote public debates about them. […] It is a way of probing the future in order to make more intelligent and informed decisions in the present." (Friedmann, 2004, 56). What is needed is *strategic wisdom in planning practices*. The objective is then not to produce strategic plans *per se*, but to produce (and reproduce) such strategic plans that can be used as *tools* in strategically wise planning practices.

This is where the scenario planning method shows its relevance. Scenarios are not made to serve as forecasts of the future but to provide insights into plausible futures in order to inform our decision making today (Schwartz, 1991; Zegras & Rayle, 2012). According to Louis Albrechts (2005, 256), "[s]cenarios help us to think about how places/institutions will operate under a variety of future possibilities and they enable decision-makers/civil society to detect and explore all or as many as possible alternative futures in order to clarify present actions and subsequent consequences".

However, there is a lot of work to be done to fully utilize scenario planning as part of strategic urban planning. While there are quite a lot of step-by-step guides for scenario planners to start from, there are only few modified for urban planners (see Celino & Concilio, 2010; Mahmud, 2011; Petrov et al., 2011) . Today, the scenario planning method is often linked with urban planning in the cases of big regional and cross-border projects, through surveys compiled by experts, with a background in economic geography or public administration, in some cases also Think Tanks. In such cases, scenario planning is usually applied to generate background documents for visions and strategies. Those documents often concentrate on various processes, most notably on investments, business climate, transportation and governance, but they rarely have spatial implications or a spatial dimension to the scenarios. This means that future developments are described as a story, but often not played out on a map or a physical plan, which would offer a very different understanding and illustration of the impact of each of the scenarios. As noted by Petrov et al. (2011, 245): "Many stakeholders/policy-makers are familiar with scenarios work, but less with spatial modeling."

In adapting the scenario planning method to urban planning, we also have to address the issue of organizational complexity. The business world, where the method has been developed, provides organizational contexts of private enterprises and corporations that are considerably simpler in their goal-setting and distribution of duties than the world of urban planning, where the relationships between the public and private sectors and the civil society are complicated. Whose strategic practice are we talking about: the local or regional government that is in charge of making the strategic plans, or also the stakeholders (e.g. developers, investors, citizens, NGOs) who are needed in implementing the strategic decisions and in giving legitimacy to the decision processes themselves – but who also have strategic practices, and related motivations, of their own? Whereas in the business world the organizational boundaries are relatively clearly defined, urban planning has fuzzy boundaries involving multiple organizations, thus making it difficult to determine who and what is inside and outside. As noted by Christopher Zegras and Lisa Rayle (2012, 314), "given heterogeneous participants with different realms of influence, factors clearly external to one organization might be within the influence of another, making it difficult to separate scenarios that represent uncertainties from scenarios that represent possible strategies".

On the other hand, Zegras and Rayle (2012) emphasize the potentiality of scenario planning to overcome the difficulties of organizational complexity in strategic urban planning. At best, scenario planning becomes an educational and transformative exercise that may "persuade participants to dislodge pre-existing views, improve understanding of the organizational context, provide a common instrument of communication among disparate actors, and encourage relationships among participants. In particular, the scenario planning process may be a means of building networks and initiating collaboration." (Zegras & Rayle, 2012, 303). Scenario planning can thus also be a capacity building exercise, widening narrow perspectives, revealing the stakeholders' mutual interdependencies and inviting joint momentum towards an envisioned future. Zegras and Rayle regard such collaboration-inducing properties of scenario planning as its "second-order effects" (Zegras & Rayle, 2012, 305).

With her concept of *strategic framing*, Healey has such second-order effects in mind. In Healey's view, strategic framing brings together local resources and imaginative visioning into a setting that invites the actors to change their thought and action schemes and their approaches to each other. Following John Dewey, Healey perceives such a strategy work to generate around itself a *'community of inquiry'* which nurtures the collective intelligence of those brought within (Healey, 2009). In striving for this, critical judgment is key:

> "*A key area of judgment relates, then, to an assessment of the institutional moment, or "opportunity structure", for spatial strategy making. This leads spatial strategy makers to consider such questions as: what is the momentum for an explicit spatial strategy-making initiative? What forces and actors are driving this? What is the scope for the transformation of discourses and practices through such an initiative? How strong is the momentum? Can it be strengthened and what might weaken it? What kind of process is already underway, what might evolve and what could be created? What seems to be at stake and around which issues will critical judgments have to be made? How are the initiators situated in relation to this momentum, and how am "I" as an actor in such a process situated, in terms of role, skills, potential to exert influence and legitimacy?"* (Healey, 2009, 443)

Healey regards critical judgment as a "practical art" (Healey, 2009, 440), but here her notion of 'art' is different from Schwartz's notion of the "art" of scenario planning. Healey's "practical art" addresses the "second order" level of scenario planning, while Schwartz´s "art" remains at the "lower" level. Schwartz sees scenario planning as an art in the sense of being able to create coherent narratives of alternative futures, integrating existing and imagined driving forces in a given activity horizon. Healey, in turn, deals with the "practical art" of framing the produced palette of alternative scenarios, in the sense of identifying a desired scenario and probing on the initiatives, arrangements and decisions to be made, in order to gain consent and joint momentum behind this scenario. For Healey, this is less an art of creative production, and more an art of dealing with people in politically contentious contexts.

Next, we will elaborate these different types of capacities that are necessary in strategic urban planning utilizing scenario planning. For this purpose we will draw on the three 'intellectual virtues' that Aristotle identified in his *Nicomachean Ethics*.

## 3. Aristotle's three intellectual virtues in strategic urban planning

The first of Aristotle's intellectual virtues, '*episteme'* is familiar today as the etymological origin for the word 'epistemic'. *Episteme* concerns knowledge that is universal and invariable in time and space and achieved with the aid of analytical rationality. It corresponds to the modern scientific ideal as expressed in natural science. With the Enlightenment tradition, this scientific ideal has become dominant. According to Flyvbjerg (2004, 285), "[t]he ideal has come close to being the only legitimate view of what constitutes

genuine science, such that even intellectual activities like planning research and other social sciences, which are not and probably never can be scientific in the epistemic sense, have found themselves compelled to strive for and justify themselves in terms of this Enlightenment ideal". Accordingly, in the beginning of this paper we noticed the hegemony of the evidence-based approach in the production of knowledge in planning. In scenario planning, episteme would concentrate on knowledge regarding existing conditions and development paths and their projections to the future.

Aristotle's second virtue*, 'techne'* can be translated into English as 'art' in the sense of 'craft' (Flyvbjerg, 2004, 286). Unlike episteme, techne does not deal with the universal truths of existence; instead, it has to do with goal-oriented production of new things. According to Flyvbjerg (2004, 286), "[p]lanning research practiced as *techne* would be a type of consulting aimed at arriving at better planning by means of instrumental rationality, where 'better' is defined in terms of the values and goals of those who employ the consultants, sometimes in negotiation with the latter". Regarding scenario planning, we associate the 'craft' of techne with the ability to produce imaginative, yet convincing, scenarios that are not merely projections of existing trends. However, we do not see them as instrumental in the sense of producing a scenario for a given goal, but rather *explorative* in their effort to generate plausible scenarios that can be deemed either desirable or undesirable. Such normative considerations bring us to Aristotle's third intellectual virtue, *phronesis*.

*Phronesis* concerns practical wisdom and ethics. It has to do with deliberation of how things should be done for the purpose of doing well, making ethical choices. It does not concentrate on the invariables of episteme, as you cannot deliberate and make ethical judgments on the eternal truths. Thus its concern is on the context-dependent variability of production - yet itself phronesis is not production in the sense of techne, but *action*. As Aristotle says, "production aims at an end other than itself; but this is impossible in the case of action, because the end is merely doing *well"* (Nicomachean Ethics, cited in Flyvbjerg, 2004, 287). Phronesis is closely associated with *political action*, which, according to Hannah Arendt (1958), was treated in ancient Greek political philosophy as an *art* among other arts. Contrary to the "productive arts", such as painting and sculpture, it was likened to such activities as healing or navigation, where, as well as in a dancer's or play-actor's performance, the "product" is identical with the performing act itself (Arendt, 1958, 207). As in dancing, where the dance is brought to existence and maintained by the very activity of dancing, the political community is created and maintained by people acting politically. Political action is an end in itself, and it is not instrumental to any external purpose. Regarding strategic urban planning, we associate Healey's notion of critical judgment with phronesis. It is a practical art of political action that aims to develop a 'community of inquiry' of strategic planning.

Thus, we can link Aristotle's three intellectual virtues to the three capacities of strategic urban planning, suggested in the Introduction, as follows:

- *episteme* - the capability to *provide scientific evidence* on that which *exists*;
- *techne* - the capability to *create scenario stories*, stretching exploratively towards the *possible* futures from that which exists;
- *phronesis* - the capability to *critically judge*, which future scenario we value as *desirable*, and to *decide* on the actions to be taken in striving for it.

For Aristotle, phronesis was superior to the other two virtues. Using Max Weber's distinction between instrumental and value rationality, Flyvbjerg reformulates Aristotle's argument by stating that "[p]*hronesis* is most important because it is that activity by which instrumental rationality is balanced by value-rationality" (Flyvbjerg, 2004, 285). Concerning strategic urban planning, we also regard phronesis as superior to episteme and techne, in the sense of "second-order" framing of plausible scenarios and judging critically, which scenario to hold as desirable and how political consensus and momentum could be gained behind it. Accordingly, in scenario planning, as a constituent of strategic urban planning, techne can be seen as superior to episteme. Through creating scenario stories it frames the relevance of evidence on existing local properties and resources, and development trends, integrating it narratively with imagined

future development directions and possibilities. Conversely, episteme can be seen as a knowledge resource for the techne of imaginative scenario stories, which, in turn, can be seen as a resource of providing alternative future development paths for the phronesis of choosing a desirable path.

Hence, all of Aristotle's intellectual virtues are essential for strategic urban planning utilizing scenario planning. Flyvbjerg's claim is that the phronetic approach is most appropriate in planning research, which in his interpretation would focus especially on detailed case analysis and normative reflectivity on power in planning (Flyvbjerg, 2004). We, however, emphasize that for understanding and learning strategic urban planning, whether as researchers or practitioners, we need to grasp the interplay of Aristotle's all three intellectual virtues: how phronesis frames techne, and how, in turn, techne frames episteme.

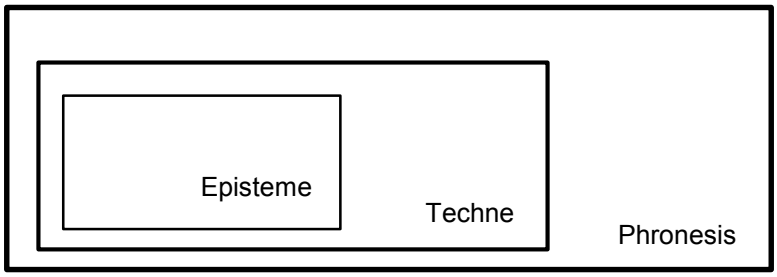

**Figure 1.** The nested hierarchy of Aristotle's three intellectual virtues in strategic urban planning utilizing scenario planning.

Next, we will examine a case of strategic urban planning, drawing on scenario work methodology, to illustrate the use of these three intellectual virtues.

## 4. Case study

Our case study area is Otaniemi, a peninsular district in the city of Espoo, Finland, roughly 7 km west of Helsinki city centre. The history and built environment of Otaniemi is closely related to Aalto University (until 2010 Helsinki University of Technology), whose campus and student community has been developed gradually since the 1940's in the previously rural peninsula. Today the Otaniemi district has around 4000 residents, most of them students. However, the daily population of Otaniemi is far greater with 14000 students and 11000 employees. The low-density campus structure, with lots of open space and listed buildings, is based on the plan by Alvar Aalto. Most of the land is owned by the real estate companies of the university and the Government of Finland. The planning of Otaniemi area by the City of Espoo has been done as a part of wider Southern Espoo master plan and with small scale detailed plans inside the campus area. However, with the university relocating activities from its two Helsinki campuses to Otaniemi, the West Metro line being under construction and general pressure for urban intensification, the need for a clearer land use vision for the whole Otaniemi area is increasingly acknowledged by the City of Espoo.

The current planning debate in Otaniemi has its origins in the plan of the new building for the School of Arts, Design and Architecture, which also houses the new metro station and forms the nucleus of the intensified campus. The architectural competition was followed by a process of detailed planning, which gave the main landowners an opportunity to envisage also wider area development in Otaniemi. The landowners prepared a strategic land use vision of the Otaniemi district, thus taking the role of the initiator in the planning process, ahead of the city. The publication of this "Kokokuva" ("The whole picture") vision in spring 2014 caused protest from the local students and other residents. The opposing groups did not

settle for a conventional reactive role in the process but started to prepare alternative plans for the area. The City of Espoo, now met with competing visions outside the legitimate planning system, asked the researchers of Aalto University to help in the planning discussions between the stakeholders.

An identification of the different actors and their roles, a crucial starting point for scenario work, is presented in Table 1. Obviously the actors are not homogenous or equal; they vary considerably by their size, composition, power, internal structure and mutual dependence. Single individuals can belong to and identify themselves with multiple actor groups. The actors who have developed their own land use vision are highlighted. The visualization of the students' and residents' visions has been assisted by Aalto University Built Environment Lab (ABE) personnel. It must be noted that both the ABE personnel and the authors of this paper are stakeholders in the case, belonging to the large and heterogeneous employee group.

**Table 1.** Actors in the area. The actors who have developed their own land use vision are highlighted.

| Actor | Actor group | Role | Voice | Position in the process |
|---|---|---|---|---|
| City of Espoo | authority | municipality, planning monopoly | single | strong |
| Aalto University | stakeholder | main tenant in the area, synonymous with the area itself | single | strong |
| **AYK and Senaatti** | **landowners** | **majority landowners, real estate companies owned by the university and the government** | **homogeneous** | **strong** |
| **AYY (Aalto University Student Union)** | **stakeholders, landowners** | **officially sanctioned and compulsory student representation body, autonomous organizations and groups, minor landowner** | **heterogeneous** | **medium** |
| **Non-student residents** | **landowners, stakeholders** | **housing associations (minor landowners), residents' association** | **heterogeneous** | **medium** |
| The employees | stakeholders | researchers, teachers, administration, personnel in other companies | heterogeneous | weak |
| VTT | stakeholder | governmentally owned research company, major tenant | single | medium |
| Other companies | stakeholder | minor tenants | heterogeneous | weak |
| Helsinki Region Transport (HSL) | authority | public transport planning authority owned by the municipalities | single | strong |
| Centre for Economic Development, Transport and the Environment (ELY) | authority | government body controlling planning, especially conservation questions | single | strong |
| National Board of Antiquities | authority | authority in built environment heritage questions | single | strong |

## 4.1 Utilization of a course in strategic urban planning in scenario work

As the debate of the future of Otaniemi land use was going on, a special course on strategic land use planning and planning cooperation was starting, in the autumn of 2014, in the Aalto University Department of Real Estate, Planning and Geoinformatics. This master's level course (5 ECTS cr.), mandatory for the students majoring in land use planning and urban studies, had 16 students from various backgrounds. The majority of the students had been studying planning or real estate economics for three to four years already. With an interesting case available in the campus itself and with a group of enthusiastic planning novices not tied to the routines and practices of the existing system, we decided, as the course teachers, to use the course as a test bed for strategic assessment with the scenario work methodology. In accordance with the threefold division of intellectual virtues, the students were asked, first, to provide evidence of the local

situation and general trends (episteme), second, to generate scenario stories (techne), and, finally, to utilize the scenario stories in critically reviewing the alternative planning schemes for the area (phronesis).

*Epistemic evidence of the planning context*

The path towards the final assessment of the alternative land use visions was guided through a few preliminary assignments. First, the students were asked to collect background information of the area and its environment. The students were split in four groups to cover specific themes: local planning history, the role of the area as one of the main business hubs of the Helsinki Metropolitan Region, the strengths and weaknesses of Espoo in promoting the area in the global competition of innovation centres, and challenges of sustainability, valued high in the official campus vision of Aalto University. The results of these assignments were shared among the other groups and they helped to orientate the students to the current challenges of strategic planning in the city of Espoo.

Moving on from the preliminary work, the students were introduced to scenario planning methodology, including extracts from Schwartz's seminal book *The Art of the Long View* (1991). Thus the next task was to identify relevant driving forces in Otaniemi and the adjoining Tapiola and Keilaniemi areas (previously branded by Espoo as "T3"). In accordance with Schwartz's instruction, a brainstorming method was used in the process. The students were once again split in groups, shuffling the groups so that experience from the previous assignment would be evenly distributed among the groups. Concentrating on specific driving force categories, the students were able to identify 23 driving forces, as shown in Table 2. As we can see, there is considerable overlap among the driving forces, a natural outcome from a rather freeform brainstorming process. However, we can see slight dominance of demographic and human forces. The students tended to see the overall growth and development of Otaniemi and surrounding areas as a predetermined force. Also their trust in relative competitiveness, internationalization and diversification was high. However, in their view, the critical uncertainty lies in the actual outcome, the rate, pace and timing of development, emphasizing the volatility of highly ambitious plans in Otaniemi.

**Table 2.** Relevant driving forces in Otaniemi, according to the student groups.

| Driving force category | Relevant for Otaniemi/T3 area | Predetermined elements | Critical uncertainties | Anticipated effect on Otaniemi/T3 area |
|---|---|---|---|---|
| **Sociocultural** | population | overall growth, high demand in Otaniemi | new development locations and the pace of building | population growth in Otaniemi due to new student housing |
| | age distribution | students dominating | Scale of diversification due to the new development | diversification of age structure, need for new services |
| | internationality | growing immigration | share of students, share of permanent dwellers | diversification of cultures |
| | mobility | better accessibility | modal share, reliability | growing popularity of the area |
| | education | increasing educational level, greater business cooperation | popularity of the campus area, functionality of cooperation | growth in businesses and international cooperation |
| | household size | high share of single households, diversification | diversity of housing stock, price level | growing need for diverse housing policy, need for diverse services |
| | social problems and phenomena | diversification of population | loneliness, segregation of subareas | new social phenomena increasing |
| | subcultures | growing popularity of T3 area as a dwelling place, diversification of population | attractiveness of the area to other than technology students | technology student culture spilling over to nearby areas |
| **Technological** | telecommuting | new possibilities for employment | overall motivation of ageing population to stay working | less need for car commuting |
| | transport technology | ongoing projects, e.g. Metro, stability of public subsidies | automation, legislation, willingness to change behavior | investment in public transport |
| | building stock | cost of conversion | solutions in energy use | innovative solutions increasing |
| **Economic** | business environment | economic system fundamentals, entrepreneurialism | cycle effects, economic policy measures | continuing investment in the area |
| | sustainability | transport path dependence, infrastructure | innovativeness in real estate and transport solutions | social innovations in services |
| | globalization | remoteness, increasing internationalization | attractiveness of the area | popularity as a studying place |
| **Environmental** | climate change | increasing volatility | actual effects | wide preparation for extreme weather |
| | sea level rise and floods | new development near the coastline | weather, general sea level rise | preparation for floods in new buildings and infrastructure |
| | biodiversity | human presence, new development | green area maintenance | less work-intensive gardening but more animal control |
| **Political** | bureaucracy | organization hierarchies, legislation | political terms, administration changes | transaction costs in development |
| | political culture | decay of conventional political participation | new ICT-powered movements | local cooperation increases |
| | sustainability | national and international regulation | upper-level decisions | austerity-driven adjustments in public services |
| **Spatial** | geography | natural geography, location in wider spatial context | prioritization of natural environment over development | conflicts in building projects |
| | built environment | graded buildings, road network | flexibility in heritage norms | some of the uniqueness of the area lost |
| | new developments | ongoing projects | attractiveness of the area | new services |

*The technical art of making scenario stories*

After the initial information gathering, the students were asked to create plausible scenarios of the development in Otaniemi. As Albrechts (2005) states, normative scenarios are essential to keep away from overt relativism. Thus the students were advised to form two scenarios, one normative (what ought to be)

and another explorative (what might be). The time frame was set to 30 years with 10 years' intervals. When building their scenarios from the elements formulated in the previous assignments, the students had to position their scenarios within the frame of two axes: local versus global networking and single-use versus multi-use functionality.

**Table 3.** Normative and explorative scenarios of the development of Otaniemi.

| | | Name | 2025 | 2035 | 2045 |
|---|---|---|---|---|---|
| **Group 1** | **Normative** | **Kelluva kampus ("Floating campus")** | intensive public transport, modal share away from private car, multi-actor cooperation generating start-ups, gradual improvement in services, English becomes the main language, ethnic services, new development honors the architectural heritage | Otaniemi international example of innovative built environment; new expertise in buildings next and on the water due to the effects of climate change; nature, culture and economy in balanced in development; support of different lifestyles and working habits | world leader in water and offshore buildings; hub of several world universities and research institutes; local autonomy complementing European federal government; increase in water transport |
| | **Explorative** | **UponnuT3 ("Sunk T3")** | problems in new development and transport; growth in population bigger than in services, dependence in other centres; turmoil both in regional administration and international relations causing uncertainty; silent revolution in studying habits | worsening usage of university facilities; disinvestment and demise of built heritage and natural areas; public transport development increasing but not meeting the needs; regional focus not in Espoo | shrinking importance of physical campus, no supplementing use; growth in population and services but uniqueness lost; regional role as a main employment and studying centre fading |
| **Group 2** | **Normative** | **24h campus** | gradual integration of both university schools and areas around Otaniemi; new development with flexible and effective space usage; traffic calming and transit oriented parking management; student lunch vouchers replacing canteens and spurring new services | flexible space management responsive to the change in studying and working habits; more social spaces available for anyone; university integration with shared identity; population and activity growth basis for new services around the clock; minimization of intra-area car use, innovative fringe parking and frequent rail-based transportation | withering away of conventional working hours, facilities and services fully supporting 24 hour lifestyle; no fundamental division in building use types; strong local community; innovative transport solutions |
| | **Explorative** | **8h campus** | continuous separation of schools despite common campus; modest new development along traditional lines; education still dominating the image; no new transport investments after the metro line, rigid space usage policies | eventual integration of university schools and identities; student housing and service needs met but otherwise problems in development; still car-based mobility, lack of parking and thus low attractiveness to businesses; bad municipal economy halting crucial projects | unified multidisciplinary university with modest international competitiveness; gradual diversification of population structure due to the location; growth in investments and services; slow modal shift away from the car |

As there is practically an unlimited number of potential future paths even starting from the very same drivers, it was no surprise to see the two student groups to formulate four very different scenarios (Table 3). The groups had slightly different perspectives for both normative and explorative scenarios. The first group had more vivid future projections, finding officially unconfirmed strengths and possibilities in the normative scenario (e.g. floating building technology) and even dystopic outlooks such as dereliction of buildings in the explorative scenario. The second group had a normative scenario quite similar to the official municipal and university strategies. The explorative scenario of the group was not a dystopia but merely a "business as usual" development with failing ambitions and modest development. The interesting common features were the emphasis on transport investments and modal shift away from the car, and the effect of studying habit revolution on the space usage. What for students represented a clear risk for the success of the area, was sticking to the conventional real estate and transport practices.

*Strategic assessment: critical judgment skills of phronesis*

The last assignment for the students was to conduct a strategic assessment of the competing land use schemes with the help of each group's normative scenario. As the schemes, by the major landowners, the student union and the resident association, were still under development during the course, and as the time available for this task was limited, the students conceived this assignment the hardest of the course. The results of this last exercise were also revised after initial comments from the teachers, as the assessments were presented first to the City of Espoo and the summaries to the different stakeholders in a participatory event in December 2014. The students had slightly different approaches in the assessment, partly representing the differences in their normative scenarios. The main results drawing on the used criteria are however summarized in comparable Tables 4 and 5.

**Table 4.** Strategic assessment of the schemes by Group 1.

| Criteria | Normative scenario: "Floating campus" | The landowners' scheme | The students' scheme | The residents' scheme |
|---|---|---|---|---|
| **Transport** | Emphasis on non-motorized and public transport, support for electric traffic and innovative solution, water transport | Generally similar to the normative scenario, greater emphasis on rail transport and shared space | Generally similar to the normative scenario, greater emphasis on rail transport and campus bikes, no vision of bus service | Support for non-motorized and rail transport, but centrality of car traffic |
| **Residential development** | Diverse and wide residential development for all groups, innovative floating housing | Wide residential development mixing with the other uses, but emphasis only on student and employee housing needs | Slightly less housing development than in the normative scenario, emphasis only on the current student housing needs | Only modest student housing development, no support for population diversification and increase needed for service development |
| **Services and offices** | More commercial services, coastal area as a meeting place, flexible space use, floating structure | Diverse service development with emphasis on local services, conventionally rigid space policy, no projection of service evolution | More local services, emphasizes the current surplus of office space | Calls for local service development based on existing real estates, new coastal cafe |
| **Natural environment** | Development based on existing recreational and conservation use, new floating routes, preparation for climate change effects | Developing the coastal area but keeping the existing conservation areas | Recreational use of coastal areas | Recreational use of coastal areas, strong emphasis on coastal path |
| **Innovations** | Supporting student-research-business cooperation, supporting start-ups, emphasis on water expertise | Emphasis on innovation environment, innovations in land use and aquatic environment, overtly advertising the world class university | Support for innovation environment, campus bikes helping intra-campus cooperation, overbranding of the university | Support for the existing studying and research environment, but less support for the innovation environment |
| **Culture** | Architectural heritage and new development, internationalization, vivid organization scene, student culture and year-round activities and events | Emphasis on built environment, urban culture complementing student heritage, coastal areas as a cultural hotspot | Internationalization, student heritage and leisure activities, vague image of cultural needs | Supports student culture heritage and development, neglects the needs of other groups |

The first group was more interpretative in its assessment, weighing elements from each scheme according to their potentials and caveats in supporting the group's scenario. Especially the potentials for water technology development, strongly represented in their normative scenario, were carefully scrutinized in the assessment. The second group concentrated more on the internal flexibility and substance of the schemes, having a more refined mobility analysis than the first group.

**Table 5.** Strategic assessment of the schemes by Group 2.

| Criteria | Normative scenario: "24h Campus" | The landowners' scheme | The students' scheme | The residents' scheme |
|---|---|---|---|---|
| **Services** | Open access for different services, diversity over quantity, based on demand | Emphasis on student services, great variety in leisure activities | Diversity in services similar to the normative scenario, also services run by the students | Service development based on the existing mall and conference centre |
| **Residential development** | Residential development in several sparsely used lots, flexibility in main use and sharing, including the office buildings | Emphasis on student housing, less residential development than in the normative scenario | Great emphasis on student housing | Only modest increase in residential development, mainly student housing |
| **Coastal areas** | A little new student housing, mainly recreational and nature reservation areas | Considerable development of the coastal areas | Recreational area | Strong emphasis on nature conservation and recreation, no new buildings except maybe a cafe |
| **Car traffic, parking and road safety** | Decrease in internal car traffic, shared parking, traffic calming measures | Similar to the normative scenario | No comments | No comments |
| **Walking, cycling and public transport** | More non-motorized routes, traffic nodes with cycle parking and sharing, internal bus circle line | Similar to the normative scenario | Emphasis on cycle lines and shared campus bikes | No comments |

Both groups noticed the differing foci of the schemes. Especially the residents' scheme was clearly a defensive act supporting the existing coastal area arrangements and only modestly having opinions of the development in other areas. This corresponds to the small and spatially concentrated landownership of the housing associations. On the other hand, the student activists' scheme, representing the official student union point of view, was geographically more substantive, but the main message of the scheme was clearly the agenda of increased student housing development. The landowners' scheme was the most comprehensive and covered several themes while promoting the vast new development clearly in the economic interest of the landowners. The versatile nature of the landowners' scheme was no surprise, as it was created by a major architectural bureau, having been involved in the planning of Otaniemi on behalf of the landowners for more than 20 years. The comprehensiveness of the landowners' scheme was noticeable also in the time scale: the landowners' scheme mapped development all the way to the 2030's, whereas the competing schemes lacked explicit time scale, implicitly suggesting development only roughly 10 years in the future. Our students saw the landowners' scheme the most supportive for the normative scenario, although there were differences in the projections of the long term development pace. The students' and residents' schemes, with their shorter time frame, did not close out the normative scenarios, but especially the residents' reluctance towards new non-student housing was seen as a risk for service development.

Overall, there were surprisingly few major disputes between the interest groups. Every party endorsed the built environment heritage and the value of nature environment, although the landowners' version of coastal route was not welcomed by the other parties. Every scheme acknowledged the need for intensification, new housing and especially new services. Even the residents, commonly seen to be the most critical of intensification and new housing, did not rule that option out, merely expressing doubts of the attractiveness of the area for people other than students. The principles of mobility reform aroused also surprisingly little argument.

## 4.2 Analyzing the results

In the post-course feedback the students thanked the urgent topic and active pace of the course, but expressed also stress from the limited time afforded for the assignments (2-3 weeks per assignment), especially the last assignment. Regarding the latter, they also criticized the fuzzy and changing instructions and the hard-to-obtain data of the opposing schemes. The roles and connections of different actors, especially between the landowners and the City administration, caused some confusion. This course differed indeed from one-directional and in-advance framed conventional course works and resembled more real-life strategic planning and participation work. The course schedule was constant but the case situation developed slightly differently than anticipated in the beginning of the course. Especially the inactivity of the Espoo City Planning Office was not anticipated, as the planner in charge of the area suddenly resigned from the City of Espoo just before the beginning of the course, causing an unexpected delay in planning work. Not surprisingly, the landowners with their stronger position and superior resources offered a more consistent and better visualized scheme than the groups investing their leisure time in trying to communicate their alternative views in a visual and constructive way. Even with the help of ABE personnel the initial schedules of the competing schemes lagged behind and our students had to rely on scattered and sometimes contradictory data from the student activists and residents.

The landowners' scheme was not only technically superior, it also corresponded the normative scenarios the best. Actually, the very name of the scenario may reveal the reason for this connection. The students were not only participants of our course but also stakeholders in the case. Not undermining the critical potential of our students, they are likely to be influenced by the very same discourse of campus development that the major landowners or their superiors, the university and the government, are committed to. The position of the university and the landowners in relation to the City of Espoo is also something far from being simple administration subordinates. In other words, the students in our course partly managed to capture and reproduce the general normative discourse in their normative scenarios. This leads to a more technical notion of scenario planning. Our case suggests that two scenarios, one normative and one explorative, are probably not enough to open the imaginative horizons, and they run the risk of working simply as another tool for legitimation.

In Otaniemi, the role of each scheme in the official planning process is slightly ambivalent. The alternative schemes are not "shadow plans" in the sense recently witnessed in Finland. Not only do the alternative schemes fail to meet the standards of a comprehensive detailed or master land use plan, the scheme they challenge is not an official plan itself. Actually each of the schemes is a "shadow scheme", as they intend to cause discussion and steer the action of the City administration in official planning. Having de facto a strong position in the planning practice, it is the major landowners' argument that is by nature the loudest for the City. It is therefore noteworthy that the landowners decided to engage in such a public discussion. The spokespersons of the landowners claim openness of their scheme to other arguments, too, welcoming the discussion from the makers of the alternative schemes. The goals of a vivid and innovative campus, complementing the economic real estate interests, definitely call for openness and civic engagement. The future will tell how this agenda of common future creation will materialize in Otaniemi and beyond.

As the main principles have caused little friction between the stakeholders, the cordial co-creation seems quite a realistic option. But how did the need for alternative schemes then ever come to place? The answer may lie in the strategic assessment results. Although the schemes do not disagree about single details, they speak of somewhat different issues. That is partly obvious as the schemes are argumentative acts emphasizing the issues important for each group. But they may also visualize the likely difference in the way of experiencing the area of Otaniemi. For the residents, it is their daily place of residence, for the students it is the university campus as a locus of both studying and dwelling, for the landowners it is mainly measurable land mass, infrastructure and buildings. In other words, Otaniemi is the stage for

different discourses in which the concept of space can be either absolute or relational (Harvey, 1973; Massey, 2005). Or, utilizing Lefebvre's (1974/1991) terms: for many it is the commonsensical mode (perceived space) that is central; for others it is the expert view (the conceived space); while the fully lived space might remain out of reach. This does not mean that the actors could not understand each other's arguments. The problem arises from the ambiguity of which discourse they are contributing to. This is exacerbated by the problematic nature of strategic visualizations: the structural graphs and other strategic maps must balance between vague abstraction and overt details. Even a full detailed plan cannot grasp all the different aspects of space, but even the highly hypothetical visualizations of future development, such as the "Kokokuva" scheme, are enough to cause fears among the stakeholders that do not share the discursive context of its authors. This unintended imagination inducing power of maps could be balanced with rightly timed and positioned scenario stories.

## 5. Discussion

The scenario analysis and strategic planning share their origins in the military context and subsequently in business life. Both realms offer the planner clearly defined organizational boundaries, separating the planner from the enemy or competitor. An army or a company has also usually a single main goal. That setting offers an ideal starting point for scenario work – once the organization is ready to think of the unthinkable. The urban planner is not privileged with such clarity. The boundaries are fuzzy and the goals multiple with changing political priorities. The actors and their roles should be known: who is the adversary and who the ally? With challenging schemes and other planning-related arguments emerging from different directions, those questions should not be set aside.

When shadow plans and other alternative land use schemes are drafted, their emergence underlines the inadequacy of official participatory processes, but yet they seldom exceed the role as arguments for public discussion only. The legitimate planning process is strictly mandated and the challenging documents face extreme difficulties in influencing the ongoing planning process, not to speak of becoming legally binding plans.

Scenarios are most effective when the exact procedure is yet to be decided. Timing is therefore crucial for effective cooperation, but with the limited resources of informal groups, their actual contribution attempts tend to come too late. Another important issue is the nature of contribution. The Aristotelian classification of intellectual virtues may help us in this question. The epistemic knowledge type of sheer facts is quite often in the focus of debates. True, without any solid base, the projection of future lacks all credibility. The 'facts' should therefore be agreed upon quite early. Another virtue that is hard to share is the phronetic action, quite naturally fitting the planners' ethos. The legal responsibilities and duties of planners and representative bodies structure the phronesis in planning.

However, the third Aristotelian virtue, techne, is by definition open for several interpretations and actors. The number of possible scenarios is unlimited and the imaginative power of scenario stories can bring different parties together. The planner, phronetically framing the process, must gather an adequately representative and open scenario group together in an early enough phase of the planning procedure.

*Hannah Arendt in The Human Condition wrote of the substitution, in modern times, of the 'social' for the 'political', thereby creating a situation of 'worldlessness' wherein the ground on which we could be held to account for our self-construction has disappeared. This 'worldless' world, in Peter Wagner's words, is 'a world in which social relations may have global extensions, but are so thin and ephemeral that contemporary modern human beings are held to realize their own lives in a social context that they cannot conceive as their own' (Wagner 2012, 66). Planning is left trying to construct a collective reality in an ephemeral and indeterminate social context where the only ground for determinations of truth and right is individual opinion .*
*In this paper we approach the question of 'worldhood' from the ontological and phenomenological perspective of Heidegger's Being and Time. We attempt a preliminary exploration of the 'Being' of planning and the 'Being' of planner as Dasein (the one that is there, for whom the world occurs). Our task is to identify the 'worldhood of the world' of planning and planner, and relate Heidegger's insights to the problem of 'worldlessness' facing the planner in today's modernity. From Being and Time we take two aspects of Heidegger's thought of helpful potential for planning in a worldless world, his concepts of authenticity and truth, noting that Heidegger always thinks in terms of both the positive and privative (or deficient) modes of qualities with which Dasein relates to Others and to the world.*

Keywords, Heidegger, Arendt, Ontology of planner

## 1. Introduction

This paper is an attempt to consider the relationship between the world as it now is and the occurring world of the planner (as reflected in the actions, rationality, knowledge and technology of the planner) to see if this sheds light on why what we now call 'strategic' planning has become problematic if not entirely meaningless.

We commence with a consideration of Heidegger's understanding of how Being works, that there is a relationship between Being and the actual and occurring world, and that the occurring world can be understood as a world view (*Weltanschauung*) which grants being to the one for whom that world occurs. We then seek to uncover key features of the world view of planners (or the Being of planners). To do so we use a version of a methodology developed from Dean (1999) and Foucault (1991) in understanding governmentality, which holds that the world view in play in a particular situation (in our case that of modern planners) can be understood through a historical analysis that identifies which technologies, rationality, and knowledge, survive and transform over time (Sturup 2010).

Having established these features of the world view of planners, the paper turns to a discussion of the idea of the worldlessness of the world presented by Arendt and Wagner amongst others. These authors posit that there has been a decided shift away from a world which can be understood as fabricated by humans (Daseins) and it has been replaced by a social world. In this view fabrication is

the act of bringing into being an object which is already envisaged, an object which is designed to hold an envisagement of the world through its existence (Arendt, 1958). Such objects include tables, institutions, and persons of historical significance. Such a fabricated world includes a public realm in which humans can fabricate themselves as public beings, beings which they come to be known as, and have a kind of historical longevity. This public realm is also the space in which humans come to create and maintain the distinction between one another. A planned world is clearly one that is fabricated. Arendt suggests that the public realm has been replaced with a 'social' world. The social world is one that allows complete and ongoing creation of the self, without any prior envisaging of who we might be. It is a world which displaces any relationship between the social self and the fabricated world in which human society functions and is maintained with any longevity.

Our discussion then turns on consideration of how this destruction of the fabricated world and the public realm, and its replacement with the 'social' interacts with the being of planner. Is there any possibility in this world without fabrication for the construction of a collective world view? What are the ontological conundrums presented for planners in this new world? What can we understand from this analysis in terms of the survival of planning?

## 2. Heidegger's Ontology or How 'Being' Works

Heidegger's project in *Being and Time* is to address a question which, he argues, philosophers – assuming that the answer is self-evident – have ignored, 'What is Being?' (Heidegger, 1962). He goes about this on the basis of the phenomenology developed by his mentor Edmund Husserl. Heidegger (Heidegger, pp.128-135 ) is seeking to break up the Cartesian way of seeing the world which informs mainstream science, the core of which is that there is a fixed distinction between what is objective (extraneous to the human mind) and what is subjective (constructed by the mind). Heidegger wants to propose a monist philosophy in which the subject-object distinction – which is after all no more than a human construct – is collapsed into one, 'experience'. Today we can say that his analysis has not changed, as he might have wished, the dominant and conventional way in which we still 'normally' perceive the world 'out there'. However it has created an opening for inquiry about whether, if there is a world 'out there', we have any relationship with it as itself (Bennett, 2004), and importantly for this paper, it sets up an understanding that while we construct the world out there in our relationship to it, this also generates the construct that we are for ourselves.

For Heidegger, all that 'is' does not exist in some ideal abstract 'reality' that is outside human experience. This is not a 'subjectivism' as we explain below. There is an outside world but it does not have 'Being' without us. All Being is conferred on entities by human experience. In that sense the only world with Being is the world that occurs to us. Being, then, starts and ends with the human, Dasein. Like many of the neologisms and compound words Heidegger uses, the term Dasein (Being-there) is designed to avoid, or bracket out, the conceptual loading given by the weight of philosophical reflection over the centuries that already attaches to a term like 'human'. In keeping with that purpose we will adopt Heidegger's term from now on.

Mulhall (2013, p.36) explains that Heidegger contests the Cartesian understanding of the human way of being 'as a synthesis of categorially distinct elements (i.e. of mind and body) in a purely material world'. Heidegger complains that Descartes, conceiving of a world of 'things' in contrast to the subjective internal world of thoughts, imposes his scheme upon the world and does not 'let entities in the world speak for themselves'. In Heidegger's critique Descartes thus disconnects the occurring world from Dasein, and forces everything that is not 'I' to occur as 'present-at-hand' – merely there.

For Heidegger, Dasein is given by the occurring world. Dasein has ‘‘Being-in-the-world’ in such a way that it can understand itself as bound up in its “destiny” with the Being of those entities which it encounters within its world’ (Heidegger, 1962, p.82). A human, then, is not fixed, but exists as a ‘Being-in-the-world’, and changes according to the assemblage the occurring world is perceived to be made up of.

Heidegger positions himself as the philosopher of the ‘everyday’ - one who looks at the everyday experience, from an everyday perspective, which is a phenomenological perspective (see for example Heidegger, 1962, pp.163-168, Section 27). In his work we can observe three different types of being given to Dasein’s relationship to the world. He notices that much of what we experience and on which we confer Being is fabricated for our use. To see this we only have to name the entities we encounter, houses, plans, organisations, strategies and so forth, but also all the tools we use and the objects around us, hammers, books, paper, laptops. The mode of being of these items is what Heidegger terms ‘ready-to-hand’ (zuhanden); they have their being as useful for us (Heidegger, 1962, p.98, Section 69).

Another sort of being Heidegger reserves for those objects to which we cannot attribute a being for our use. Such being he terms ‘present-at-hand’ (*vorhanden*, Heidegger, 1962, p.103). These present-at-hand entities, or objects, are thing-like. Entities that are ready-to-hand typically become thing-like when they are broken, as with a broken hammer which devolves to pieces of wood and metal (see Mulhall, 2013, p.58). Thus ‘ready-to-hand’ and ‘present-at-hand’ should not be thought of as a backdoor into dualism for they both stem from the singular experience of Dasein.

Finally, in turning to the matter of the relationship of Dasein to others of its kind, Heidegger once again insists that we must not make the mistake of starting from an isolated ‘I’. To characterise this relationship Heidegger introduces another term marking a mode of being of Dasein, Being-with (Heidegger, 1962, pp.154, 157). Being-with is the kind of being we share collectively with that which occurs as also creating an occurring world. Collectively those which create an occurring world come to an agreement about that which ‘is’ sufficient to allow society to function. This collective, agreed ‘is-ness’ is the always already world, the dictatorship of the ‘they’. The market is perhaps its most familiar manifestation, an occurring world in which we find ourselves dissolved, being without intent. Entities which occur as capable of being-with are provided room to present themselves ‘as they are’, or at least as they would occur for themselves.

In Heidegger’s terms, then, the being of the world, or the *is-ness* of the world, is given by Dasein. Dasein is Being in a world which occurs as ready-to-hand, present-at-hand, or being-with. Things ‘occur as’ because they are not fixed. For example something like the environment can occur as present to hand (*Vorhandene*) when it occurs as ‘that which we are in’, or as ready to hand (*Zuhandene*) when we search the Amazon for cancer curing plants, or able to create its own occurring world (to be-with) when an environmentalist experiences it as itself. Dasein is the kind of being that has choice in how it constructs the world and therefore, in so doing, reflexively constructs itself. In more commonly used terms, the ‘worldhood of the world’ consists of instruments (Zuhandene), things (Vorhandene), and of course people (Daseins), and the being of a particular individual person is constituted by which things are occurring as Zuhandene, Vorhandene and Daseins. That is to say what occurs (the occurring of everything including ourselves, or Being-in), provides a world view from which what it is logical, necessary or possible to do is derived, and with which our actions are in perfect accord. When Dasein learns to distinguish the world in particular configurations, they are said to have ‘become’ something, for example a planner.

Our next section will attempt to draw out key features of the world as it occurs for planners, always bearing in mind that this occurring gives being to both the world and the planner. It creates the world as it 'is' and thus what can be done in it. It creates planners as they 'are' and thus what it is possible for them to do. We can say that the discipline of planning holds a particular understanding of Zuhandene, Vorhandene and Mit-dasein ( that *with* which one can Be), which can be understood through observing the actions of 'the planner' and that with which it is concerned. Thus planning is a world view which gives being to planners and we can understand the construction of this being (and thus what is it possible to do) through understanding that constructed reality.

## 3. The Worldview of Planning

The 'world' of planning in which planners are situated has gone through a number of transformations over the last hundred years. Observing these transformations, what is resisted and how things adapt, provide insight into the underlying world view that constitutes planning. In this section we offer a – necessarily brief – interpretation of the recent trajectory of planning's world which seems to correspond with historical interpretation by at least one leading scholar and historian of planning (e.g Hall, 1996, 2000; Tewdwr-Jones et al. 2014).

By the end of the nineteenth century in Europe urbanisation had delivered crowded cities infested by squalor, poverty, malnutrition and disease. The modifications to capitalist growth engendered by the collective struggles of factory workers and the response of the more enlightened elements of ruling elites had opened the way to new ideas about cities, and yet failed to offer a path of 'real reform'. Those who we think of today as the founders of modern planning were visionaries drawn forth by the currents of modernity. Marshall Berman (1982) argues that the idea of 'planned development' can be traced to the Romantic interpreters of Enlightenment thought such as Johann Wolfgang von Goethe. Though not a central theme in Goethe's *Faust*, towards the conclusion of the great poem and near the end of his journey through life with Mephistopheles, Faust turns to a vision of great works transforming the environment for the good of humanity, and he uses the power of the Devil to force labour to the great work (Goethe, 1999, p.344).Berman comments 'Gradually, as the work comes together, we see Faust radiant with pride. He has finally achieved a synthesis of thought and action, used his mind to transform the world. He has helped mankind assert its rights over the anarchic elements' [of land and sea]' (Berman, 1982, p.65). Berman argues that to be modern is to believe in a kind of victory over the world. That all things will eventually bend to our will and design. We can make a plan and impose our will upon the world.

Several key elements in the world view of planners then stem from these earliest planners. Firstly from modernity we find the world 'out there' which of its own course will not lead us to where we wish to be. Second the idea that we can impose our will and design upon this world. Third that to do so requires a vision of what should be. This vision is beyond what will just happen in any case if societies are left to behave as an earlier vision has dictated[1], but somehow must deal with what the world 'out there' throws up.

[1] We are not suggesting that urban development left to a free market is somehow 'natural'. That would in any case be in precise contradiction of Heidegger's thought. In fact the 'naturalisation' of the market as beyond the human is a thoroughly Cartesian idea.

We can see this thinking in the work of the twentieth century Swiss-French architect, Charles-Eduard Jeanneret – Le Corbusier – developing grand visions for entire cities on green field sites, embracing the new world of individual car-borne mobility (Le Corbusier, 1929). 'We must kill the street' he thundered in a 1929 lecture (Moholy-Nagy, 1968, p.274), tear down the old cities and build new ones. 'Cafés and places of recreation will no longer be the fungus that eats up the pavements of Paris' (Le Corbusier, 1946, p.58). Such places would be 'transferred to the tops of flat roofs' segregated from 'the complete network of traffic' (Le Corbusier, 1946, p.58). Even the vision of the more accountant-like Ebenezer Howard involved creating new systems of cities in the countryside, effectively abandoning the industrial cities to their fate (Howard, 1898). Among British innovators, only Patrick Geddes (1915) in Scotland stood out as urging a more nuanced and socially informed approach to the understanding of city regions, looking beyond the carbon economy which polluted cities with coal smoke.

The bombers launched at the industrial cities of Europe during World War 2 did much in the way of 'slum' demolition, killing enormous numbers of civilians in the process, and transforming the world of planning (Judt, 2006, p.18). After the War European governments had little choice but to rapidly reconstruct the old cities to better standards and lower densities, and build new ones in what Hall (2000, p.26) calls 'the great postwar rebuild'. Planning for reconstruction, commenced during the War, became legislated and institutionalized in the aftermath. The world of planning was brought inside government and the state. Planners brought their visions into state bureaucracies and became part of a wider pattern of management, though still with little contact with the social worlds of the 'planned' (Dennis, 1970; 1972). The success of planning in reconstruction deepened the understood functioning of vision versus that which the world 'throws up'. Clearly the flattened landscapes of post war Europe were easier to plan than the complicated reconstruction of Haussman's Paris. The world 'out there' was most easily dealt with if it could be reduced to rubble. Further, planners embraced new developments in rational processes, positivist methods and architectural design. Methods which are rooted in the modernist world view, and which demonstrate the truth of a 'correct' design better than what would have occurred if the current political dispensation in society were allowed to take its own course. Though they were now inside government, planners were insulated from politics. They counted on the legitimacy of liberal democratic institutions to secure the influence of their world view.

The legitimacy of planning, and thus the influence of the world view, began to be disrupted once the solutions proposed by the rational planners were implemented, and the social consequences of those solutions fully appreciated. The universal rightness of the professional prescriptions began to be questioned and a more pluralist understanding of planning was demanded by, mostly American, planning theorists. Jane Jacobs (1963) launched a blistering attack on both the visionaries and their epigones. Yet her fundamental concern, that planning interrupts the organic, chaotic, 'what would have happened anyway' world, was transmuted. It never successfully impacted the world view that a designed world would be better than what would have occurred without planners. Instead her concern was reinterpreted to the question of *whose* design should be implemented, *how* the vision to be implemented should be found. In the quasi-revolutionary climate culminating in the rebellions of 1968 there were demands for public participation in all aspects and at every level of town planning (Skeffington, 1969; Sewell and Coppock, 1977).

This transformation of the critique can be seen in the systems view of planning where the choice of planning solutions was placed firmly in the hands of elected authorities (McLoughlin, 1969; Faludi, 1973). In this perspective it was not the business of professional planners either to make choices or to

resolve conflicts amongst interest and pressure groups. That political role was for elected authorities to perform. In the world view of planning, the planner as visionary was surrendered, but not the fundamental view that a vision was necessary. The planner remained the implementer. This latter view soon came under attack in an onslaught of criticism from both left and right aiming at the very institutions of liberal democracy on which the planners relied to secure their standing. Marxist geographers interpreted urban development, its private entrepreneurs and all agents connected with its regulation, including planners, as agents of the capitalist class and the state as, if not 'the committee for managing the common affairs of the whole bourgeoisie', at least functionally related to the maintenance of capitalism (Scott and Roweis, 1977; Harvey, 1985). These criticisms were again absorbed, not impacting the fundamental view that a vision was necessary and should be implemented, but causing some shift in who should do the implementing.

The next wave of critique, 'postmodernism' questioned the objective reality of the very world in which planning existed and intervened, and the universal truth of the values justifying such intervention (Rorty, 1979; Lyotard, 1979). This critique was aimed at the epistemic foundations of which pluralism was a political manifestation, a critique of 'knowledge'. Basing his 'report on knowledge' on Wittgenstein's later work, Lyotard took apart the narratives that 'allow the society in which they are told, on the one hand, to define its criteria of competence and, on the other, to evaluate according to those criteria what is performed or can be performed within it' (Lyotard, 1979, pp.19-20). In planning literature the emphasis on narratives, 'stories' (Sandercock, 2003, p.183) threw into doubt the idea that social progress would be based on an objective understanding of the world. Reflecting on postmodern, feminist and post-colonial critiques, Sandercock (2003, p. 73) writes,

> If we accept what is common to all these critiques – that all knowledge is embodied, historically situated, shaped by language, and embedded in power relations, institutionalized or not – then the very idea of the expert planner able to arrive at an understanding of "the public interest" through rational deliberation will have to be revised in favour of a notion of planning for multiple publics, based on an epistemology of multiplicity.

Sandercock's words can look like a critique of 'expertness' per se, but actually, as is clear from what immediately follows, they seek merely to redefine the planner's expertise as one who plans with multiple publics and their values, dodging the question of whether multiple and potentially conflicting values should be planned at all.

At this point it is worth making the obvious point that the occurring worlds of planners vary widely across different nations and institutional cultures. But we would argue that key features of the world view persist inside these variations. These key features include the idea that the world 'is' out there, and that something will negative happen if it is left to follow its current trajectory. There is also the idea that a vision can be created which will be a more legitimate expression of what should happen (or what people want to have happen, or the public good) than the default. Finally there is the idea that we can implement the vision and impose it on the world. This understanding of the world provides planners with the way they think about what can be done. Without this world view it would be ridiculous to even attempt a plan.

## 4. 'Worldlessness' and the Loss of the Public Realm

Just as the worldview of planning surrendered the position of visionary to some sort of collective, pluralist point of view, the validity and permanence of the 'public realm' as a means of collective

expression of needs was eroded. Arendt (1958, p.55) saw this coming in the USA even while the public realm still seemed secure as the foundation of post-war reconstruction in Europe, 'Only the existence of a public realm and the world's subsequent transformation into a community of things which gathers men together and relates them to each other depends entirely on permanence. If the world is to contain a public space, it cannot be erected for one generation and planned for the living only; it must transcend the life-span of mortal men'. Individualization and privatization results in a condition of 'worldlessness'.

> To live together in the world means essentially that a world of things is between those who have it in common, as a table is located between those who sit around it; the world, like every in-between, relates and separates men at the same time. The public realm, as the common world, gathers us together and yet prevents our falling over each other, so to speak. What makes mass society so difficult to bear is not the number of people involved, or at least not primarily, but the fact that the world between them has lost its power to gather them together, to relate and to separate them (Arendt, 1958, pp.43-44).

As Wagner (2012, p.66) puts it, a worldless world is 'a world in which social relations may have global extensions, but are so thin and ephemeral that contemporary modern human beings are held to realize their own lives in a social context that they cannot conceive as their own'. Gone is the 'communistic fiction' (in Arendt's term) that there is a natural harmony of interests in society, whether that be expressed through the 'workers' political party or through the invisible hand of the market – or, one might add, through some sort of pluralistic process (Arendt, 1958, pp.43-44).

As noted in the introduction the public realm was the place where a person could fabricate themselves in some sort of permanent way. The promise of the public realm was posterity, it provided the space whereby one could *speak* oneself into existence, and be held to account for that speaking. Acting and speaking in the public realm needed to be in alignment, so that the observed would be interpreted as who they were speaking themselves to be. In losing the public realm we have lost the space that held our self-constructions beyond the moment of our speaking them. The social self is constructed, but in such a way that any accountability or authenticity for that self lies at a place so removed from us that we might as well be something external to ourselves or something that we cannot control (the other). Although some argue that the lynchpin of liberal democracy, the nation state and its democratic forums, which provide a means for the formation of the long term public interest remain intact (Streeck, 2014, p.40), it seems increasingly the case that they are becoming empty shells, unfilled by any who is willing to speak themselves into existence, and none that would hear them even if they did.

Under these circumstances, the worldhood of planning has 'splintered' (Graham and Marvin, 2001) there is no ground upon which to create a collective vision, and nothing to 'hold' it in existence. Planners are thrown back on their own resources of interpretation and judgement to create a vision even while acknowledging its illegitimacy. The alternative is to attempt to create an expression of collective need and the long term public welfare, even while at the same time there seems no solid ground upon which to build this collective understanding. In the social world each person retains the right to their own world view, and to change that construction on a daily or hourly basis. In such conditions, agreement to a collective world view - let alone one that extends into a time frame relevant to planning horizons - seems impossible. The next section discusses the implications of the intersection between planners and this new worldless world.

## 5. Authenticity – Regenerating the Public Realm

Heidegger puts forward the proposition that while Dasein is often lured into a social world in which we cease to invent ourselves, it retains the capacity for self-saying, and truth finding. Heidegger invites us to see ourselves as 'fallen' or 'thrown' into a social situation which shapes our being, but from which, nevertheless, it is possible to distinguish ourselves as 'authentically' ourselves. In a most telling passage on the everyday condition Heidegger explains how we are all shaped by *das Man* translated as 'the they',

> 'We have shown earlier how in the environment which lies closest to us, the 'public environment' already is ready-to-hand and is also a matter of concern (mitbesorgt). In utilizing public means of transport and in making use of information services such as the newspaper, every Other is like the next. This Being-with-one-another dissolves one's own Dasein completely into the kind of Being of "the Others", in such a way, indeed, the Others as distinguishable and explicit, vanish more and more. In this inconspicuousness and unascertainability, the real dictatorship of the 'they' (*das Man*) is unfolded. We take pleasure and enjoy ourselves as they take pleasure; we read, see and judge about literature and art as they see and judge; likewise we shrink back from the 'great mass' as they shrink back; we find 'shocking' what they find shocking. The 'they', which is nothing definite, and which all are, though not as the sum, prescribes the kind of Being of everydayness. (Heidegger, 1962, p.164).

Dasein can never be like a blank slate with the ability to write anything whatsoever on it. Dasein is a social being thrown into an already existing social world constructed by 'the they'. The above quotation describes precisely the 'social' world that Arendt is referring to. The one in which, rather than distinguishing ourselves within, we merge into. But Dasein is the kind of being that has choice in how it constructs the world and therefore, in doing so, reflexively constructs itself. At this point Heidegger (1962, p.165) hints further at what authenticity might mean, 'If *Dasein* discovers the world in its own way and brings it close, if it discloses to itself its own authentic Being, then this discovery of the "world" and this disclosure of *Dasein* are always accomplished as a clearing away of concealments and obscurities, as a breaking up of the disguises with which *Dasein* bars its own way'.

This means that planners can and should choose from the great welter of identifying and prescriptive messages (what is and should be) coming from 'the they' to shape their world and themselves as planners. This is to be 'authentic'. The process starts with recognition of the pressure on them (dictatorship) of 'the they'. It does not mean, and cannot mean, a rejection of the world constructed by 'the they' (which is the sum total of human knowledge), but rather of choice from within it. It also means that planners have a say about the apparent disappearance of the public realm. Such a realm was only ever constructed, and it can be again. Every time one speaks oneself into existence and then holds to that speaking, the public realm is reconstructed, especially where the speaking occurs in the presence of those who will hold the speaker to account.

## 6. Being With – New Concern for New Entities

To bring the focus down to one Heideggerian theme of particular relevance to planning today, consider 'solicitousness' (Fürsorge) which characterises Dasein's relationship to other Daseins. Heidegger recognises that we don't treat other humans in the same way as we treat things. This is not a categorical imperative as in Kant, it is a mode of Being of Dasein, Being-with. We can see that it is

not a matter of how to behave towards others of our species, because solicitousness includes its privative modes, 'Being for, against, or without one another, passing one another by, not "mattering" to one another - these are possible ways of solicitude. And it is precisely these last named deficient and indifferent modes that characterise everyday, average Being-with-one-another.' (Heidegger, 1962, p.158)

The mode of being of planning, in its early modern days planning seems to have been involved not so much with people as with things, it could be said that it was not planning –with, but rather planning-of. So the expression of solicitousness was more like the privative modes; planning for but not with them, as can be seen in Abercrombie and most dramatically in Le Corbusier. People become more like the things they inhabit and use – houses, roads, cars, mere sociological statistics.

The revolution of the so called 'post-modern' movement has been to force planning back into a condition in which the Other matters in all diversity. This revolution in planning can be further specified. Heidegger (1962, pp.158-9) introduces two different bands on the wavelength of solicitude. On the one hand solicitude can mean caring for someone by 'leaping in' so to speak and 'taking over'. 'In such solicitude', Heidegger remarks, 'the Other can become one who is dominated and dependent, even if this domination is a tacit one and remains hidden from him'. On the other hand solicitude can mean not taking over 'care' but handing it back to the Other. Heidegger says, ' This kind of solicitude pertains essentially to authentic care – that is, to the existence of the Other, not as a "what" with which he is concerned; it helps the Other to become transparent to himself in his care and to become *free for* it' (Heidegger, 1962).

It hardly needs emphasising that this mode of solicitousness introduces great complexity into the worldview of Planning, throwing open the difficulties of the planning task, the formation of a collective will out of the diversity, and the waywardness, stubbornness, distractedness, ignorance and *the-they*-directedness, just as much as the insightfulness, compassion and selflessness of the Other. There is a by now a huge planning literature on how to achieve this difficult task using various means (for instance see Healey, 2006). Facing those difficulties head-on, however, is what makes *planning* distinctively what it is, and not a branch of economics, political science, sociology or geography. Not shrinking from human complexity is something planners should wear proudly as a badge of honour.

Recently a new agent which we could be -with (have a kind of solicitude of authentic care) has emerged. An undeniable reality beyond the human has emerged which suggests once again that there is an 'out there' which can generate a world which occurs. The degradation of Nature through the very success of its exploitation for human purposes, and a long term public interest in bringing it under control, has created the conditions in which Nature is occurring as itself. Manifesting most clearly and dangerously in climate change, the 'limits to growth' have begun to appear across a spectrum of global ecological processes despite our repeated insistence that it does not have to occur that way (Meadows et al. 2005; Steffen, W. et al. 2005).

## 7. Truth and Reality

Experience is that of Dasein, and without Dasein no concepts of 'reality', 'being' or 'truth' are possible. As Heidegger puts it, '"There is" truth only in so far as Dasein *is*. Entities are uncovered only when Dasein is; and only as long as Dasein *is*, are they disclosed' (the quote marks and emphasis are in the text). Put another way, The 'isness' of truth is entirely dependent on the 'isness' of Dasein. Thus if planners are to find solutions to problems in the world they have to trust a kind of knowledge

beyond mere opinion. Given that everything that 'is' is constructed, and things as they really are, are concealed in that construction, what is beyond opinion? Recall that Dasein is 'thrown' into an 'everyday' world imbued with 'the they'. 'Its absorption in "the they" means that it is dominated by the way things are publicly interpreted' (Heidegger, 1962, p.264). Dasein, even more today than in Heidegger's time, is always immersed in an ocean of public communication in which 'proximally and for the most part Dasein is absorbed in the "they" and is mastered by it' (Heidegger, 1962, p.210). This idea approximates that of 'stories' or 'storylines' about which much has been written in the planning literature (Hajer, 1995; Sandercock, 2003). To find truth in these stories requires that we are reminded that they are stories and that we are the story teller.

All attempts to 'uncover'(find truth) must start from the understanding of Dasein's being-in-the-world. That is the necessary point of departure for the struggle to uncover the truth of entities. Despite being embedded in a world structured by the they, Dasein's Being is not completely predetermined. Dasein has a choice through an awareness, first of the constructed world it is in, and second, of its own authentic potentiality for Being. Since Dasein's being is characterised by 'care', Dasein can project (think) itself out of its pre-structured world as it becomes aware of it. At this point we are brought back to the potential for authenticity. 'Dasein is always beyond itself' [*über sich hinaus*] not as a way of behaving towards other entities which it is *not*, but as Being towards the potentiality-for-Being which it is itself' (Heidegger, 1962, p.236).

Essentially this means that everything I know is already given by the human world I am born into and later insert myself into (my profession, my role, my job), but planners can still choose the standards by which they discriminate amongst all that given knowledge. The choices I make also make the person that is myself. My knowledge that makes 'the world' – my world view – also makes me as a person.

The problematic of climate change provides a demonstration of the need for a kind of truth finding. There are conflicting opinions on climate change, and then there is the science of climate change which claims access to a truth – 'an inconvenient truth' – beyond opinion. In the question of what to do, there is an existential choice involved in what knowledge to trust and act on. (on science see Mulhall, 2013, p.172) (Heidegger, 1962, p.409). The arrival of Nature as an entity which we can be – with is acknowledged, then a collective truth, which includes Nature as one which creates an occurring world, becomes logical.

Equally, to assume that consultative planning is now the only kind of ethically acceptable planning is to fall into the trap of listening only to 'the they' (including all the aforementioned planning literature) instead of consulting one's own judgement and knowledge. To do so is to sacrifice authenticity. In fact there may well be times, and perhaps not so far ahead, when sovereign action is needed *without consultation* to address exceptionally urgent or otherwise intractable urban problems. Reconstruction of Europe after WW2 was one such occasion. While we should try to avoid the planning mistakes of the past, looking ahead it is possible that tackling climate emergencies for instance might well be another such occasion (see for example Gilding, 2011; Moriarty and Honnery, 2011; Christoff, 2014).

## 8. Conclusion

In this paper we have demonstrated that being is a product of an occurring world. The occurring world is based on the three types of being we give to entities in the world, being present at hand, ready to hand and being with. The occurring world, or world view, is created by, but also reflexively

creates us. We have seen that the planning worldview relies on a world that is out there, which will progress somehow, planned or not. It is a world upon which we can impose our will, and which will be improved by the imposition of a vision upon it.

The question of whose world view is to be imposed upon the world has been uncovered. Such a vision should be created in the plurality of beings which have the capacity to generate an occurring world. Those with whom it is possible to be with. We have seen that this being with can result in a social world, one in which it is possible to merge and lose oneself. But we have also seen that we retain the capacity for authenticity. We can create an occurring world which aligns with our experience and in which we can express some generated self. This fabrication of ourselves requires no more nor less than our willingness to speak it, and a set of people to listen to it. This can be done in a social world, indeed we are freer to do so than ever, because the social world does not hold us to account. Tomorrow we can say ourselves anew and who would gainsay us? If we are no more than who we say we are, why not change that as we would?

The public realm, the realm we have lost, is the place where what we say develops an existence of its own. In losing it we have lost the ability to fabricate a world that lasts beyond the saying of it. The institutions which used to hold the world in some sense fixed, that mediated which sayings would last and which would not, have disappeared. Nothing lasts, all is mutable, 'all that is solid melts into air' (Berman 1982). The lack of a public realm expands the complexity of planning, because the public realm is what provides the ground for a lasting collective vision. Just as we seem on the edge of solving the question of how to create a valid, pluralist vision, the ground in which such a vision could be planted and expected to grow has blown away like so much dust. The question then becomes who will hold the vision while it is fabricated into the entities occurring as present to hand, and ready to hand. Who will generate the stories of what is present to hand and what is ready to hand that will fix a certain occurring into what is fabricated? Since we have lost the institutions of nation states, and liberal democracy, we can no longer rely on the old structures of the public realm. Perhaps instead coalitions brought into existence for the purpose of creating a vision, must also take up the burden of carrying that vision, and ensuring it is embedded in an occurring world that lasts beyond one human saying.

# City Crafting in a Contested World: An Elected City Councilman's Perspective

James A. Throgmorton
Emeritus Professor, The University of Iowa, james-throgmorton@uiowa.edu

Key words: City crafting, action, storytelling

**Abstract**

*Very few planning scholars have served as elected officials. I have, twice: first in the mid-1990s and most recently from 2012 to the present. Service as an elected official generates a very different perspective from the one typically available to planning scholars and professional practitioners. In brief, it enables one to see that urban planning as typically practiced (at least in the U. S.) addresses only some of the factors that shape the transformation of cities. This broader perspective available to elected officials might point the way toward inventing a new practice, which could be called "City Crafting." This paper explores city crafting in a small city located in the Midwest of the United States, with a special focus on a rapidly redeveloping area just south of the city's downtown. After briefly explaining what I mean by city crafting and how it differs from conventional planning, I narrate a story based on my own personal experiences as a scholar engaged in practical action. The story focuses primarily on the City Council's May 20, 2014, meetings and the Council's consideration of a several interrelated topics, including proposed adoption of a new "Form Based Code" for the new "Riverfront Crossings District" south of downtown. After briefly recounting the aftermath of this new Code's adoption, I conclude by considering the implications for planning and planners.*

## 1. Introduction: From City Planning to City Crafting

I taught urban and regional planning at the University of Iowa for 24 years before retiring in the summer of 2010. For 26 months in the mid-1990s I also served as an elected city councilman in Iowa City, Iowa, which is where the University of Iowa is located (Throgmorton, 2000). And from the start of 2012 through the present (May 2015) I have been serving in that position once again. This gives me unique perspective shared by very few scholars of urban planning.

The practice of urban planning in the United States is driven by a belief, or should I say the hope, that planners' plans can shape the future of cities. They do, at least in part. But, when seen from an elected city councilor's point of view, the planners' plans appear far from comprehensive.

Here is the nub of the issue: *plans mean nothing until people act*. Such actions unfold step by step, with each step affecting other actors who respond in ways that are consistent with their own values, interests, and (I would say) stories. Those actions in turn imply or produce effects that bleed across jurisdictional and functional boundaries, and hence escape the control of the planners and their plans. Unable to control the action of others, actors use a variety of means to influence those actions. One of the means often used is for actors to tell stories about the past (how things came to be as they are), or about the future (what is likely to happen if a particular action is taken). Sometimes these stories are designed to manipulate other actors, but they can also take the form of what I would call *ethically-sound persuasive storytelling*. This, and mobilizing a political constituency around an ethically-sound persuasive story, is precisely what I take to be the role of good elected officials. Whichever form they take, persuasive stories have significant implications for the *identity and demographic composition of places*.

Let me explain just a bit further. The fact that action unfolds step-by-step has significant implications for professional planners, at least in the United States. Regardless of how skillfully professionally-trained practitioners plan for the future, and regardless of how useful and important their efforts, they will be able to convey no more than a partial version of what must be done to craft the future of existing cities. They will—on any complicated topic being contested in the public realm—discover that their analyses and plans are rendered inadequate or insufficient by a combination of disciplinary blinders, avoidable and unavoidable errors, intentional exclusion of unwelcome perspectives, politically-motivated falsifications and obfuscations, unexpected events and unanticipated consequences, technological changes, shifts in budgetary and legislative priorities, the emergence of unforeseen opposition, demographic and cultural transformations, limitations imposed by jurisdictional and functional boundaries, and other factors. They will also discover that disciplined inquiry and practice cannot authoritatively specify how particular issues *should* be framed or how specific problems *should* be defined, for those tasks are normative in character and hence go beyond the reach of the empirical scientist and the technical expert.

On first glance, it might appear as though this simply restates the tiresome lament about the ways in which politics damages, undercuts, and corrupts the plans and evidence-based recommendations that professional planners and other experts provide. Having worked in both the scholarly and political worlds, however, I prefer to reformulate that lament and take it in a different direction: that is, to emphasize the power of stories and persuasive storytelling. When confronted by the circumstances described above, professional planners and other experts consistently find it necessary, even against their own inclinations, to invent and tell stories that explain the need to do as they advise. Their stories, moreover, have to be told to other people, people who inhabit, tell, and enact different stories. The quality of this interaction between this diverse array of tellers and recipients is crucial, for the interaction can help the people of a place live together amicably and possibly construct a shared sense of community and identity.[1] Conversely, it can divide tellers and recipients of stories into hostile camps. In a contested world such as ours, deeds become words and words can become wars.

By saying storytelling has this potential, I am not claiming that storytelling is the only activity that matters, that all stories told in the public realm are true or effective, or that stories commonly repeated within narrowly bounded communities should necessarily be assigned higher priority than professional plans or analyses. Nor am I claiming that that everything I have to say applies equally to all cities throughout the world. My experience, expertise, and focus is limited to cities within the formally democratic regimes of the West, especially in the United States and parts of Europe. Finally, I do not mean to be contributing exclusively to the scholarly literature within my home discipline, urban and regional planning. I hope, instead, to probe how stories and storytelling affect action in the public realm, especially with regard to the inherently political tasks of *city crafting* and *place making*.

By "city crafting" I mean action that produces real outcomes in physical design and social relationships at the street level within cities and the city-regions within which those cities are embedded. Of all the categories of action related to such outcomes, I think most about "wicked problems" (Rittel and Webber, 1973) involving major "matters of concern" (Latour, 2004), especially: global climate change and species extinction, extreme inequality in income and

[1] In making this claim, I fully recognize that persuasive storytelling is often used as mere manipulation. This manipulative use of storytelling (and the "noble lies" associated with it) should be resisted. But I believe that an ethically sound version of persuasive storytelling also has the potential to link the technical and political spheres, the sciences and the humanities, the secular and the religious, into a pragmatic and democratic way of building better cities and crafting a shared life in a contestable world.

wealth, ethno-nationalist impasses associated with transnational movements of people; the role of religious beliefs in public affairs, seemingly intractable debates over race and social justice, and techno-biological transformations associated with computerization, biotechnology, robotics, and nanotechnology.

I believe good city crafting requires actors to draw upon the best available research generated by a diverse array of professions and scholarly disciplines. Likewise, I believe good stories can be made stronger by using scientific evidence as tropes that can turn a story in a preferred direction (Tilly, 2002; Throgmorton, 2008). But skillful research, professional expertise, and dispassionate reflection are not sufficient. Crafting a better world also requires a willingness and ability to learn from stories that come from diverse sources, especially those rooted in the practicalities of ordinary life and including those that articulate the birth, development, ambitions, and boundaries of the disciplines and professions.

In brief, I want to make space for elected officials *within* planning (that is, city crafting), not treat them as intruders who can only wreck good planning, and I think ethically-sound persuasive storytelling is a crucial part of the emergent practice.

I now want to explore this relationship between story telling and city crafting to life by narrating a story based on my own personal experiences as a scholar engaged in practical action. The story focuses primarily on the City Council's May 20, 2014, meetings and the Council's consideration of a several interrelated topics, including proposed adoption of a new Form Based Code (FBC) for the new Riverfront Crossings District south of downtown. Narrated in first-person present tense from one city councilman's situated point of view, the tale is unavoidably subjective and limited in a variety of ways.[2]

As suggested above, the tale suggests that city crafting requires acting on a complexly interwoven mix of topics that cut across institutional, professional, and disciplinary boundaries. It also suggests that a city unfolds step by step, and that each step changes the context for subsequent actions.[3] And it suggests that storytelling—especially the interaction between community storytellers and professional experts who are enacting the deep stories of their professions and disciplines—plays a key role in this process of unfolding. Last, while at least hinting at how complex public action can be even in one small city, this story also introduces questions of community identity that we U. S. Americans and you in Europe face early in the 21st Century: Who are *we*? Where did *we* come from? And where are *we* headed?

## 2. Two Days in the Life of an Elected City Councilman

To help you make sense out of the tale I am about to tell, I must first give you a sense of the city in which I serve and the political structure of the city's government.

---

[2] This poses a serious very practical challenge for an elected official like me, namely: how can one find time to craft a rigorous theoretical argument about engaging in practical action while simultaneously engaging in that action? It may not be possible, for the challenge returns with every passing day. But if one doesn't try, the truths of practical action will remain deeply mysterious and easily manipulated.

[3] This unfolding is related to "path dependency" wherein a sequence of decisions and actions radically constrain subsequent actions. In the worst case, such a sequence can produce a "rigidity trap" that inexorably leads to the "predictable surprise" of catastrophe. The practical challenge is to figure out how to turn away from such destructive paths, step-by-step. This is an enormously difficult political task, primarily because interest groups and political constituencies have over time been assembled around the ways things are and hence resist substantive change except on their own terms.

Iowa City is a city of roughly 68,000 residents (2010) located in east-central Iowa near the middle of the United States. Most residents of the city like the fact that it combines the virtues of a small town with—because it is the home of The University of Iowa—the cultural attractions of a much larger city. According to the City's recently modified Comprehensive Plan (City of Iowa City, 2013a), several key events since the late 1990s have presented the city with an array of new challenges and opportunities. It further indicates that application of the concept "sustainability" will enable "the community" to "strike a balance between preservation [of the city's small town character] and change [growth and investment that brings big-city vitality]." The Update does not, however, indicate how this balance should or will be achieved. The City Council is formally responsible for resolving these tensions and ambiguities and for striking the balance, and it does so by exercising discretion within constraints imposed by existing laws and codes. But, for reasons described below, City Councilors are strongly inclined to defer to the professional staff's recommendations. The Update implicitly treats this staff-led process as a "black box."

One cannot understand why the City Council is so strongly inclined to defer to the professional staff's recommendations, or indeed even understand how politics work in Iowa City, without knowing that the city has a Council/Manager form of government. Voters elect the Council, the Council elects the Mayor, the Council hires and, if necessary, fires the City Manager, the City Attorney, and the City Clerk, and (supposedly) the Council sets policy while the Manager executes it. I say "supposedly" because most Council members almost always do as the City Manager and staff recommend. As a practical matter, therefore, the City Manager has most of the power in Iowa City government; I often feel as though we Council members are but puppets on a stage, with a skilled City Manager manipulating our actions. Plato might be pleased.

Now entering the 42nd month of a 4-year term as an elected city council member in Iowa City, I've grown used to hearing questions such as: "What's it like being a council member?" "How much time do you spend on the job?" And "how has the job changed since you were on the Council 20 years ago?" I usually respond by saying it's much harder being a city councilor now than it was back then. The population of the city and surrounding area has diversified considerably; the percentage of residents who are black, Latino, or Asian has increased significantly over the past ten or more years. The city faces much stiffer competition from communities near and far, especially from the neighboring cities of Coralville and North Liberty. Social media have radically transformed how people communicate their interests and concerns, and the politics of the state are far more polarized than they used to be. As a result, the issues we have to deal with are far more complicated they were when I first served as a city councilor in the 1990s. This is especially true for anything having to do with the juncture of schools, housing, race, and poverty, largely because the Iowa City Community School District includes Iowa City and its two largest neighboring cities.

But describing the context is not quite like experiencing the action. Picture a brightly lit City Council's chambers, and imagine yourself accompanying me as I prepare for and participate in one of the City Council of Iowa City's regular bi-monthly meetings. These meetings begin with a work session, which starts at 5 p.m. and typically ends at 6:30. It is followed by a formal meeting, which begins at 7 p.m. and ends anywhere from 8:30 to 11 p.m. or later depending on the number and complexity of topics on the agenda. The formal meetings are televised live and rebroadcast on the City's Cable TV channel. Normally, the work sessions are not.

It is Monday, May 19, 2014. I spent most of the weekend at home reading the ~100-page information packet for the work session and the much longer ~550 page packet for the formal meeting, and now I'm sitting in one of the coffee shops downtown trying to finish. One can't (and

I don't) read all the material the city staff gives us. Inevitably I must sort through it, focusing on what I consider important. Tomorrow night's agenda includes three such items. I'm feverishly trying finish reading the packet and drafting notes to use during the meetings. I feel as though I've run out of time and don't feel adequately prepared.

"You talk too much," a now-retired member of the council told me a couple years ago. To an extent, she might be right. I do prepare quite thoroughly. This leads me to ask far more questions and to challenge the staff's recommendations far more frequently than the others do. No surprise there. I'm a 69-year old retired professor who has a clear set of priorities that often reflect those of a large proportion of the local electorate. I am here, first, to do the best job I can for the people of the city and, second, to empower people who feel their concerns are being marginalized or ignored.

So, yes, maybe I do talk too much. But maybe the other Council members talk too little and are far too deferent to the City staff. It is very easy to see why this might be the case: they have varying types of full-time jobs and often have parental responsibilities at home. Mayor Matt H., for example, is a handsome, personable, and smart but (in my view) very cautious young lawyer who is married, has three children, and comes from an Iowa City family that has deep roots in the city. I have a great deal of respect for him and my five other colleagues, partly because I recognize that they bring diverse kinds of expertise to issues confronting the city. Susan M., for example, is a financial analyst and Rick D. is medical doctor who works for the University of Iowa's Hospital. But I am also aware that none of them have the same knowledge and experience I have concerning urban planning and public policy making.

During tomorrow night's work session we're going to discuss a proposal sent to us by the Chair of the City's Planning & Zoning Commission. (We call it the P&Z Commission.) That Chairperson recommends that we ask the School District's Board to incorporate a "walkability clause" into a "Diversity Policy" the Board adopted a year ago. During the formal meeting we will also vote on the second reading of a proposed ordinance to adopt a new Form Based Code for the recently created 76-acre Riverfront Crossings District south of downtown (Figure 1). This new Code was explicitly intended to implement a "Downtown and Riverfront Crossings Plan," which the City Council had adopted in January, 2013. And we will vote first consideration on an ordinance creating a new Conservation District for an older core residential neighborhood, which is located just northeast of the downtown and the main part of the University of Iowa's campus.

Figure 1. The Downtown and Riverfront Crossings Plan (North is on the left).

The proposed walkability clause raises difficult issues. Many parents who live in the city's core neighborhoods currently walk their children to nearby elementary schools. They want to ensure that the District's new diversity policy – which is intended to achieve greater socio-economic balance among the District's 19 elementary schools – won't compel their children to attend a more distant school. In emails and public statements they have typically emphasized the virtues of neighborhood schools and have often highlighted the value of walkability for the sustainability of neighborhoods and the city as a whole.[4] But many of these parents are actually upset because their children would have to attend a school that has one of District's three largest percentages of low-income students, as measured by Free and Reduced Lunch (FRL) rates.[5] It also has one of the largest percentages of African-American students. Other residents have stressed the importance of sticking to the School Board's Diversity Policy, even if that means requiring some students to attend a more distant school. I have advocated *both* walkability *and* diversity, not either/or, and I want our Council to take actions that will reduce socio-economic imbalances among our city's neighborhoods. The staff and other Council members typically respond that we can do that only if the other cities in the School District agree to reduce socioeconomic imbalances within the region's neighborhoods, which has thus far produced a seemingly endless cycle of unproductive intergovernmental debate about the merits of mandating "inclusionary zoning" and dispersing federally-subsidized housing for low-to-moderate income households.

The second issue, adopting the new and quite complicated Form Based Code for the Riverfront Crossings District, raises related complexities. Our Council approved the first reading on the Code 7-0 two weeks ago after hearing comments that night and two weeks previously from only a few residents. (I wasn't really surprised that so few people showed up. The FBC is a very complicated topic, which would entail a large shift away from conventional zoning. More important, there had been virtually no coverage of the proposed code in the local news media.)

At that earlier meeting on May 6, one of the City's planners (Karen H.) had displayed lots of appealing photos and images to help Council members and others envision what the Form Based Code would hopefully produce. The Code, in turn, was proposed as a key means of implementing the "Downtown and Riverfront Crossings Master Plan," the text of which also contained a large number of very compelling images (Figure 2). In a sense the images and the planners' vision might have been too appealing, for it was not at all clear (at least to me) how the transition from the present day place to the planners' vision for its future would be achieved. So I asked the staff how they thought the transition from existing zoning to the FBC in that area would occur.[6]

---

[4] Although Iowa City is hardly the kind of city Jane Jacobs had in mind when she wrote *The Death and Life of Great American Cities* in 1961, many residents seemed to be inspired by, or at least aware of, her work. For Jacobs, cities are "problems in organized complexity" (p. 438). To really understand them, she wrote, "You've got to get out and walk" (Jacobs, cited in Allen, 2011, p. 41).

[5] The School District uses participation in the FRL program as a surrogate measure for poverty. In 2013, 33.8 percent of all students in the School District were enrolled in the program. FRL rates for elementary schools ranged from 5.9 percent at Lincoln in Iowa City and Wickham in Coralville to 72 percent at Kirkwood in Coralville, and 77.1 and 78.6 percent at Grant Wood and Mark Twain respectively on the southeast side of Iowa City (CITE SOURCE).

[6] In *Planning Matter*, Bob Beauregard (forthcoming) states, "Plans erase what exists in order to propose what has been imagined" (p. 4). The Riverfront Crossings District contains several notable older buildings and quirky structures, some of which might have to be erased to make space for that which our city planners have imagined. It also includes the University's new Music Building, the County's small Jail and beautiful old Courthouse, and the site of a proposed and now twice-rejected County "Justice Center."

NOTE: Fig 2 goes here.

Figure 2. Birds-eye view of southern half of the Riverfront Crossings District

I couldn't know for sure, but it seemed to me that the question caught the planning staff by surprise. When asking this question, I was fully aware that the process by which plans are developed is like a "black box": the planning staff solicits public participation and obtains many ideas and recommendations, but then translates those ideas and recommendations into a final plan without fully explaining to the public the technical and political judgments involved in making that translation. Also aware of this "black box" phenomenon, attentive local residents know that "politics" influences what the staff submits. Hence they often do not trust that the planners are truly offering expert advice and recommendations.[7]

Who knows what really will emerge in the District? I think of Riverfront Crossings' future not as something that anyone can fully foresee, as if one were designing a new bridge, but as a place that is, and will always be, in the process of becoming.[8] Architect Christopher Alexander (2002-04) calls that process *unfolding* (or "wholeness-extending transformation"); transformations occur step-by-step. I like that concept, for it expresses the core idea that it is action and interaction that truly matter, not merely formal plans and decisions. For me, the whole process is a matter of city crafting in which the city planners and I are actors in what Bruno Latour and others have described as an "actor-network" or "assemblage."[9]

There were many other topics I wanted to probe during that May 6 work session. They concerned the very large increase in development density that would accompany the FBC; the likelihood that Tax Increment Financing (TIF) would be used to provide an additional development incentive; the use of density bonuses to encourage construction of Class A office space, workforce and affordable housing, LEED certified buildings, and preservation of historic structures; and other topics. But our mayor likes to run a tight ship and keep our work session discussions within the allocated 90 minutes, so I had to leave some questions unasked. I agreed to submit a written version of my questions to the planning staff so that they would have time to

[7] I was also thinking about urban theorist David Harvey's (2001) comment about utopia: "Utopias of spatial form are typically meant to stabilize and control the processes that must be mobilized to build them. In the very act of realization, therefore, the historical process takes control of the spatial form that is supposed to control it" (p. 173).

[8] If adopted and fulfilled, the Plan could produce a built form akin to what Jacobs advocated in *Death and Life*: short blocks, mixed uses, old buildings mingled with new, and sufficient residential density, and it could facilitate the kind of economic development that, in her view, produces great cities. But the Plan and FBC would also use financial incentives to encourage construction of buildings considerably taller than ones she advocated and considerably out of scale with current buildings in the city. The proposed use of these incentives recalls a question posed in one of Jacobs' later books: how can local governments play a significant role in city development without becoming or creating a "monstrous moral hybrid"? (Jacobs, 1994).

[9] According to Latour's (2004) Actor-Network Theory, facts become matters of concern when they gather around themselves a variety of human and non-human actors. Such an "assemblage" exists when humans, non-human things (whether living or not), and technologies (or tools) are brought together into a functioning whole. These grouping might be fleeting, are always heterogeneous, and constantly evolve as they enroll other actors and lose allies when conditions change and successes or failures accumulate. In later work, Latour (2010) later argues that scholarship and social practices are "compositional" activities; they put things together to enable intellectual positions and desirable conditions to become stable and endure.

prepare a written response for the whole Council. In other words, we Council members did not discuss and probably did not understand the complexities of what we were on the verge of adopting. In the end I too voted for the FBC that night primarily because I thought it had the potential to greatly improve the quality of urban design in the area, at least in relation to the existing zoning code.[10] This Riverfront Crossings Plan is not so massive a project as, say, New York Mayor Bloomberg's Willets Point Redevelopment, nor is it as important as the redevelopment of New Orleans after Hurricane Katrina in 2005. But for the people and businesses in Iowa City, adoption of the Code for Riverfront Crossings could be a very big deal.

Now, on May 19 and having just read the staff's response to my questions, I intend to focus on just a few key topics during tomorrow night's work session and meeting. I intend to move that we amend the proposed Form Based Code in three specific ways: to increase the minimum amount of time that affordability must be maintained for projects that receive an affordable or workforce housing density bonus; to reduce the maximum post-bonus building height in two sub-districts from 15 and 12 to 10 stories; and to reduce the density bonus for Class A space. I also intend to move that we amend an amendment that has been proposed for the Downtown and Riverfront Crossings Plan. The proposed amendment contains some very weak language about considering affordable housing in the area. I want to strengthen it. To ensure that my amendment even gets considered, I've asked another Council member to second my motion.

The emphasis on affordable housing is connected to the discussion about walkability and the School District's diversity policy. Knowing that other Council members think I talk too much and ask too many questions, and having already posted my ideas on this topic in an email to the Mayor and City Manager, which appeared in our Council packet for the meeting, I plan to remain quiet, let other Councilors express their thoughts, and then ask questions to clarify the consequences of their own proposals. At that point, I expect to offer my own ideas.

The third topic, creating a new conservation district, emerged out of long-standing concerns of homeowners that landlords and developers who profit from the lucrative student housing market are undermining the long-term health of the Northside neighborhood. Located within easy walking distance of the downtown and the University, the neighborhood contains many ~100 year old homes, streets lined with mature trees, an elementary school, and three successful neighborhood parks. But it also contains homes that have either been converted into rental units or else replaced by banal apartment structures. The proposal sailed through the Historic Preservation Commission and then the P&Z Commission, and now looks like it will pass the Council's scrutiny very easily.

It's now 5 p.m. on the 20th. Our work session begins and I immediately find myself caught off guard. The Mayor surprises me by proposing that we defer action on the very modest amendment to the Downtown and Riverfront Crossings Plan. The amendment is untimely, he says, because we had, in our May 6 meeting, instructed staff and the P&Z Commission to investigate the possibility of including affordable housing into the Form Based Code. Oh good grief! I've completely forgotten about that. What is it we instructed the staff to do? No one seems to remember exactly, and we don't have the exact text in front of us.[11] Surprised, unclear about what

[10] Inspired by Jacobs' words, "you've got to get out and walk," and thinking of her ideas not as ideology but as a source of inspiration, I led a "Jane Jacobs Walk" through the northern part of Riverfront Crossings back in May 2012. I wanted my fellow walkers to see the area's present and planned future through Jacobs' eyes, and to imagine ways to make the area into an even more attractive, diverse, and lively place.

[11] A few days later I read the actual text. It instructed the staff and the P&Z Commission "to discuss or consider inclusionary zoning and other affordable housing incentives in the form-based Code and report

we had actually instructed the staff to do, and possibly not fully prepared, we become confused. Suddenly I realize that at least four other councilors are willing to defer action on the amendment indefinitely, and to wait instead for the staff to talk to the Home Builders Association about the proposal to include affordable housing into the FBC. Having expected the amendment to pass easily, and having prepared to introduce a modification to the basic amendment, I become quite flustered. From whom else, I ask impatiently, would the staff solicit advice? Who counts as a meaningful stakeholder? I see some proponents of the amendment in the audience and know they expect to speak during the public hearing, but indefinite deferral will mean they won't be able to. Hearing four votes in favor of deferring, the mayor indicates no public hearing will take place tonight and the topic will be deferred indefinitely.

The more I thought about this over the next 24 hours, the more steamed I became. Those residents had paid a fee of approximately $150 to introduce the amendment, had labored hard to marshal an effective case on its behalf, had persuaded the P&Z Commission to pass a watered down version of their proposal, and had come to the Council Chambers to speak at the public hearing, which the Council cancelled. I could not imagine the Council responding in the same way to the Home Builders Association or the Chamber of Commerce if they had proposed a similarly minor amendment to the Plan. We could have opened the public hearing, listened to what people had to say, and then deferred action on the proposed amendment to some future meeting. In my view, the Council's action was not fair, not just, and an insult to those people! And yet, I had contributed to the confusion by not remembering what we had said to the staff two weeks earlier.

As for the walkability clause, the mayor says he is very leery of telling another government body what to do. The rest of us agree. But I emphasize as strongly and as clearly as I can how important it is that we take responsibility for our own actions and not shift the burden onto the School District. If we want to support the District in its efforts to achieve greater economic balance among the *elementary schools*, we need to achieve greater economic balance among *the schools' neighborhoods*.[12] But nobody else responds, other than the mayor, who briefly recounts all the things he claims the city currently is doing to promote greater balance. I can't tell whether he really believes what he says, knows something I don't know, is wearing rose-tinted glasses, or is talking the talk while being completely unwilling to walk the walk.

Soon, thankfully, the work session ends. I feel agitated, partly because I am annoyed at myself for becoming confused early in the work session, and partly because I don't believe the other Council members really want to increase the economic balance among our neighborhoods. I need to cool off by walking to the nearby New Pioneer Co-Op and eating a cookie. As I walk, I'm thinking: the public seems to be presenting us with an either/or choice between walkability and diversity and, more generally, between sustainability and justice. This reminds me of Susan Fainstein's (2010) recent book *The Just City* and Michael Sandel's (2010) *Justice*. But, what is justice? Oh, wait a minute. I'm suddenly in Plato land. Back toward City Hall I go. One of the other council

---

back to the City Council with a recommendation." No one, myself included, seemed to notice that the modest amendment concerned the Riverfront Crossings *Plan*, not the Form-Based *Code*.

[12] I argued that we needed to explicitly state or improve policies that promote economic diversity within Iowa City neighborhoods, especially by adopting policies that distribute new affordable housing units throughout the city by using inclusionary zoning and economic incentives. I further argued we should ensure that all new neighborhoods built in Iowa City are designed to be walkable in a strong sense, especially in the areas surrounding the two new elementary schools. And, lastly, I argued we should enhance the (strong sense) walkability of existing post-1970s neighborhoods, especially ones that currently have a disproportionately high concentration of very low-income households.

members, owner of a downtown jewelry store, is sitting outside smoking a cigar. I cross the street and sit next to him. We start chatting about the local Catholic high school, which quickly leads me tell him about my recent visit to my *alma mater*, Notre Dame. Departing, I walk to City Hall's entrance. There I chat briefly with two members of the Human Rights Commission and the director of our new Department of Development and Neighborhood Services, and then go into the Council's chamber. I greet dozens of Northside neighbors, most of whom are friends, five members of the Telecommunications Commission, a man whose young son would be receiving an award, the director of the Senior Center, and several others.

A few minutes into our formal meeting, members of the general public begin speaking (as is the usual practice) about topics not on the formal meeting's agenda. Mary G., an older African-American woman who often appears at our meetings, speaks first. She seems unusually upset and angry tonight. Once again she draws our attention to the lack of a bench at the new bus shelter near a new grocery store, to a cut we made in funding for SEATS (the local paratransit service) many months ago, and to the many ways in which we let our socio-economic class position affect our decisions. Sally S. from the Affordable Housing Coalition speaks next about our inaction on the affordable housing amendment. Affordable housing is, she said, a building block of sustainable communities. Having lived in Baltimore for years, she remembers how deeply divided that city had become in terms of race and class, and she urges us not to let our city become like that. We should instead strive to ensure that our economic success is inclusive. She agrees that affordable housing should be a *regional* priority, but she doesn't think we have to wait for other communities in the region to agree; we can take the lead and show how it can be done well in Iowa City. Lauren B. of the Telecommunications Commission then shows us a video about a cable TV education campaign the commission has produced. Mark P. of Habitat for Humanity gives us a handout about the relationship between local wages and affordable housing. The last person to speak is Roger K., a youngish heavy-set man in a wheelchair who, like Mary G., often appears during these periods. "You guys couldn't care less for this community," he says. "You tend to care only for the rich." He disparages a local developer and two 14-story structures he has built downtown. Downtown "is absolutely horrible," he says; "You guys are catering to the students."

We turn to items on the formal agenda, the first of which is the proposed conservation district. A city planner describes the neighborhood, indicates who proposed creating the district, and reports that it has been reviewed and approved by two commissions. During the public hearing on the proposal, 10 people support creation of the new district and no one opposes it. The Council votes unanimously in favor of creating the new district, and the Council chambers erupt with neighbors clapping and cheering. They exit toward the antechamber and excitedly celebrate their victory while we council members proceed to work our way through the other items on the agenda.

Immediately after voting on the Conservation District, we turn to our second reading of the Form Based Code. I speak only briefly, basically summarizing the ways I think the proposal should be amended and indicating that I would defer introducing the amendments to our next meeting in order to give the staff time to provide feedback. I don't want to do this, and worry that we would end up adopting the Code with very little discussion or understanding, but I recognize that the mayor and other Council members don't want to discuss the amendments tonight. I am only one of seven, and cannot control what the Council as a whole chooses to do. So, despite many misgivings, I vote for the new Code along with the other Council members.

The meeting ends after a few other items are considered, and I depart rather quickly to walk the mile to my home in the Northside neighborhood. As usual, I feel agitated and worn down by the complexity and emotional intensity of the experience. My "monkey mind" is chattering away. I

need to be much more nimble when encountering the unexpected during meetings. But I also want to learn how to get out of my own way. As a long-time professor, I have a very strong tendency to let myself become tied down to carefully crafted written words, to lecture, to claim the moral high ground. This simply does not work well in these meetings with other elected officials. I want to ground my words more in what *I* think and feel rather than tell other Council members what *they* should think, feel, or do. I also want to be much more deft in helping publics form around major matters of concern such as affordable housing. Are all these heated debates merely about the *shadows* of justice? The calm of engaging in stimulating intellectual discussions with philosophical friends beckons yet again. More important in the short run, my wife and daughter await. I continue walking through the dark, toward home.

## 3. Urban Renewal: The Sequel

Embedded in the story just narrated are brief summaries of the City Council's short discussions about the proposed Form Based Code for the Riverfront Crossings District. In June 2014, the Council adopted the Code as originally proposed; i.e., none of my concerns or proposed changes were included. Eleven months have now passed. The subsequent unfolding of action in the District might be called "Urban Renewal: The Sequel," for those actions have begun changing the District rapidly, not through old-style, large-scale slum clearance by the government but through a series of incremental but still profound steps. One might initially think that the "Downtown and Riverfront Crossings Master Plan" would have guided this unfolding. It has in part, but the actual unfolding has differed in important ways from that Plan. An interwoven series of actions involving a multitude of actors both near and took place in the months after the "Two Days" meeting, many of which were either not anticipated or not explicitly considered by the formulators of the Plan. These actions, in turn, strongly influenced what actually took place on the ground. I cannot detail them here, but the most important ones include the following:

- In Spring 2013 the State Legislature adopted property tax reforms that, according to City staff estimates, would reduce Iowa City's commercial and industrial property tax revenues by $37-52 million over the next 10 years. These tax "reforms" have compelled City government to find ways to decrease its costs and/or increase its revenues.

- Also in June 2014 the State Board of Regents adopted a new funding model for the Regents' universities. This new model has caused the University to begin recruiting new in-state students quite energetically and to begin foreseeing 2,000 additional students over the next four years while adding a net increase of only ___ dorm beds over the next 4+ years. The University's planned increase in enrollment in turn led local developers and public officials to begin anticipating a large increase in demand for student housing near the University.

- In the summer of 2014 the City Council proposed a 1% Local Option Sales Tax to replace the revenues lost due to the State's action, but voters rejected the proposed tax in November 2014. Many opposed the tax because they believed it would transfer income from ordinary people to wealthier property owners, including owners who were already receiving property tax cuts as a result of the State's reforms.

- The City has become much more active in using Tax Increment Financing (TIF) as a means of stimulating new development, primarily in response to the very aggressive use of TIF by a neighboring city, Coralville.[13]

- An unanticipated and very contentious debate emerged over the future of three historic working class cottages on S. Dubuque Street in the Riverfront Crossings District.

Of these many actions, the last may well be the most revealing. The full tale about those three cottages is quite complicated and must be deferred to a future paper. However, a quick synopsis can convey the essence of its relationship to the core claims of the present paper.

The Riverfront Crossings Plan explicitly stated, "preservation of these structures should be a goal" (Figure 3). Moreover, the new Form Based Code authorized a density bonus and a transfer of development rights in return for preserving historic structures such as the cottages. Shortly after adoption of the Form Based Code, however, a private developer applied to have the site of three cottages rezoned from its current CC-2 to a new Riverfront Crossings zone, RCD-CX. If approved, that rezoning would be likely to increase the assessed value of the property from about $3.6 M to about $14.2 M. Friends of Historic Preservation hurriedly applied to have the cottages

Figure 3. The Three Cottages in the Riverfront Crossings District Master Plan

designated as historic landmarks, and, after contentious public hearings, the Historic Preservation Commission and the P&Z Commission both recommended approval of the designation. The issue went to the City Council. The property owner objected to the designation, claiming he was being victimized. Many dozens of people weighed in, with builders, realtors and developers on one side, and preservationists on the other. Passions ran high, hyperbole abounded, and positions became polarized. Needing a 6-1 vote to pass, only a 3-4 minority of the City Council voted for designating the cottages as historic landmarks. The majority condemned "11th hour" efforts to preserve the structures, emphasized the rights of the property owner, and cited other language in the Riverfront Crossings Plan, which stated, "The plan is simply a vision, highlighting certain areas. The decision to redevelop is ultimately up to the property owner." The first cottage was

[13] In December 2014, the Council approved a 7-story density bonus for a professionally managed mixed-use building near the corner of Burlington and Madison Sts. It would contain 248 units of student housing. The bonus resulted in a 15-story building instead of doing what the Downtown and Riverfront Crossings Master Plan called for; that is, four 4- to 7-story buildings organized around a quadrangle. In February 2015 the Council subsidized that project with a $4.7 M TIF. Also in December 2014 the Council approved a $1.8 M TIF for a 96-unit housing project on S. Riverside Dr. In January 2015 it approved a $976 K TIF for 28 townhouses on S. Dubuque Street at the site of the soon-to-be-demolished Sabin School building. And in March it approved an $8.8 M TIF for a 12-story hotel on S. Clinton St.

demolished during the night of December 25-26, 2014 (Figure 4). As one locally prominent real estate appraiser said during a public hearing, “In short, it is about the money.”

## 3. Conclusions

As I hope the tale just recounted reveals, the role of City Councilor is not an easy one to enact. The work can feel rewarding, as it did when Northside neighbors responded so happily to our vote on the Conservation District. But it is hard work, both intellectually and emotionally, and it can often feel quite fruitless and frustrating. Engaging in this particular kind of practical action poses a unique challenge that I have not yet mastered and maybe never will. More important for present purposes, meetings such as the ones just described are only part of the never ending and complicated process of co-crafting how the future of a city will unfold. Plato would have us believe that everyone involved in such a process inhabits a world of shadow and illusion. Unlike Plato, I don’t see people in chains mistaking shadows for reality. Instead, I see people who possess many different kinds of knowledge, expertise, and ways of valuing, all of which need to be brought to bear in the here and now, over and over.

Recognizing that the tale just recounted is open to many interpretations, I would hope readers find within it at least four key elements pertaining to my claim about the importance of storytelling in the crafting of cities: first, multiple actors-storytellers have legitimate claims to be actively involved in co-crafting the future of their cities (and the regions within which their cities are located); second, these community-based storytellers interact with professional experts who are enacting the deep stories of their professions or disciplines, and are thereby living out the Platonic fantasy that professional planners (and other experts in narrowly defined domains) know more than others and hence can actually plan a city’s future; and third, powerful actors use their skills and resources to shape how that fantasy is actually executed.

At a deeper level the tale also reveals, fourth, that the decision about the three cottages ultimately involved two key questions of city crafting and community identity: who are *we*, and where are *we* headed? Our answers to these questions in the Council’s Chambers and throughout the full range of place-making and city-crafting activities were being influenced in no small part by stories and the narrative imaginations of the storytellers. In the case of Riverfront Crossings, one story dominated: the need to make space for the so called “creative class,” a concept that in a place like Iowa City would not instantly be mocked. Other relevant stories, such as those directly pertaining to the city’s African-American and Latino residents, the area’s small businesses,

lower-income people in general, Libertarians, and Fundamentalist Christians were scarcely visible and had no meaningful effect on either the city planners' or the City Council's vision of Iowa City's future. And yet, commonly shared stories about the dangers associated with having lower-income black people live in mostly white neighborhoods or attend mostly white schools, or about black kids being the ones who always get bused, lurked prominently just below the surface of the debates over "walkability" and affordable housing. And the Libertarians' and Fundamentalist Christians' stories were exerting considerable influence over State and National elections, policies and budgets, which in turn were altering the incentives and constraints within which our City government acted.

But mine is only one telling of this tale. Other versions can be told and, in fact, are currently circulating around town. Those circulating stories are, in turn, likely to play a major role in this coming November's City Council elections. This fact indicates how storytelling influences the co-crafting of cities.

# TRACK 02

# Territorial Cohesion in the Multi-Actor Arena

## Track description

Co-chairs: **Dominic Stead**, **Juho Luukkonen**

The EU concept of territorial cohesion is being increasingly used to frame spatial planning and regional development policies at different spatial scales across Europe (and beyond). Addressing the issue of territorial cohesion (and also social and economic cohesion) often involves multi-actor and/or multi-level approaches. This track aims to provide a forum for discussing the multi-actor and multi-level nature of policies to promote territorial cohesion, particularly in discussing the role, contribution and responsibility of planning in fostering territorial cohesion in the multi-actor arena. The track welcomes theoretical, methodological and/or empirical (either qualitative or quantitative) contributions. Comparative studies will be particularly welcomed. These might include papers on policy analysis, policy transfer, institutional analysis or lesson drawing related to territorial cohesion, spatial planning and/or regional policy.

**Not to Split Hairs: EU Territorial Cohesion a Contradiction in Terms**

Andreas Faludi

Professor Emeritus of Spatial Policy Systems in Europe, Delft University of Technology, a.faludi@xs4all.nl.

Keywords: Territorial cohesion, State territoriality, The EU construct

*Abstract: Amongst various territorial cohesion 'storylines', 'Coherent EU Policy' is its unique selling point. State territories as frames are unsuitable for spatial relations and functional areas crisscrossing state boundaries. However, if they were considered in earnest, states would become concerned. If this were to happen –which so far it has not and will not unless we change our thinking about the EU construct– then his would challenge their control over their territories. A defining characteristic of states being this, their 'territoriality', EU territorial cohesion policy would undermine their very existence as sovereign states, so it will always hurt itself on the wish of member states to sustain their control their territories, people and resources. Also, states will always have considerations other than managing various spatial networks in mind. Their integrity and prosperity and, importantly, their administrations retaining power depend on electoral consent articulated in and by territorially defined constituencies. Networks come second. Without splitting hairs, therefore, we may say: In an EU seen as a collection of member states, territorial cohesion is a contradiction in terms. One would have to consider another form, like an EU as an archipelago or as a cloud.*

## 1. Introduction[1]

The call for papers posits the increasing use at different spatial scales of the concept of territorial cohesion, but at the EU scale the framing of spatial planning and regional development policies would cast doubt on the sovereignty of member states. The levying of customs duties and many other issues are of course EU competences, but an overall EU territorial cohesion policy would come up against state territoriality. Of course, an EU as a real federation would make an overall frame for spatial planning and regional development policies conceivable, but this is unrealistic. My ultimate purpose is not, however, to debunk EU territorial cohesion but to lay the groundwork for speculating about other, more diffuse EU constructs than what we have now. Under those constructs, the meaning of territorial cohesion would shift from integrating developments with territories to their management within relational networks.

Part 2 discusses territorial cohesion as a 'shared competence'. Of the various 'storylines' (Waterhout 2008) articulating what it might mean, 'Coherent EU Policy' represents the unique selling point of territorial cohesion (Faludi, 2010). It implies looking at the EU territory as a whole, thus questioning the privilege of member states to exercise control over their territories, what is called territoriality. State territoriality is what Part 3 is about. It implies a view of the EU as consisting of a set of containers. Networks beyond state borders are secondary to what happens within those containers. To

[1] In the Netherlands there is concern about self-plagiarism: without due acknowledgement recycling previous works. Part of an ongoing quest, this essay builds on others on multi-level governance (Faludi, 2012), subsidiarity (Faludi, 2013a) and on further attempts to synthesise relevant literature (Faludi, 2013bc), sometimes in terms of the governance of places (Faludi (2015). This paper, too, may become yet another building block for future essays on matters which concern me.

the 'hard' view of space which this implies the literature juxtaposes a soft, 'relational' view. It implies a negotiated territoriality. Part 4 discusses negotiated territoriality in terms of 'soft' planning, but where does this leave democratic legitimacy? Part 5 explores this issue, including the example of Switzerland where democratically legitimated territorial and functional administrations coexist. In the Conclusions I introduce two alternative metaphors for the EU construct as we know it: the 'EU archipelago', with member states islands in a sea of spatial relations and the 'EU cloud' with neither clear-cut internal nor external borders. Under either, territorial cohesion would mean something different from what it does for boxed-in territories.

**2. Coherent EU Policy**

Taken seriously, 'Coherent EU Policy' would mean coordinating regional, environmental, agricultural and transport and also other EU policies where they affect space. The current reasoning that EU policy should not be 'space-blind' (Barca, McCann & Rodrígues-Pose, 2012) supports this. Nonetheless, the dominant frame for pursuing territorial cohesion is not the EU but each of the member states individually. Not all give due attention to the cohesion of their territories, but if the EU were doing this for them, all would feel concerned. Any such policy would first of all imply more procedural and substantive requirements, as for instance the requirement to conduct territorial impact assessments to meet. The trouble of having to implement them apart, the more fundamental reason for opposing the idea is that EU territorial cohesion policy would interfere with state territoriality.

True, in the EU, member states do surrender some of their powers, and well in a two-step process. As the masters of the EU treaties, they first of all agree on some competences to be surrendered in principle. The next step comes in the form of what is called the 'ordinary legislative procedure'. Its choreography involves the main EU institutions, with a key role reserved for representatives of member states sitting on the Council of the European Union. Their decision as to whether to effectuate a shared competence already listed in the EU treaties is subject to the subsidiarity principle. It means that the case for EU directives and regulations must be proven. So, subsidiarity gives the Council of the European Union an opportunity to reconsider the issue. Importantly, with this hurdle taken it becomes difficult for member states to 'repatriate' any competence, making them ever more reluctant to take this last step.

Territorial cohesion s of course a shared competences, so it could potentially lead to relevant regulations and directives being adopted following the path as outlined. Albeit under the flag of spatial cohesion, the European Spatial Development Perspective (ESDP) of the 1990s (Faludi & Waterhout, 2002) has already pursued its 'Coherent EU Policy' storyline, but the ESDP foundered because spatial planning was not an EU competences. So the ESDP has never been the object of the procedure as outlined. In fact, the Commissioners have never had the opportunity to even consider whether to exercise their exclusive right of initiative in the matter. There was no legal basis. Rather, member states respectively their planners were in charge.

Now, a new French Commissioner, Michel Barnier, proposed a shared competence, if not for spatial planning, then for territorial cohesion to be included in the next EU treaty. To him this meant '*aménagement du territoire*': the integration of various public regional development policies based on multi-annual agreements between French national and regional authorities. In France, this happens under the tutelage of the '*Délegation à l'aménagement du territoire et à l'action régionale*' operating under the Prime Minister. EU regional development policy has always been prominently shaped by this example, and this has been influential also in formulating the very notion of territorial cohesion (Faludi, 2006).

The eventual adoption of the Lisbon Treaty with territorial cohesion in it does not, however, mean that territorial cohesion is a live issue. Estimating that the hurdle of the 'ordinary legislative procedure' would be too high, the Commission has not so far taken the requisite initiative in the matter and Barnier's initiative has altogether lost momentum, but this is not what this paper discusses. The paper is rather about the concept of territory in territorial cohesion. Where states are concerned, the meaning

of territory is taken for granted. Ignoring arguments about '*La fin des territoires'* ('The End of Territories'; Badie, 1995), states conceive of their national territory as the fixed container for all the resources to sustain their governments and the citizens on whose consent their governments depend. Thinking in these terms, they would find it hard to accept the EU territory as the relevant frame.

The reason is not only subsidiarity in the EU treaties. If the case were proven, territorial cohesion might very well be taken to the EU level. The reason is that its wielding power over its territory –its territoriality– defines the sovereign state (Ryngaert, 2009). As Storey (2012, p. 40) says: 'Sovereignty implies the existence of geographic space over which control is exerted; territory is produced and claimed.' Any serious EU policy on territorial cohesion would thus be a direct challenge to a core belief of member states of what they are. They may of course share their territoriality with sub-national administrations, but unless this takes the form of claims for independent statehood, this nowhere affects their sovereignty. Under international law, it is states and not regions that have it. The many arenas, identities, interests and power relations criss-crossing state boundaries are of secondary importance. So where, as might be useful, state functions could be devolved to cross-border agencies, the states draw a clear line: State functions may not be devolved (Evrard & Chilla, 2012). In another paper on cross-border regions, Chilla et al., (2012) doubt even whether cross-border regions may be said to have territoriality. Anyhow, the 'logic of government' always trumps the 'logic of interdependence' which according to his biographer, Jean Monnet as 'The First Statesman of Interdependence' (Duchêne (1976) invoked. In the EU, conflict between these two logics is endemic.

In all this the focus is on vertical relations between member states and the EU which is, for instance, where EU subsidiarity come into its own. Horizontal subsidiarity respecting the autonomy of associations and corporations, what Delors identified as the *forces vives* (Ross, 1995) tends to be forgotten. The same is true in discussions of multi-level governance. The concept has been applied first in studying EU regional policy. As originally conceived, multi-level governance stands for the cooperation between levels of government from the EU down to the regional and local one. Hooghe and Marks (2010) describe this since as multi-level governance Type I. What is less common is to consider is its horizontal dimension: Type II multi-level governance referring to the role of single-purpose agencies for functional areas criss-crossing administrative territories. In Faludi (2012, 2013a) I have shown that discourses both on subsidiarity and on multi-level governance fail to properly address the different notions of territory and territoriality.

**3. Alternatives to State Territoriality**

Territoriality is communicated via boundaries. Under international law, boundaries apportion space, thereby effectuating state territoriality. Boundaries "…indicate territorial control and, hence, power over prescribed space" (Storey, 2012, p. 20). According to another prominent source, Sack (1986), territoriality is about controlling resources and people by controlling area. Being about reducing border thresholds, European integration presents states with a problem. Witness the discussions about rolling back the free movement of labour. Witness Germany discussing whether foreign truckers in their country should be paid the German minimum wage. Witness also the intention of levying tolls on foreign private car users crossing the German border. Witness finally discussions over roaming charges and geo-blocking of on-line services. All this has to do with territoriality.

Maintaining borders is important for the 'territorial administrative complex' in each state: members of its government and administration owing their power and quite likely also their livelihood to the exercise of state territoriality. However, look also at recent thinking in geography challenging the prevailing, what Murphy (2008) calls metageography underlying the state system. It enforces the view of territory as a container with fixed boundaries. Scholte (2000, p. 47) talks about this as territorialism: macro social space being seen as '…wholly organized in terms of units such as districts, towns, provinces, countries and regions.' Without invoking that term, where he continues saying: 'In times of statist territorialism more particularly, countries have held pride of place above the other kinds of territorial realms…', Scholte, too, means state territoriality. This state territoriality is what the EU challenges.

Scholte, and this is where spatial networks come in, points also to connections that are at least partly detached from any territorial logic. In global transactions, 'place' is not necessarily territorially fixed, distance is covered in effectively no time, and boundaries present no particular impediment. Think once more about online services. He may not yet have had those in mind, but according to Castells (1996) the 'space of flows' is overgrowing the 'space of places.' Social space cannot, therefore, be understood in terms of territorial geography alone.

Murphy (2008, p. 9) discussed the power aspects involved: The current 'cartography of social life' is the outcome, he says, '…of efforts to achieve particular ends with concrete implications for how things are organized and how people think about the world around them.' Other than Scholte, he continues by invoking the term territoriality. Thus, he says that the '…territoriality of the European state system helped to produce a geographical imagination that privileges the 'nation-states' over river basins, vegetation zones, population concentrations, or other possible regionalizations…' Storey (2012, p. 66) says on this point that states '…reflect processes through which territory (and those living in that territory) is controlled. … This state-centred approach reifies current political-territorial structures and tends to ignore the fact that, rather than being permanent features, they are historically contingent.' Scholte (2000, p.57) himself holds that '…we need to develop an alternative, nonterritorialist cartography of social life', one that does not treat jurisdictions with their fixed borders as the inevitable building blocks.

However, there is the loss of democratic legitimacy as a perennial threat, but at the same time representatives eying nothing but their re-election may become 'rent-seeking elites' (Barca, 2009) diverting attention and resources away from solving real problems. Their chief concern may be to please their constituencies and their time horizon limited to the time until the next elections. Wishing to maintain the territorial-administrative complex, politicians sustain the belief as if democracy was only viable within closed territories. They are celebrating an ideology of territories-as-containers for citizens with identities shaped by imagined homelands and histories reaching back to, often fictional forebears. Where history and geography do not conform, they attempt to shape either of both, and the populations also whom they are supposed to serve accordingly (Loriaux, 2008). This is the story of common school curricula and of national languages, like where Weber (1976) writes about turning 'Peasants into Frenchmen'. It is the story also of welfare and social policy (Lascoumes & Le Gales, 2012; Chevalier, 2012). Relevant measures are always and necessarily particularistic, with the territorial-administrative complex focusing on the territories and the territorial constituencies that sustain them.

However, there are also non-state actors, including service providers, and there are functional logics. Seeking to formulate coherent policy, as territorial cohesion would require, would mean reconciling functional with territorial logics. It would also imply sharing territoriality: thinking outside the box of state territoriality, in fact, outside any box, any territory with fixed boundaries. Taking territorial cohesion seriously would mean thinking, not of territory but of territories in their complex and dynamic configurations.

European integration has started by addressing specific functional interrelations: French post-war steel production needing German coal. At the same time, German integration into a Western alliance promoted by a United States concerned about defence against a real or perceived Soviet menace depended on French consent. This has been the time of United-States-of-Europe-type enthusiasm. Conceivably, it might have led to a form of supra-state territoriality, including common European defence: a large box containing the EU territory as a whole. Territoriality would then mean giving primacy, as in federal systems, to the joint territory. Elements of this exist: the Eurozone; the area in which the 'Four Freedoms' are operative; the Schengen Area, neither of which coinciding with the territory of the EU. Rather, the areas concerned overlap. They even overlap the EU's external borders. So, where it exists, European territoriality is a hotchpotch, a diffuse form of negotiated territoriality complementing an interconnected world. In the conclusions I reflect upon this further. First I discuss how all this reminds of the planning literature discussing soft spaces and soft planning.

**4. Soft planning for soft spaces**

In a case study of Thames Gateway, Allmendinger and Haughton see the literature reflecting '… an apparent predilection for promoting new policy scales, initially at least through the device of fuzzy boundaries' (2009, p. 3). In Faludi (2012, 2013ab) I discuss this and other studies conceptualising soft planning for the soft places marked by them. Much of this is going on under the Cohesion policy objective 'European Territorial Cooperation' (Ek & Santamaria, 2009). Under the authority of the European Council, the European Commission coordinates relevant policies and brokers agreements on concrete actions, also under the macro-regional strategies for the Baltic Sea Area, the Danube Area, the Adriatic and Ionian Sea Region with one for Alpine Space in the offing and more being contemplated (European Parliament, 2015). They are soft because their boundaries are not clearly marked. Also, they involve no new EU legislation, no new EU money and no new EU institutions. Sociologists would say that the meetings, exchanges and, where they occur, mutual commitments entered nonetheless mean institution-building. However, this is institution-building of an informal kind, one which may in due course lead to more formal arrangements even so. For instance, under the current Financial Framework 2014-2020, where one exists, Cohesion policy must pay regard to a macro-regional strategy. So, they soft arrangements may be hardening, something that, writing about the Baltic Sea Strategy, Metzger and Schmitt (2012) have already noted.

From all this it is clear that territory is not necessarily the envelope of all major aspects of social and political which state territoriality assumes it to be. Academic research, mainly in geography, has explored the meaning of territory and like concepts. Part 3 has already referred to Murphy. The debate is not couched in terms of soft and hard but in terms of relative, or relational, and absolute space, terms already invoked by Harvey (1969) in his 'Explanation in Geography'. A special 2007 issue of Regional Studies focused the debate on the regional scale, with another one of 2013 seeking to come to conclusions. According to Varró and Lagendijk (2013, p.21) this 'relational versus territorial debate' , in particular in the UK where this related to regional policy and regional reform, but the arguments are of more general relevance, opposed 'radicals' to 'moderates'. So, instead of '... the misleading celebration of self-reliant regions that actually remain entangled in centrally orchestrated policy frameworks, radicals have called for a more radical revision of the UK territorial management'. Whilst sympathising, '…moderates (…) have pointed out the need to be aware of the persisting relevance of the territorial dimension of socio-spatial processes'. In the same issue, Harrison (2013, pp 71-72) comments on a backlash, therefore, against the 'relational' view, concluding that what is needed are '… ever-more-complex configurations in order to make emergent strategies compatible with inherited landscapes of socio-political organization, and for new conceptual frameworks capable of theorizing the 'inherently polymorphic and multi- dimensional' nature of social relations'. He alludes to Jessop, Paasi and Jones (2008) reviewing relevant discussions in geography. Nilsson, Eskilsson and Ek (2010) draw attention to the fact that all this involves the re-negotiation of socially and historically constructed regional identities.

Be that as it may, this chimes well with the observation by Healey of what she calls place governance being complex, with arrangements cutting across government boundaries. The outcome of places being mixed in with administrative areas is '...a tangle of complex relations and arenas, in which particular actors come together.' (Healey 2010, p. 71). Accountability is an issue. In any case, soft spaces places are surely different from, necessarily hard, administrative territories. They not only have definite boundaries, they are also the constituencies to whom politicians are accountable. Where places rather than territories are concerned, accountability is a problem, therefore. Commenting on 'localism' in England, Davoudi and Cowie (2013) are concerned, for instance, that under 'localism' addressing places called 'community planning areas', with ad-hoc boundaries drawn around them, issues relevant to the entire jurisdiction may be neglected.

As 'ambiguous' lands, places thus throw the democratic legitimacy of their governance into relief. Voting in and by territorial constituencies is the accepted way of arriving at legitimate decisions. The underlying assumption is that society can be neatly apportioned into boxes, the 'container view' I criticise (see also Faludi 2010). In reality, in a networked world, functional areas form places of many shapes and sizes. Even macro-regions, the object of strategy-making in the EU, may be described as places. Indeed, Jessop et al. (2008, p. 395) talk about 'globalities' like macro-regions in such terms. All this leads to anxiety about the democratic legitimacy of place-governance.

**5. Democratic Legitimacy?**

Is voting by territorial constituencies the only way to produce democratic legitimacy? Surely, one may ask this question without leaving oneself open to the charge of being undemocratic. After all, none of the conventions for arriving at democratically legitimate decisions is self-evident, which is above all true for the very idea of electing representatives (Manin, 2012). This and other current practices have been invented and argued over before becoming routine to the extent that governments are now measured against standards of inclusiveness and fairness thought to be universal. Nonetheless, that democratic legitimacy comes from majority voting in territorial constituencies may be questioned.

As is well-known, the rallying cry of the American Revolution was that taxation without representation was tyranny (Pitkin, 1976, p. 3). It was in this context that representation became identified with territorial self-government. A key authority on the matter, Pitkin does not discuss representation being territorially bounded. One of her concerns is rather whether representatives are bound by what constituents want, or whether they their duty is to pursue the interest of the nation as a whole. It would be possible to also argue that the representative must take broader, territorial or functional areas into account, and not just his or her constituency. Ignoring current requirements of gender-neutrality, Pitkin says, indeed, that the '…representative is, typically, both special pleader and judge, an agent of the locality as well as a governor of the nation. His duty is to pursue both local and national interests, the one because he is a representative, the other because his job as representative is governing the nation.' (Pitkin, 1976, p. 218) However, this may reduce the chances of being re-elected, this being the crux of territorial representation. So it is relevant to critically examine the situation created by territorial constituencies forming the exclusive frames of reference.

According to Rehfeld (2008, p. xv) '...the use of territory for representation has never been explained or justified ... In never having been contested ... territorial constituencies qualify as an arbitrary institution... ' Discussing elections US congressional elections, he argues for random constituencies instead. Urbanati and Warren concur, saying that '...when represented geographically, the people are only a 'demos' insofar as their primary interests and identities are geographical in nature. Nongeographical constituencies ... are represented only insofar as they intersect with the circumstances of location, producing only an accidental relationship between democratic autonomy ... and forms of representation'. They conclude that the '…geography-based constituency definition introduces an arbitrary criterion... Exclusion works not on people ...but rather on issues, since residence-based constituencies define residency-based interests as most worthy of political conversation and decision...' (Urbanati & Warren, 2008, pp. 396-397). Amongst excluded issues, there are those –which they do not mention– relating to places within, or cross-cutting the boundaries of territorial constituencies.

There are, of course, action groups and NGOs articulating neglected issues, including those relating to places, but the default condition is that territorial representation prevails. Apparently being unfamiliar with alternative understandings of space, the writers above do not consider configurations other than territorial containers. Maybe, though, there is no alternative! The planning and human geography authors discussed above offer none beyond saying that the situation is complex.

Maybe the example of Switzerland can help. Apparently, there the tangle of relations and arenas which Harrison and Healey talk about is a lived reality, but without raising concerns about accountability. Accountability is simply spread over issues and institutions. The authors whom I am referring to, Eichenberger and Frey (2006), discuss territorial and functional issues being treated on an equal basis. Their key concept is what they call functional, overlapping and competing jurisdictions (FOCJ). These exist next to, and sometimes in opposition to what in this paper I call territorial-administrative complexes. Drawing on the economic theory of federalism, Eichenberger and Frey describe FOCJ as expressions of 'functionalist federalism'. With areas of responsibilities and powers which are task-specific, They follow a different logic from any territorialist meta-geography.

The same authors also address the issue of democratic legitimacy. Thus, individuals and/or communities who join school districts, water purification services, refuse collection services and so forth, have a say in running FOCJ. They may even take the initiative to set up new ones. They can also leave them for alternative providers. This, their right of exit mimics market competition. Also, they elect the management, so there is political competition. In this way, each of the FOCJ is a democratic governmental unit. Importantly, once citizens or communities who can also be members have joined, FOCJ exercise authority over them, including the power of taxation (Eichenberger & Frey 2006, p. 160). Citizens or communities must, however, be relieved form having to paying the same tax to territorial governments.

There are plenty of details in the paper under discussion, using one of the 26 cantons of the Swiss Confederation, Zurich, as an example. Eichenberger and Frey report people there to be generally satisfied to a point where they usually defy attempts by cantonal bureaucracies and politicians to suppress any of the FOJC. So, the '…example of Switzerland –which is generally considered to be a well-organised and -administered country– demonstrates that a multiplicity of functional jurisdictions under democratic control is not a theorist's wishful thinking but has worked in reality.' (Eichenberger & Frey, 2006, p. 168)

Their proposal reminds of 'directly deliberate polyarchy' of which Cohen and Sabel claim that it has '…problem-solving capacities useful under current conditions and unavailable to representative systems….[C]ollective decisions are made through public deliberation in arenas open to citizens who use public services, or who are otherwise regulated by public decisions.' (Cohen & Sabel, 1997, pp.313-314) Something which Eichenberger and Frey themselves emphasise is also true: Their proposals have a bearing on the EU. Multi-level governance, the governance turn, democratic experimentalism referred to by Piattoni (2011; see also Sabel & Zeitlin 2010), but see also studies of the 'comitology system' preparing and managing many an EU policy. Comitology in particular represents an '…uneasy fit with the idea of principal-agent democratic accountability through parliamentary representation...' (Smithmans, 2008, p. 875). Indeed, all these deliberative governance structures indicate how the purported democratic deficit, also and in particular in the EU, could be reduced. As Joerges and Neyer (1997, p. 621) say, the '…majoritarian models of democracy are primarily suited for decision-making at the level of the nation-state and face serious normative difficulties when adapted to the European level.'

**5. Conclusions**

Much of the above has a bearing on territorial cohesion at the level of the EU where the nation-state seems, perhaps wrongly, the all-pervasive measure of European integration. This makes the unrealistic option of a United States of Europe seem the only alternative. Whether this has been Jean Monnet's view is a moot question. He did talk in terms of a United States of Europe, but whether he really

meant something like a federal or super-state is doubtful. One can read in his ´Mémoires' (Monnet 1976) that he was aware of the problems of representative government, and there is of course the accolade, already mentioned, of Duchêne (1994) of him as the first 'statesman of interdependence'. This brings him closer to the governance of overlapping places than to the management of territories as containers.

Nonetheless, the container view and attendant notions of how to govern remain dominant. Thus, the European Parliament fancies itself as a parliament in-the-making and has arrogated appointing the President of the European Commission to itself, as if the Commission was destined to be the EU government. At the same time, the members of the European Council of heads of state and government consider themselves as the legitimate representatives of their national jurisdictions. The context thus remains one between different levels within a territorial hierarchy. There is insufficient appreciation of functional institutions cross-cutting the territorial boundaries in and around the EU.

Alternatives, looking at the EU as a 'sui-generis' construct, do exist. Consider authors like Zielonka (2006) writing on the EU as an empire. Roche (2012, p.40) comes to a view of Europe as a 'socio-political complex': 'The image of the EU ... as a puzzling socio-political UFO has guided the discussion towards models which visualise Europe and the EU in socio-spatial terms as a network society and as a neo-imperial system.' The EU is thus said to be '…both an international and supra-state organisation, an organisation which has multinational and multicultural characteristics, and in which the governance system is multi-level and multi-form'. On this basis, Roche notes '…the inadequacy of the 'super-state' and nation-state analogies' (Roche 2012, pp. 40-41). If true, then maybe not only macro-regions, but also the EU as such is more like a place without fixed boundaries than a territorial block. The implication for the EU territory would be that it is fuzzy, with less structure internally and less clearly separated from its neighbourhood than generally assumed. Come to think about it, this may by more accurate as a description of reality than maps showing an EU of twenty-eight state territories.

Indeed, a wider 'EU-orchestrated Europe' reaching beyond the external borders comes close to what has been described as a 'place'. In any case, it is more complex and fluid than a jurisdiction. Also, EU policies often address spatial configurations cross-cutting local, regional, and national boundaries, encouraging the areas and the stakeholders concerned to conceive of new identities. The reflections above on the production of democratic legitimacy may be relevant here. They suggest that Europe as a place deserves better than being forced into the straightjacket of a container. As I suggest elsewhere (Faludi 2013c; 2014), if and when broad and searching discussions along such lines about the nature of the EU project take place, then, with experience in place governance, spatial planning may even have a contribution to make.

In their paper discussed above, Eichenberger and Frey discuss implications for the EU which support the view of it as a new type of governance and of territoriality. Rather than approximating a federal construct with a fixed *acquis communautaire* which newcomers have to accept, they suggest that members and also non-members should be encouraged to establish FOCJ. Going '…beyond the proposal for a multispeed integration of some 'chosen' countries into a 'core Europe'' (Eichenberger & Frey 2006, p. 170) this indicates a looser, more complex negotiated territoriality and a more subtle approach to territorial cohesion. The result would be state territories, each with borders enclosing 'absolute' spaces, alongside a multitude of 'relative' spaces cross-crossing their boundaries. Such relative spaces would be constituted, not by borders, but by networks. And each would imply its own, tailor made form, just as its governance is tailor made, of territorial cohesion.

What this all comes down to is that the fixed territories that we know are in fact islands in a sea of malleable functional territories: an archipelago. The wave patterns caused by the interaction of the many functional territories form that imaginary sea unremittingly re-model the islands' shorelines. Remaining within this metaphor, territorial cohesion may thus refer to, but this is only part of the story, how well the activities on the islands are integrated. It may equally well refer, and this would also be true for the other metaphor of the EU as a cloud, to how the islands and their inhabitants

manage their relations with the sea of functional territories around them. So conceived, the pursuit of territorial cohesion would mean conceptualising and re-conceptualising territorial relations, amounting to ever-new spatial visions, the tool-in-trade of soft, non-binding strategic spatial planning (Zonneveld 2005; Ek and Santamaria 2009). Such spatial visions are not intended to replace the hard analysis of the shape and structure of the islands. Rather, their purpose is to better cope with the many interrelations between the islands and the sea and to prepare for changes, including changes to the shapes of the islands themselves, as well as the situation and identities of the islanders.

# SPATIAL PLANNING AND HEALTH POLICIES: SYNERGY OR FRAGMENTATION? EVIDENCE FROM PORTUGAL THROUGH THE LENS OF THE TERRITORIAL COHESION CONCEPT

Gonçalo Santinha[1]

[1]DSPTC – University of Aveiro, g.santinha@ua.pt

## Abstract

*The significance of spatial planning for health and well-being is well recorded. While there has been recently an increasing body of literature in academic circles and public policy guidelines illustrating the importance of both fields working closely, evidence shows that cross-sectoral integration between spatial planning and health policies is still scarce. This article aims to develop a deeper understanding of how this integration can be considered in conceptual terms and how it is actually embraced in practice by health decision-makers. Drawing upon the concept of territorial cohesion, the new EU political objective which highlights the importance of considering the spatial dimension for public policies cross-sectoral integration, the article presents and discusses the results of a research held in Portugal aiming to understand how territory and spatial policies taken into account in health decision-making processes. Face-to-face semi-structured interviews to current and former national and regional health decision-makers were conducted for this purpose. The research also comprised the analysis of the main national and regional health policy guiding documents. Findings show that, although decision-makers and policy guiding documents value the importance of promoting a cross-sectoral integration of both domains, there is still a long path ahead to integrate in a comprehensive manner the spatial dimension in health policies. The article concludes by pondering on the added value of using the conceptual framework proposed based on the decision-makers perspective and on the new institutional EU policy context.*

Keywords: Health, Territorial cohesion, cross-sectoral integration

## 1. Introduction: context and aim

The economic and social crisis that several European Union (EU) member states have been facing this past years has led to a number of public administration reforms regarding more efficient organizational models for the provision of public services. Although the importance of these services to both citizens' quality of life and social and economic development of different territories is long recognised, the debate around the role of public policy in their provision has gained increased visibility and centrality in political, academic and media agendas. There are multiple reasons that can explain these circumstances: political changes, particularly in the last two decades, aimed at the liberalization of markets, the transition from the idea of a service user for the consumer/client logic or even the current economic and financial crisis are usually pointed out as examples.

Much of the discussion concerning public services, however, has been done in a comprehensive but a-territorial way. "[There is] a curious partial sightedness concerning the role of public services. (…) public services are frequently powerful placeshapers, and that their role in this regard has been largely ignored by most of the relevant academic literature. (…) Public services – health care, education, the police, social services, defence - they feature only rarely in the spatial planning literature (…) most of these services have their own spatial planning procedures and routines – hospitals are sited in relation to other hospitals and schools in relation to other schools rather than in relation to any more unified vision of the spatial disposition of the whole suite of public services and their integration with a wider plan for spatial development" argues Pollitt (2012, pp.33, 37-38). "The lack of an integrated strategy across policy areas serves to perpetuate and possibly increase the [existing] disadvantages (…) While separate working in silos continues, it will be harder to address these issues and tackle inequalities" add Geddes et al. (2011, pp.35). Indeed, pointing out the narrow view that is traditionally adopted in the discussion around these services in relation to its potential for transformation of the territories and calling attention to the apparent lack of coordination between the different areas of intervention, with the consequent perpetuation of existing inequalities, these authors confirm the observation previously made.

The health sector is a good example of the importance of this debate and creates the necessary conditions to ponder on the way the territorial dimension is included in decision-making processes. According to Barros (2013), health appears regularly at the top of the main concerns expressed by citizens in what they consider essential. However, particularly in the Portuguese case, citizens express frustration with the health system, in general, and the provision of healthcare under the National Health Service, in particular. This is mainly a result of the difficulty experienced in accessing healthcare due to the costs, the time travel and waiting lists, and even the spatial distribution of services.

The Portuguese health system is based on a National Health Service (NHS), Beveridge model - the principle of universal coverage, with mandatory funding through taxes, whose institutional management is public (Simões, 2009) -, in which all the Portuguese population has access to by constitutional precept (Boquinhas, 2012). Following the Portuguese Constitution, the health system is based on a centralised control and decentralised management: the Ministry of Health and its central level institutions are responsible for the Planning and regulation whereas five NUTS II Regional Health Administrations, though accountable to the Ministry of Health, are responsible for the strategic management of the population health, supervision of hospitals, management of primary care and implementation of national health policy objectives (for a comprehensive account of the Portuguese health system see Barros et al., 2011). However, as Oliveira and Pinto (2005) claim, in practice a centralised structure tends to prevail as most powers are still exercised at the central government level.

The discontent with respect to how health policies are being conducted has been observed at several moments. For example, in 2013, the presidents of the national medical association and other personalities of Portugal and three other member states signed an open letter to political leaders and health authorities in Europe invoking a quick reversal of the austerity policies to "urgently avoid further deterioration of health and health services." Arguments as the reduction of access to appropriate health services, the existence of poor working conditions for health professionals and a decrease of health resources while increasing health needs in the community were presented as warning signs for a deep consideration on the path health policies should take.

The fact that the health system is seen financially unsustainable by the present government, having the NHS no excuse to not contribute to a greater containment of public expenditure given the existing deficit, has actually been one of the main arguments widely broadcast by the media to sustain such worries. Though the government discourse is also focusing the idea of an improvement of care quality, policy guidelines regarding the concentration of health services, the closure of certain healthcare units or increased user fees, to name a few, have engendered enough controversy and misunderstanding not only among the population but also among health professionals in academia and in the political arena.

Indeed, little is known about which principles and criteria sustain health policy decisions and the role the territory plays in this process. In Portugal, studies tend to focus on the historical-political context of the major reforms that have taken place since the creation of the NHS in 1979, describing in some cases with enough detail the purposes, processes and outcomes achieved by each government decision. Examples can be found in Campos (2008), Barros et al (2011), Campos and Simões (2011), and Fernandes and Barros (2012). Other studies, discussing the implications of certain reforms in the health sector regarding certain social groups, such as health professionals, can also be found. This includes the research published namely by Carvalho (2009) and Teixeira (2012). One common feature that marks the majority of these studies, however, is the scant analysis of the role of the territorial dimension in health policies.

It is in the health geography field that the relationship between health and territory is mostly analyzed. In Portugal, the studies published by Santana (2005; 2007; 2014) and Santinha (2013) are considered a conceptual and analytical reference in this field. Still, in such studies, the analysis and discussion of decision making processes and governance mechanisms regarding the relationship between the two fields is usually not taken into account. How and under what circumstances the territorial dimension is taken into account in health policy decision making processes? Which criteria are used? Is the territorial dimension of health considered occasional or systematically? And from an institutional viewpoint, which synergies between agents and instruments of health and spatial planning fields are there in order to design and implement integrated policies? The aim of this paper is to address these issues and accordingly contribute to this debate in the public policy and spatial planning domains.

## 2. Linking territory to health in light of the territorial cohesion concept

From a conceptual viewpoint, territorial cohesion, the new EU development paradigm and political objective, is used as a framework of analysis for the purpose of this paper. With a central and strong position in the Treaty of Lisbon, territorial cohesion has been placed explicitly in the core of EU territorial development agenda (CEC, 2011) and has emphasised the spatial dimension of Europe 2020 Strategy (CEC, 2010a). As such, Member States are encouraged to adopt the principle of territorial cohesion in their policy agendas and strengthen territorial objectives in sectoral policies. The argument draws on recent debates on territorial cohesion and links the concept to health. It is suggested that the main lines of action underpinning the concept of territorial cohesion, which combined add value to public policy decisions, when transposed to the health policy domain can be observed in four different ways:

- In terms of the geographical nature of accessibility to healthcare;
- In factors of a broader nature beyond the healthcare per se, such as the social, economic and political impacts of health services at local and regional levels or even citizens' behaviours and lifestyles within a public health perspective;
- In the importance of health as an export sector, a job-creating activity and a means to promote social, economic and territorial development (with links to other activities, such as medical and health tourism);
- In the promotion of more coherence between different actors and policies (i.e. addressing territorial governance), in which health policies can benefit not only from cooperating in a joined up manner with other areas, namely spatial planning, but also from inserting a spatial dimension into the process of integrated policy development.

## 3. Methodology

The arguments made are empirically grounded in a study developed in Portugal between 2012 and 2013, comprehending two phases of data collection.

Phase I consisted of face-to-face semi-structured interviews to 23 key actors in the area of healthcare, at the governmental level, as well as in central and regional administrations. The sample of the interviewed decision-makers comprised current and former health ministries and secretaries of state (from both social democrat and socialist governments), directors/presidents of central level institutions (e.g. Directorate-General of Health) and independent administration entities (e.g. Health Regulation Authority), and presidents of Regional Health Administrations. Consistency was addressed by means of interview topic guidelines to make sure that significant issues regarding the concept of governance were covered systematically, while allowing participants freedom to describe their own experiences. The line of thought of this approach is to understand the processes from the voices of those who are or have been involved in health policy-making.

Phase II draws on documentary sources, namely on the main health policy guiding documents. The policy documents were chosen by the own decision-makers during the interview process. Four types of documents were analysed: documents of governmental nature (the XIX Government Programme and the Memorandum of Understanding signed by Portugal), documents of strategic nature (the National Health Plan 2012/16 and NUTS II Regional Health Plans) and documents for health planning and organisation (the Hospital Chart proposed by the Health Regulation Authority and the Hospital Referral Network available for most medical specialities).

With this double approach, qualitative evidence about the spatial dimension of health policies in light of the new EU political goal is provided.

## 4. Main findings

Several lines of debate emerge from this study. First, spatial issues do not emerge spontaneously in the discourse of health decision-makers (who tend to emphasise issues like hospital management, clinical aspects and the pharmaceutical market) and are sporadically addressed by health policy documents.

Second, the relationship between health and spatial issues is thought over in narrow terms and when discussed the geographical access to healthcare services tended to be highlighted. The idea of creating opportunities from local specificities and endogenous assets is clearly not a priority in the health policy agenda (for both decision-makers and policy documents) and when considered is seen as a separate goal.

Third, health decision-making processes are basically of political nature (questions such as which criteria should be used to determine the need to positively support certain less developed areas or where should healthcare facilities close remain unanswered) and accordingly verdicts tend to be made on a case-by-case basis and scarcely based on decision support methods.

Fourth, health decision-making processes are very centralised and sectoral. The pyramidal structure of the health sector like a one-way passage tends to reduce the capacity of taking stock of local specificities, as well as the social acceptance of policy decisions.

Fifth, health policy makers have a negative perception of spatial planning and plans, partly explaining why almost no institutional collaboration between the two fields exists. In fact, the few moments of cooperation occur due to financial reasons, such as applying for new infrastructures/facilities through structural funds.

## 5. Conclusion remarks

This paper aimed at understanding how spatial issues are taken into account in health decision-making processes in Portugal. Findings show that the spatial dimension of health policies is scarcely considered in decision-making and looked in a reductionist way. Nonetheless, from an optimistic viewpoint, health decision-makers acknowledged that the adoption of the territorial dimension in health decision-making processes in light of the framework presented in this study can be of added value to make decisions more fair and at the same time more efficient, not only concerning health but in a global public policy perspective. This assertion provides an additional hint to include the territorial cohesion political objective in the public policy agenda as it brings further elements to debate in an integrated manner that are usually not taken into account in health policy-making.

This research is but one qualitative study of governance in one country (Portugal), but findings do provide valuable insights that open the door to significant questions to be explored in future research and accordingly derive lessons for theory and future practice. For future research, findings should now be compared with other countries to see if patterns emerge.

# European Union Cohesion Policy and the (Re-) Production of Centrality and Peripherality through Soft Spaces with Fuzzy Boundaries

Stefan Telle[1]

**Abstract** *The paper discusses the co-evolution of the mode of governance of the European Union (EU) and the rationale of EU Cohesion Policy. It is argued that the process of European integration has led to the challenging situation of heightened complexity of decision-making at the EU level under the community method. As a consequence, consensus-seeking deliberation and policy-experimentation are becoming increasingly important in EU governance. In this context, the paper argues that the alignment of Cohesion Policy with the EU 2020 objectives of smart, inclusive, and sustainable growth may be explained by a shift toward a post-political mode of multi-level metagovernance. Adopting Neil Brenner´s spatialized version of Bob Jessop´s strategic-relational approach, the paper analyzes EU Cohesion Policy as a spatial strategy and spatial project in the period from 1988 to 2014+. The main finding is that EU territoriality is markedly different from the territorial arrangement of the Keynesian-Welfare-National-State. Crucially, EU territoriality appears more flexible and issue-driven, which is interpreted as a consequence of a more experimental way of decision-making at the EU level. Future research will use the framework developed in this paper to investigate effects of the making of this soft European space on the (re-) production of socio-spatial polarization in Central and Eastern Europe.*

## Socio-Spatial Polarization, EU Integration and EU Cohesion Policy

With the "Big Bang" of the 2004 enlargement of the European Union (EU), economic disparities between EU member states are now larger than those between U.S. states (Majone, 2005). Thus, with regards to EU Cohesion Policy (Adams, Alden, & Harris, 2006), the eastern enlargement poses a challenge to the objective of "reducing disparities between the levels of development of the various regions and the backwardness of the least favoured regions" (TFEU, Art. 174). In fact, it has been argued that socio-spatial polarization has become a "striking feature" of the settlement system on the subnational scale, especially in Central and Eastern Europe (Lang, 2011, 2012).

This paper investigates the link between EU enlargement and regional polarization. Viewed from the perspective of Stein Rokkan's (1999) theory of boundary building and political structuring (see also Bartolini, 2005; Ferrera, 2012), political systems can be understood as being structured by a membership boundary and a territorial boundary. The relative openness of these boundaries conditions the structuring of the internal political system. Therefore, EU enlargement can be expected to have a discernible structuring effect on the EU governance architecture in general, and on EU Cohesion Policy in particular.

Indeed, the emergence of new modes of governance (Bache & Flinders, 2004a; Marks, Scharpf, Schmitter, & Streeck, 1996; Piattoni, 2010; Puetter, 2006b; Sabel & Zeitlin, 2008) can be seen as driven by the desire to achieve efficient solutions to political coordination problems by

[1] Slovak Technical University, Marie Curie Fellow ITN RegPol[2], stefan.telle@stuba.sk

accommodating the diversity of the political and social systems of an ever growing number of member states. While some authors (Sabel & Zeitlin, 2008, 2010; Zeitlin & Vanhecke, 2014) are optimistic about the potential of experimentalist forms of governance to deliver on social objectives, others point to the weaknesses of open forms of coordination and question the possibility of a European Social Model (Scharpf, 2002; Smismans, 2008).

In fact, aspirations of becoming the most competitive knowledge-based economy in the world (Lisbon Agenda) through smart, inclusive and sustainable growth (EU 2020) seem to emphasize economic over social objectives, or, at least, suggest that the latter follows from the former. Following Majone (2005) the paper argues that European integration by stealth is leading to inconsistent policy paradigms (or hegemonic projects Jessop, 2002) which are nevertheless imposing a specific spatial selectivity (Brenner, 2004) on EU Cohesion Policy. *Soft spaces with fuzzy boundaries* (Allmendinger & Haughton, 2009; Haughton, Allmendinger, Counsell, & Vigar, 2010) are seen as distinct expressions of new modes of governance, which mediate the tensions between the inclusiveness (Social Europe) and the growth (Competitive Europe) objectives on the discursive level. Nevertheless, this does not necessarily mean that these tensions are also resolved on the empirical level. Indeed, soft spaces have been described as "spaces of neoliberal experimentation" (Haughton et al., 2013) and as such their fuzzy character may, in fact, facilitate socio-spatial polarization by funneling Cohesion Policy funds into the production of spaces of global competitiveness.

The paper is divided into three parts. The first section will discuss the relation between European integration and the structuring of governance, arguing that EU Cohesion Policy can be seen as a form of multi-level metagovernance. In the second section, the development of the spatial selectivity of EU Cohesion Policy is discussed, suggesting that making Cohesion Policy a delivery vehicle of EU 2020 is conducive to prioritizing competitiveness and efficiency objectives over cohesion. This is expected to translate into a spatial selectivity where the production of competitive spaces is becoming more important compared to assisting backward regions. The third section will briefly investigate how EU Cohesion Policy is constructing soft spaces with fuzzy boundaries to redirect local and national planning strategies toward the competitive logic of the Single Market. It is suggested that the growing importance of urban regions / poly-centric urban networks in the EU discourse may be an outcome of the alignment of EU Cohesion Policy with the EU 2020 Strategy. Finally, some concluding remarks will be made to indicate a few points of departure for a future research agenda.

**New Modes of Governance: EU Cohesion Policy to Deliver EU 2020?**

This section will investigate the link between European Integration and the emergence of new modes of governance. In view of the available budget and the political objectives of EU Cohesion Policy, it is remarkable that there seems to exist no agreement on its effectiveness (Molle, 2007, ch. 10, Leonardi, 2005, p. 92). However, the paper is not questioning the rationale of creating a policy to alleviate socio-spatial disparities across the EU. Indeed, the degree of disparities following the 2004 enlargement reinforces the need for a European-wide redistribution mechanism, from an economic (competitiveness), political (legitimacy, trade-offs) and moral perspective (solidarity, equity). Nevertheless, it is argued that socio-spatial polarization may occur not only despite of, but also due to EU Cohesion Policy intervention.

The argument in a nutshell: in the absence of a European demos that would lend democratic legitimacy to EU policy-making, interest representation at the European level is one of the main legitimizing mechanism of EU integration (Majone, 2005). Due to a multiplication of political and social systems, and hence an increase of national and regional actors and interests seeking representation at the European level, repeated EU enlargements are posing a challenge to policy coordination under the community method. This has encouraged the emergence of new modes of governance – like the open method of coordination (OMC, see Borrás & Jacobsson, 2004; Smismans,

2008). These, however, may be premised on logically flawed, overly optimistic assumptions about the relationship between efficiency and inclusiveness (Peters & Pierre, 2004; Scharpf, 2002; Smismans, 2008). This is characteristic of a "post-political" way of consensus seeking, wherein conflicting interests are reframed as mutually reinforcing (Laclau & Mouffe, 2001; Metzger, Allmendinger, & Oosterlynck, 2015a; Mouffe, 2005). In this sense, the EU 2020 Strategy is seen as an inconsistent policy paradigm or hegemonic project, redirecting the rationale of EU Cohesion Policy towards efficiency/competitiveness objectives. In consequence, because EU Cohesion Policy is currently based on inconsistent "post-political" paradigms, it may become ineffective or even facilitate socio-spatial polarization.

## EU Enlargement, Interest Representation and New Modes of Governance

In accordance with Majone (2005), it is argued that that overly optimistic expectations about the prospects of EU integration have led to a pro-integration bias imposing upon the institutional architecture of the EU a logic that prioritizes interest representation over problem-solving. The problem is that the essentially open-ended nature of European integration is restricting the possibility for a European demos to emerge and, thus, limits the scope for redistributory policies based on solidarity among the European citizens. Therefore, EU enlargements pose a significant challenge to the consolidation of one particular mode of policy making, or, indeed, politics (see contributions in Metzger et al., 2015).

Especially since the 2004 enlargement, the community method of integration is increasingly seen as being too inflexible in facing the pressures resulting from the multiplication of interests at the European level (Scharpf, 2002). Attempts to reach consensus on the future development of European integration under conditions of increased diversity and uncertainty have resulted in a shift towards more open, informal, experimentalist and deliberative forms of coordination. New modes of governance can be seen as attempts to create channels of interest representation (Bartolini, 2005; Rokkan, 1999), through which the EU attempts to increase the legitimacy of its policy-making.

Thus, while new modes of governance may improve the representation of interests at the European level, it is not clear whether they constitute a more efficient solution to political problems. Indeed, there seems to be no agreement as to the efficiency of more open modes of governance. On the one hand, the EU's practice of policy coordination and learning through "trial-and-error" strategies and feedback-mechanisms has been seen as evidence of a new experimentalist governance architecture (C. F. Sabel & Zeitlin, 2010) that has a positive impact on the social dimension of EU policy making (Zeitlin & Vanhecke, 2014). Others discern a trend towards a consensus-seeking deliberative (Hajer & Wagenaar, 2003) intergovernmentalism (Bickerton, Hodson, & Puetter, 2014; Puetter, 2012), which may circumvent the inflexibilities of the official EU institutional architecture by referring to informal governance practices (Puetter, 2006a, esp. ch.2).

On the other hand, Peters & Pierre (2004) view the informalization of governmental functions in multi-level governance arrangements as a Faustian-Bargain where democratic accountability and political control are traded for seemingly more efficient governance solutions. Indeed, one of the most eminent theoreticians of European governance now seems to be rather wary that the representation of the interests of a continuously growing number of member states may, in the absence of a European demos, lead to a democratic default (Majone, 2005, 2012, 2014a, 2014b). Moreover, while new modes of governance may be seen as attempts on the part of various local, national and supranational actors, to institutionalize channels of interest representation (Rokkan, 1999), doubt has been cast on the problem-solving capacity of participatory governance (Heinelt, Getimis, Kafkalas, Smith, & Swyngedouw, 2002; Smismans, 2008).

Hence, more skeptical evaluations about the extent to which the OMC may facilitate the emergence of a European Social Model (Scharpf, 2002) should not easily be dismissed. What can be stated is that the multiplication of interests as a consequence of EU enlargement seems to have led to a transformation of the political process of EU policy-making. This lends renewed salience to the old question: "What is Politics" (Satori, 1973) and what is "the Political"(Metzger, Allmendinger, & Oosterlynck, 2015b, p. 8-10; Mouffe, 2005)?

## Post-Political or Multi-level Metagovernance? Aligning EU Cohesion Policy and EU 2020

To explain the alignment of EU Cohesion Policy with the EU 2020 objectives, it is useful to introduce some elements of Bob Jessop's strategic-relational approach (1990, 2004, 2007), which understands the capitalist state as social relation/process. From this perspective, capitalism is based on two major social relations: the capital relation and the *state form*. The articulation of these relations determines their precarious functional unity and institutional coherence by enabling historically specific strategies and projects (Jessop, 1990 in Brenner, 2004, p. 86). *State projects* are initiatives that "endow state institutions with organizational coherence, functional coordination, and operational unity". In other words, they produce a "state effect" (ibid., p. 88). *State strategies* are initiatives to "mobilize state institutions in order to promote particular forms of socioeconomic intervention" (ibid.). In other words, they can be seen as "hegemonic projects" or policy paradigms. In Jessop's view, the articulation of state form, state project and state strategy results in a *strategic selectivity* of the state that privileges "particular social forces, interests, and actors over others" (ibid., p. 87). How can this help to explain the alignment of EU Cohesion Policy with the EU 2020 Strategy?

The paper previously argued that the new modes of governance in the EU emerge from the trade-off between interest representation and attempts at efficient political coordination[2]. Therefore, the search for new modes of governance that aim to resolve this dilemma can be seen as a *European political project*. In the context of this paper an understanding of the current EU "state" *form* as a Schumpeterian Workfare Postnational Regime (SWPR) is proposed (Jessop, 2002b). The mode of governance in this regime may be characterized as multi-level metagovernance (Jessop, 2002a, 2004), as the "key issue" of EU governance is

> "the manner and extent to which the multiplying levels, arenas and regimes of politics, policy making, and policy implementation can be endowed with a certain apparatus and operational unity horizontally and vertically; and how this affects the overall operation of politics and the legitimacy of the new political arrangements" (Jessop, 2004, p. 73).

According to Jessop, meta-governance is the management of the complexity, plurality, and tangled hierarchies of existing modes of governance (ibid., p. 66, see also Bache & Flinders, 2004b, p. 97). Nevertheless, he cautions that, eventually, it is unrealistic to expect meta-governance not to fail in the face of growing complexity. Hence, an ironic approach - characterized by "continuing experimentation, improvisation, and adaptation" (ibid., p. 72) – is proposed as a remedy. It is argued that multi-level metagovernance equips the "multiplying levels, arenas and regimes of politics, policy making, and policy implementation" (Bache & Flinders, 2004a, p. 8) with a certain operational unity.

[2] In this sense, EU integration is dominated neither by the member states, as liberal intergovernmentalists would argue (Moravcsik, 1998), nor by the supranational level, as in the opinion of (neo-) neo-functionalists (Haas, 1968; Schmitter, 2003). George (2004) states that the concept of multi-level governance is often viewed as an attempt to overcome this theoretical divide, since it claims that decision-making power in the EU is effectively distributes across various scales.

Multi-level metagovernance is, therefore, characterized by an unstable equilibrium of compromise rather than by the systematic application of one method of coordination.

Moreover, since the available *political strategies* in a political system depend on its distinct historical form, inconsistencies in these strategies "may be part of an overall self-organizing, self-adjusting practice of metagovernance within a complex division of government and governance powers" (Jessop, 2004, p. 71). Therefore, the EU 2020 Strategy can be seen as a *political strategy* that activates the capacity of the multi-level metagovernance regime to act in a coordinated, but not necessarily consistent, fashion.

This is because the articulation of *political project* (trade-off between interest representation and policy efficiency = search for new modes of governance), *political strategy* (EU 2020) and *form* (SWPR with multi-level metagovernance) imbue the EU with a peculiar *strategic selectivity*. This paper argues that the strategic selectivity of the EU can be understood as the forging of a "post-political" consensus, in which inconsistencies between policy objectives are discursively erased. According to this perspective, the "political" is understood as an arena where actors are struggling with each other in the pursuit of their (at least potentially) *conflictive* interests, while respecting the general rules of the game. In the "post-political" situation interests are made *commensurable* by restructuring the arena and the rules under which interests encounter each other (Mouffe, 2005).

In the preface to the second edition to their 1985 book Hegemony and Social Strategy, Laclau and Mouffe (2001) argue that the political *is* the primary (indeed, the only) mode in the formation of *hegemonic universality*. In this sense, hegemony is understood as the "very condition" in which "a *particular* social force assumes the representation of a *totality* that is radically incommensurable with it" (ibid. x). The establishment of hegemony depends on the political articulation of the social division of society. However, according to Laclau and Mouffe, the "internal frontiers within society" also reveal the "limits of all objectivity" (ibid. xiii-xiv). Therefore, *antagonism* is the central category of articulation. They disagree with proponents of a "Third Way", who argue that with the end of communism, the emergence of the network society and globalization, antagonisms have disappeared. Specifically, they do not agree that a "politics without frontiers would now be possible – a 'win-win politics' where solutions could be found that favoured everybody in society" because this would imply "that politics is no longer structured around social division, and that political problems have become merely technical" (ibid. xiv-xv). Here is their argument:

> "According to Ulrich Beck and Anthony Giddens - the theorists of this new politics - we are now living under conditions of 'reflexive modernization' where the adversarial model of politics, of us versus them, does not apply any more. They affirm that we have entered a new era in which politics needs to be envisaged in a completely different way. Radical politics should concern 'life' issues and be 'generative', allowing people and groups to make things happen; and democracy should be envisaged in the form of a 'dialogue', controversial issues being resolved through listening to each other.
>
> There is much talk nowadays of a 'democratization of democracy'. There is nothing wrong, in principle, with such a perspective, and at first sight it seems to chime with our idea of a 'radical and plural democracy'. There is, however, a crucial difference because we never envisaged the process of a radicalization of democracy that we were advocating as taking place within a neutral terrain, whose topology would not be affected, but as a profound transformation of the existing relations of power. For us, the objective was the establishment of a new hegemony, which requires the creation of new political frontiers, not their disappearance" (ibid. xv).

Thus, instead of accepting the "neo-liberal orthodoxy"-discourse of globalization and the tight fiscal constraints it imposes on the state as a necessity without alternatives, Laclau and Mouffe argue that "the present conjuncture, far from being the only natural or possible societal order, is the expression of a certain configuration of power-relations" (ibid. xvi). The reality of a not-so-level playing field and the "ineradicability of antagonism" foreclose the possibility of a "deliberative democracy" in the sense of Habermas: There is no final resolution of conflict and/or reconciliation of divided interests through dialogue. However, the existence and acceptance of an 'outside' to every consensus that prevents its full realization, is part of a radical conception of democracy[3].

What this means in terms of EU governance can be indicated by looking at 2001 Commission White Paper on "European governance" (European Commission, 2001). In the preface to the white paper, Jerome Vignon has made the point that "a strict separation" of the executive, legislative and judicative powers, characteristic of the nation-state institutional systems, "cannot function at the Community level" (in Leonardi, 2005, p. 14). Instead, cooperation between these branches is essential and the participation of relevant political and social actors "has to be sufficiently broad and capable of taking into account the great diversity of interests and views that exist within the Community" (ibid.). In this sense, he concludes that "[i]t is not by accident that the territorial dimension, which is inter-sectoral by nature and conducive to participation, is imposing itself upon the new European governance" (ibid., see also Hajer & Wagenaar, 2003).

The heightened importance of the territorial dimension in multi-level metagovernance, based on territory's perceived potential to improve interest representation of EU governance, makes it attractive and susceptible to the intrumentalization for a specific *political strategy*. The "discovery of territory" (Leonardi, 2005, p. 6) by the Commission makes possible new ways for conceptualizing the relationship between territorial cohesion and economic competitiveness. Talking about "impossible sustainability", Erik Swyngedouw (2007) cautioned that post-political concepts and the political agendas they justify, while allegedly offering inclusive and efficient solutions, are in fact based on the logically flawed assumption of commensurable interests[4]. Instead of truly open and deliberate reasoning, participatory modes of governance are often plagued by an "elitism" in which "fundamental political questions often curiously appear to have already been determined 'somewhere else' on the basis of some 'general interest' which no-one in his or her right mind can supposedly disagree with" (Metzger et al., 2015b, p. 7). In turn, this framing of political objectives (as growth or equality) as unproblematic, according to Allmendinger & Haughton (2015, p. 31) is leading to a "blurring of institutional responsibilities, accountability and legitimacy".

Thus, this process of reframing interests as commensurable, rather than conflictive, allows the European Commission to portrait EU Cohesion Policy as a delivery mechanism of the EU 2020 Strategy:

[3] For a critical reading see Grange (2015), who argues that the political is not restricted to conflictuality, but should be seen as the actualisation of potentials through identification.

[4] The emergence of this post-political way of policy making may be seen as part of a broader "Condition of Postmodernity" (Harvey, 1989) wherein the limits of Enlightenment reasoning (Horkheimer & Adorno, 2002) are overcome by the replacement of the idea of progress through eclectic amalgamations of meanings into *in situ* paradigms. In this sense, it may be argued with Ernesto Laclau (2011) that post-political concepts can be understood as working on the level of *doxa* (common-sense), while the logic of Enlightenment worked at the level of rationality: "If the level of *doxa* constitutes a continuous fabric which absorbs and articulates every possible meaning, the level of [Enlightenment] philosophy aspires to reconstruct the totality of meaning of this fabric *in a necessary order and through rational links*" (ibid. p. 9).

> "Cohesion policy and its structural funds, while important in their own right, are key delivery mechanisms to achieve the priorities of smart, sustainable and inclusive growth in Member States and regions" (European Commission, 2010, p. 20).

The post-political consensus formation of the EU may, therefore, conceal and/or reinforce the reality of socio-spatial polarization by discursively obscuring the conflict between the competitiveness objectives of the EU 2020 Strategy and the equity objectives of EU Cohesion Policy. Consequently, the contradictions between interests at the EU level are not completely resolved, but managed in a way that displaces them temporally and spatially (Habermas, 1977; Harvey, 1982).

In sum, the previous discussion offers an explanation as to how the logic of the European integration produces inconsistent political strategies/hegemonic projects in an attempt to accommodate a multiplying number of interests. In this context, two question are important for this paper: (1) How does this influence the *spatial selectivity* (Brenner, 2004) of EU Cohesion Policy? (2) How is the discursive alignment of EU Cohesion Policy objectives and EU 2020 objectives implemented? These questions will be dealt with in the following two sections.

## The Development of the Spatial Selectivity of EU Cohesion Policy

The following section will look at how changing political projects and political strategies influence the spatial selectivity of EU Cohesion Policy. The argument is that the decision to make Cohesion Policy a key delivery instrument of the EU 2020 strategy may divert the Cohesion Policy rationale from redistribution to lagging regions towards an increased spatial concentration of socioeconomic activities in spaces that are relevant for the competitiveness of the Single Market.

### Spatial Selectivity

This section will look at the spatial implications of the alignment of EU Cohesion Policy and EU 2020. The paper follows Neil Brenner's (Brenner, 2004) adaptation/spatialization of Bob Jessop's strategic-relational approach (Jessop, 1990, 2004, 2007). Importantly, state space and the state spatial process, according to Brenner, should be understood as the spatial expressions of the *political strategy* (Brenner, 2004, ch. 3; see also Harrison, 2010; Heley, 2013; Raco, 2009).

In analogy to strategic selectivity, *spatial selectivity* "refers to the processes of 'spatial privileging and articulation' through which state policies are differentiated across territorial space in order to target particular geographical zones and scales" (Jones, 1997 in Brenner, 2004, p. 89). Making reference to Harvey (1982), Brenner suggests that while state institutions may be equipped with a spatial selectivity that helps to temporally displace capitalism's inherent contradictions, this outcome is not pre-given. Instead, he contends that "insofar as state institutions may also be harnessed in ways that exacerbate uneven spatial development, they may seriously exacerbate, rather than displace, capital's endemic crisis-tendencies and contradictions" (Brenner, 2004, p. 96).

To conceptualize the evolution of spatial selectivity, Brenner formulates a set of parameters. He develops a two-by-two diagram where state spatial project and state spatial strategy each have a scalar dimension and a territorial dimension (see Table 1, overleaf). The four cells, he argues, contain some of the "core tensions" as well as the "scale and area-specific patterns of state territorial organization and state spatial intervention that may emerge through such struggles" (ibid., p. 98).

Each cell contains two polar alternatives for the spatial selectivity of the state. In this way, he arrives at a four-dimensional matrix, indicating possible directions for the evolution of the state spatial selectivity (see Figure 1, 9). Importantly, Brenner asserts that, in the period from WWII until the late 1970s, the (1) state spatial projects were oriented toward centralization and administrative uniformity,

while (2) state spatial strategies were oriented toward scalar singularity (the national) and the territorial balancing of socio-economic activities. Following Jessop (1990, 2002), this type of state is characterized as the Keynesian Welfare National State (KWNS).

In Jessop's view, this state form is currently being superseded by a new type of state – the Schumpeterian Competition State[5] (SCS). This path-dependent process, Brenner (2004, p. 105f.) hypothesizes, involves the reorientation of (1) state spatial projects "toward administrative differentiation and decentralization" and of (2) state spatial strategies "toward the differentiation of socioeconomic activities within a national territory and toward the management of scalar multiplicity" (ibid., p. 106f.). According to Brenner, this process has resulted in the emergence of "new state spaces" with urban region becoming the primary spaces within the "Rescaled Competition State Regime" (RCSR) (ibid., p. 295).

Table 1: State Spatial Projects and State Spatial Strategies

| | **STATE SPATIAL PROJECTS:** geographies of state territorial organization and administrative differentiation within a given territory | **STATE SPATIAL STRATEGIES:** geographies of state intervention into socio-economic life within a given territory |
|---|---|---|
| **SCALAR DIMENSION:** the *scalar articulation* of state policies and institutions among different levels of political-economic organization within a given territory | **(1) Centralization vs. decentralization**<br>• *Centralization* of state operations: tends to concentrate political authority at one over-arching scale of state administration (generally the national)<br>• *Decentralization* of state operations: transfers various regulatory tasks away from the central coordinating tier of state power (generally to subnational levels) | **(3) Singularity vs. multiplicity**<br>• Privileging of a *single* dominant scale (for instance, the national) as the overarching level for socioeconomic activities<br>• Distribution of socio-economic activities among *multiple* spatial scales |
| **TERRITORIAL DIMENSION:** the *territorial articulation* of state policies and institutions among different types of juridical units or economic zones within a given territory | **(2) Uniformity vs. customization**<br>• Promotion of *uniform* and *standardized* administrative coverage in which broadly equivalent levels of service provision and bureaucratic organization are extended throughout an entire territory;<br>• Promotion of *patchy, differentiated,* or *uneven* administrative geographies in which *customized, area-specific* institutional arrangements and levels of service provision are established in specific places or geographic zones within a territory | **(4) Equalization vs. concentration**<br>• Promotion of an *equalization* of socioeconomic activities and investments within the state's territorial borders: goal is to spread socio-economic assets and public resources as evenly as possible across a national territory and thus to alleviate territorial inequalities<br>• Promotion of a *concentration* of socioeconomic activities and investments: goal is to promote the agglomeration of socioeconomic assets and public resources in particular locations, places, and regions within a territory |

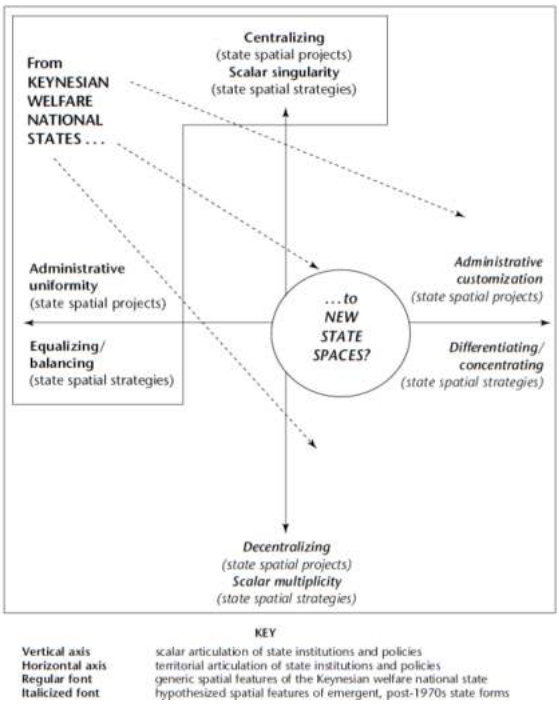
Source: Brenner (2004): 97

[5] Later on Brenner, Peck, & Theodore (2010) have described this process as "variegated neoliberalization", where the logic of the capital relation is seen to have become more dominant relative to the capacity of the state to implement socio-political objectives. In this view, the uneven regulatory development under the neoliberal regime is a constitutive part of neoliberalization.

This model will be used to study the spatial selectivity of EU Cohesion Policy under the EU 2020 Strategy (see Figure 2). In order to extract the spatial implications of the alignment of EU Cohesion Policy with the EU 2020 Strategy, the objectives of Cohesion Policy in previous programing periods will be compared to the reformed post-2014 Cohesion Policy. Furthermore, the objectives of the EU 2020 strategy will be scrutinized and evaluated according to their spatial implications.

The *political strategy* will generally remain in the bottom right corner as, following Majone (2005), the integration-bias of the EU generally tends to frame political strategies in terms of "Europeanization" (scalar multiplicity). Furthermore, (negative) integration is assumed to have a negative effect on socio-spatial equality due to the superior competitiveness of the core countries.

Figure 1: The Evolution of State Spatial Selectivity



Source: Brenner (2004): 106

This was, indeed, the main rationale for the institutionalization of EU Cohesion Policy as a mechanism to equalize and balance the socio-spatial impact of integration (which is why it will initially be situated in the bottom left corner). Importantly, what is determined by the *political project* (mode of governance) is the framing of the relationship between the *political strategy* and the *spatial strategy*. In other words, what is the relation between the *objectives* of EU Cohesion Policy and those of the single market program, the Lisbon Agenda and EU 2020? Finally, the *structure* of EU Cohesion Policy is understood as an expression of the *spatial project*. As discussed above, the emerging *form* of the political system of the EU can best be characterized as SWPR + multi-level metagovernance, which can be situated at the opposite to the KWNS in the matrix[6].

[6] In fact, the EU has attributes similar to the Schumpeterian Workfare Postnational Regime (SWPR)(Jessop, 2002b). SWPR seems more appropriate than RCSR because it not state-centric.

## The Development of the Spatial Selectivity of EU Cohesion Policy

The table below (see Table 2) shows how the objectives and instruments of EU Cohesion Policy have evolved between 1988 and 2013. Based on the table, the relation between EU enlargements and the development of Cohesion Policy will be discussed. Three periods are identified: the birth of Cohesion Policy (1988-1999), the 2004 enlargement (1999-2013), and the alignment of Cohesion Policy with EU 2020 (2014-2020). Following the previous discussion of EU enlargement and interest representation, it is argued that subsequent enlargements had a structuring effect on the *EU political project* (governance), which in turn influenced the way in which the *EU political strategy* and the *EU spatial strategy* are articulated[7].

[7] It is apparent that the 1995 enlargement (Austria, Finland, and Sweden) did not have a major impact on the objectives and distribution of Cohesion Policy. This may be explained by the high level of socio-economic

Table 2: Development of cohesion policy; change of objectives and distribution of aid (billions of euro) by objective, 1988–2013

The general argument is that with the development of more open methods of interest coordination (multi-level metagovernance), Cohesion Policy has experienced a move toward delivering political objectives that are contradictory to the attainment of economic, social and territorial cohesion.

## The Development of EU Cohesion Policy: The Birth of Cohesion Policy 1988

The development of EU Cohesion Policy has always been closely connected to the process of European Integration and, in particular, to the creation of the single market (Manzella & Mendez, 2009). After a period of relative stagnation of the integration process in the 1970s and early 1980s, the Single Market program (the dominant *political strategy* at the time) under Commission President Jacques Delors and the accession of the less competitive Mediterranean countries (Greece (1981), Portugal and Spain (1986)) became important triggers of the 1988 reform, which ushered in a "new era" for Cohesion Policy (ibid., p. 13). As a counterweight to balance the negative effects of market integration, the establishment of a supranational redistribution mechanism – the Europeanization of Cohesion Policy – has been called a "revolutionary change" (Leonardi, 2005, p. 1). Significantly, in this new peculiar arrangement, political responsibility was to be distributed across the regional, the national and the European scale, which has been captured by Gary Marks and Liesbet Hooghe (Hooghe, 1996 Marks & Hooghe, 2004; see also George, 2004) in the concept of multi-level governance.

In terms of Brenner's model, the *political project* at the time can be described as "integration through regulation" (Majone, 1996), whereby the dominance of the community method tends towards Europeanizing competences (centralization) through legislation and treaty modification

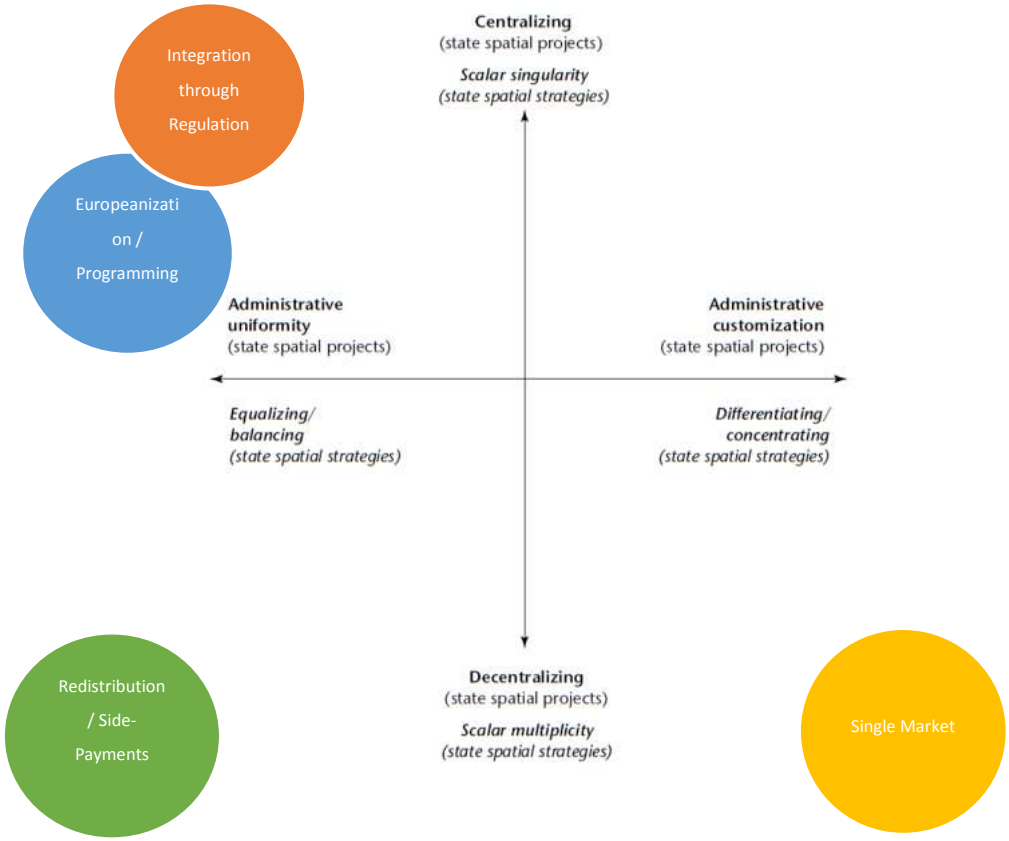
development in these countries, which did not significantly alter the allocation patterns, as all three countries are, since their accession, net contributors to Cohesion Policy (Molle, 2007, p. 148).

(administrative uniformity)[8]. However, the Single European Act (1986) had already introduced the cooperation procedure and extended qualified majority voting in an attempt to remove barriers to further harmonization (administrative customization). The *political strategy* of market integration (negative integration) was met by the opposition of the less developed Mediterranean member states, which, were successful in pushing their interest in a supranational redistribution mechanism (positive integration): the birth of EU Cohesion Policy (Leonardi, 2005). Structurally (*spatial project*), the new EU Cohesion Policy was to be characterized by its firm establishment at the Community level (centralization), which was expressed inter alia by the principle of programming (administrative uniformity). According to Leonardi (2005, p. 36) this Europeanization of Cohesion Policy has "significantly changed the nature of relations between institutions and has led to the emergence for the first time of sub-national institutions as significant actors" (scalar multiplicity). Politically, the objectives of EU Cohesion Policy (*spatial strategy*) can be understood as a side-payment to the new member states (to gain their consent to further market integration). Socially, however, the rationale was one of solidarity with the least developed regions within the expanding Community (equalizing/balancing of socioeconomic activities)(see Figure 3). In the words of Leonardi, the

> "challenge posed by the Single Market allowed the Commission to fully assume the responsibilities transferred to it by the SEA; national governments on the periphery were given access to the financial resources necessary to counter the economic shock that was expected to be produced by the Single Market; and regions were empowered to become involved in a policy process that allowed them to fulfill their constitutional responsibilities and have a say in determining their response to challenges posed by the realization of the Single Market" (2005, .p 19).

[8] The 1992 Maatricht Treaty can be seen as the beginning of a new "era" wherein treaty amendments became less inclusive with the *opt-outs* by the UK and Denmark of the EMU.

Figure 3: Spatial Selectivity of EU Cohesion Policy 1988-1999



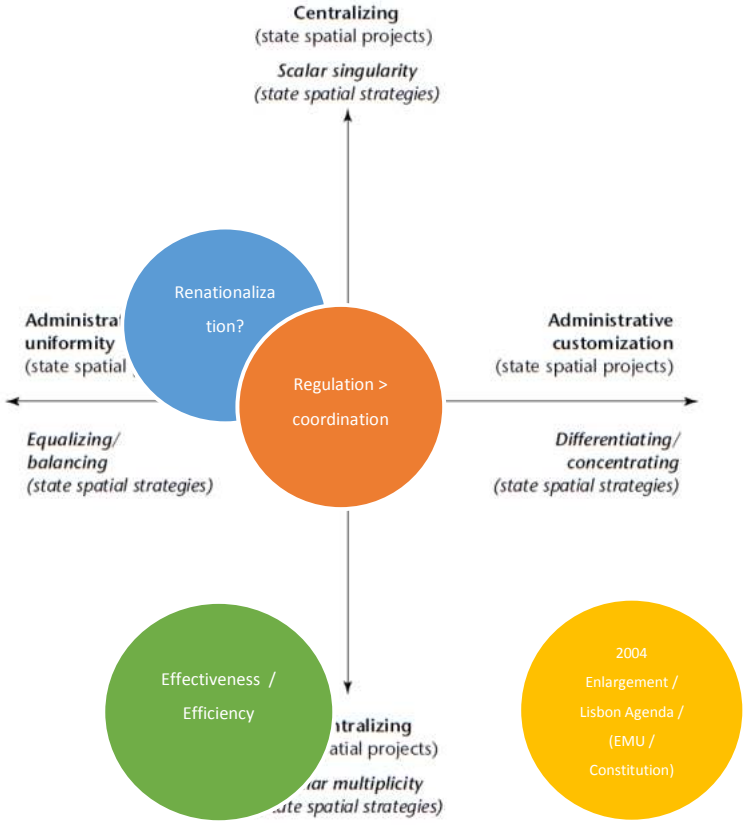
## The Development of EU Cohesion Policy: The 2004 Enlargement

Like in the context of the accession of the Mediterranean countries in the 1980s, EU enlargements since the 1990s were paralleled by changes in the instruments and objectives of Cohesion Policy (see Table 2). New instruments for particular issues (pre-accession assistance, urban regions, peripheral regions, cross-border cooperation) were launched, many of which were later mainstreamed. The budget of Cohesion Policy grew continuously and came to constitute roughly one third of the total EU budget. However, Manzella & Mendez (2009, p. 15-17, see also Leonardi, 2005, p. 21-22) have characterized the 1993 and the 1999 reforms as efforts in "fine-tuning, decentralization and effectiveness".

The 2004 enlargement can be seen as the next watershed moment. While in 1992 twelve "western" member states signed the Treaty of Maastricht to form the European Union, over the subsequent two decades a further sixteen states were to join, out of which thirteen were countries with a post-socialist legacy, situated in the far less developed eastern periphery. In addition to the numerical increase in interests, the poor socio-economic conditions in the new member states would make all of them net recipients of EU funds with a severe negative impact on the allocation of funds to the older member states (most of which would become net contributors (Molle 2007, p. 148)).

The 2004 enlargement had a major impact on the *political project* of the EU. The massive increase and divergence of interests made consensus seeking under the community method cumbersome, and led to the introduction of the OMC in several policy fields (administrative customization). This gave increased weight to the member states (decentralization). Thus, in terms of the structure of EU Cohesion Policy (*spatial project*), a debate about its renationalization developed (Bachtler & Mendez, 2007; Bruszt, 2008; Faludi, 2009, 2010; Leonardi, 2005; Manzella & Mendez, 2009). Indeed, the 2006 reforms can be seen as a move toward administrative customization and decentralization of Cohesion Policy (*spatial project*), as the new planning framework involved the steering of interests through Community Strategic Guidelines (CSG) and National Strategic Reference Frameworks (NSRF) (Manzella & Mendez, p. 19).

Figure 4: Spatial Selectivity of EU Cohesion Policy 1999-2013



Furthermore, an increased emphasis on efficiency considerations led to a concentration of support and a reduction in both priority objectives and the proportion of population eligible for support under the territorial Objectives 1 and 2 (ibid. 16f., see also Table 2 above). Parallel to the efforts to make the EU "the most competitive and dynamic knowledge-based economy in the world capable of sustainable economic growth with more and better jobs and greater social cohesion" (Lisbon Agenda), increased thematic concentration saw the European Social Fund "increasingly [being] tied to the European employment strategy" (ibid. p. 17). Thus, Manzella & Mendez, (2009) have argued that the programming-period 2007-2013 can be characterized as a turn to a more "strategic approach for targeting EU priorities, centered on the Lisbon strategy" (p. 19). Furthermore, competitiveness and efficiency considerations have gained in importance relative to social and redistribution issues.

Therefore, in terms of objectives (*spatial strategy*), a tendency away from equalization/balancing and toward a convergence with the thematic objectives of the Lisbon Agenda can be detected[9] (see Figure 4).

## The Development of EU Cohesion Policy: 2014-2020

Willem Molle (2007) has made the point that horizontal coordination of Cohesion is far from ideal. He argues that the existence of large funds for Cohesion Policy relative to the size of the funds available for other EU objectives (notably competitiveness and sustainability) has led to a "blurring of objectives", where Cohesion Policy is made instrumental to these other objectives (p. 285-287). In accordance with Jessop's point that metagovernance should be seen as an unstable equilibrium of different coordination methods, Molle continues to say that while policy coordination depends largely on the OMC, the financial instruments of the Cohesion Policy delivery system attach strong conditional ties to the distribution of funds. Thus, Molle concludes, the present coordination mechanisms "are in need of review and that more adequate mechanisms are to be found to produce lasting and balanced results (p. 287).

However, then came the crisis and with it Europe 2020: a European strategy for smart, sustainable and inclusive growth. In the words of former Commission president Jose Manuel Barroso:

> "The crisis is a wake-up call, the moment where we recognise that "business as usual" would consign us to a gradual decline, to the second rank of the new global order. This is Europe's moment of truth. It is the time to be bold and ambitious" (European Commission, 2010, preface).

Primarily, the EU 2020 Strategy (*political strategy*) "is about delivering growth". Growth is framed as "smart, sustainable, and inclusive", defined by a set of quantified targets (see Annex 1) and operationalized through seven Flagship initiatives (see Annex 2). The implementation of the EU 2020 Strategy is shared between the EU, the member states, regional and local authorities and civil society. Coordination is implemented through the "European Semester" based on Annual Growth Surveys and Country-specific Recommendations (Annex 3).

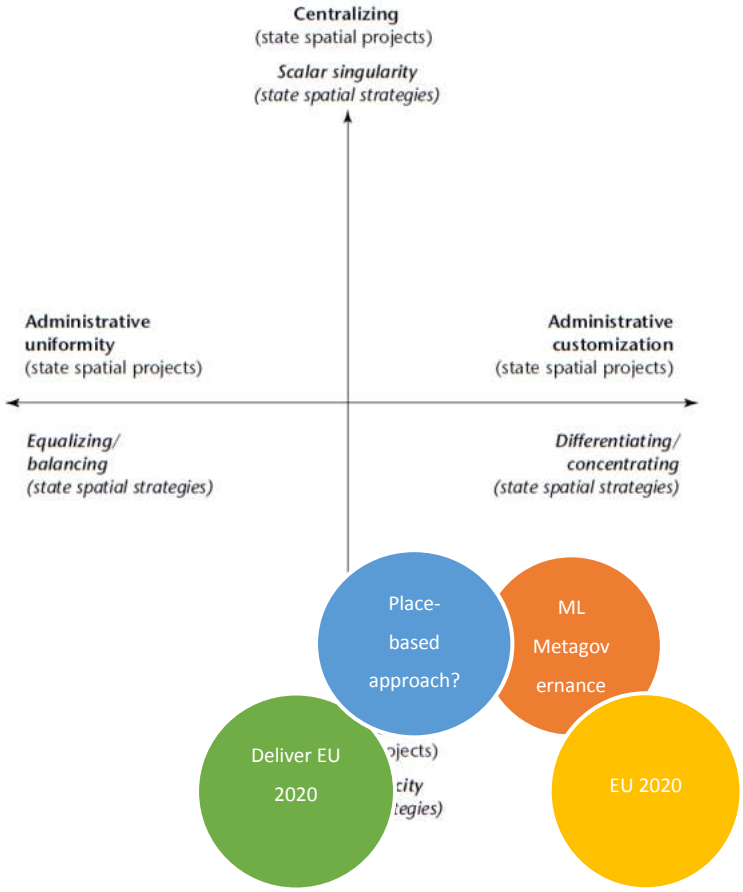
This open form of coordination, based on the constant monitoring and evaluation of the performance of the member states in achieving their non-binding targets, can be understood as multi-level metagovernance (*political project*). As discussed, this form of coordination is conducive to the emergence of a *post-political consensus* where contradictory interests are reframed as commensurable. Evidence for this claim can be found in the framing of growth as "smart, sustainable and inclusive" whereby it effectively becomes the panacea to prevent Europe's "gradual decline" to the second rank of the new global order. Furthermore, the deepening of the single market is seen as important to overcome the crisis (*integration bias*). Crucially, EU Cohesion Policy is presented as "the principle investment tool for delivering the Europe 2020 goals" (European Commission InfoRegio: http://ec.europa.eu/regional_policy/ what/future/index_en.cfm). Hence, in addition to and in deviation from its initial rationale as a counterweight to the single market, EU Cohesion Policy is now seen as the primary tool for delivering growth and competitiveness (*spatial strategy*).

Thus, while the majority of the funds will still be allocated to the less developed peripheral regions (especially the new member states and Portugal), the focus on "Key Growth Priorities"[10] seem to tilt

[9] The problems of the European Monetary Union (EMU) and the ineffectiveness of the Stability and Growth Pact (SGP) in the context of the economic and sovereign debt crises, as well as the failed attempt of a European Constitution, can be seen as examples of how the discursive framing of interests as commensurable (integration bias) may have unexpected results.

the *spatial selectivity* of EU Cohesion Policy toward spaces with greater potential to contribute to smart, sustainable and inclusive growth. This may partially explain, why EU Cohesion Policy was ineffective in preventing socio-spatial polarization in the new member states (Darvas, 2014). Indeed, there is the possibility that focusing Cohesion Policy on the thematic/key growth priorities of EU 2020 prioritizes urban over rural regions, which is in accordance with Brenner's (2004) finding that the urban is becoming the primary spatial unit for capital accumulation and, thus, the driving force in the re-scaling of regulatory landscapes (Brenner, Peck, & Theodore, 2010). The creation of a specific instrument for urban regions (urban innovation actions) and the growing importance of place-based interventions (Barca, 2009) can be seen as evidence for a changing spatial selectivity of EU Cohesion Policy (see Figure 5), where efficiency and equity objectives become increasingly framed as mutually constitutive (Demidov, 2015, p. 45-46).

Figure 5: Spatial Selectivity of EU Cohesion Policy 2014+



[10] These are research and innovation; information and communication technologies; enhancing the competitiveness of small and medium-sized enterprises; and supporting the shift toward a low-carbon economy (http://ec.europa.eu/regional_policy/what/future/index_en.cfm, accessed 11/01/2015).

**Governing Polarization through Soft Spaces with Fuzzy Boundaries?**

The final section of this paper will indicate how the spatial selectivity of EU Cohesion Policy under the EU 2020 Strategy is influencing the (re-) production of socio-spatial polarization. The point is that the post-political consensus of *cohesion cum competitiveness* is articulated spatially through "soft spaces with fuzzy boundaries" (Haughton et al., 2010).

### Socio-Spatial Polarization as the (Re) Production of Centrality and Peripherality

As Brenner's (2004) model indicates, the space of a political system is the outcome of a socio-political process. In this context, political institutions may be geared toward territorial cohesion or may contribute to socio-spatial polarization. Therefore, polarization can be understood in terms of the production of space (Lefebvre, 1991). More precisely, polarization may be understood as the process of simultaneous centralization and *peripheralization* (Kühn, 2014, see Table 3).

Table 3: From *Periphery* as a condition to *Peripheralization* as a process

| Periphery | Peripheralization |
|---|---|
| *Pre-given spaces—with social implications*<br>Fringes, edges, outskirts, borders | *Social relations—with spatial implications*<br>"Production" of peripheries |
| *Status: static*<br>• Distance to centres<br>• Remote location<br>• Sparse population | *Processes: dynamic*<br>• Political<br>• Economic<br>• Social<br>• Communicative |
| *Fields of application: non-urban*<br>• Rural regions<br>• Border regions<br>• Suburban fringes | *Fields of application: open*<br>• Developing countries<br>• Urban regions and cities<br>• Rural (non-metropolitan) regions<br>• Urban neighbourhoods |
| *Conditions for actors: fixed*<br>• Determined by structural deficits<br>• Periphery as "destiny" | *Conditions for actors: changeable*<br>• Role of periphery in a system changes<br>• Actor networks matter |

Source: Kühn (2014): 3

Rather than perceiving of *periphery* as a pre-given and static space, *peripheralization* looks at the spatial implications of social interactions. These interactions are understood as unfolding dynamically at different scales and in different spaces, driven by interactions among actors within continuously changing networks.

Following Lang (2013), the simultaneity of metropolization and urban shrinkage can be understood as a process of peripheralization in which centers are "are constantly portrayed as 'core' spaces of modernity and progress" while peripheries experience a "stigmatization in public discourse" (p. 228). Thus, while Lang assumes that center-periphery relations are a "system-immanent part of the capitalist economic system" (ibid.), he adds that they "are not constituted structurally but emerge discursively" (p. 230). Based on the postcolonial notion of *difference* and *otherness*, Lang suggests to look at peripheralization as a process through which "knowledge" about a specific space is constructed "through formations of power, which is replicated through discourse by individuals, organizations and

institutions" (p. 231). In the German context, he argues, *metropolitan regions* have emerged as "a current paradigm of spatial planning" (p. 229). However, the borders of these central spaces are characterized by Lang as vaguely defined "in-between-spaces", where political conflicts about belonging to core or periphery are fought out.

Viewed from this perspective, Cohesion Policy can be understood as a tool of center-formation (Bartolini, 2005), selectively privileging some spaces over others. The point is that the alignment of Cohesion Policy with the EU 2020 Strategy may contribute to the process of peripheralization. It has been argued that the establishment of policy priorities centered on economic growth (rather than social-spatial equity) is impacting on the spatial selectivity of Cohesion Policy. This entails that the discursive construction of a space as central or peripheral is dependent on the overall logic of the political system (multi-level metagovernance). In this sense, the primacy of interest representation (coordination) at the European level, discussed above, has a structuring effect of the spatiality of the member states and of the EU as a whole (articulated through EU Cohesion Policy).

EU Enlargements play an important role in this structuring process. This may be explained by Stein Rokkan's theory of boundary-building and internal structuring (Rokkan, 1999), which assumes an intimate link between the establishment of control over the external demarcation and the internal differentiation of political systems. Rokkan's concept of *boundary* refers to the mutual constitutiveness of the territorial and the membership dimensions of the political system. Indeed, processes of "bounded structuring" (Ferrera, 2003) at the national level are increasingly challenged by European Integration, which according to Ferrera "rests on opening: on weakening or tearing apart those spatial demarcations and closure practices that nation-states have built to protect themselves" (Ferrera, 2012, p. 258).

Therefore, looking at European integration through the lenses of Rokkan's theory suggests that enlargements are be crucial in the de-structuring of existing nation-state borders and functions and their contingent and selective re-structuring at the European and the regional levels (Bartolini, 2005). This restructuring, it is argued, occurs through the creation of problem-centric *soft spaces with fuzzy boundaries* (Allmendinger & Haughton, 2009; Haughton, Allmendinger, Counsell, & Vigar, 2010). In sum, it is argued that EU Cohesion Policy - as an EU-wide redistribution mechanism - gears the logic of regional development away from the national level by superimposing a strategic-spatial selectivity that follows the logic of the internal market (Conzelmann, 2006). In other words, this may be described as the Europeanization (Bache & Jordan, 2006) of spatial planning (Dühr, Stead, & Zonneveld, 2007; Kunzmann, 2006).

### Soft Spaces with Fuzzy Boundaries

Leonardi (2005, p. 36) has argued that the emergence of multi-level governance "has had an impact on the reconfiguration of linkages among national, regional and local levels within member states and has reinforced the regional devolution of policies". In the UK, he continues, the existence of Cohesion Policy has supported the devolution of the regions of Scotland and Wales after the Labour victory in 1997 (see also Conzelmann, 2006).

He attributes this to the "revolutionary nature" of EU Cohesion Policy (ibid., p. 74). According to Leonardi (ibid., p. 74), the multi-level governance process of Cohesion Policy is characterized by a decision-making and implementation process that is characterized by a "series of interactive learning loops", incompatible with any of the pre-existing national regional policies. Following Leonardi, this "lack of fit"[11] requires "substantial institutional adjustment and learning on how to use the policy"

[11] For a brief discussion of the idea of "misfit" or "mismatch" in the Europeanization literature see Bache & Jordan, 2006 (based on Radaelli, 2000).

(ibid.). The decision-making process of *national* developmental planning did usually not involve great responsibilities for the regional level. Indeed, the phases of decision-making and implementation characteristic for Cohesion Policy (learning loops) were normally not a part of national regional policy formulations (ibid., p. 75).

Talking about the new member states, Leonardi (2005) states that while there are no provisions in the Cohesion Policy *acquis* prescribing a particular institutional setup at the subnational level, what is seen as crucial in the transition is the possibility for "institutional learning and the ability to implement the policies according to prevailing procedures and norms" (p. 148). He concludes that the entry of the new member states increased the importance of the efficient and effective management of Cohesion Policy (p. 172).

This paper suggest, that EU Cohesion Policy is an important driver of the emergence of soft spaces with fuzzy boundaries. In this context, the conditionality attached to the EU funds has been seen as a major driver for institutional change, particularly in the New Member States (NMS) (Bache, 2010a, 2010b, Alden et al. 2006, Grabbe 2006). The concept of soft spaces with fuzzy boundaries has been developed in the context of the devolution of the UK and Irish spatial planning systems. This suggests that the emergence of soft spaces is linked to the opening up of the territorial boundedness of the nation state in order to achieve efficient political interventions in the context of an increasingly competitive and complex global arena. The emergence of soft spaces, therefore, can be seen as a reaction to greater social complexity, which has resulted in "governance systems becoming more functionally differentiated [as well as in] an increased fuzziness of institutional boundaries, the multiplication and rescaling of spatial horizons, and a need for reflexive knowledge and understanding to cope with this complexity" (Haughton et al., 2010, p. 49). Thus, soft spaces are seen as a deliberate attempt to "insert new opportunities for creative thinking" at the interface between public and private engagement. Additionally, they are "deliberately fluid and fuzzy in the sense that they can be amended and shaped easily to reflect different interests and challenges" (ibid., p. 52).

The impact of EU Cohesion Policy on the decision-making process and the rationale of policy making can be illustrated by shortly introducing the examples of Ireland and Northern Ireland discussed by Haughton et al. (2010). First, Haughton et al. (2010) argue that EU funding had a significant impact on the decentralization of the Irish planning system. After the 1988 reform, Ireland as a whole qualified as an Objective 1 region. However with high rates of economic growth continuing throughout the 1990s, the Irish government decided (1999) to divide the country into two NUTS 2 regions in order to sustain eligibility for EU funds in the economically weaker southern region. This meant the introduction of a "regional approach" to planning in a country that was traditionally highly centralized. Thus, Haughton et al. (2010) conclude that "the lure of European funding" was essential "to bring about a more enduring set of regional structures" (p. 58). The "pragmatic desire to attract European structural funds" rendered the regional governance structures into "largely bureaucratic creations" that not sitting well with the entrenched regional identities (ibid.). Subsequently the authors illustrate their claim by looking at the case of the Cork metropolitan area. They maintain that the combination of (1) uncontroversial policy guidelines rather than legally binding statutory plans and (2) widespread "mistrust" toward the new regional authorities (which were perceived as representative of a hierarchical system of government) prevented the problems of congestion, urban sprawl and socio-spatial polarization from being tackled effectively.

Second, discussing the 2001 Regional Development Strategy of Northern Ireland, Haughton et al. (2010) find that it picks up the "conceptual language" of the European Spatial Development Perspective (ESDP, 1999) of hubs, corridors, gateways and polycentric development. However, in focusing on consensus-building around the "neutral concepts" of territorial equity and balanced development, substantive debates about "hard issues" (i.e. concentration vs. dispersion) were avoided (Ellis & Neill 2006, in Haughton et al., 2010, p. 88). According to one interviewed academic "keeping

everybody on board and everybody happy with it", was the political rationale behind the strategy. Thus, Haughton et al. (2010) conclude that "EU thinking […] provided a means for accommodating and hiding from view underlying tensions" (p. 88).

The point is that EU Cohesion Policy may destabilize regional development practices at the national level by *constructing* and *injecting* soft spaces with fuzzy boundaries, whose logic is increasingly geared toward competitiveness in and of the single market. The Baltic Sea Region can be named as a rather successful example (Metzger & Schmitt, 2012), while the more recent Danube Region seems to require more time and commitment by the participants to get off the ground. However, soft spaces can be created at different spatial scales. In fact, the EU itself could be described as a soft space with fuzzy boundaries, a complex governance system with rather fluid and evolving responsibilities. However, what can be concluded from the previous discussion is that the alignment of EU Cohesion Policy with the EU 2020 Strategy may increase the importance of urban regions. In this sense, the emergence of a poly-centric metropolitan network (Hamza, Frangenheim, Charles, & Miller, 2014; Meijers & Sandberg, 2007; Meijers, Waterhout, & Zonneveld, 2007; Molle, 2007) might be a result of the refocussing of EU Cohesion Policy toward the delivery of "smart, sustainable, and inclusive growth".

## Conclusion

In conclusion, the paper has attempted to indicate how the process of European integration under the primacy of interest representation at the EU level, is leading to a transformation of the political process. The emergence of multi-level metagovernance, understood as the management of disparate modes of coordination, is presented as a source for the emergence of inconsistent post-political strategies. Here, interest are framed as commensurable rather than conflicting, which allows the discursive framing of cohesion and competitive objectives as mutually reinforcing. This enables the depiction of EU Cohesion Policy as a delivery mechanism of the growth objectives of the EU 2020 Strategy and, in opposition to its treaty rationale of enhancing social, territorial and economic cohesion, shifts the *spatial selectivity* of Cohesion Policy toward spaces that may contribute to the competitiveness of the single market – including, but not exclusively, poly-centric metropolitan regions.

Based on the framework developed in this paper a future research agenda will investigate the construction of poly-centric metropolitan regions and its impact on socio-spatial polarization, with a focus on Central and Eastern Europe (CEE). Due to the large share of EU Cohesion Policy in the total budget for regional development of the new member states, the construction of soft spaces, geared toward the competitiveness of the single market, have a great potential to contribute to socio-spatial polarization.

**Annexes**

Annex 1: EU 2020 Targets

- **Employment**
  - 75% of the 20-64 year-olds to be employed
- **R&D**
  - 3% of the EU's GDP to be invested in R&D
- **Climate change and energy sustainability**
  - greenhouse gas emissions 20% (or even 30%, if the conditions are right) lower than 1990
  - 20% of energy from renewables
  - 20% increase in energy efficiency
- **Education**
  - Reducing the rates of early school leaving below 10%
  - at least 40% of 30-34–year-olds completing third level education
- **Fighting poverty and social exclusion**
  - at least 20 million fewer people in or at risk of poverty and social exclusion

# TRACK 03

# Responsibilities in Planning Education and Practice

## Track description

Co-chairs: **Andrea Frank**, **Anna Geppert**

Planning programmes teach students about planning legislation and professional responsibilities of planners with a prevailing view that the governments of cities, municipalities and nation states take on the responsibility for sustainable spatial development. Yet, the move from public leadership in development to ever greater private sector dominance in urban planning and development introduces a new constellation of powers and responsibilities. Does planning education prepare students adequately to perceive the ethical dimension in respect to their professional actions? What are the ethical challenges the future planners will have to cope with? Are the future challenges recognized and analysed sufficiently in the teaching and curricula to prepare students and practitioners for the new complexities and confrontations?

# Encountering the Unfamiliar in International Studies in Planning

*Andrew Butt*[1] *& Rangajeewa Ratnayake*[2]

*Abstract*

*The opportunities of internationalised planning curricula are manifold. For students this includes scope to expand their horizons for planning careers and to develop more reflective understandings of planning issues in their 'home' environment (Yigitcanlar, 2013). For educators, it provides a fertile environment for exploring cross-cultural encounter, a space to investigate varied planning traditions, and to situate examples for teaching. Within planning education, professional and academic discourse offers a way for students from diverse backgrounds to communicate and conceptualise field studies within a common (universal) understanding of traditions of planning practice and public policy solutions, but also to consider those contingent on place and culture (Healey, 2012). The ethical and political implications of working internationally can, however, be masked within the seeming familiarity of planning language, concepts and techniques. Planning is inherently political and contextual, yet the explicit dilemmas of the political and economic setting can appear hidden during a field project where the apparently universal notions of effective spatial planning are central to the dialogue amongst a diverse student group. Using the example of four joint field/project visits (2010-2014) involving Australian and Sri Lankan planning students in tsunami and conflict affected areas of Sri Lanka, this paper draws on student reflections and observations to explore the explicit encounters with ethical dilemmas and political settings. It then considers the implications and transferability of these lessons for ethical reflection in planning practice within the home setting.*

***Keywords****: cultural literacy, international study*

## 1 Introduction

Zygmunt Bauman (1990:15) contends, "familiarity is the staunchest enemy of inquisitiveness and criticism". Yet using and guiding discomfort and confusion into the unfamiliar requires student planners not just to encounter the unsettling 'other', but to learn from this encounter, despite its challenges. This offers a significant opportunity for a planning education that is reflective and challenges normative (and localised) assumptions of practice and of problem fomation. Planning's own inherent tendency towards universalism in problem-setting and practice is challenge to this. These received logics of practice often mask the value of cross-cultural encounters; planning problems and solutions can look and feel familiar to students and practitioners from elsewhere, despite vastly different cultural and economic settings.

Internationalising the curriculum for planning educators provides a pathway into these learning opportunities as well as offering attractive options for students seeking possibilities in a globalising profession. There is capacity to demonstrate diversity through various education settings. Yet while these objectives can often be interwoven through the classroom setting, international field studies provide a most effective way to explore the practices of planning in 'other' settings, and also to provide examples for reflection in the 'home' setting. Activities including student exchanges, overseas (travelling) studio projects and study tours provide instances of this approach within tertiary study.

The planning student experience of these activities is wide-ranging, and strongly personalised, but typically includes an expanded awareness of the scope of professional planning practice and the development of a *critical reflexivity* in relation to previously assumed norms of planning and urbanism at home. Further, an often-reported outcome relates to learning from the encounter of difference with consequent benefits for engagement and communication in planning practice in diverse communities (Abramson 2005, Yigitcanlar et al 2009, Butt et al, 2011). This suggests a range of questions regarding the cultural, political and socio-economic setting of the international experience.

This paper focuses the way in which Australian planning students consider the ethical and political setting in relation to project activities and personal encounter in a developing nation. The paper will report on student feedback and supervisors' observations over four annual international field studies programs from an Australian university to Sri Lanka undertaken alongside local planning students. It considers the planning values and knowledge that appear universal to the discipline and those that are contingent upon the cultural, economic and political setting and the ways that students engage with this contrast and its consequences for scholarship and professionalism in planning.

## 2 Planning and Internationalism

Planning as an international field of practice, with consequent modes of policy transfer, has a long tradition. Whether in its visionary and value-laden inception in the early Twentieth Century, during the zenith of the rational and instrumental methods of comprehensive planning, or through the more recent consideration of collaborative modes within neo-liberal agendas, transitional flows of practice, ideals and education have persisted. While contemporary planning practice is ostensibly more reflexive and pluralistic in its intent – recognising the highly contextualised settings for negotiated and collaborative processes – institutional traditions, developmentalist tendencies and the transnational process of politics and information gathering each operate in a complex network of transfer. Such flows are neither unitary nor one-way, but they are important to planning systems and to professional self-identity.

The dilemma of planning as a universal, while local, project has been identified in regard to the suitability of policy transfer (Burke, 1967; Ward, 2000; 2010), with developmental phases of the post-colonial era being the most acute examples of where context, cultures and priorities have collided with an international (usually developed world) agenda for planning. While difference has become increasingly acknowledged (Sanyal, 2010), this has not necessarily reduced the individual (ethical) dilemma of identifying what useful and universal professional knowledge suits international transfer and what is culturally contingent, or (best) based-in-place. Recognizing and unravveling this difference is important not of international relevance, but is also central to communicative and engaged practice at 'home'.

Healey (2012) identifies that the decline in the unitary 'modernisation' myth in planning has allowed, and indeed required, reconsideration of the directions and necessity for the transfer of knowledge, practice and techniques. However, despite this, packaged and decontextualized examples remain prominent in contemporary planning practice – ideas are seen, taken-up and reproduced through global education approaches. She contends that while ideas and assumed 'good' practices still flow, they continue to risk a new hegemony at the expense of locally-developed invention.

Yet rejecting such transfer potentially results in extreme localism – hence the need for universality of some ideas, with others being contingent on context. Planning practice remains a largely normative exercise, concerned with how things *ought* to be, and examples of this are often best sought, and presented through comparative example from elsewhere. Healey concludes that a 'dynamic contingency' or reflective consideration of universal planning ideas is necessary – however this throws up new challenges for internationalised education and students and professionals negotiating this dynamism by making choices regarding the suitability of transfer for their developing planning knowledge. The crucial questions appear to relate to the capacity to make judgments regarding an appropriate stance or action (or planning practice) that is neither ill-suited nor lacking cognisance of the setting, while recognising that elements of 'good' planning practice are potentially pervasive, including those relating to an ethical stance such as equity, justice, as well as aspects more technical in nature.

The internationalisation of planning practice and planning education is challenged by dilemmas of understanding, assumptions of professional norms and challenges to the value of knowledge. Yet these

experiences potentially serve three important purposes. They create reflection in values and cultural literacy in engagement and encounter, create a sense of participation in a 'globalised' profession. Ultimately they expand and deepen students' knowledge, skills and experience, which are valuable for students' personal and professional development and relevant in any setting. They require students/planners to consider and separate *aconscious* knowledge and practice from contextually contingent aims and values and international immersion offers this opportunity most readily.

### 2.1 Internationalised Planning Curricula

The forms that this 'internationalisation' takes vary and could be considered to include attention to 'global' issues of population, governance and urbanization, the encounter provided by international student cohorts I various education markets globally and also the opportunities to study abroad as a studio/project or on exchange. International engagement opportunities exist most strongly in relation to the attraction of international (fee paying) students, but also through the recognition of the relevance of international research linkages, student exchanges and student mobility. Harman (2005) describes the emergence of an internationalisation *imperative* within Australian higher education in recent years, and while dominated (perhaps fleetingly) by an international education 'market', the benefits of encounter and outward movement are seen positively. This is in line with the global formation of corporatized models of higher education, linked to its *economization* and the mobility of labour markets (Spring, 2015). The counter-flows from developed economies to less-developed regions are typically in the form of exchange, field studies and comparative research.

Internationalised planning curricula have been identified as a product of an expressed need and awareness from staff and students. Ali and Doan (2006), for example, identify emergent strategies for internationalisation in their survey of planning curricula in the United States. Goldstein et al (2005) suggest a globalisation in the planning academy, and describe a multi-national collaborative project where, despite some limits to 'direct relevance' of the experience, the development of culturally aware professionals was enhanced. Dandekar (2009) offers support for international encounter and collaboration in smaller planning schools due to more limited opportunities for encounter. Similarly, Absolum and Vadura (2006: 332) recognise that "simply adding international content is not enough" in their study of students at the University of South Australia; students consider *interaction* to be a critical part of their education. Clifford (2009) identifies that less 'pure' disciplines are able to contextualise these experiences well – a seeming advantage for planning education.

### 2.2 Ethics, Politics and Experiential Learning

In disciplines such as planning, experiential modes of teaching and learning are often common and have a long history through fieldwork and studio/project activity. A primary intention of such experiential approaches is to explore a range of themes and issues through the context of a project, problem or encounter. Consequently (and evidently), context matters; with the social, environmental and political setting being entangled in the project space. For students, this means that such factors are central to the project task, rather than a potentially decontextualized example in the classroom. Such approaches, while potentially powerful, also assume and rely on this understanding, notwithstanding the preparation and pre-briefing that is typically associated with these activities. In this regard, the ethics, cultures and politics of doing planning are in fact given prominence in informing and guiding method and practice. In an international setting these elements are amplified through cross-cultural understanding, or lack thereof, and familiarity with the agenda for planning practice and priorities.

Consequently, for students involved in international settings, ethical dilemmas exist not only in knowing, and in learning from habits in practice grounded in culturally contingent settings, but also in reflecting on suitable lessons for transference – an issue that extends in both directions. In this regard, we consider a range of potentially 'contingent' issues that consistently confront our Australian planning students in Sri Lanka: (i) the exercise of patronage politics and power, (ii) the resources and priorities of development and (iii) the nature of informality in the use of space and the development of

the urban environment. At times each of these issues have confronted and confounded students, requiring navigation and negotiation of ethical questions of the application of lessons and knowledge from elsewhere and the applicability of 'universal' planning ideals, all while operating in the familiar context of (nearly) familiar planning language, historical conventions and administrative structures. We outline these issues below.

## 3 Sri Lankan Planning: from post-colonial lessons to globalisation

The modern Sri Lankan planning system has links to British colonial planning system, as does Australian planning. In early 20th century, British colonial government introduced planning regulations and practices to Sri Lanka. Based on these Colonial procedures, localised plans and development projects were progressively implemented in cities as well as some regional areas, firstly through the *Housing and Town Improvement Ordinance* 1918 and the *Town and Country Planning Ordinance* 1946. Reflecting international trends, the early planning approaches in Sri Lanka tended to emphasise comprehensive master-planning. This produced a centralised, rigid, and top-down planning approach that dominated in 1930s until the 1980s – a legacy that continues today.

The involvement of international planners such as Patrick Abercrombie and agencies including the United Nations Development Program (UNDP) reinforced the 'borrowed' planning of the colonial era even after Sri Lanka gained independence in 1948 in projects such as the UNDP *Colombo Master Plan* (1978*)* The desired outcomes of past master-plans and regional plans were not well contextualised within local cultural and economic settings and did not deliver expected physical and social development at the ground level (Steinberg 1984, van Horen, 2002). This has been attributed to the often-identified drawbacks of master planning processes; inflexibility, lack of fluidity, inability to tackle uncertainty and inability to cope with the rapid urban growth that occurred in urban areas during 1980s (van Horen et al, 2004). These approaches also raised questions about the suitability of broad planning goals for local problems, especially where local problems and solutions were identified through Euro-centric or universalist lenses rather than from an insider's point of view. Additionally Sri Lanka's political challenges since the 1980s have hindered the implementation of urban plans.

From the 1980s economic liberalization policies were introduced in Sri Lanka resulting in unprecedented urbanisation and urban development. This resulted in significant population growth and new urban forms with linear development along main roads and slum settlements becoming common features in urban areas. In order to manage urban growth, promote integrated development and to effectively enforce the statutory planning framework, the *Urban Development Authority* (UDA) was established in 1980. The UDA planning process provided a new framework to prepare much needed strategic plans with a more flexible structure planning and developmentalist perspective. Accordingly, local level development plans for urban and regional areas were progressively prepared for almost all urban areas under the guidance of UDA. Additionally, the UDA has also prepared regional level framework plans such as the *Colombo Metropolitan Regional Structure Plan* (UDA, 1998, Munasinghe, 2009). These plans indicate emergent flexible planning approaches extending beyond conventional master-planning processes.

Planners and policy-makers further adapted emergent modes of strategic and collaborative planning during the last two decades. Accordingly, the *National Physical Planning Department* (NPPD) was formed in 2001 to offer a statutory framework for preparing national, provincial and regional level structure plans through the *Town and Country Planning (Amendment) Act*, 2001). The subsequent *National Physical Structure Plan*, (2005) proposed nationally important strategic development projects including ports, domestic and international airports and highways. Since 2005, the incumbent government has taken measures to implement identified strategic projects (often through foreign direct investment) particularly evident in the Southern Growth Centre area under the *Hambantota Regional Development Plan* (UDA 2007) and development and renewal projects in Colombo Metropolitan area. The Hambantota plan received considerable political patronage from the previous Sri Lankan

President and mainly involved direct investment from Chinese government agencies (De Alwis, 2010). More recent planning and development projects have been undertaken within the strongly directional objectives of post-conflict reconstruction and the involvement of a range of state agencies, including the military.

## 4 How is Sri Lankan planning familiar and unfamiliar to Australian planners?

As Healey (2012) describes, the universal knowledge and practice of planning is contrasted with elements that are contextualised in place. For students in both places, apparently 'universal' ciphers of planning exist in the form of a common British legislative tradition, the language of planning and the shifting modes of practice from past comprehensive master-planning to current developmentalist and neo-liberal approaches that have become typical in both places. Yet from an Australian planning perspective, the 'contingent' or 'unfamiliar' roles of planning and the conception of planning relate to issues including the visible exercise of power and patronage, the collisions of traditional and introduced models of administration, resources to realise planning outcomes and the informality of urbanization and development in general.

### 4.1 Politics, centrality and economic resources

Like many other developing nations, Sri Lanka has a highly centralized political and administrative structure and planning operates within this framework. Planning and politics are visibly linked through political and development agenda. Similarly to many developing nations, planning in Sri Lanka is a project of a state-directed future (Rakodi, 2001) and, while planners are equipped to operate in a neutral way, Sri Lankan provincial council and local authorities have organised along sectoral lines with relationships to central power. They do not have autonomy to guide their future in policy making, nor do they have a fiscal base to realise development plan proposals. The prevailing provincial and local government systems has resulted in dependency on the central government. Instead of implementing proactive plans, provincial and local government have become agencies to disseminate central political agendas and strengthen the voter base of the centre.

Of course planning is a political and value-laden process in Australia, and as elsewhere "the boundary between the technical and the political regularly moves" (Murdoch and Abram, 2002: 11) despite preferences for expert techniques. Planners in Australia, as elsewhere, often imagine themselves in the mode of Baumann's (1987) 'legislators', rather than as actors within the active policy-networks described by Hajer (2009). What is different in Sri Lanka however is the visible exercise of patronage politics without consequent enframing narratives of planning rationality and the resource limitations and centralization with a resulting disjuncture between plans and on-ground outcomes.

### 4.2 Formal and informal development and planning practice

The formal and informal distinction in planning is a fundamental feature in contemporary urbanism in cities and that plays a fundamental role in urban imagination and practice especially in global South. This is perhaps the most different and unfamiliar feature of planning and urbanism for students from developed economies. Understanding seeming informality as a part of the process of planning networks, alongside the administrative cultures this implies is difficult for students from the global north. Likewise the physical informality of place, with its initial surface appearance of disorder, despite the legible signs and codes apparent to insiders, is taken as a physical manifestation of the informal city by visiting students.

The formal-informal distinction is a complex and multifaceted phenomenon. Traditionally, informality was understood as one of the key problems facing cities, offending the foundational legalities of urban development, rooted in property rights and regulated settlement (UN-Habitat, 2009). Informal practices were seen to belong to the global south while the *formal* was practiced in the global north.

Alternative perspectives suggest that both processes coexist in each part of the world (Roy, 2009). Behind the seeming rigidities of official procedures in first world cities, there are uncertified negotiative networks of hidden influence and deal-making "subterranean" politics take place (Gaffin & Perry, 2012). For example, Alexandroni (2007) argues there is nowhere else in the world that deals with more corrupt money than the City of London with implications for urban development. Generally, informal agreements and forms of valuation and negotiation drive urban development and urban life in the north as much as they do in the global south (McFarlane, 2012).

Consequently many scholars emphasize neither pure informality nor formality, but rather a spectrum (Innes et al, 2007). In Sri Lanka, slum settlements, illegal constructions and development deregulation have been identified as informal practices (REEL, 1998; The Sunday Times, 2012). Further, patronage politics in planning for those with political contacts or directly through bribery are considered as features of informal practice in Sri Lanka. Yet informality can also be identified in a more organized and functioning form through the negotiation and institutional devices that allow service provision and resource allocation. As elsewhere, decisions are made within networks of policy, power and practice.

In Sri Lanka, outsiders may consider the visual form and flows of urban settlements as chaotic but there is a functioning order to be seen, eventually. Such conditions, however, are not clear on the surface to the visitor. There are functional networks even within informal settlements and they become the everyday lived experience of the city, and of the claims to space within it. Informality is not an aberration, but rather a mode of urbanism in Sri Lanka. Since formal plans and regulations cannot respond to adaptive urbanisation, planners and politicians, often in good faith, identify flexible collaborative and adaptive solutions to urban problems. While illegal or informal, these activities are an engine of growth through formal organisation in many Asian cities. They respond to realities of spatial practices and the to right to city (Lefebvre, 1996) and recognize that life in these settlements *is* urban life (Gaffin and Perry, 2012).

These practices are internalized in the planning and administrative culture as a form of 'institutionalised regulation' (Castells & Portres, 1989) imagined as a 'para–legal' (Chatterjee, 2004) or 'extra legal' processes (de Soto, 1989). Therefore, local planning students can easily comprehend these hidden dynamics and its relationship to development in the local built environment. However, foreign planners and planning students need to realise this hybridity: the formal functioning planning system backed by legality and the informal, unwritten and invisible system that has strong links to politics. Visiting students and planners may see this as "chaos" or "illegality" in the development process in Sri Lanka, but this apparent duality and complexity in the context is the everyday reality of urban planning in the hybrid cities of the region.

## 5 The international planning project: Australian students' encounter with ethical challenges

Between 2010 and 2014 the authors have designed and co-ordinated four annual planning projects involving Australian planning students travelling to Sri Lanka for short (2-3 week) visits. Each has involved regional and local strategy development projects and included Australian students coupled with students in an undergraduate program at a Sri Lankan University. Project locations and focus sought to engage in the processes of local communication, data collection and strategy development. While focusing on spatial planning issues, the activities have sought to encompass elements of community engagement, local economic development and exploration of local governance issues. Some learning outcomes and students experiences from past activities have been reported elsewhere (Butt et al, 2011, Butt and Ratnayake, 2012) and are considered to include negotiating varied cultures of planning practice, developing cross-cultural literacies and building a reflective approach to planning activities at home. The authors of this paper have a background in planning practice and planning education in each country, and had been previously involved in exchange activities between Australia and Sri Lanka as participants in a Planning Institute of Australia/Red Cross post-tsunami project.

The four visits involved students jointly undertaking field studies, survey activities and community meetings over various years in a number of non-metropolitan locations in Sri Lanka. These have included rural Uwa Province, Hambantota which is a tsunami-affected city in the south where significant new investment in metropolitan-scale infrastructure is occurring, Trincomalee, a city on the east coast where both post-tsunami and post-conflict redevelopment remain priorities and Weligama on the south-east coast where an expanding tourism industry is reshaping economic potential after tsunami recovery. The project field activities were supported by lectures, seminars and workshops before the trip, in the field and on return to the Sri Lankan university. The project design and partnership has been framed through consequent visits to Australia from Sri Lankan staff and students and ongoing staff and student connections.

Over 75 students have visited Sri Lanka with responses obtained through pre and post visit surveys, interviews, student reports and author observations for each visit and additionally, in early 2012, an independently-facilitated focus group comprising a sample of students and graduates from each of three project visits (2010-2012) and student discussions and reflective-journal reviews in 2014[1].

Student feedback has identified that the project activities and shared experiences, while not always familiar, have been supported by the shared knowledge and the language of planning theory and practice (Healey's 'universals'). Familiarity with planning history and consistent use of specific language and analytical techniques were often seen as common in both cohorts. However, the Australian students have also identified that they have been challenged by the different understandings of critical issues (culturally contingent) in development and the local agenda for planning practice. These issues include housing, transport, cultural practices in the use of public space, informal development, the seemingly overt intrusion of political objectives and the priorities for planning policy in a developmentalist state undergoing transformation.

### 5.1 Understanding planning transference and ethical encounter

Student responses reveal a desire to learn fro unfamiliarity and that this was a motivation for participation. Students often saw this mainly as a chance to become 'internationalized' planning professionals, but some recognized the usefulness at 'home' in this exposure. In part this reflects self-selection amongst willing participants seeking an international experience, as the subject is not a core unit of the planning program. However, on return, perspectives vary in two critical ways; in terms of the capacity to offer planning input in an unfamiliar setting rather than to simply 'observe', understandings of how this experience is relevant for planning practice back in Australia.

Working along with Sri Lankan planning students confronts Australian planning students. For some students disjuncture between their own planning knowledge and local practice lead them to understand the complexity of the way things work and called for further inquiry of the planning system. Therefore, students dedicated considerable discussion and response to their preparedness for identifying planning priorities and for understanding the limits and boundaries to planning in Sri Lanka. The unfamiliarity of development (informality) contrasts with the familiar language and structures of planning as expressed through the legislation and strategy that is a focus of formal education. Walking between these extremes is a challenge identified by many participants.

> *"…the issues are so different, I couldn't see what to do." (Student Response 2010)*

[1] These review activities have been conducted and reported subject to Faculty Ethics Approvals 1012/12 and 20131/13

*"…no matter where planning is practiced the fundamental planning principles are the same, however the manner in which it is practiced and implemented must reflect the local situation." (Student Response 2011)*

*"What works in one country may not work in other - one solution is not the only solution" (Student Response 2012)*

*"Then I realized…the beach is not conceptualised in the same way as in Australia!" (Student Response, 2014)*

Critically, students are often strongly aware of the lack of direct applicability of their own (Australian) planning project examples, however *expressing* relevant planning ideas within the mixed student team in the project setting often emerges as a greater challenge. Many identified that the modes of communication and indeed of cultural practices of working in group-settings and the roles and status of participants, including local agencies, are more fundamental. Survey and interview findings tend to indicate that while students are aware of the need to develop cross-cultural literacies the skills in this area their pre-tour expectations appeared to under-estimate this challenge when in Sri Lanka. Many students indicated their literacies were not as developed as they had hoped. In this regard, student responses included:

*"…Australian students tend to speak first, rather than listen." (Student Observation, 2012)*

*"The experience reminded me that all you can do sometimes is sit and watch, instead of trying to influence activities…in a cross-cultural situation." (Student Observation, 2012)*

*"A lot of the time I don't think they understood our ideas and we did not understand theirs. The differences in ideas were drastic despite the fact we are studying the same profession" (Student Observation, 2014)*

The authors observed a range of student responses including those who adamantly attempt to apply their 'Australian' planning knowledge and techniques, to those who appear to retreat from participation – and of course many participants operating between these extremes. Each student has had to negotiate his or her capacity to actively participate socially within the group and in relation to their knowledge of planning within the local context. Some students take on a different identity within the group than they are accustomed to, while others enact a familiar or accentuated role in group-work as they adjust to the different modes and expectations of student group work, a cultural factor in the practice of planning. For some, the experience represents an opportunity to influence projects with assumed 'universal' planning knowledge – for others it suggests they lack useful contribution.

### 5.2 Reflecting on practice

Similarly, contrasting views are held in relation to transferability *to* Australian planning practice. While a most students consider the experience useful for reflection on practice at home, others consider the differences too great to extract value and transferable lessons. For some, the starkness of the Sri Lankan situation challenges explicit linkages between power, politics and planning in ways that are masked and implicit in an Australian context.

The authors observed students who were aware of politics in decision-making and the power relationships evident in the built-form of the urban landscape – particularly the informality of development and land use, but did not always see how a planning system actually existed in this setting. The informality of certain planning procedures, the hybrid and negotiated nature of dialogical decision-making and the direct political intervention in planning practice present significant dilemmas for students, but become clearer after discussions with Sri Lankan students and planners, and through field observations.

> *"…I have gained an appreciation of the bureaucratic and social barriers to planning in a developing country" (Student Response 2010)*

> *"…there were developments that we would have considered to have not worked [and] some that you would wonder why they were put there. Some [were] organic development that just worked and fitted together" (Student Response, 2014)*

For students, the ethical challenges of conceptualizing these processes as being either immovable problems, a opportunities for change, or as culturally appropriate responses to local circumstance arose consistently during in-country discussions and also in post-visit debriefings. Student responses reflect both their unease with the seeming informality of space, and surprise and a desire to understand how such systems and places function despite the apparent lack (to them) of order and formality typical in urban Australia.

> *"…with less order and structure in the public realm including roads, shopping strips, and other civic spaces can still actually function efficiently" (Student Response 2011)*

> *"Being in an unfamiliar and at times uncomfortable environment was challenging. (Student Response, 2011)"*

> *"It posed the questions in my mind what happens when there aren't planners? What happens when planners can't do what we considered their job to be? And what happens when planners fail to get it right?" (Student Response, 2014)*

The way in which these reflections on spatial patterning are linked to understandings of power and politics in Australia is less clear from student responses. Australian students typically view the role of planning in Sri Lanka skeptically, with a difficulty in seeing a role for the institutions and systems of planning in what appears to be a chaotic built environment. Further, the role of 'non-planning' stakeholders (both public and private, powerful and powerless) in influencing development is more apparent in many locations, although this of course has parallels in the entrepreneurial or neo-liberal models of contemporary Australian planning. This understanding indicates a different reading of the way in which forms of development occur and the representations of urbanization, with a consequent planning response.

Longer-term reflection indicated that many students understood that their learning only emerged in time. In part this may be a product of the immediacy and short-term encounter of the fieldwork activity. Perhaps this indicates a dilemma in Healey's "dynamic contingency" (2012) insofar as the recognition of issues of difference is not always immediately evident. Student reflections may also be an indication of the uncertainty associated with developing confidence in professional knowledge experienced by students anyway (although many have professional experience to some extent), and consequently the challenge of applying and extracting appropriate planning 'practices' in an otherwise unfamiliar setting. Comments from students reveal:

> *"…there were hidden learning outcomes…" (Student Response 2011)*

> *"One of the main things I learnt from this study tour was to look at a problem and explore what is causing the problem, as well as to know how to fix it" (Student Response, 2014)*

> *"…what you learn you don't find out until you return to Australia." (Student Response 2011)*

## 6 Lessons for cross-cultural encounter and local planning

Healey (2012) challenges planners to recognise a pathway between assumptions of universal knowledge and the surrender of any applicability beyond narrow local contexts by the development of *dynamic contingencies*; she calls for a *reflexivity* in applying what planners know and do to new circumstances. This, while sensible, proves difficult to know and learn. For Australian students

undertaking joint projects in Sri Lanka, it is apparent that while planning offers some universal possibilities, there is a general acceptance that local priorities and problems may not be best addressed with practice examples from elsewhere. This creates a dilemma for students in discovering what useful and transferable knowledge and skills they have.

The authors, over several visits, have found that students are able to best uncover this through engagement with local students and planners and through participation in data collection, discussions with local stakeholders and through broad and wide-ranging discussions regarding history, politics and culture. These are approaches that take time however, and building relationships beyond the overseas project period is essential to students recognising similarities and differences in approaches to planning. Reflection, dialogue and cultural awareness each play a part in refining and defining how their developing planning knowledge has a role in a new place. These steps present challenges relating to modes of communication (not simply language), expectations of project work and time constraints for students in a full curriculum in both countries.

Over the period of three annual visits, we have sought to increasingly emphasise engagement and dialogue, using planning examples and practices as an important, but in some ways secondary, vehicle for these activities. The universality of planning knowledge and language, while useful, at times appears to mask difference, whereas skills in communication, engagement and thorough observation and reflection appears to serve students better in equipping them to participate while away, and bring useful learning back to Australia.

Planning internationally presents significant ethical challenges that include those relating to the transferability of knowledge and practice. In educating students through international encounter, these challenges are heightened through the development of a 'planning' literacy, in additional to cultural literacy. The experiences of international study offer scope to learn adaptive and reflective practice, and typically students are aware of the limitations of a universal approach to planning, despite the historical tendencies in this regard and the shared language and understandings of planning students from different countries. Further, students began to understand and appreciate informal form of urbanism and direct politics in a more positive and practical framework. However, moving from this awareness to making effective choices about applicability of practice approaches and examples, and understanding the potential positive roles of international practice is challenging for students (and no doubt for practitioners).

Engagement between visitors and local planners and planning students helps is important to achieve an international perspective, but additional engagement with communities, local data collection and shared group project activities present ways for students to truly reflect on what they actually know about planning, how this can be applied and what is transferable or adaptable. Discussions before, during and after international field visits covered a range of issues of concern for students. Understanding of politics, historical land management, culture and economic structures – in addition to planning knowledge – is required to take students through a process of ethical encounter with their own knowledge and culture, albeit in another place, and the recognition of adaptive 'dynamically contingent' approaches to planning practice in new contexts and settings.

**Lessons learnt from teaching practices of participatory neighbourhood planning in China**

Ying Chang

[1] Department of Urban Planning and Design, Xi'an Jiaotong-Liverpool University, P.R of China
ying.chang@xjtlu.edu.cn
Keywords: planning education, participatory planning, Urban China

Abstract: Healey (2010) has questioned the limitations when planning theories and ideas travelled fro m developed countries to other places. In 2006, there is a new international university opened in Suzhou China, with close cooperation with Liverpool University in the UK. Since 2010, a new programme of Urban Planning and Design (was called Civic Design as the same as the parent department at Liverpool University) was started and in the spring of 2013, a new module of Neighbourhood Planning was taught. During this module, participatory planning methods (Barton, 2010; Sanoff 2000) were introduced and assessed for the group work at local community.

This paper will introduce the teaching practice of Neighbourhood Planning, with a focus on how participatory planning methods were taught, received, developed and applied in the context in urban China. At the end, an evaluation was made based on students' and residents' feedbacks. Lesson and experiences will be concluded for future teaching and practices in China.

## 1. Introduction

This paper summarises and reviews and teaching practice in the course CDE110 Neighbourhood Planning as it was offered in the spring of 2012-13 at Xi'an Jiaotong-Liverpool University in Suzhou, China. It was delivered by Dr Ying Chang and Dr Raffaele Pernice. Fifty students participated. A live project methodology was employed to develop students' participatory neighbourhood planning skills. Neighbourhood consultation events with about 50 families were organised by students to collect information effectively. The learning outcomes were evaluated by assessment, peer review, student feedback in 2013, interviews with local residents and a separate follow-up feedback in 2015. The conclusion offers a reflection on the experiment of transplanting an international concept to a Chinese context and applying it to Chinese students and Chinese community. It also discusses the benefits and challenges of employing life project methodology in conducting group assessment.

## 2. Course Summary

The module has two main aims to achieve: firstly, to develop student's appreciation of the importance of planning at the neighbourhood scale with a focus on understanding local needs; secondly, to equip them with relevant planning skills, particularly with an understanding of the value of community engagement in the plan making process. The assessments include two parts, one is an individual critique (60% of the final mark) of neighbourhood planning theories, and the other task is group work (40% of the final mark) consisting of a comprehensive neighbourhood appraisal and proposal for improvements. The neighbourhood planning skills were taught workshop style, and combined with field visits, tutorials, field work, and neighbourhood consultation events with local community. For the purposes of group work, the 50 students were divided into teams of five each.

## 3. Pedagogical goals

The whole design of the participatory neighbourhood planning workshop is to follow the international trend of the communicative turn in planning practice and accordingly in planning education (Forester 1985, Healey 1992, Jiang and Jiang 2008, Cao and Wang 2009, Hu, de Roo et al. 2013). As early as in 1970's, there was a trend towards the exploration of new perspectives, processes and approaches of planning and the new role of planners as a quick leaner, a facilitator, and a mediator among complicated reality in which individuals, society, built environment, economic development, and environmental issues are intertwined with each other. As diagrams below show, different from the traditional top-down model of planning, the process of planning is an evolving learning process, in which both planners and clients contribute to the mutual learning they develop together, in which planners learn intimate knowledge of context, priorities, and realistic alternatives from clients; and clients learn concepts, processed knowledge, and new perspectives from planners. In addition, the international trend of planning has shifted from bold and visionary physical planning and design into process oriented development of collective vision and consensus building, mainly through higher level of participation and innovative participatory methods.

## 4. Challenges

### From the UK to China, will it work in local context?

During the design of the module specifications, the module leaders tried to match the pedagogical approach adopted in the University of Liverpool, which is to put people and their demand in the centre. Thus it is very different from the top-down approach that is the norm of planning education in China. In China, there is a lack of empirical evidence of successful consultation with local people on affairs that matter their own neighbourhoods. Transformed from early socialist society, Chinese society is undergoing a transitional period to form new local communities based on private homeownership. Nevertheless, there is an absence of public sphere that is fundamental to achieving mutual understanding.

**Were our students ready?**

At the time of the live project, it was the second semester of the first year of the professional programme of students enrolled in BA Civic Design. Other modules taught in the first semester included foundation courses, such as Planning in the UK, Planning in China, History of Planning and Urban Economics. CDE110 was the first module that has narrowed down to neighbourhood scale, with specific tasks of practical skills and fieldwork. After traditional high school education which focus on entry exams, students are lack of life experience and people skills to work with real clients, particularly those who were senior to them.

**Work with uncertainty-Live project and partnership**

The risks in employing live project methodology lay in time management and coordination with clients. The workshop had a rigid weekly syllabus to follow, which was decided as part of the module specification before the semester started. However, many uncertainties existed: firstly, the consultation event with local residents also required a good fit into the existing plan of community regular programme and to avoid the time conflict with other events with same scale; secondly, the level of cooperation of local residents could only be anticipated and not be promised or controlled; thirdly, weather conditions, other preparation work such as advertisement, music equipment also increase the uncertainties and accordingly, the stress to both teachers and students.

## 5. Creative Approach and to Overcome Difficulties Together

The initial site visit was organised by teachers and an introductory talk by the developer was given to the students. The first step in participatory neighbourhood planning is the building of trust. Bearing all the challenges in mind, students started ice-breaking activity to get closer to the local community. It was student's idea to organise activities for children to use Lego to build their ideal home. Teachers from LC were invited to participate in the event too. Through the success of this activity, local community got to know students from XJTLU. Students have used this opportunity to promote the forthcoming neighbourhood consultation event and some parents have already expressed strong interests in participating.

Figure 2: site visit and ice-breaking activity at Living Bank neighbourhood

One month later, a neighbourhood event was organised to collect residents' opinions and suggestions about their community. Before the event, teachers have delivered the lecture on participatory neighbourhood planning skills and provided resources for student self-study. Each group has developed their own innovative way to engage local residents. Tutorials were given during the

workshop. Student leaders also met with community leaders to discuss details of the neighbourhood consultation event, including its programme, advertisement, invitation, table settings, etc.

Figure 3: Left and middle: student discussion in class; Right: students discuss with community leaders

On the day, 50 families worked with the ten teams of students. Students used various methods to encourage the participation of local residents of all ages, including model making, walking tour, interactive iPad presentation, post-it notes, and a message wall, etc. Dr Rebecca Kiddle joined in the event and made the following comments:

'From what I can see, the kids really enjoyed making models, I am sure they really like to see how the whole thing, pieces together, at the end. I think students come out with some really creative ideas, about how they create buildings, using sand and grass, etc. So the young kids obviously have their hands on to making models. This experience is really a good one. I really like the ideas of the board at the back, on which parents can write down what they really like and the whole range of different tools you try to use, that board, questionnaire, things like this, I think they did really well. '

## 6. Effects on students and society

### Capacity building as individual, as group and as a community

The success of the neighbourhood consultation event enabled students to collect information efficiently. With the aid of models, drawing, maps, sticky notes, iPad and message wall, residents

Figure 4: various methods innovated by students have facilitated efficient communication with local residents

were able to express their opinion openly and more importantly, collectively, which is impossible if it was individual interview or survey. Student's communication skills have been greatly improved during this practice.

In addition, it can be observed that because it is a live project which demanded intensive preparation, organising and communication tasks, each student has been commissioned to some sorts of tasks and there was no "free rider" could be found. Instead, a strong spirit of team working was developed when students have to work under stress, and with uncertainties. Teachers also asked each group to choose a team name for them and local residents to have a shared identity. Students have made logo for their own team and their invited guests too.

Figure 5: Left top: group meeting before the event; Right top: group memory after the event; Bottom: gala event with local residents after the consultation

The head of the community committee, Mrs Su, said, 'I think it really turned out very well, the students really have brought many new ideas to our neighbourhood and it was much more interactive than our activities before.' A young father said the activity: '…can reduce the distance between children and our home owners with our neighbourhood'. This event also helped build the sense of community of local residents. One young mother said: 'I like this community very much and here is my real home.' One young father said: ''I feel this place is my home.'

After the event, trust and partnership has been built with local community and students were invited again to facilitate another two participatory neighbourhood planning workshop on the decision making of the new use of community centre. A documentary video[1] was made with help from staff and students of ECC department, to record the series of events and its significance in China.

## 7. Assessment and peer review

[1] Video of the Living Bank Community Project

Youku: http://v.youku.com/v_show/id_XODA0OTAwODg4.html
XJTLU Media Centre: http://media.xjtlu.edu.cn/Play/686

Figure 6: Left: students are delighted to use sticky notes to give comments to other groups
Right: students are learning from each other by group peer review

At the end, the information collected at the neighbourhood event turned into part of the key findings of their group poster, in addition to the spatial analysis, road network, etc. The methods they have used during the events were not assessed but the outcomes generated from their methods were evaluated, which minimised the uneven outcomes cause d by uncertainties, for example, some groups have fewer family members on the day, and different group has created their own methods which was impossible to define a clear marking criteria beforehand. Group peer review was undertaken to give students extra points or deduced points according to their contribution to the group. In addition, after the final presentation, teachers have invited all the groups to give comments to other group's work. Students appeared to have enjoyed the peer review very much and benefited from learning from each other.

**8. Feedback: the first and second order effects of learning outcomes**

Student feedback was collected via two methods: XJTLU standard module questionnaire survey in 2013 and Survey Monkey in April 2015. Because the MQS at XJTLU did not separate the workshop from the entire programme, only written comments related to the workshop have been used for the purposes of analysis. The purpose to have a follow-up feedback survey is to evaluate the second order effects of learning outcomes of this new pedagogy.

In the student feedback survey in 2013, many students had given positive feedback such as:

*'what I enjoy most in this module is that I can work as a group and go to the local neighbourhood to participate some activities with the local residents'*
*'workshop is the best! This module really put theory into practice.'*
*'we can have real world practice, it's very helpful. I enjoy fieldtrip and the neighbourhood activity most.'*
*'a direct contact with local neighbourhood and residents.'*
*' I enjoyed the participation as groups and the involvement of local neighbourhoods.'*
*'Everyone could participant in and the activities were interesting.'*
*'Communication with local residents.'*

However, it is also found out that some students did not like live project because it is too stressful or they did not agree with the whole pedagogy, for example:

*' it is unnecessary for us to 'play' with children.'*
*'some of the procedures of class are too fussy. The teacher is too annoyed.'*
*'I guess Ying Chang could relax herself a little bit. Sometimes she is too worried, yet it is not necessary.'*

The negative feedback could be a result as immediate emotional reaction after working under stress. Thus, we undertake another survey in 2015 for students both at XJTLU and those who have studied at Liverpool for two years. Questions include the process, growth of social capital, skills, employability,

as well as the contribution to other modules in the last two years. By April 17th, there were 20 students who have completed the survey, seven of those are studying at Liverpool.

The table below has shown that higher credits are given to the active involvement, team building, usefulness to future career, less credits for improved communication skills and overall value of the learning process. Owing to it was a one-off activity, students did not feel strongly that they became closer to the community.

Table 1Score from student feedbacks 2015

About the question on to which modules this workshop has contributed, the answers from XJTLU and Liverpool are very different. It seems that it has contributed to more various courses which are more project-based in Liverpool and more theory-based courses at XJTLU.

## 9. Conclusion

### Transplanting new methods from the UK to China

All in all, the participatory neighbourhood planning workshop at Living Bank was a success to both students and teachers. Students valued it as a well-structured, well-organised and enjoyable learning process. The success of this experiment is also because the case study neighbourhood is already a very vibrant community with high level of trust among residents. The methods we learnt from textbook all proved to work well, for example, the trust building at the beginning, the innovative participatory methods, people skills etc. Students have learnt that local residents are really knowledgeable about their own neighbourhood and have learnt how to listen and respect their voices.

### Real clients, work with uncertainty and work together

Students have shown positive attitudes and have taken active actions when they work with real clients and work with uncertainties. Every team had shown strong team work spirit to share the workload and tasks, help and support each other. Students, as a team, were able to think strategically, concisely, and carefully to make the whole programme to be implemented successfully. For example, students have shown very impressive ability to innovate new methods from other resources, including the use of Lego, iPad, and the costume play of Brother Mario.

In addition, from the supporting letter from students at Liverpool, students really have appreciated the collaboration between teachers and students because we have faced the challenges together, found the solutions and overcome the difficulties.

### First and second order effects

The most interesting part is students' different reaction regarding their experience to play with children and work under stress. However, the follow-up survey shows that most results have turned into the positive side over time and students trust more after they found same pedagogy in other modules. As one student wrote in 2015:

> *'Real practice is really good even though it is tired.'*

### Sustainable?

The course was repeated in 2013-14 and 2014-15. Owing to the large class size of 120 to 130 students, it became impossible to organise neighbourhood consultation event as for 2012-13 cohort. However, the documentary video made from the teaching practice in 2013 became a useful reference resource and demonstration to other students. An appropriate size of class and good partnership with local community are crucial to achieve same quality.

### Acknowledgement

Sincere gratitudes go to Austin Rhys Williams, Ann Brantingham, Dr Rebecca Kiddle, Dr Anjuli Pandavar, for their great support to the neighbourhood events and special thanks go to Dr Paul Cheung, and Dr Nick Cope their great contribution to edit the documentary film.

# The Teaching Practice Research of International Student Urban Design Course in China UniversitynaInternational Urban Design Course in HKU and TJU as Cases

**Jingshu Chen**
Shanghai Tongji Urban Planning & Design Institute, email: 12751891@qq.com

**Key Words:** International Student, Urban Design Course, China University

## Abstract:

*In recent years, more and more international students are coming to china as exchange students or pursuing dual-degrees. Some of them choose to study in urban planning or urban design course while their undergraduate background are architecture, sociology, engineering or geography and so on. More and more architecture and urban planning schools began to start the urban design course for international students. Most of them choose the project approach as the teaching method which can kindly fit for a three months or half a year course schedule. But they also notice the problems as coordinating the group design work, guiding the design direction, supplementing the design expertise or understanding the planning policy of china.*

*This article take the urban design course teaching process in the University of Hongkong and shanghai Tongji University as cases. It will address different approaches in urban design teaching for international students and compare the work of students. The teaching process combine diversified teaching modes like lecture teaching or social survey but all around a real design project. The participants of the course including the professors from different background, the manager or designer of design company and the local government. The article try to provide a new method for other Chinese university which can be used in future teaching.*

## 1. Introduction:

In the age of globalization, talents also flow all over the world. In the process of rapid urbanization, with its booming and large architecture market, China attracts not only numerous large-scale international design agencies to expand their business in the mainland, but also thousands of foreign students to study and work in China. The policy of education internationalization has become a key focus of Chinese colleges and universities in this new period. An increasing number of Chinese universities conduct joint-teaching programs, exchange programs and other programs with internationally known universities, which not only promote the Chinese students to go abroad, but also create a more diverse platform and environment to attract overseas students to study in China.

Planning and design is an industry with a strong local flavor, and the international teaching of this major is facing a problem of localization. China's architectural planning education system has shifted from meeting basic needs to dealing with rapid urbanization, sustainable development and social changes of over 1.3 billion people and so on(Bryson,B.W, 2012). Especially in China's current unique

political, economic and social development environment, a key problem faced by Chinese colleges and universities in setting international student-oriented design course is to make the overseas students gain an correct and accurate understanding of the differences in the development of China and overseas countries in a short time, and build a design thinking system with compatibility of global vision and local context in the development of thought. Due to differences in urban planning education course at home and abroad, the international students, who studying planning and design courses at Chinese universities, have relatively diversified backgrounds, coming not only from different countries and regions, but also from different specialties such as architecture, landscape architecture, geography, sociology and engineering design. This also makes the students and teachers face more challenges.

The author once attended the Faculty of Architecture in The University of Hong Kong, studying urban design postgraduate course, and now works as a part-time teacher in College of Architecture and Urban Planning in shanghai Tongji University, teaching international student-oriented urban design courses. By experiencing international teaching as both student and teacher, the author has developed a profound feeling of Chinese educational practice under this special historical background, and also identifies a lot of problems and challenges which exist in this area.

## 2. Status Quo of International Student-Oriented Urban Design Course Teaching at Chinese Universities

With the booming of Chinese design market and the increased support of Chinese government's various policies to attract foreign students to come to China, more and more foreign designers and students swarm into China, gathering in Hong Kong, Shanghai, Beijing, Shenzhen and other cities. Take Tongji University for example, in 2013, it recruited a total of 5123 overseas students, with an increase of 33% compared to 2010; the number of overseas students recruited accounted for 13.9% of the total number of students in Tongji University. Among them, there were 1227 students to study in including the majors of architecture and urban planning, accounting for 24% of the total number of overseas students, and this number is growing rapidly. In response to the rapid growth of the overseas students, it is the addition and promotion of various special courses by each university to meet the need of overseas students.

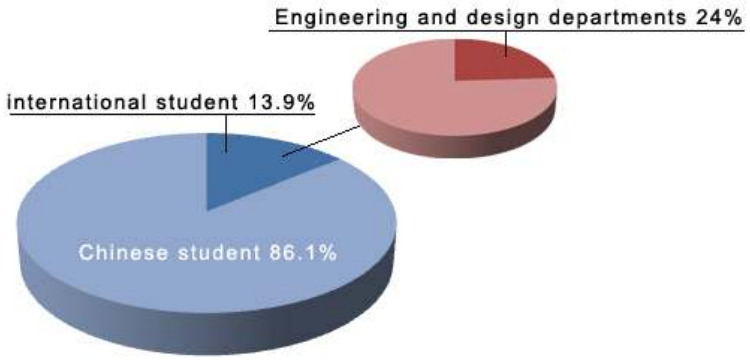

Figure 1. The student composition of Tongji University

Urban design course is an important component of urban planning professional education. Due to China's unique urban planning system, compared with overall planning, detailed planning and other courses needing a lot of expertise and understanding of national, local laws and regulations, urban design has greater flexibility, inclusiveness and innovation, which is of higher compatibility with architecture, landscape and other specialties and is easier to be used into internship or work by overseas students after graduation. Thus, urban design has become one of the most popular courses in overseas students in China during the study of planning and design.

Early in 2008, The University of Hong Kong has noticed the development trend of urban design. The university has opened a post-graduate course of urban design within its Faculty of Architecture and run it as an independent department with class hours of one year, becoming China's first university to set master degree in major of urban design. Enrollment targets are selected in a balanced way from the students coming from Hong Kong, the mainland China and overseas countries. By now, the university has awarded more than two hundred students majoring in urban design a postgraduate degree.

THE UNIVERSITY OF HONG KONG 香港大學
faculty of architecture 建築學院
Department of Urban Planning and Design 城市規劃及設計系
Centre of Urban Studies and Urban Planning 城市研究及城市規劃中心

香港大学城市规划及设计系硕士班招生

香港大学城市规划及设计系（DUPAD）前身是1980成立的香港大学城市规划及环境管理研究中心（CUPEM）。2008年中心改组为城市规划及设计系。我们诚邀优秀本科毕业生申请以下我系的硕士班课程：

理科硕士（城市规划）

理科硕士（城市规划）是一个为期两年的全日制硕士学位课程，它提供关于城市和区域规划的理论、方法和实践的专业培训。该课程毕业生具有两年相关的工作经验后将有资格成为香港规划师学会（HKIP）和英国皇家规划师学会（RTPI）的会员，并成为香港专业注册规划师。交通专业的学生在完成交通主题的毕业论文后也可以成为物流与交通学会（MCILT）的专业会员。

城市设计硕士

城市设计硕士是一个为期一年的全日制硕士学位课程，旨在满足希望以后从事城市设计和物质空间规划的建筑师或景观设计师的教育需求。

申请要求

1、香港大学及同等大学的学士学位。城市设计硕士特别欢迎有建筑、环境设计、景观规划、城市规划和建筑行业学术背景或工作经验的人申请。

2、英语要求：托福（TOEFL）纸考（PBT）成绩550以上、机考（IBT）成绩80以上，或雅思（IELTS）成绩6以上。

奖学金

1、理科硕士（城市规划）和城市设计硕士的大陆申请人有机会有资格申请亚洲开发银行（ADB）奖学金。该奖学金包含学费和生活费用。详情请查询http://www.adb.org。

2、所有交通政策与规划硕士的大陆申请人均有资格申请该课程的奖学金。申请人须在本科学业或硕士学业中有优秀荣誉。获奖人将在第一个学年的第一个学期内获得通知。

申请截止期

ADB奖学金申请截止期：2010年1月31日

申请截止期：2010年3月31日

Figure 2. 2010 Admissions Advertisement of HKU Urban Design Post-graduate Course in Magazines

Since the 1990s, led by College of Architecture and Urban Planning in Tongji University, some universities' professional departments in the mainland China have begun to try to conduct joint design collaboration on a regular basis with some universities that are famous all over the world. With the deepening of internationalization, the joint design courses are increasing in frequency and expanding in scale. These joint design courses usually take residential design, urban design and conceptual planning as the main contents. For instance, during the planning period of the 2000 Shanghai World Expo, Tongji University carried out a joint design competition in the theme of World Expo together

with a number of universities in various foreign countries, receiving student works from 28 universities in 14 countries. Among the student works, the proposed plan to arrange the Shanghai World Expo along the Huangpu River aroused great attention and contributed to selection of the final World Expo site after being submitted to the Shanghai municipal government.(Wu Changfu,2011) From unscheduled joint design work camp, regular summer school of international students to long-term joint teaching with double degree, Tongji University has gradually been improving its international teaching system, become a front runner among universities with design major in mainland China, and continuously delivers relevant experience to other universities. Different from The University of Hong Kong, colleges and universities in mainland China cultivate a larger number of students and are more diverse in course selection. Compared with the full English teaching system of The University of Hong Kong, however, Tongji University and other domestic universities are faced with many difficulties, including the transition from Chinese teaching system to English teaching course system, the lack of teaching materials of relevant courses, and the absence of senior experience.

Figure3.The Historical Process of Tongji University International Architecture & Urban Planning Education (Wu Changfu,2011)

## 3. Framework and Practice of Urban Design Course in The University of Hong Kong

### 3.1 Background of course setting

The University of Hong Kong has formed a high international teaching system at an early time due to its unique geographical location, historical and political context. Many international students, who are interested in China, would like to choose Hong Kong as a spring board to understand China. The inheritance of full English teaching system and the British education system make international students encounter no obstacles in studying in The University of Hong Kong basically. Thus, The University of Hong Kong does not open the same courses specialized for international students as universities in the mainland, and stresses the diversification of the student composition. The

University of Hong Kong has been laying emphasis on enrolling students with different nationalities and professional backgrounds from the opening of postgraduate course of urban design course, with students from Hong Kong, the mainland China and overseas countries each accounting for one-third of proportion respectively. Its courses are also considerably diverse, taking into account the needs of the students with different expertise and capabilities. This paper is to focus on the comparison of representative graduation design courses.

### 3.2Basic framework of course teaching

The period of graduation design course is about 16 weeks, substantially occupying one third of the entire duration of postgraduate course, with a focus on guiding students to summarize the research methods and design techniques that has been learned during the entire phase of postgraduate study and comprehensively applying what learned into the graduation design. The course is divided into five phases: topic selection and research, Site investigation and analysis, design concept generation, work production and graduation presentation. The specific aspects of operations are: topic selection and discussion with teachers → literature reading and preliminary research report → freedom to choose study site and field research →presentation of site study report →concept development and discussion →improve the design outcomes →final presentation and report submission

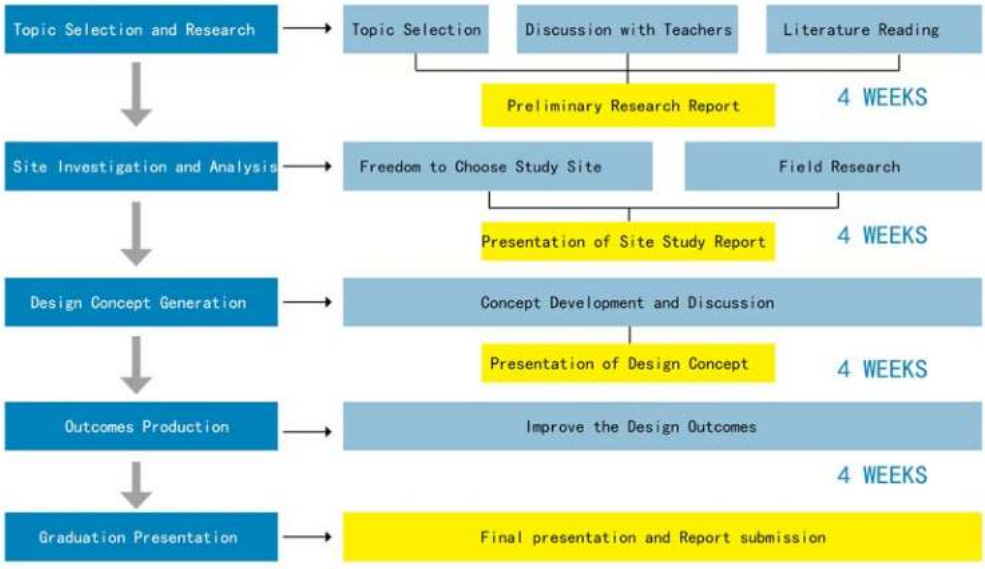

Figure 4. Schedule of Progress for Graduation Course in HKU

### 3.3 Features of course teaching methods

#### (1) Topic selection of design: freedom and independence of topic selection

The topic of graduation design course is determined by teachers, which is not limited to specific research direction, and the research framework is discussed by teachers and students together. For example, a teacher proposes the theme of "South China Factory City", and students in the class jointly select five cities in the Pearl River Delta class as the focus of research; what's more, the students are free to form five groups with members from 3 to 4 students, and each group is responsible for the

study on a city. Each member in the five groups jointly completes the research missions, while they also select their own design sites respectively and put forward their own topics, which will be reviewed by the tutor to ensure that their research topics do not depart from the general theme. Such a way of feely selecting topics without client makes the students conduct pre-research on the topics proposed by the teacher, collect all kinds of related material on their own and read relevant literatures, and select the their interested direction to conduct in-depth research, greatly improving the students' autonomy and active learning ability.

Compared with the traditional way of selecting a "site" before determining a "topic", this way of selecting a "topic" before determining a "site" can better combine research and design, and motivate students to make proactive observation and consideration on the city. In order to select a suitable site, students are automatically to study the fields related to the entire city or region, so as not to confine their thinking by the red line boundary of the "site". If the traditional site-based design were a tailor, then this topic-based design would be like a costume designer taking responsibility for fashion shows. Selecting a site is like choosing the right model in order to fully demonstrate their creativity.

### (2) Work pattern: group research and independent design

The work pattern of this course is basically equals to the mode of design work camp. Given that it is a graduation design and a personal achievement to be submitted, the course builds a model combining independent work and cooperative research. Before determining their own design sites, students must conduct research and studies in groups. Students of different nationalities and majors within a group can complement each other. For instance, when conducting investigation and interviews in mainland China, mainland students enjoy a language advantage and can help the ones who cannot speak Chinese; when looking up international literature or network data, international students can use English, Japanese, French and other familiar ways to find richer information. At the same time, different professional backgrounds can also give the students in a group multiple perspectives. 1 or 2 teachers work as tutors for each group to conduct daily guidance, adopt heuristic education method and guide the direction of group research. At the presentation of phased research achievements, all tutors debrief the students together and give guidance on more aspects, which can also form a competitive atmosphere among student groups.

In the subsequent phase of independent design, the students conduct design based on the site selected by themselves and finally submit personal graduation design results. In the phase of personal design, since the topics of each group member are in correlation, group members still can make cooperation, help and offer advices to each other. In the final phase, all students in a class complete together the general report of the research, during which members of the class and groups share out the work and collaborate with each other. Members in a group are free to choose a group leader, get the task and work in cooperation with a due division of specialization, in which the tasks involves aspects including the preparation of report framework, making of drawings, writing of contents, typesetting of report and so on.

Such a work pattern can complete and deepen the achievements of every student and make their achievements as a part of the overall results, which can not only ensure each student to independently finish their own design, but also stress the importance of cooperation and collaboration in process of design and research.

Figure 5: Pictures of the Urban Design Course in HKU

**(3) Tutorial mode: joint teaching and diversified guidance**

The University of Hong Kong not only has the most powerful and qualified teachers in China and Asia, but also can leverage external forces. In terms of teachers of graduation design course, in addition to the teachers within faculties, it also hires designers in outside organizations or companies to work as part-time teachers, constituting teacher groups with 5 to 8 members. 1 or 2 teachers work as the tutors of each student group to deliver guidance, achieving the teaching level that each teacher can guide 2 or 3 students and realizing full exchange between students and teachers. In the whole course duration, phased achievement report will be held every two to three weeks and student groups need to report to all students and teachers, which allows students to get more guidance from different angles. In the mid reporting and final reporting phase, in addition to the fixed members in teacher groups, teachers in other departments, owners of design agencies outside the university, real estate developers, famous designers and other well-known experts in different fields are invited to debrief the students and provide comments and advices. Experts' opinions are different at times, even contrast sharply with each other, which process can also develop critical thinking skills of students.

## 4. Framework and Practice of Urban Design Course for International Students in Tongji University

### 4.1 Background of course setting

On the basis of years of experience in holding international urban design work camps, the Department of Urban Planning of Tongji University officially in 2010 opened urban design course for double-degree, jointly cultivated international students with full English teaching method. The students are mainly from Bauhaus-Universität Weimar, Berlin Institute of Technology, Georgia Institute of Technology, University of Hawaii, University of Colorado, Polytechnic University of Milan and other universities, with nationalities covering a total of 12 countries on four continents. This course is also a public elective course for postgraduates in Tongji University.

Figure 6: Sources of International students

### 4.2 Course teaching objectives and framework

Given that the target students of this course are mainly the international students who just come to China, the main objectives of the course is to encourage students learn courses, seminars and courses design, apply cutting-edge design methods and tools and think the planning and design methods against the rapid development of Chinese cities on the basis of understanding China and local environment. At present, the course duration is 17 weeks in all, divided into three phases and six parts. The three phases include observation and analysis of site, generation of design concept, design outcomes production and final review, and six parts are visit to site → site analysis report by groups → personal design conception → regrouping of students according to the plan, submission of group achievements and conduction of midterm presentation → modification, improvement and deepening of planning and design → final defense and design comment at the end of term.

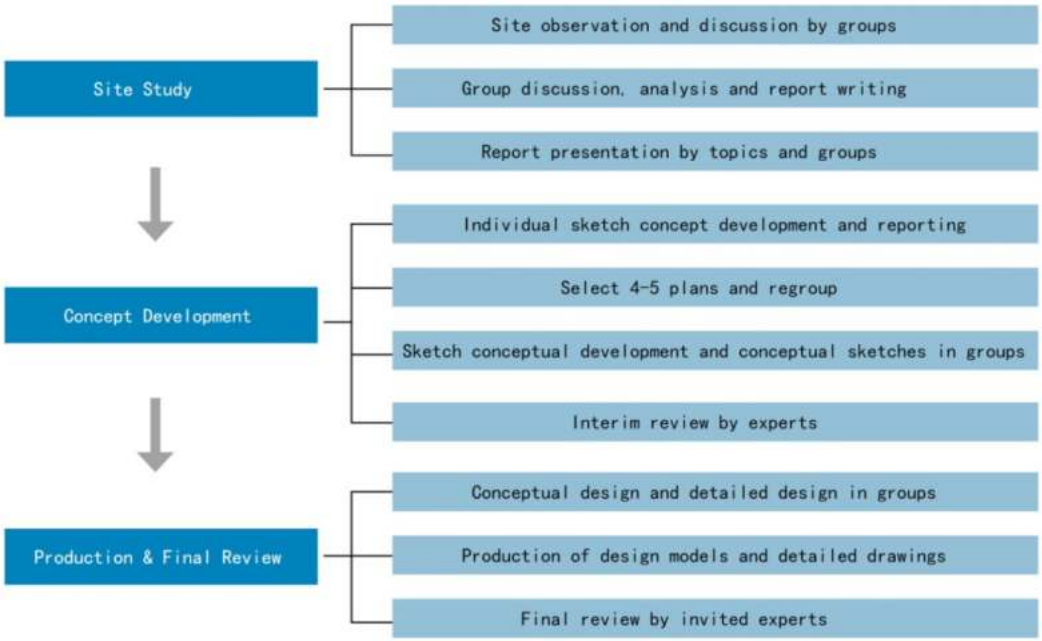

Figure 7. Schedule of Progress for International Student Urban Design Course in Tongji

### 4.3 Features of course teaching methods

The course continue to adopt free design and learning environment of design work camp in terms of teaching methods, and achieve innovations and breakthroughs in many aspects including design topic selection, work pattern, auxiliary lectures, design assessment methods, etc.

### (1) Topic selection: real topic design and real client

In each year, before the starting of the course, the university communicates with Shanghai planning administrative department or other proprietors with need of practical research and design, and chooses a real and convenient design site. After the starting of the course, the client publishes the design task. In the process of scene teaching, real design topic and real client can better stimulate students' interest and responsibility. The selection of design topics also pay attention to representative sites and instances, for instance, the design topic in 2014 is urban design of cruise port in Baoshan District of Shanghai. For China's current rapid growth of cruise tourism industry, Baoshan Port, the current largest cruise home-port in China, is faced with the problem that how to conduct the construction of related facilities. Such a topic leaves a plenty of imagination space. The real client of this topic - Shanghai Baoshan Cruise Port Company, has great interest in that how the overseas students, coming from areas with more mature cruise culture, design the cruise port in China. During the past four years, the topic of the course cover from macro scale - such as Scenario of Shanghai in 2040, middle-scale (50-80 ha) - such as transformation and renovation of Tinglin Town to microscopic scale –such as Core Open Space in Central Jinshan District of Shanghai (about 10 hectares) and other distinctive topics. Cooperative client includes multi-types of organization covering from governmental planning administrative department to actual construction organizations.

Teaching groups and client agree not to strictly limit the design works submitted by students, but the client can make their own opinion on the design requirements and design achievements of students throughout the process. One hand, it does not limit students' thinking and innovation; on the other hand, it can guarantee certain reality constraints, avoiding ideas without any border. This flexible design assignment can allow students to combine their interests, specialties and field awareness, to further refine the design conditions and always immerse in the active process experience.

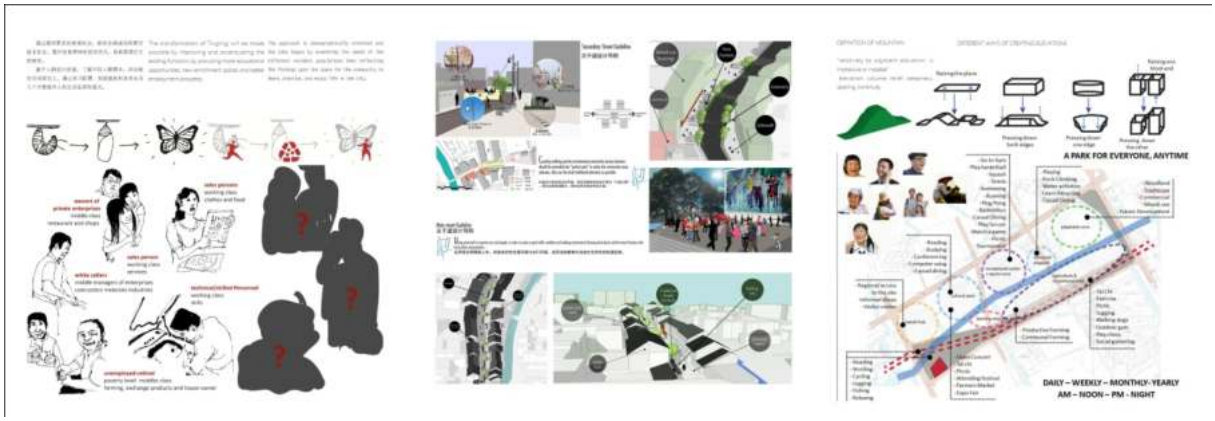

Figure 8. Some Student Works while Express Their Concepts

**(2) Work pattern: personal creativity and group cooperation**

The course takes the work pattern combining independent work and group work. At the phase of site research, teachers arrange 4 to 5 students with different professional backgrounds to form a group, and make them carry out site research and analysis from different perspectives of society, economy, space and humanity. In the successive phase of concept generation, each student works independently to show individual creativity by using drawings, text, hand-painting, video and other means, forming a kind of "brainstorming" effect. This process is also a process of mutual learning and inspiration among students, between students and teachers.

Teachers choose 4 to 5 creative ideas with great potential and features in all ideas proposed by students, encourage students to choose the idea they interested in, and ultimately form design teams with 4 to 5 members. Teachers consciously guide students to form groups according to different professional backgrounds and different nationalities, to take advantage of mutual learning in the context of cross-cultural and inter-professional environment. Students in different design teams can work together, assign tasks on their own, and independently reconcile the differences. For planning and design industry, this collective studio model is common in the future works of students. Therefore, students are required to form a sense of cooperation with mutual respect, coordination and convergence. In this process, teachers are mainly responsible for coordination and guidance, using heuristic teaching method to break the traditional step-by-step teaching method of planning and design course, carrying out work around developing students' independent thinking skills, innovation ability, practical ability and spirit of cooperation.

**(3) Auxiliary lecture: expanding thinking and understanding**

Since the courses set for one class once a week with only 3 to 4 hours each class, this decides that most students should complete their design works in spare time and the class time is quite valuable. In addition to centralized communication and teachers comments, courses introduce a mode of auxiliary lecture to more fully utilize class time. Many professionals are invited to offer seminars. Composed of Professionals includes teachers in other schools, such as departments of landscape and architecture, some experts in field of urban problems outside the university or executives of design companies and the like. Lecture topics are freely chosen by professionals, basically related to design tasks of students. These lectures provide students with a broader vision and more diversified perspectives, greatly stimulating students' creativity. For example, in course of design of Tinglin Town in Shanghai, a sociology expert, who specializes in Chinese urban and rural changes, is invited to talk about the changes in urban and rural life styles and spaces during the process of China's rapid urbanization, to make students who just come to China understand the uniqueness of Chinese urban and rural areas. In subsequent design, a student analyzes the spatial characteristics of Tinglin Town in the perspective of changes in human composition, and thus forms an interesting concept.

**(4) Assessment method: scenario professional review team**

Throughout the course, students have many opportunities to report the results, and make phased reports to client in accordance with the needs of the client. In the phases of mid-presentation and final presentation, professional review teams, composed by teachers in other schools, clients, designers from design companies and course teachers, make comments on students' achievements from various perspectives and areas of expertise.

Students are grouped to make report, and express their programs mainly in the form of PowerPoint. The limited time of group presentation is 20 to 30 minutes. Each member of the group is required to participate in presentation to promote cooperation and specialization among team members, as well as foster and examine students' oral presentation ability. After the group reports, the professional review teams propose questions or suggestions respectively in the defense of 5 to 10 minutes. In the process of teaching over the years, this part is usually fully exciting, and the confident and excellent expressive skills of international students leave a deep impression on reviewers and teachers.

Professional review teams give scores after hearing the reports and defenses of each group according to groups' design concept, achievement presentation, field reporting, group cooperation and other aspects. The rankings submitted are a part of students' final achievement assessment. This assessment method is a part of scenario teaching, so that students have the opportunity to showcase their ideas and listen to various views.

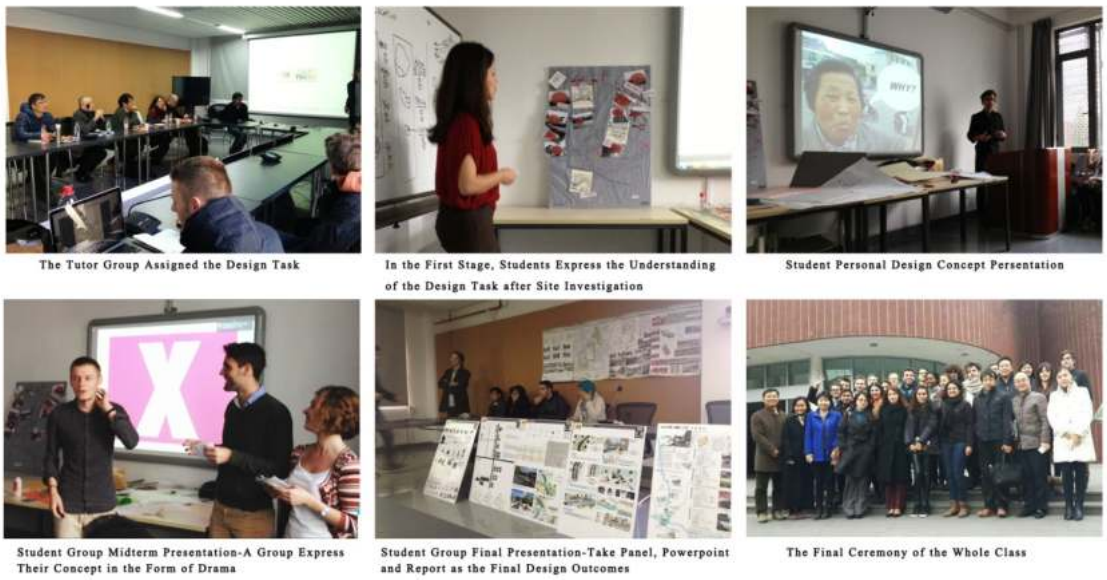

Figure 9: Pictures of the Urban Design Course in Tongji University

## 5. Demonstration and Dissemination of Teaching Results

### 5.1 Combing design task and research, forming and publishing special reports

In the urban design course of The University of Hong Kong, the design topics are without so many constraints and most designs are no-client tasks, which prefers to conduct research and interpretation of the spatiality of some cities. The whole design course consists of research and design. Students need to submit not only design results, but also research reports on the design bases. Students and students groups are closely linked in research contents and share out works in a cooperative manner. In this process, design results of each student, and research results of student groups and common outcomes of all students together constitute a final report on the selected topic with rich contents and diverse perspectives. Such achievements already have detailed first-hand research data and professional analysis and demonstration. With the students' individual designs, questions proposed can be solved in various and creative ways. The final reports are different from the books compiling students' assignments, but a research report with a certain depth and height.

In design courses conducted in The University of Hong Kong in the past few years, several books are compiled and published in themes of "the South China Factory City", "Urban Villages in Pearl River Delta" and other topics, and these books get a good social feedback. As an attempt to combining teaching and practice, the students also participated in compilation process of books while doing design tasks, which greatly increase their interest in the course, since their achievements are not just "assignments", but also published "works".

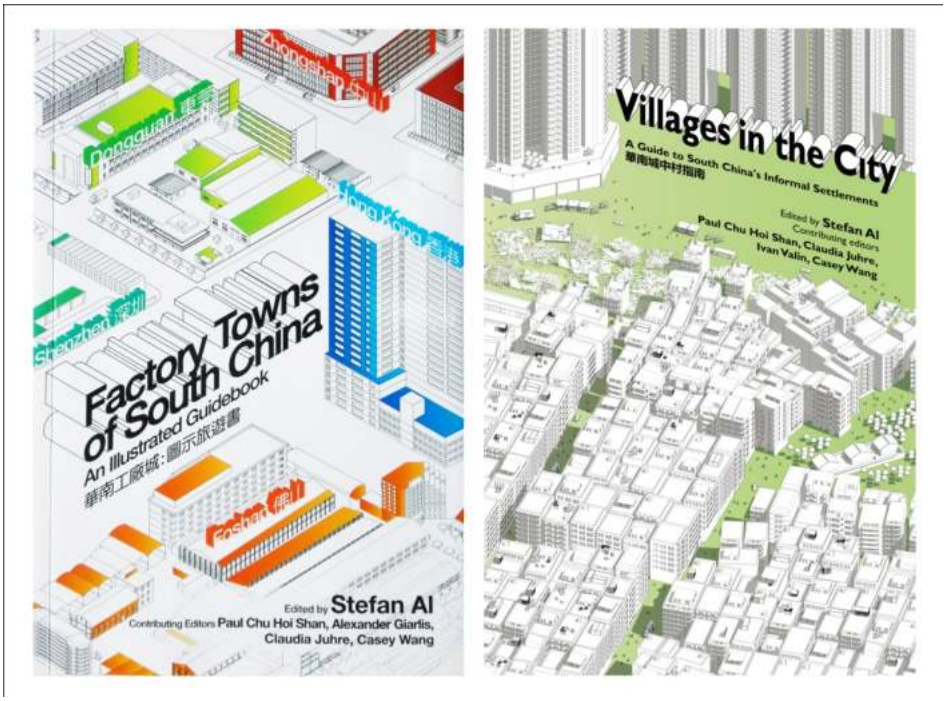

Figure 10: Published Special Reports of the Urban Design Course in HKU(Stefan.A.L,2013)

It is worth noting that in order to compile a book containing some expertise and attracting to the public with readability, students and teachers can design and formulate framework and template of contents to be published when students' researches and designs enter a certain phase. At the time of completing the final designs and researches, students should take into account the contents to be published and fill the achievements of their own and groups into the template in order to ensure books to be published in a more unified form. In addition to the content of students' work, a number of experts are invited to make comments on the writing of topics, so that the final book is more professional.

### 5.2 Publishing the teaching process and experience of design course as the teaching materials

Compared with the experimental and social study of design course of The University of Hong Kong, international student-oriented urban design courses in Tongji University are the pioneer and pathfinder in mainland China, and pay more emphasis on the normalization and instruction of course setting. Tongji University sums up relevant experiences of course by educational innovative practices in recent years. It summarizes the international student-oriented design course in terms of course description, framework, content, teaching methods, teaching achievements, etc., and publishes what summarized in the form of thematic teaching materials. This paper shares the experiences of Tongji University with other domestic colleges and universities, to better promote the construction of international course and platform in domestic design colleges and universities, and make up for the lack of teaching materials in this field. Selection of design works of gradated students in the teaching materials also can be used as references for students to understand the requirements of design course.

## 6. Summary of Experience and Anticipation of Future Development

### 6.1 International student-oriented urban design course — problems and experience

In recent years, educational work for international students in China has achieved remarkable development, but the author still detects some problems based on the hands-on experience. Domestic universities, like Tongji University, still fall behind their foreign counterparts in teachers, sources of students, and educational resources, though they have established a course system for international students.

Teachers responsible for the course oriented to international students are mostly graduates of domestic universities or overseas returnees, while teachers who have working experience in foreign schools are difficulty to introduce. In addition, international teachers are lacking and only a few participate in the teaching activities in the form of short-time exchange or lectures. What's worse, unlike in Hong Kong, it is difficult to introduce social forces, such as part-time teachers into teaching international students, and there is no such educational fund. In terms of the source of students, most international students study in China in the form of educational aid or cooperation and the proportion of self-funded international students is relatively low. Besides, the existing courses are designed to meet the requirements of double-degree and international exchange students. Some universities lack a long-term plan for the education of international students, and do not attach importance to the number of students to be enrolled, majors, student backgrounds, and source of students. (Li Xiangning,2010) As a result, the source of students is unstable, student backgrounds vary, and it becomes difficult to teach students in accordance with their aptitudes. Moreover, compared with foreign universities which provide a great many auxiliary materials or a complete librarian system for students, in domestic universities, international students often have trouble in finding books or materials to learn more about China and they find it impossible to access some foreign websites which are blocked by the government for security while they stay in china.

In an international appraisal of the globalization work of the Faculty of Architecture and Urban Planning, Tongji University, international expert advisors, apart from affirming the achievements the School has made, proposed that globalization level should be further improved by setting one international language as the uniform language used in teaching and research, increasing the number of international teachers, and putting more emphasis on the link between teaching and social practice. (Wu Changfu,2011)

### 6.2 Development trend for the international student industry in China

The deepening of economic globalization has made the international education service industry among the major industries of a country. Owing to the political, economic, and cultural benefits brought by international students, countries around the world makes the development of the international education services a significant national strategy. For example, the nearly one million international students flocking into the UK not only bring enormous economic benefits to the country, but also help to elevate the technical strength and resolve the lack of high-level technicians. Compared with

developed countries, the education work of international students in China is still at its early development stage. Among the postgraduates in top universities around the world, international students usually account for 20% to 40%, sometimes even higher than 50%. However, this proportion at the most famous Chinese universities is only around 20%. With Chinese universities paying more attention to the internationalized education, the number of international students is expected to be on a sharp rise in the future. To improve the competitiveness of Chinese universities in the international student market, designing focused and attractive courses plays an importance role.

In this process, indiscriminately copying the educational system of western countries does no good to improving the competences of Chinese universities. For instance, as for planning education, the original purpose of selecting overseas students in China stems from the increased demand of understanding and research on Chinese cities. Some scholars believe that the universality of globalization and English in the teaching of international planning makes planning, design and related teaching more susceptible to the traditional design thinking way of English-speaking countries. The non-English speaking countries have few opportunities to demonstrate and disseminate their planning experience and knowledge to the international community. (Klaus R. Kunzmann,1999)Therefore, in the era of globalization, assimilation of international experience and exploration of local experience have become two key points, which has received increasing attention in today's China. Various colleges and universities in the guidance of internalization of university management also have shifted from unidirectional learning of international experience to bi-directional development of both output and input. In this paper, The University of Hong Kong and Tongji University are different in course setting and same in combination of international advanced educational philosophy and local practical education ideas, which can be used as case study for China to explore the international education.

# THE USE OF STUDIO PEDAGOGY IN ENVIRONMENTAL PLANNING EDUCATION

Aysin Dedekorkut-Howes[1] and Caryl Bosman[1]

[1]Urban and Environmental Planning, Griffith University, a.dedekorkut@griffith.edu.au

Keywords: Studio pedagogy, environmental planning education, challenges

## Abstract

*Teaching environmental planning is challenging at the best of times with wicked learning and teaching issues such as diversity of skills and knowledge required, the role of science and values in environmental decision making and political viability but periods of rapid political and economic change can present additional difficulties. This paper overviews the current state of environmental planning education and the challenges it is facing as well as suggestions on how and what to teach environmental planners. While the benefits of studio pedagogy which involves a student-centred, collaborative, inquiry/problem-based approach based on a 'real world' project is well documented, particularly in the United States and Australia these courses are becoming less prominent in the planning curriculum. We argue that studio pedagogy is an ideal learning and teaching environment and approach to overcome the challenges of environmental planning education in particular because studio pedagogy teaches students how to work successfully, in a collaborative way, with 'wicked', complex issues. Evidence from planning studios are used to illustrate how studio pedagogy can be useful in overcoming the wicked learning and teaching issues that arise in environmental planning education and producing successful environmental planning graduates that are leaders in their field.*

## 1. Introduction

The interdisciplinary nature of urban planning requires basic knowledge in many different fields and involves difficult choices in curriculum planning. Environmental planning education is even more complicated as it requires high level understanding of biophysical sciences. While there is substantial amount of literature on urban planning education in general there is little on the environmental component of urban planning education or teaching environmental planning in particular.

Designing environmental planning courses pose particular challenges in planning curricula (Deknatel, 1984) as it requires great diversity of skills and knowledge (Niebanck 1993). In addition to the number and diversity of topics that need to be covered in an environmental planning course, including the basic science behind environmental issues, two other problems complicate environmental planning education further (Vos, 2000). The first of these problems arises from the fact that scientific information is much more important for environmental decision making than other policy arenas and the science behind environmental issues is not only complicated but also continuously changing and quite often involves uncertainty. The second problem is related to the tension between the triple bottom line of sustainability, namely environmental quality, economic growth and social equity. The values that underlie the trade-offs between these add another layer of complexity to teaching environmental planning. There is no easy way to prepare the students to handle the conflict between environmental, economic, and equity values but they need to be able to understand all three perspectives and consequences of proposed actions on each. Another challenge of teaching environmental planning is related to the political viability of proposed solutions. Students feel frustrated when they realise political realities might not allow what they as planners

think is the right course of action. What if you cannot communicate the consequences of actions and choices to the decision makers or the society in general effectively (e.g. what is happening with climate change at the moment in many countries)?

This paper argues that studio pedagogy is an ideal learning and teaching environment and approach to teach students environmental planning. Secondary data from environmental planning and studio pedagogy literature are used to construct our argument. First, a review of the literature relating to environmental planning establishes the context and illustrates the complexities of the discipline area. This then leads into a review of the Australian planning education curricula to identify the degree to which environmental planning is incorporated into it. Next, the wicked learning and teaching issues related to environmental planning education are highlighted and the knowledge and skills necessary for an environmental planner is identified. The paper concludes with a discussion on the beneficial links between studio pedagogy and environmental planning education.

## 2. Environment in the Australian Planning Education Curricula

Environmental planning has a substantial impact on social, economic and environmental welfare and getting it right is a complex challenge facing governments, the private sector and communities around Australia. Over time, the complexity of planning has grown and planners today are asked to address a wide range of pressing problems in a context of constantly changing community preferences and demands. Some of the issues confronting planners include managing and responding to significant population growth, an ageing population and demographic change, urban congestion, transportation of goods and services, ensuring adequate energy and water supplies, adapting to climate change, managing hazards, responding to disasters, preserving natural and cultural heritage and the growing expectation that residents should be consulted on changes to their neighbourhood (Productivity Commission, 2011, p.XXI). Complex environmental planning problems present significant challenges for policy, institutions and management. Environmental problems are multi-dimensional and often not well understood. They involve spatial and temporal disparities between cause and effect and the effects of planning interventions on people and environments and decision making in complex systems are difficult to predict. Environmental planners need to find ways of dealing with complex problems in multi-scalar natural and human systems (Rittel and Webber, 1973; Holling, 1973; 1995).

In complex policy and institutional contexts such as this, scholars and practitioners advocate for innovative arrangements that are holistic (Berkes et al., 2003; Folke et al., 2005); integrated across public and private sectors and decision-making at multiple scales (Lane and Robinson, 2009); and collaborative to engage different kinds of knowledge for social learning and build mutual understandings of problems and solutions (Pahl-Wostl et al., 2007; Armitage et al., 2009). Scholars and practitioners also emphasise adaptive ecosystems-based approaches to deal with issues of uncertainty (Walters, 1986; Williams, 2011). These approaches accept that the suitability of policy and management approaches are unknown, treat interventions as hypotheses to be tested and learned from, and employ policy ‘experiments’ to trial, evaluate, and adapt institutional arrangements (Johnson, 1999). Although widely advocated, adaptive approaches have had limited implementation in practice (Walters, 1986). This is because there is little information available to planners on how to actually undertake adaptive management (Eberhard et al., 2009). The quality of biophysical, social and economic benchmarks and evaluative information against which to assess the performance of planning arrangements is poor (Kenward et al., 2011). Multiple forms of knowledge (e.g. scientific, local, customary, traditional owner, policy) are often not effectively integrated into decision making at various stages of adaptive management cycles (Hillman et al., 2005; Hill et al., 2010).

Concepts of resilience, particularly social-ecological resilience are also gaining momentum in environmental planning to better understand the social, economic and governance vulnerabilities, adaptive capacity of communities in managing and overcoming the environmental problems facing them (NOAA Science Advisory Board, 2009; Marshall et al., 2010). Resilience and related concepts however are conceptualized in a number of different ways according to the different disciplines, problem contexts, scale, and objectives (e.g. resisting change, bouncing back, or transforming in response to environmental or social perturbations).

Thus, environmental planning, which is characterised by complex problems, requires planners to integrate multiple forms of data to make decisions transparently under conditions of uncertainty. As described above, the theory about how to resolve environmental problems points to adaptive ecosystems based approaches, which build social and ecological resilience, and take a holistic, flexible, collaborative and dialogic approach to planning and decision-making. Achieving this requires considerable reorientation of current planning and decision-making systems. Current systems are not flexible or holistic across scales and issues. Planners need skills in big picture thinking and analysis to support systemic reform and critical research and evaluation skills to address current shortfalls in the evidence base. Planners need to have the capacity to build and analyse information to undertake adaptive planning and to understand and monitor the impact of planning interventions on social and ecological resilience. They require skills in managing complexity. They need to be able to evaluate planning options in the context of decisions and actions at multiple-scales of decision making to ensure that strategies help rather than hinder solutions. Planners also need to know how to work with stakeholders to negotiate reforms within and across political systems. Finally, environmental planners need coping skills to deal with personal and professional fatigue in dealing with difficult and contested problems, which can seem never-ending, and to deal with ethical dilemmas. So how well do we prepare young planners to this kind of work environment?

To ensure professional graduate outcomes the professional body, Planning Institute of Australia (PIA), implements a stringent accreditation policy. The objective of this policy (PIA, 2011, p.4) is ‘to encourage and support students … to become planning professionals, who can think creatively, analytically and critically, undertake independent research, communicate effectively, and act ethically.’ In addition, the accreditation policy (PIA, 2011, p.7) ‘identifies core and desirable capabilities, competencies, skills and knowledge, and ethical standards, which are expected to be demonstrated in all accredited planning programs.’ Three components related to skills and knowledge defined in the accreditation policy include generic capabilities and competencies, core competencies and supporting knowledge areas. *Generic skills* include problem identification and the formation of creative solutions; critical thinking and spatial analysis, understanding and the application of theory to practice and written, verbal and graphic communication and team work. *Core skills* include professionalism, practice and ethics; plan making, land use allocation and management, and design; and governance, law, plan implementation and administration.

Inclusion of environmental issues and sustainability into the planning curricula has been limited in Australia and New Zealand (Gunder, 2006; Hurlimann, 2009). Gunder and Fookes (1997) found that on average in 1995, accredited planning-school curricula in Australasia focused less than 5 percent of their total programs on environmental issues. While over a quarter of all programs had no environment-orientated courses the most any program had was only 12 percent of overall course content focused on environmental issues. Sandercock (1997) called for a paradigm shift in the role of planners to prepare them for the twenty first century and included ecological literacy among the needs of planners to work effectively in the changing environment. In contrast to Australia the

percentage of accredited planning programs in North America offering environmental planning as an area of specialization increased from 48% in 1984 (Deknatel 1984) to 86% in 2000 (White and Mayo 2005) and Association of Collegiate Schools of Planning (2000) describes environmental planning as one of the five primary areas of planning practice.

A more recent survey of planning professionals in Australia (Hurlimann, 2009) identified perceived gaps in environmental knowledge of planners in the areas of climate change and water management and skills gaps of critical thinking and independent inquiry. This is not surprising if we consider how little environmental planning is emphasized in the Accreditation Policy of PIA (PIA, 2011). The only allusions to environmental issues in core competency areas is in performance outcomes: 'Capacity to make appropriate choices in ethically ambiguous situations based on knowledge of social, economic, *environmental*, and cultural aspects of planning' and 'Knowledge and theories of urban and regional planning and systems, including but not restricted to principles of land use, urban form, infrastructure, *natural systems*, transport, the integration of land use and transport, heritage conservation, landscape and human settlement patterns' [p.11, emphasis added]. This level of focus on environmental concerns does not go beyond using environmental planning as an element of land use planning to increase sensitization of land use planning to natural systems variables (Deknatel, 1984).

Environmental planning is one of the five main supporting knowledge areas PIA Accreditation Policy identifies and elaborates on, however, it is made clear that these areas are not intended to be mandatory and individual planning programs may include all or some of these areas or substitute others if they see fit. The competency objective PIA (2011, p.20) identifies in environmental planning is: 'Planners take a collaborative role in the production and implementation of environmental plans, whether these are discrete plans, components of other plans, or by providing environmental planning analyses of others' plans or actions.' The four performance outcomes expected include:

1. Knowledge of the main principles of sustainable development, ecological systems and key issues such as climate change.
2. Knowledge of natural hazards and planning approaches to managing those hazards.
3. Capacity to produce basic environmental plans at a level demonstrating understanding of broader principles and policy implementation.
4. Capacity to practically and critically link plans into wider frameworks of environmental action and influence at a variety of scales (PIA, 2011, p.20).

In 2007 the Australian Research Institute in Education for Sustainability (ARIES) published a report entitled *Shifting towards Sustainability: Education for Climate Change Adaptation in the Built Environment Sector* that focussed on planning, engineering, architecture and landscape architecture and was supported by the relevant professional organisations including PIA (Lyth et al., 2007). It suggested that graduates in the built environment area should have nine competencies that would enable them to:

1. think about problems holistically and through the 'prism' of climate change
2. understand principles of sustainable development
3. problem solve using lateral and integrated thinking
4. comprehend the significance of the climate change problem
5. interpret information about climate change from a range of sources and disciplines
6. effectively interpret information about impacts and vulnerabilities specific to the locality, region or sector they are working in to develop appropriate problem solving strategies for climate change adaptation

7. make judgements for decision making based on interpretations of degrees of uncertainty associated with scenarios for local and regional impacts
8. think beyond social and professional practice norms to develop creative climate change adaptation strategies
9. demonstrate resolve to make decisions despite uncertainties about local and regional climate change impacts (Lyth et al., 2007, p.7).

With regards to the current state of climate change adaptation knowledge and skills around the country, the ARIES research found that planning graduates had an 'inconsistent level of knowledge and skills' and they gained these skills in something of an ad hoc manner; there was a lack of professional development programs for existing planners; and teachers needed more training, resources and experience with climate change adaptation (Lyth et al., 2007, p.26).

## 3. Wicked Learning and Teaching Issues of Environmental Planning

The scant literature on environmental planning education highlights a number of challenges: diversity of skills and knowledge that needs to be covered, the role of science and values in environmental decision-making, and political viability of solutions.

### *3.1 Diversity of Skills and Knowledge*

Linking of planning and science is one of the central dilemmas in designing environmental planning programs (Deknatel, 1984). While pure science courses such as ecology are not within the scope of most planning programs, the need for increased scientific and technical knowledge for environmental planning is acknowledged and these types of courses may be the most appropriate foundation for environmental planning education (Deknatel, 1984). When there is such a variety of subjects to be covered tough decisions need to be made regarding what to include in the curricula. In environmental planning education the key question is whether environmental knowledge or general skills of implementation and analysis are more important (Hurlimann, 2009) as including courses from other fields would reduce the coverage of traditional planning subjects (Cardew, 1999). *Environmental or foundational knowledge* includes theoretical principles and provides scientific and ideological perspectives to analyse the issues. White and Mayo (2005) identify five foundational knowledge topics in environmental planning as ecological concepts, environmental economics, environmental philosophy, environmental psychology, and sustainability. They also identify areas that have *general skills or implementation methods* to apply these principles as environmental design, geographical information systems, environmental impact assessment, environmental policy and law, and site planning. Foundational topics are usually taught at the beginning of the program and applied skills are toward the end.

Which one of these is more important for an environmental planner depends on a number of factors such as the type of job a planner is likely to have. Hurlimann's (2009, p.655) study found that 'for a significant number of respondents, skills are more important for planners to possess than specific knowledge in order to address environmental problems... However, it could also be argued that planners must have sufficient environmental literacy to be able to adequately and accurately apply their skills to these issues. It is argued that possession of research and analytical skills, accompanied by specific knowledge in one or two environmental areas will equip planners well with the skills to address environmental challenges.' White and Mayo's (2005) findings for North American planning schools are similar: For students, applied knowledge skills are more important for getting employment and succeeding initially in practice since most new planners are expected to perform as technicians. However, as they move toward management positions foundational knowledge (i.e. understanding of

ecological concepts), philosophical knowledge and political skills gain importance. The changing needs of the practicing planner in time indicate that the challenge does not finish within tertiary education but continue throughout their career. Like all professionals continued education is crucial for a successful career.

### *3.2 The Role of Science in Environmental Decision-Making*

Understanding ecological processes is a prerequisite to identifying solutions to environmental problems (White and Mayo, 2004). While planners will not necessarily undertake environmental research themselves they should have enough environmental literacy to understand the technical and science-oriented members of the interdisciplinary teams they need to work in as well as understand and recognize key issues in technical reports (Vos, 2000). Cardew (1999) argued for the importance of integrating environmental management into urban planning education focusing on the key questions of how much environmental science planners need, how is it to be taught, and by whom (generalists or specialists). Generally science courses are taught independently from planning courses but discussion of the role of science and uncertainty in environmental decision-making is also necessary. Hurlimann (2009) noted the two major approaches of design of specific courses versus integration throughout the curriculum and challenges to each approach.

### *3.3 The Role of Values: Balancing Environment, Economy, Equity*

One of the earliest challenges environmental planning education faced was to incorporate normative and social factors in what was viewed as a technical field and including public participation into the planning process (Deknatel, 1984). One of the toughest challenges planners face every day is balancing the competing claims of environment, economy and social equity. This requires knowledge in all three areas of environmental decision making (Vos, 2000), environmental science, economy and the actual costs of all the decisions made, and equity, the social implications of the decisions and how they affect people. But having this knowledge does not mean value-free, scientific and objective decisions will be made, ultimately the decision is based on which one of the values weighs heaviest at the moment the decision is made. Gunder (2006) reminds planning educators of their responsibility to ensure that the tension between market efficiency and environmental protection is not resolved at the expense of social justice.

Back in the 1970s Ian McHarg (1978) claimed that planner's most important role is to elicit the value systems of the people who are seeking to solve a problem because these values would ultimately determine the planning solutions. Planner's job in this sense is to help the community make its values explicit. McHarg further defined an ecological planner as one who identifies alternative solutions with attendant costs and benefits based on an understanding of both biophysical and social systems. Planning is not a value-neutral applied science but 'an inherently social, communicative, and ethical undertaking' (Klosterman, 1995, p.247). A planner is not a value-neutral technician and it is important for planning students to understand the importance of values in planning decisions as well as planner's own values. Hence, one issue to discuss with students in the classroom is their own values, the roles they may take as a professional planner and their ethical responsibilities in upholding planning principles. Are there going to be some that become the advocate planner and do advocacy on behalf of certain groups or certain issues?

### *3.4 Political Viability*

Planning students are challenged particularly by looking for realistic and politically viable yet effective solutions. We try not to stifle their creativity and expect them to stick to their principles and

invariably face with questions such as what is the point of this exercise if the recommendations are not politically viable. They may feel particularly hopeless and discouraged during periods such as now when planning is not looked at all that favourably. What tools can we equip them with to deal with these situations in real life?

The political nature of planning is an important issue planning students need to come to terms with. Planners are not decision makers but they advise the decision makers. In their capacity as advisors they can influence events through their capacity to articulate viewpoints and develop consensus and coalitions (Levy, 2003). Discussing the kinds of powers planners have (persuasion, logical argument, communication skills) with planning students will prepare them for the realities of the workplace.

## 4. Toolbox of the Environmental Planner

So how do we prepare future planners to deal with this complicated work environment and the challenges they will face at their work place? The scant literature on environmental planning education contains plenty of suggestions in terms of specific knowledge and skills an environmental planner should have. The literature reviewed highlights a number of foundational knowledge topics that are important including environmental ethics (Martin and Beatley, 1993; Niebanck, 1993; Beatley, 1995), environmental justice (Washington and Strong, 1997; Gunder, 2006), and sustainability (Martin and Beatley, 1993). The skills that are identified to be important for environmental planners include negotiation, arbitration and conflict resolution (Deknatel, 1984; Niebanck, 1993; Susskind, 2000), and critical inquiry (Gunder, 2006).

### *4.1 Environmental Ethics*

Beatley (1995) views an understanding of environmental values and ethics as an essential underpinning not only for environmental planners but all planners since 'value-neutral discussions of management tools and techniques such as environmental impact assessment, growth management, or carrying capacity are simply not possible' (Martin and Beatley, 1993, pp.123-124). As such, Beatley (1995, p.321) argues that environmental ethics is 'an especially important component of any environmental planning curriculum or concentration.' However, Martin and Beatley's (1993) survey of planning curricula in North America found that in the early 1990s only three out of 87 responding programs offered a separate environmental ethics course, though 64 percent indicated that the subject was covered to some degree in other courses.

Beatley (1995) claims that tertiary education is one of the last opportunities for students to engage in informed moral reflection and to clarify and critically assess their personal values and moral convictions before entering the 'world of professional practice, political compromise, and economic expedience' (Klosterman, 1995, p.248). As such, exposure to ethical literature is necessary to help students develop their own personal ethical frameworks (Beatley, 1995). He further suggests that rather than relegating environmental values and ethics to a single course, consideration of ethics should be injected wherever possible.

### *4.2 Environmental Justice*

Washington and Strong (1997) argue for an emphasis on environmental justice in the planning curriculum as the issues raised by the movement are within planners' professional responsibility, yet neither planning practice nor education has paid much attention to it. They claim that planning education should provide students with an understanding of planner's role in decision making (i.e. they are not neutral experts) and values, norms and rules of professional practice. Washington and

Strong (1997) suggest that environmental justice can provide a framework for examining both planner's own personal and professional values as well as those of the stakeholders. Gunder (2006, p.218) points out planning educators' additional responsibility to ensure that 'social justice is not swept aside in the dualistic tension between market efficiency and environmental protection, even if economic growth always continues to seem to prevail'. His suggestion is to achieve this through developing core skills of critical inquiry and ethical judgment in planning students.

### *4.3 Sustainability*

Martin and Beatley (1993) argue that given the focus of planning on managing land use and human settlement patterns, coverage of sustainability in planning curricula in addition to environmental ethics is essential for providing normative guidance to planners. Their survey of planning programs in North America found that only two-fifths of the programs offered courses that explicitly addressed issues of sustainability at that time. In conclusion they suggested in the early 1990s that sustainability needs to be incorporated into the planning curricula more explicitly and directly. White and Mayo's (2004) research found that sustainability was considered to be one of the most important knowledge topics by the faculty in environmental specialization of North American planning programs. With sustainability becoming a dominant concept in planning education by the new millennium concerns on its conceptualization arose and led to warnings that triple bottom-line based sustainable development is quite different than ecological sustainability (Gunder, 2006). This shifted the focus of the discussion to which sustainability planning education should emphasize.

### *4.4 Negotiation, Arbitration and Conflict Resolution*

The roles and skills an environmental planner needs have to go beyond procedural organisation to structuring and coordinating decision making processes involving many interests much like a mediator or a coordinator. An environmental planner needs to have increased substantive knowledge as well as ability for interdisciplinary teamwork (Deknatel, 1984).

Niebanck (1993) suggests previously neglected skill areas of negotiation, arbitration and conflict resolution should be included in environmental planning education. He argues that one form environmental planning takes is targeted action and in addition to negotiation and communication skills this needs advocacy planning. Ethics and values underlie planning as principled action.

### *4.5 Critical Inquiry*

The importance of balancing environment, economy and equity values in making environmental planning decisions has already been discussed. Gunder's (2006) warning of the dangers of the way sustainability is perceived and taught in planning schools has also been mentioned. His specific concern is that even though economic growth always continues to seem to prevail in particular social justice may bet swept aside in the dualistic tension between market efficiency and environmental protection. To prevent this he suggests that planning education must develop in its students core skills of critical inquiry and of ethical judgment.

## 5. Studio Pedagogy and Environmental Planning

Adding to the complexities of the special requirements and challenges of environmental planning education is the significant shifts in advanced economies from manufacturing and knowledge services which create demand for a different set of skills in the workforce compared to what came before.

Binkley et al. (2012, pp.18-9) provide a list of ten a list of twenty-first century skills across four categories:

*Ways of Thinking*
1. Creativity and innovation
2. Critical thinking, problem solving, decision making
3. Learning to learn, Metacognition

*Ways of Working*
4. Communication
5. Collaboration (teamwork)

*Tools for Working*
6. Information literacy (includes research on sources, evidence, biases, etc.)
7. ICT literacy

*Living in the World*
8. Citizenship -local and global
9. Life and career
10. Personal and social responsibility- including cultural awareness and competence

How can environmental planning educators respond to the challenges they are facing while delivering the twenty-first century skills Gen Y needs? In designing environmental planning program curricula the tough choice between environmental knowledge and general skills/implementation methods can be overcome by striking a good balance between them. However, this is easier said than done. Experiential learning and project-based courses such as studios can deliver environmental knowledge and principles along with the practical skills that will lead to jobs while stimulating ways of thinking, and working, tools for working and living in the world. Properly conceptualised, designed and delivered, planning studios can provide students with substantive knowledge about environmental planning and a range of generic skills including communications skills, creative problem solving and critical thinking. The feedback received from students in Mid-semester Student Experience and Student Evaluation of Course Surveys for studio courses taught at Griffith University indicate that studio pedagogy is effective in overcoming some of the challenges of environmental planning education and delivering twenty-first century skills.

One of the difficulties of environmental planning education is integrating environmental science content into the curriculum. As foundations of the advanced planning content, these courses are usually delivered in the initial years of the degree and this may put off students who have a particular understanding of what planning is and what it involves. Even students who persist in the degree complain about the perceived irrelevance of these subjects. Alumni who work in resource management agencies or environment focused jobs appreciate that knowledge later on but one way to illustrate its relevance early on is integrating it with planning knowledge in studio projects. One of the key benefits of studio is integration and synthesis of knowledge and skills in a field example (Hollander and Thomas, 2009). Planning studios require students to draw upon personal knowledge and experiences as well as their academic learning from all their courses. Testimonials from students confirm that students acknowledge and appreciate the studio pedagogy because it gives them opportunity to see the linkages between the knowledge they gained through their previous coursework and allows them to integrate these in a studio project and put it into practice: ‘Through the studio course the lecturer was able to link the information we had received and the skills we had developed in our degree and put them to use in the development of a professional document.’

Studio projects also provide the perfect opportunity to illustrate the role of science and scientific information in environmental decision making. Using real world problems in hypothetical or real settings also allow students to see the role of values and the need to balance competing claims of environment, economy and equity. Discussions on political viability of proposals illustrate the difficulties planners face in the workplace to planning students in the studio.

The literature highlights negotiation, arbitration and conflict resolution (Deknatel, 1984; Niebanck, 1993; Susskind, 2000), and critical inquiry among *generic skills* important to environmental planners. Plan making, evaluation and related tasks that are at the heart of planning studios involve creative and critical thinking and analysis (Higgins, 2009; Balsas, 2012). Developing critical thinking ability is among the learning outcomes of studio courses (Németh and Long, 2012). Furthermore, studio pedagogy often involves team-based learning through which students learn to collaborate, understand group dynamics and develop interpersonal cooperation skills (Németh and Long, 2012; Senbel, 2012). Problem solving element of the studio pedagogy helps students develop skills in negotiating oppositional viewpoints and dispute resolution (Higgins, 2009; Németh and Long, 2012) and 'dialogical experience' in the negotiation of solutions within and across teams (Senbel, 2012).

Studio courses may include dealing with ethical issues as a learning outcome (Balassiano, and West, 2012) and aim at teaching students to assess planning outcomes based on a set of values such as justice or sustainability (Németh and Long, 2012). As such, through the selection of projects, *foundational knowledge* areas of sustainability, environmental justice and environmental ethics may be explored through a studio course. Project discussions are a valuable way of discussing role of values in decision making. Through the projects in a planning studio students are challenged to balance the competing claims of environment, economy, and equity and how science is included in the process. In this simulated planning environment they understand the various roles of the planner and develop their personal professional ethics (Németh and Long, 2012).

Studio pedagogy is also effective in integrating the twenty-first century skills. Planning studios are student centred learning and teaching environments characterised by problem based learning and learning by inquiry pedagogies which emphasise active independent student-focused learning. Students are required to work collaboratively with input from the profession and staff where the staff: student ratio is typically high (see Zehner et al., 2009). The main value comes from shifting the role of the student from passive receiver of information to an active and engaged learner. Studios provide the opportunity for teachers and students to explore problems and identify and reflect on solutions in a reiterative way. Students learn from their teachers' experience, from their peers, their application of concepts and they develop deep understanding by doing. While the learning by doing nature of the studio projects can initially be frustrating to students who are used to being told how to do things, once they get used to it they appreciate the freedom this gives them and enjoy being creative and innovative: 'I found the detailed, useful, and carefully-selected feedback regarding projects beneficial to my learning, as feedback would guide and develop my thinking as opposed to provide me the "correct" answer'. Students also enjoy the practical nature of the studio projects that allow them to 'problem solve real and relevant issues' and 'require critical and strategic thinking'.

Studio pedagogy relies on group work and through this teaches communication and collaboration skills (Higgins, 2009; Hollander and Thomas, 2009, Long 2012). When groups work students enjoy the experience and cite group work as one of the things they enjoyed most about the studio: 'Group work as you get to have different people's opinions and ideas you might not have thought off'.

One essential learning outcome of studio courses is improving students' research and communication skills (Long, 2012). Project based nature of the studio and its focus on a real project makes the learning directly relevant to the professional workplace and makes students highly employable.

## 6. Conclusions

The scant literature on environmental planning education highlights a number of challenges: diversity of skills and knowledge that needs to be covered, the role of science and values in environmental decision-making, and political viability of solutions. Added to this is changing economic structure and the rising need for a workforce equipped with a different set of skills. Studio type courses relying on project-based learning where foundational knowledge and planning principles can be integrated as well as practical skills and principles are applied to a real project can provide an efficient way of teaching the two sets of knowledge and skills necessary for an environmental planner.

Recommendations on dealing with the other challenges focus on the topics and skills that should be included in the environmental planning curriculum. A review of the literature on suggested emphasis in the curriculum shows agreement on the core themes that are deemed important in environmental planning education. Social and environmental justice forms one of the three pillars of sustainability. Both environmental ethics and environmental justice emphasize the importance of values in planning. Planner's role in the process is also a recurring theme. The skills that are emphasized include critical inquiry, negotiation, arbitration, and conflict resolution.

While recommendations are aplenty in terms of what should be included in the curriculum, there are no studies that confirm or reject the importance of these topics and skills in relation to environmental planning education. This points to a need for additional studies that can not only test these suggestions but also evaluate them. It is notable that of the three foundational knowledge areas of sustainability, environmental justice and environmental ethics found to be cornerstones of environmental planning education PIA accreditation policy mentions only principles of sustainable development in its discussion of supporting knowledge are of environmental planning and does not mention environmental ethics or justice at all.

In this paper we have argued for the importance of a studio teaching and learning environment as an important and valuable component of environmental planning education. The studio, we suggest, is just as relevant today for teaching environmental planning to Gen Y students as it ever was in previous times, as a method of teaching planning to generations of Boomers and Gen X students. And it will remain core to educating environmental planners in future generations.

# DILEMMAS IN THE DEVELOPMENT OF A CURRICULUM FOR URBAN PLANNERS IN A GLOBALIZED WORLD

Emile Dopheide[1], Mark Brussel[1], Johannes Flacke[1], Monika Kuffer[1]

Key words: planning education; curriculum development; international development agenda

*A number of dilemmas present themselves in the development of a new curriculum for urban planning and management for a changing target group from the global south. These dilemmas include the definition of a proper balance between general planning knowledge and skills versus specialized knowledge and skills; between theory and practice; between an academic versus a more professional orientation; and between examples and case studies from developing countries versus examples and case studies from European and North-American countries.*

*Based on actual experiences, this paper discusses the dilemmas in designing a curriculum for a changing target group as well as the challenge to develop a curriculum for the urban planner in a globalized world. It further discusses the potential of the international development agenda as a structuring element for the development of such a 'global' curriculum.*

*A number of good arguments exist to use the international development agenda in the development of such type of curricula. At the same time it underlines the importance of the development of a critical view towards the same agenda to ensure a proper link with the local practices of urban planning and management.*

*The paper invites for a further exchange of experiences and a debate on the dilemmas to develop a global curriculum for a global target group.*

## 1. The challenge of a global course in urban planning and management

Planning education programmes and curricula, and urban planning and management courses in particular, vary around the world and present them in many different dimensions, including disciplinary orientation; academic level and orientation; curriculum contents; adopted planning models; level of contextualization; importance given to technical, analytical and communication skills among others.

Over the years urban planning and planning curricula world-wide have seen an evolution form a design, survey and architecture orientation towards a more comprehensive curriculum including social and economic scientific concepts and methods, as well as the integration of the use of modern technologies like GIS to various degrees (e.g., UN-Habitat, 2010; Frank, A. I. et al., 2014).

[1] Department of Urban and Regional Planning and Geo-information management, Faculty of Geo-Information Science and Earth Observation (ITC), University of Twente, 7500 AE Enschede, The Netherlands; corresponding author: e.j.m.dopheide@utwente.nl

At the Faculty of Geo-Information Science and Earth Observation (ITC) of the University of Twente, urban and regional planners world-wide have been educated with a strong emphasis on the acquisition, analysis and use of geo-information.

Educational programmes at ITC have been constantly adapted and modified to cater for the changing needs of the target groups from mainly developing countries and emerging economies. Given this background the recent review of the MSc course Geo-information and Earth Observation for Urban Planning and Management (UPM) is used as a case to illustrate and analyze the challenges in the development of a curriculum in the field of urban planning that wants to be attractive, up-to-date and relevant in an international global context. Major questions addressed in this paper:

- What are the challenges for a developing a curriculum on urban planning and management for a wide international audience, particularly for individuals coming from the south?
- What is the potential of the international development agenda to offer a frame and point of reference for the contents and setup for such a curriculum?

One of the obvious challenges facing the development of a curriculum that is relevant to a wide international audience is satisfying the needs of a group with major differences in economic, social and cultural background; legal planning framework; levels of technological development; and human and financial resources. In other words a curriculum for a wide international audience encounters the difficulty to embed the contextual knowledge, which “”…….*is comparatively easy to relay in a one nation-focused classroom; but when students come from many countries, teaching of context becomes much more difficult* ..(UN Habitat, 2010).

This challenge is further enhanced when the students enrolled in such a programme have less of a professional background coupled with working experience. A recent change at ITC is the swift of the student population from a highly motivated mid-career professional to a fresh graduate with a strong academic ambition, i.e. students who recently have completed their BSC and immediately continue with their Master degree, often with the further motivation to pursue a PhD.

The so-called mid-career professional has the potential to bring his or her own working experience and challenges, which if appropriately utilized in the implementation of the course contributes to contextualize the learned knowledge and skills and increase the relevance of the learning process. Furthermore the mid-career professional stimulates the teaching staff to remain critical towards the taught curriculum as he or she demands knowledge, skills and competences relevant for their further professional and academic development.

A growing gap between theory and practice as identifief by Kunzmann, and Koll-Schretzenmayr (2015b) is a further challenge in the development of a contextual relevant curriculum. This growing gap is attributed by the authors to the decline in appointments of planners with a professional experience in academia as well as to accreditation and internal university evaluation, which often favours theory rather than practice.

## 2. Urban planning at ITC

Urban and region al planners world-wide have been educated since decades in the acquisition, analysis and use of geo-information at the Faculty of Geo-Information Science and Earth Observation (ITC) of the University of Twente.

Educational programmes at ITC have been constantly modified to cater for the changing needs of the target groups from mainly developing countries and emerging economies.

Urban planning at ITC is not a stand-alone planning course but an orientation and specialization of a MSc degree programme on Geo-information and Earth Observation. The MSc programma offers a 118 EC programme in a modular setup in 18-months (most MSc programmes of a similar study load in Europe are offered in 2 years). The programme consists of 23 modules: the first three modules are dealing with the core of the MSc degree programme, i.e. geo-information and earth observation; followed by a block of 7 modules properly dedicated to the specialization, e.g. urban planning and management (5 other specializations are being offered, see: http://www.itc.nl/Pub/study/Programmes/Master-of-Science-degree ). The subsequent 5 modules deal with academic research skills and advanced MSc subjects (elective). The last half year of the programme is dedicated to individual research through eexecuting research (often with fieldwork and/or information collection in the home country or country in the south where on-going projects with staff involved provide the frame for the MSc research).

Predecessors of the ITC MSc degree programme on Geo-information and Earth Observation for Urban Planning and Management in previous decades were very much focused towards surveying, mapping and data collection on human settlements. Throughout the years this focus has evolved towards more spatial analysis and decision support in the context of urban planning and management. Where core elements of the programme always remained s the use of spatial data and its specific aim at students from countries that are “economically and/or technologically less developed”.

The latest curriculum departed very much from a twin set of objectives of urban planning and management: i.e. the understanding of the nature and dynamics of the urban area and the development of interventions, which were taken as part of the main objectives for the new course. At the same time these two elements (analysis and developing interventions) were also an important structuring element in domain block of the course. Although for the lecturers and staff these twin objectives provided a logic structure, students did not recognize very clearly this structure and did not consider it very supportive in their learning process. Moreover, also staff over the years did not adhere very strictly anymore to the main structuring logic of the programme and elements of analysis and planning were interwoven in a number of thematic subjects.

Since 2006 the latest curriculum of the MSc degree programme on Geo-information and Earth Observation for Urban Planning and Management (UPM) has been implemented relatively successfully (positive evaluations from students; joint education with universities abroad, particularly Indonesia,; and a positive assessment as part of the renewal of the former accreditation of the MSc degree programme). However, since 2006 structural changes have not been introduced and particularly staff of the programme considered it opportune to have a closer look at the present curriculum to maintain and to maintain and where possible increase its relevance, attractiveness and quality.

## 3. Development of a new curriculum – description of process

DRAFT

To achieve the objectives of the development of a new curriculum a working group was formed consisting of 4 staff members, who together developed the following activities:

- Review of the present curriculum. The strong and weak points of the present curriculum were analyzed, among others based on previous course and module evaluations and curriculum development workshops as well as on the suggestions and feedback from the accreditation process 2014-2015
- Review of the research agenda in the field of urban planning and management in order to identify themes and research developments, that could be considered in a new UPM curriculum
- Review of the International Development Agenda. Review of the International Development Agenda should identify the main relevant issues and trends in the field of UPM which could to be addressed in the revised curriculum. Particular attention is given to those themes and sectors that have a clear opportunity for funding and sponsorships.
- Review of comparable curricula. Objective of this review was to identify interesting innovative contents and alternative educational approaches that possibly are interesting to be adopted within the modules 4-10 of UPM. Similar courses in Anglo-Saxon countries, the Netherlands, Germany; elsewhere in Europe; and in Latin American context were evaluated. This review also include the identification of relevant GI topics to be considered in the UPM course
- Alumni consultation. In December 2014 a set of questions was made available on-line to a selected group of alumni who all had taken part in the UPM course during last 8 years.
- Curriculum development workshop with staff and students in May 2015

In the following a number of results from these activities are being discussed; after which the latest proposed structure of the course will be presented.

## 1. Alumni survey – most salient features – some figures

In the review of the curriculum a survey was conducted among a selective group of alumni. A total of 92 UPM alumni (graduated in period 2008-2014) was purposively selected and approached by those staff members who still had some contact with these alumni. This approach certainly introduce some bias in the survey; but also made it possible to receive serious responses and noticeably very elaborated answers on the open questions. 52 UPM alumni responded , i.e. a response rate of 57%. The age of the respondents was mainly in the category 30-40 years (71%) and gender distribution was 50:50.

The respondents came predominantly from research, teaching and academic organizations (60%) and a considerable smaller group from public agencies (25%). This might be due to bias in the respondent selection, i.e. staff particularly maintains contacts with alumni through joint research projects or PhD research rather than with alumni from the professional field.

Further, the field of employment is predominantly urban planning (75%) followed by infrastructure and transport (41%). Architecture (25%) and land administration (19%) are reasonably represented. Functions vary from planner to academia. Almost 20% of the respondents were in leading positions.

These fields of employment are in line with the background of the students of the last 3 academic years. Students of the last 3 academic years have either an background in urban and regional planning (28%) or in architecture and planning 23%, followed by civil engineering.

Surprisingly, academic skills were mentioned most frequently (40% of the respondents) as one of the most useful elements of the course, followed by GIS and spatial analysis. Planning, policy and management was mentioned by about 20% respondents as the most useful. Remote sensing came clearly out as the element that was mostly mentioned as the least useful element of the course.

The above outcome in relation to the usefulness of GIS and RS respectively was largely in line with the response on the use of GIS and RS in the current of the respondents: 71% use GIS regularly or most of the time (RS: only 31%), while RS is used sporadically or not at all by 70% of the respondents.

Interesting enough among the missed subjects "planning-planning systems-planning theory" was most mentioned, followed by "land use (change) modelling" and "policy studies and urban policies". Particularly the call for more attention to subjects as "planning-planning systems-planning theory" and "policy studies and urban policies" was surprising as the respondents and the common target group applies for education at ITC because of the use and application of geographical information (in the context of for the urban planning).

The survey endorsed a number of assumptions and points of departure of the most recent curriculum review. The main motivation and aim of the UPM course was clearly reconfirmed through the survey, i.e. the main focus is on the application of geographical information in urban planning and management. That is students apply to study urban planning and management at ITC not to study urban planning as such, nor the geographical information technology as such. The use and application of geographical information is the clear niche of the UPM course offered at ITC, where the alumni very much appreciate the balance between theory and practice. Students expect to learn the advanced use and new development and application areas of GIS and RS technologies.

Furthermore the real world orientation coupled with the learning of practical skills is seen as an asset of the curriculum. It was repeatedly suggested to maintain and where possible enhance the use of real-world experiences through case studies, field research on location, study trips; guest speakers; and internships. Learning academic skills and critical thinking were explicitly mentioned a number of time as assets of the course.

Finally, it became very clear that the applicability of the course for developing countries and the international learning environment were very much appreciated by the alumni and they reiterated various times that these elements should be maintained and where possible further enhanced.

## 2. International Development agenda – sources; how and what to incorporate into the curriculum

As was outlined in the introduction one of the obvious challenges facing the development of a curriculum that is relevant to a wide international audience is the embedding of the contextual knowledge. As Habitat (2010) states: "the *'one-world' approach to planning education seeks to bypass these challenges by fundamentally altering planning school curricula to provide internationally relevant training regardless of the anticipated future location of the student's practice"* In the redevelopment of the UPM curriculum

it was decided to explore the international development agenda as a structuring element and content area to make the curriculum relevant for a wide audience.

Why is it interesting to look at the international development agendas in relation to the redevelopment of the UPM course?

These agendas kind of represent the thermometer of what, according to the international donor community, are the key problems and challenges in contemporary urban development in the south. They are the result of a continuous debate among donors and recipients on where to put budget priority for development in general and the urban sector in particular. They therefore offer an interesting perspective of what the most stressing issues to be addressed are. By design, these are (or at least should be) those issues that cities in the south are trying to come to grips with. UPM, being a programme that aspires to educate people to be able to analyse and solve problems in the urban sector, particularly in developing countries, has a clear problem orientation, which is why it is interesting to take note of this perspective.

It is also interesting to look at international development agendas in a broader sense. If we base ourselves on the principle that our work in research, education and projects needs to be aligned thematically, it makes sense to look at which themes are "hot" and where therefore funding opportunities may exist. A thematic development of UPM that aligns with some of the big themes in the international development agenda can help direct our thematic development and can help mobilize projects and resources, for research and capacity building, but potentially also for student fellowships.

In reviewing these international agendas we are looking for themes that are emerging, that are of interest and that are related to the expertise of the faculty involved. The overall agendas and specifically urban agendas of the following organisations have been reviewed: The Netherlands Ministry of Foreign Affairs, The World Bank, UN Habitat and the UN overall Sustainable Development Goals.

The word clouds below gives a graphical representation of themes extracted from these overall development agendas (left) and the urban development agendas (right) (words that appear more often in these agendas are in a larger font).

Fig. 1 Key words of overall development agendas and of urban development agendas [**proper sources to be added**]

DRAFT

Looking at these word clouds, it is interesting to note a couple of things:

In the general development agendas the traditional theme of poverty is still very prominent, however, there is equal attention to the theme of equality, which can be interpreted to have a similar meaning, but may also be interpreted a bit more broadly to be connected to all kinds of sectoral issues such as living environment, access to basic services of water and sanitation, health, transport etc. This has been an area of focus for the UPM course since its inception and is still of interest.

Moving to the urban agendas, we can basically observe a lower, varied level of words and a higher level with a limited number of words that feature prominently. At the lower level we can distinguish between words that represent more qualitative notions such as liveable, inclusive, green, safe, and words that represent more sectoral areas where challenges need to be overcome such as the economy, land, transport, infrastructure, buildings etc. These represent the more traditional sectoral areas that still draw a lot of attention in the development agendas.

The prominent themes are a mix of key challenges that cities need to overcome or refer to a desired future urban state. Here we see more traditional ones such as slums, housing, services, planning and governance, but also with contemporary ones that feature very prominently, most notably risk and resilience, reflecting the increased challenges of cities to respond to climate change and other hazards. In order for UPM students to be able to better plan cities and making them more resilient to hazards, and thus reduce urban risk, these themes warrant inclusion in the new course.

## 3. Research agenda

Various authors have analyzed recently emerging research agendas in spatial planning, including both novel areas of research and important shifts in the direction of a research area (Banco et al. 2009a, Blanco et al. 2009b). They claim that the challenge for planning schools is to reflect critically on these changes and develop long-term research agendas that can better position the domain of spatial planning field in society and academia, and providing a basis for state of the art educational programmes. The following new and emerging research topics are to be included in a the new ITC urban planning programme.

The first and probably most relevant issue is the increasing number of occurrence and severity of natural disasters including climate change. Worldwide the number of disasters has almost quadrupled during the past 30 years and there is a widespread consensus that urban disasters are increasing exponentially. Moreover, the role of cities has changed from places of refuge and buffers against environmental changes to hotspots of disasters and risk (Wamsler, 2014).

Secondly and strongly related to the former in several aspects, the world is becoming urban. Since 2008 more than half the world's population is living in cities and urbanized areas and this trend is continuing. It is expected that 60 percent of the world's population will live in cities by the year 2030 and 70 % by 2050. Moreover, also the number of large cities and the size of the world's largest cities are increasing. The number of cities in the world with populations greater than 1 million increased from 75 in 1950 to 447 in 2011. Consequently, an state of the art educational programme needs to put a strong focus particularly on

the relationship and interplay between these two emerging issues, which are in turn also strongly affecting other important sectors of urban planning, such as health, poverty, and spatial equity and justice issues.

Both issues mentioned above are particular relevant in the rapidly growing cities of the global south. Much of the disasters are taking place there resp. having more severe impacts, and particularly climate change adaptation is a burning issue in global south countries and cities. On the other hand, we have to acknowledge, that the "urban planning ideals and the corresponding organisational and planning models of e.g. African cities are inherited from the Western countries that colonised them". With respect to this Watson (2009) points out that national to local planning systems of the global south "have changed very slowly and some hardly at all, with many approaches and systems reflecting planning ideas from the global North simplistically transferred to Southern contexts through complex processes of colonialism and globalisation". Contemporary debates on a new planning agenda for the global south and instruments such as south-south collaboration for mutual learning and knowledge transfer are to be considered in a new curriculum.

Another upcoming new research relevant in the global north as well as in the global south is labelled with the slogan 'health in all policies' (Ottawa Charter for Health Promotion 1986). Traditionally urban planning has had a strong focus on health issues (Rodenstein 2012). One goal of planning was to provide more or less healthy living conditions for the rapidly growing cities during industrialization since the 19th century. Nowadays we see this primal vision of planning having a strong renaissance. Several studies and publications related to health issues stress the importance of place and space in health related research and the need for a better integration of public health and spatial planning (Barton and Grant 2013, Abernethy 2014).

## 4. Other comparable curricula

As a first part of the curriculum redevelopment, other MSc programmes in the field of urban planning were reviewed. Starting in the Netherlands, the review covered several Msc programmes that offer MSc courses with an urban focus to Dutch and international students in English language. The main key figures and setups of the Dutch Urban MSc courses are (March, 2015):

- IHS Rotterdam: MSc in Urban Management and Development
  Duration 12 months (72 ECTS)
  The programme is divided in three periods, i.e. a core period, the specialization period and the thesis period.
- UVA Amsterdam: MSc Urban and Regional Planning
  Duration 12 months (60 ECTS)
  The program is split in several planning topics, e.g. planning methodologies, innovative international planning practices, and ends with a thesis project
- UVA Amsterdam: MSc in Urban Studies (Research Master)
  Duration 24 months
  Prepares students for PhD, the setup is multidisciplinary, the programme is a mix between core topics, electives and contains an exchange semester abroad, it ends with a thesis or a research article.
- Delft University: MSc of Science Architecture, Urbanism and Building Sciences
  Duration: 24 months (120 EC)

Students can choose between five tracks, the programme contains elements of scale in planning (neighborhood to region) and topics based on upcoming trends (e.g. congestion, climate change).

- University of Groningen: MSc in Environmental and Infrastructure Planning
  Duration: 12/24 months (120 ECTS)
  It is also offered as double degree course for Indonesian students (24 moths). This students spent the first twelve months in Indonesia and the second twelve months in the Netherlands. Planning topics are treated at different levels from local to central planning.
- University Utrecht: MSc Human Geography and Planning
  Duration: 2 years (120 ECTS)
  The course is split into theory and planning methods, with also a study abroad element, Master's thesis research project. The course ends with a scientific paper.

The course durations range from 12 months to 24 months. In particular research oriented MSc courses that aim to prepare students for a future academic carrier have durations of 24 months. Innovative or at least interesting aspects in the reviewed courses are the inclusion of academic exchange (semester abroad) and to end the course with an academic paper. The extent to which these courses deal with urban planning in the Global South vary, only IHS has a very specific focus on the Global South but the course focuses on planning theory and practices and does not cover much the use of geo-information for planners. The set-up of the courses has often elements of core mixed with elective topics. However, the structure of the courses differ, some have a sequence of topics, other follow a planning cycle or a addressing planning topics at different scales.

To get a better overview the review was extended to examples beyond the Dutch MSc. But focusing on MSc taught in English language. Also in the UK courses have often the setup to include core and elective topics, e.g. at UCL the course is having 75% core components and 25 % electives where students can choose from a large set of topics. Also many programmes in the UK offer MSc programs within 1 year, but they also offer the option of a flexible duration. It is possible to study full time (e.g. 1 year) and part-time (2-5 years). A very similar programme with a strong focus on the Global South is offered by SPRING Dortmund University as a 2 years master. The setup is a 1st year in Dortmund, 2nd year at a partner universities (Chile, Ghana, The Philippines, Tanzania). The programme structure follows very much the planning cycle from analysis, planning to implementation. The Urban Management Program of the Berlin Institute of Technology (TU Berlin) has a similar focus. Within a period of 1.5 years to course focuses on development situations in the South and transition countries. The Mundus Urbano programme, advanced Master of Science programme specialising in International Cooperation in Urban Development, is jointly offered by four European Institutions and promotes internships.

Based on a review of some further European MSc courses in the field of urban planning and management, a further list of important and upcoming topics for planners in the Global South was identified:

- Gender and development with a geographical perspective
- The politics of housing and informality and low cost housing
- Spatial economic analysis
- Crime and control
- Urban design for development

DRAFT

- Disaster risk reduction in cities and post disaster recovery planning
- Critical issues in mega infrastructure investments
- Adapting cities to climate change in the Global South
- Transport policy and finance
- Territorial governance and policy analysis
- Smart Cities

Besides a review of planning courses also GIS course were included into the review to derive a list of GIS topics that have gained importance in the last year. The following topics have been extracted to have potential to be relevant of urban planner and young planning academics:

- Geodesign and Geovisualisation
- 3D GIS
- Web & Mobile GIS
- Open Source GIS
- Big Data
- Artificial intelligence
- Machine learning and decision trees for image analysis
- Web Based GIS

Based on the review of other MSc programmes, interesting and relevant ideas for structuring an urban programme were synthesized:

- Structure based on planning cycle/process
- Structure based on major planning topics (e.g. mix between theories and methodologies)
- Structure based on scales in planning (national, regional, local, neighborhood)
- Structure based on future city models – to deal with global challenges
- Semester versus module structure or mix (e.g. Berlin)
- Core versus optional/elective modules (e.g. UCL)
- Mix between theory and studios
- Integration of study abroad and/or internships

Thus in conclusion the structure of programmes vary, some following a topic structure or according to scales while others structure according to the planning cycle. Some programmes are more professional oriented while others have a very strong research focus and aim preparing students for research and a PhD. Most programmes mix core and elective topics and mix theory and methods. Many programmes have study aboard, exchange or internship components, which brings an added value for students and increases future employment opportunities of graduates.

## 5. Inputs from present students

Students recognize and reiterate that there main objective for studies at ITC is the learn GI in the context of urban planning and do this in a truly international environment. The niche is learning geo-information science in a context of urban planning and management

## 6. A new set up of curriculum Master of Science degree in Geo-information Science and Earth Observation in Urban Planning and Management (UPM)

Based on the analysis of the various reviews a curriculum is being proposed which is relying to a large extent on themes of the international development agenda. This curriculum is further endorsed by the research agenda in the field of urban planning and management, from which we can learn the importance of addressing the link between growing cities and the interrelationship with disasters and climate change; but also the need to build in mechanisms of mutual learning and knowledge exchange to contribute to a relevant planning agenda. From other curricula a further list of important and upcoming topics for planners in the Global South as well emerging GIS topics that have gained importance in the last year and are of relevance for urban planners.

The proposed structure consists of the following modules:

M4: Introductory module discussing the urban planning and policy process, the roles of different actors in this process and the use of spatial methods and techniques. Introduction to the themes and contents of modules 5-10.

M 5-10: 5 thematic modules and a project module. Methods and techniques are interwoven in such a way that a whole palette will have been offered at the end of M10.

Module 5. The sustainable city

Module 6. The inclusive city

Module 7. The competitive city

Module 8. The compact city

Module 9. The resilient city

Module 10. Final project module

As UPM is meant to be a planning programme, we want to start off module 4 with a focus on planning. It is important that students get a sufficient and shared understanding of historical and contemporary thinking on planning and how it is practiced in different contexts and how spatial information is contributing. We also want to develop process thinking with our students. Not only do they need to be aware of abstractions of the planning process and what is commonly done in different parts of this process, they should also recognize the role of various actors and appreciate GI based methods and techniques that can be used. The experience in module 4 is also meant to help the students to better understand the policy directed thematic discussions in the consecutive modules and the linkages between them.

Although the sustainability concept has been around for some time, it is still a useful concept for students. It helps them to appreciate the multi-faceted nature of development and to understand that development has different connotations. The SD idea is still very much central in the new development agenda of the

UN and in that sense of particular importance to students from the developing world. Students need to be made critically aware that there are many ways to measure sustainability and that the concept is therefore rather difficult to make concrete, but that it has its value in the urban policy arena.

A key scientific and policy issue is the creation of inclusive cities. A lot of work is ongoing in the PGM department in terms of how we can analyse, evaluate and improve the position of disadvantaged groups in society in terms of their overall well-being and perspectives and their access to basic services. In this work a variety of spatial and statistical techniques are of use that students need to be made aware of and that have value for other parts of the curriculum.

In a globalizing economy, cities are increasingly challenged to be competitive and offer a high quality living environment, affordable housing, attractive conditions for businesses and a varied set of accessible services. A key condition to achieve this is a proper functioning of the land market. Questions of access to land, land taxation, flexible land arrangements, tenure security and the functioning of the housing and rental market are all underlying the promise of success for urban development strategies. On top of this, strategies of infrastructure and residential, commercial and industrial development will be the key determinants of achieving economic growth. Understanding the anticipated effects of these proposed interventions through a variety of economic and environmental appraisal techniques is essential learning for our students.

A central discussion in urban planning relates to how we shape our cities. Where do we plan the different functions to achieve our strategic objectives? Students will learn that various spatial configurations of cities have great impact on the spread of activities and the demands placed on the transport system but also that it works the other way around: how the transport system is developed has a great influence on how cities are shaped and functions located. This understanding, in a dynamic urban growth context, will be addressed in the compact city module. Students will get acquainted with relevant theory and practical application of land use and transport models that will help them to analyse and quantify the current situation and future development scenarios.

Urban dwellers are increasingly under threat from natural and man-made hazards. Cities need to develop strategic choices to avoid high levels of hazard and target development in such a way that risks are contained and are manageable. It is important therefore that urban planners are able to understand and analyse urban risk and are able to direct spatial planning at making cities more resilient.

In a final project module, the students will work in a real case setting on an urban development/planning problem in which a number of important concepts/methods and techniques that have been addressed in the curriculum can be brought into practice. In this work, the students need to demonstrate that they are able to describe, analyse and discuss a planning problem and come up with well-motivated plans. The emphasis will be on students' ability to critically to discuss and explain the choices made and to critically reflect on their proposed course of action.

DRAFT

## 7. Remaining dilemmas and challenges in curriculum development and implementation

In this paper we identified a number of challenges in the development of the a curriculum on urban planning and management for a wide international audience, particularly for individuals coming from the south. The challenges were illustrated with the experience of the development of a 18-month MSc curriculum on MSc course Geo-information and Earth Observation for Urban Planning and Management at the Faculty of ITC, University of Twente, Netherlands.

- Applicability and contextualization of the knowledge and skills
- A changing audience from less professional towards more academic
- Growing competitive global environment
- Tightening demands from accreditation frameworks
- Weakening links with the planning practice, i.e. a growing gap between practice and theory
- Higher priority given in academia to research excellence rather than to education
- Accreditation and quality control schemes
- The tension between rational comprehensive planning approaches and the planning practice with prevailing uncertainties, power relationships, conflicts and complexities.

The paper shows the potential of the international development agenda as a frame and point of reference for the contents and setup for such a global oriented curriculum. International development processes and debates set an agenda for a number of academic and policy developments that provide the frame in which the graduates have to operate. Funding schemes on which graduates and their organizations depend to a large extent are guided by the themes and priorities set in the international development agenda.

Departing from the international agenda to identify the main relevant topic areas in the curriculum poses the risk of implanting the agenda of the elite in international development policies. As said above, many alumni are confronted with the international development agenda. This requires students being conversant with these themes in a critical manner. A global oriented curriculum should therefore offer ample room for developing a critical attitude so that students could relate these themes to their own local needs as well as linking their local planning needs to the international development debate.

# NEW PERSPECTIVES IN PLANNING EDUCATION: HOW PLANNERS CAN COLLABORATE IN INTERDISCIPLINARY WORK ENVIRONMENTS

Bahar Gedikli, Ela Babalık-Sutcliffe

[1]Middle East Technical University, gedikli@metu.edu.tr
[2]Middle East Technical University, ebaba@metu.edu.tr

Keywords: Planning education, Interdisciplinarity, Multiculturality,

## Abstract

The ever-networking contemporary society has impacted on urban areas, making their physical, social, economic and organizational dimensions more complex. Consequently, sustainable spatial development has become a challenging aim, which requires planners to collaborate with professionals from other disciplinary domains. Many urban sustainability problems necessitate joint action of different practitioners/researchers (representing public and private institutions and/or non-governmental organizations). Their involvement may range from the physical/design dimension to technical/engineering, sociological, economic, environmental and organizational dimensions. These public and private actors explicate their standpoints, negotiate, and develop a common response to a specific problem.

Given the increasing need for collaboration with different professionals, planning education should be improved in such ways to prepare students for interdisciplinary work. Furthermore, today city planners increasingly work in international projects/ institutions requiring a global as well as a multicultural understanding of urban problems. Both interdisciplinary and multicultural approaches should be incorporated into planning education.

This study portrays the findings of an international interdisciplinary programme (an Erasmus Intensive Programme), where 45 master students from 9 different countries with different disciplinary backgrounds (city planning, architecture, sociology, geography, territorial sciences) came together. They worked in teams to develop sustainable spatial development projects for an urban area in Ankara. Based on questionnaires with students, the study shows students' perspectives about interdisciplinarity; what new perspectives they learned from one another, what challenges they faced. The outcomes help us understand the achievements and challenges that interdisciplinary experiences present, provide lessons in preparing similar programmes, and better prepare planning students for interdisciplinary work environments.

## 1. Introduction

The ever-networking contemporary society has impacted on urban areas, making their physical, social, economic and organizational dimensions more complex. Consequently, sustainable spatial development has become a challenging aim, which often requires planners to collaborate with professionals from other disciplines. Many urban sustainability problems necessitate joint action of different practitioners and researchers from public and private institutions and/or non-governmental organizations. Their involvement may range from the physical/design dimension to technical/engineering, sociological, economic, environmental and organizational dimensions.

Obviously urban planning and design does have a domain of its own, it involves in the physical organization of urban space starting from the regional scale and going down to the neighbourhood

and even smaller spatial scales (Balaban et al. 2014). The increasing need for joint action with other professionals does not make planning an "interdisciplinary" area; planners collaborate with others keeping their disciplinary position and expertise like other professionals do. Having said that, given the increasing need for collaboration with different professionals, planning education should be improved to prepare students for interdisciplinary work. Furthermore, today city planners increasingly work in international projects and institutions requiring a global as well as a multicultural understanding of urban problems. There is a need to incorporate both interdisciplinary and multicultural approaches into planning education.

Today many problems do not clearly fall into the research and practice of one single discipline; they stand in a place where several disciplines could intervene. There are three different modes of collaboration of multiple disciplines so as to tackle such problems and phenomena: First is the *multidisciplinary* approach, involving researchers from two or more disciplines who work jointly on a common problem, without modifying disciplinary approaches or developing synthetic conceptual frameworks. The second is the *interdisciplinary* approach that uses an innovative conceptual framework to combine and modify two or more disciplinary approaches. The third is the *transdisciplinary* approach which involves non-academic practitioners working with academics on real-world problems (Tress et al., 2003; cited in Graybill et al., 2006).

Another set of definition is developed by Rosenfield (1992). He defines multidisciplinary projects as the ones in which researchers from different fields contribute methods and ideas of their own disciplines towards a research question. Meanwhile, interdisciplinary projects require closer collaboration of researchers from different fields who work together on a common problem. In transdisciplinary projects, researchers from different fields work closely together on a common problem for a longer period, and develop a shared conceptual model that integrates and transcends their disciplines (Rosenfield, 1992; cited in Mitrany and Stokols, 2005).

There are obviously certain differences in these sets of definitions. For some other study, it would be necessary to differentiate between the approaches and discuss them separately; however, this study aims at emphasizing the increasing "collaboration" of planners with other professionals for multi-, inter- and/or transdisciplinary purposes. Therefore, it brings these approaches together since all of them imply collaboration of professionals from different disciplines, and uses the term "interdisciplinarity" to refer to all of them.[1]

This study, after reviewing the literature on interdisciplinarity in planning education, elaborates the achievements of an interdisciplinary and international programme (an Erasmus Intensive Programme) in this respect. The programme was held twice in Ankara, each of which was organized with the participation of approximately 45 students with different disciplinary backgrounds from 9 different countries. They worked in teams to develop sustainable spatial development projects for an urban area in Ankara. Based on questionnaires with these students, the study shows students' perspectives about interdisciplinarity in a work environment; what new perspectives they learned from one another, and what challenges they faced. The outcomes help us understand the achievements and challenges that interdisciplinary experiences present, provide lessons in preparing similar programmes, and better prepare planning students for interdisciplinary work environments. The study concludes with implications and recommendations for planning education.

[1] There are also other terms in the literature such as interprofessional and cross-disciplinary collaboration. We have chosen interdisciplinarity, as it is more commonly used in Turkey.

## 2. Interdisciplinary approach in planning education

As mentioned before, complex urban problems require collaborative work of different professionals. Sustainable development, environmental degradation, and brownfield redevelopment are among this kind of problems and phenomena (Mitrany and Stokols, 2005). As Davoudi (2010, 34) argues, *"interdisciplinary perspectives provide a useful means of dealing with complex or 'wicked problems' which cannot be addressed satisfactorily by a single discipline"*. Stating that in the real world, interesting and complex questions are left at the interfaces between disciplines, she suggests that addressing them requires synthetic and integrative approaches and that it is this need for integration which puts spatial planning in a position of strength. While some consider the interdisciplinary basis of the planning discipline as a weakness, others see it as a key strength (Davoudi, 2010).

There are two major arguments that support the interdisciplinary approach. The first one suggests that it fills the gaps that disciplinarity leaves empty, or surpasses what disciplinarity cannot achieve. The second argument mentions that interdisciplinarity already exists within disciplines. That is, disciplinarity and interdisciplinarity have evolved in an interlacing manner, with latter growing within disciplines. The interactions that are created via boundary crossing are seen as central to the production of knowledge as boundary formation and maintenance (Chettiparamb, 2007 cited in Balaban et al., 2014).

Those who advocate interdisciplinary learning in university education justify it with the following arguments (Woods, 2007):

- Student engages in his/her own discipline critically by viewing it from another perspective,
- Contemporary working patterns increasingly call for interdisciplinary team work,
- Present global challenges require new, holistic approaches.

Essential to the interdisciplinary attempts is the *ability to understand and be understood* in a diverse group of specialists. Woods (2007) states that interdisciplinarity, by implication, is all about communication. Experience of this type of collaborative problem-solving holds potential for developing students' abilities in effective interdisciplinary interaction after graduation.

Since the complex spatial phenomena often require an interdisciplinary analysis and problem-solving approach, planning schools have to play a major role in providing students with skills for interdisciplinary work. Here, it is important to underline that interdisciplinarity in planning education refers to many different levels and types: It may refer to developing a new interdisciplinary graduate programme in which urban planning is a significant contributor; it may refer to a specific course in the undergraduate/graduate planning curriculum which is conducted cooperatively by teachers from different disciplines; it may be a joint course of more than one department including urban planning; it may be a temporary activity/summer school/workshop where both teachers and students are from different professional backgrounds, etc. The content of interdisciplinary courses or programmes, and the extent that planning schools adopt them certainly vary from one context to the other, depending on specific needs and priorities.

Planning has a strong interdisciplinarity in its root: in addition to the knowledge of planning, knowledge of other disciplines that closely influence the built environment, the society and all socio-spatial processes are relevant to a planner, and hence addressed in most planning education curricula. However, only delivering the knowledge of other disciplines does not necessarily help an education programme to equip its students with the skills and experience of working in interdisciplinary

environments. Sandercock (1999) argues that the profession is in danger of becoming irrelevant if it does not adopt a more interdisciplinary approach to the problems of the urban habitat but that there are difficulties in adopting more interdisciplinary studies, often related to the fears of not satisfying professional requirements for accreditation. Doebele (2007) also states that true interdisciplinary efforts in universities are difficult to achieve due to the pressures of time and conflict of basic interests.

Urban planning education is composed of theoretical as well as practical courses. Planning studios are of the second type, where students exercise what they are going to do in practical life. The Planning studio models after the approach of "learning by doing" and it is the platform where theory and practice comes together, with theoretical courses feeding the studio. Studio can also be considered as an ideal platform for facilitating interdisciplinary work environments. It is common that instructors with different disciplinary backgrounds come together as the members of the studio teaching staff. This may help reflect, albeit only to a certain extent, the interdisciplinary perspectives that may be considered in handling an urban problem. This is also supported by a survey made with head of planning schools in Turkey, in which the results reported showed that studios were seen as the main arena for providing an interdisciplinary study experience for students, and that this was achieved through the participation of teachers from different disciplines or through role playing by students (Balaban et al., 2014).

Planning studio courses often comprise a field trip, and this may be another tool in creating an interdisciplinary experience as Doebele (2007) suggests. Tackling a specific field problem by a group of students from varying professions can be challenging but the results rewarding. According to Doebele, field trips can also be a means for bridging the cultural gap between different members of the class. The research below also proves that the field survey performed in the Intensive Programme was very useful for the analysis of the same problem from different disciplinary angles: students mention that they analysed the case study area with the approaches and tools of their own disciplines, but in their interdisciplinary teamwork they were amazed by the fact that the approaches of students from other disciplines were also meaningful for the very same case study area, and synthesizing the outputs of all of these perspectives enriched their team project.

The way fieldtrips are used in planning schools also point to an international experience (Peel and Frank, 2008) in addition to an interdisciplinary one. These fieldtrips provide an opportunity for students to learn about urban problems and processes in a different urban setting, but also experience different perspectives on how urban problems tackled in a given locality. The research below also supports this idea: Participants of the IP found it useful to get in contact with local culture.

Bringing together opportunities for interdisciplinary and international work-environments, the Intensive Programmes implemented through Erasmus deserve attention. Balaban et al. (2014) also mention in their research depicting the interdisciplinary study opportunities in Turkish planning schools that Intensive Programmes were highly valued by chairpersons and instructors who experienced them. Such experiences were limited in number for the case of Turkey, but they created a work environment where planning students were required to work with team members from other disciplines, often architects, in order to prepare the final product of the Intensive Programme. Building on these arguments, the current study focuses on an Intensive Programme in Ankara that brought students not only from city planning and architecture programmes, but also departments of geography, sociology, social and territorial sciences.

## 3. Evaluation of the interdisciplinary aspect of an education experience: An Intensive Programme held in Turkey

The research below was conducted with the students who participated in the Intensive Programme held in Ankara twice. Each of them was organized with approximately 45 students from 13 different schools across Europe for a duration of 14 days. The programme focused on two case study areas in the city. It was held in the form of a short studio course, where study teams were composed with students from different disciplines and different countries. These groups worked on one of the case study areas, analysed its problems and potentials, and developed strategies and policies through a sustainable urban development perspective. Schools were from 9 different countries (Belgium, France, Netherlands, Portugal, Slovakia, Spain, Sweden, UK, and Turkey) and include fields of city and regional planning, architecture, geography, social and territorial studies, and sociology. The analysis regarding this interdisciplinary and international experience is described below.

*3.1 Findings of the Questionnaire Survey*

The questionnaire survey was responded by 35 students with an average age of 26 (11 male and 24 female). 27 of them were enrolled in a graduate programme, while 8 of them were undergraduate students when they participated the IP course. They represent 13 schools from different countries; namely 10 students from Italy, 8 from Turkey, 4 from Greece, 3 from Belgium, 3 from Netherlands, 2 from France, 2 from Portugal, 1 from Sweden, 1 from UK, and 1 from Slovakia. Their disciplinary domains are displayed in the following figure:

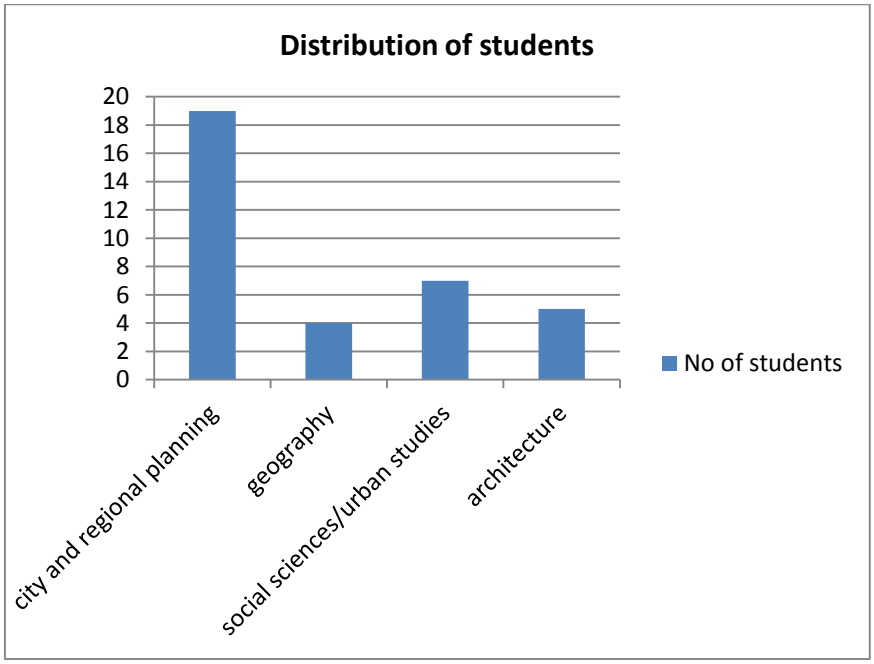

Figure 1-Disciplines of students who participated the questionnaire survey

The participants of the IP were asked a number of questions on the interdisciplinary and international nature of the programme: how they viewed the experience, what challenges they faced, and how they thought it impacted on the final product were few of such questions. Below, the replies of respondents are described under headings that correspond to each of these questions:

*3.1.1 Working/studying with those from other disciplines*

The first question regarding interdisciplinarity was whether the participants found it important to work/study/collaborate with those from other disciplines. The results reveal that the entire participants

consider it important to collaborate with people from different disciplines. The benefits of interdisciplinary collaboration that the participants have mentioned in the survey can be categorized as follows:

- **Learning different perspectives and achieving more innovative outcomes:**

Seventeen students believe that interdisciplinary work allows learning new perspectives, new terminologies and methods. They mention that through interdisciplinary work, a given problem can be handled from different points of view which can complement one another. Four students (of the 17), together with the significance of different perspectives, also express that interdisciplinary work leads to innovative conclusions/outputs. One participant states that such work not only helps to understand other dimensions of the topics at hand, but sometimes to discover new ones. Another student explains that different points of view help understanding the given problem in a larger perspective and adds that interdisciplinary work also provides an opportunity to assess one's own understanding.

- **The subject matter, namely cities/settlements, requiring interdisciplinary collaboration:**

Eight participants emphasize that interdisciplinary analysis is useful to analyze the dynamics and characteristics of cities. The "complexity" of the object necessitates a team with different skills.

- **Improving teamwork skills:**

Six students mention that interdisciplinary educational activities improve their teamwork abilities. Three (out of 6) students say that these experiences are useful, because practical life often requires to work in teams.

- **Improving one's skills in his/her own discipline:**

Six students believe that interdisciplinary work, via sharing knowledge and experience, contributes to their own professional skills and knowledge. One student states that a too specialized knowledge might limit the horizons, and thus we must draw inspiration and contribution from others. Another one mentions that interdisciplinary work helps to develop a more interdisciplinary perspective in his own field of research.

- **Understanding and responding to multifaceted problems:**

Two students highlight that the results of interdisciplinary work are stronger in order to face the multivariable social, economic, cultural and political spheres.

Consequently, the most highlighted benefit of interdisciplinary working is learning new approaches and methodologies to understand a given problem in a larger perspective, and provide better and more innovative solutions. The figure below shows the entire benefits mentioned by the participants of the survey.

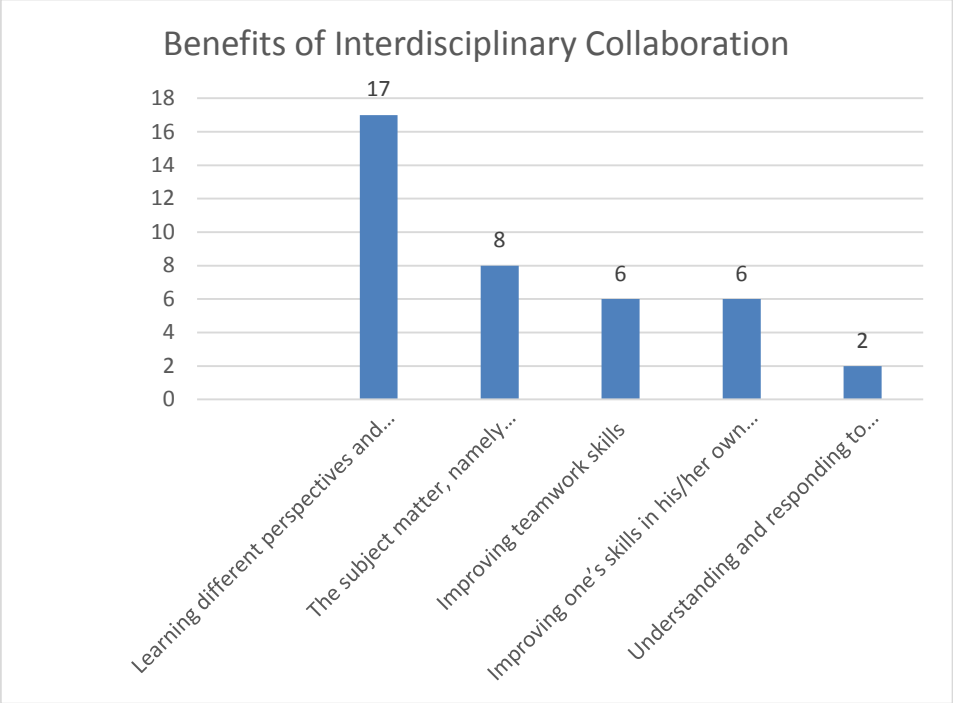

Figure 2-Benefits of interdisciplinary collaboration in students' views

*3.1.2 Courses for interdisciplinary working/studying*

Students have been asked whether there are such courses in their undergraduate/graduate programmes that provide them with the opportunity to work with people from other disciplines. Participants of the 11 schools (out of 13) answer positively to this question. The courses which provide them with interdisciplinary experience represent a very large variety that include planning theory, anthropology, economics, ecology, history, sociology, chemistry, GIS, research methods, study trip, and so on. As mentioned in Section 1, the approaches to interdisciplinarity in education can differ from one context to the other. Responses of students reflect that they have experienced interdisciplinary learning environments in different courses.

*3.1.3 Interdisciplinary working/studying experience within the IP course*

The questionnaire asked the participants whether the IP course in Ankara provided them with a useful learning experience in terms of working with people from other disciplines. All of them respond positively to this question. They have been asked to elaborate particularly what aspect(s) was/were useful in the course. Their answers are grouped as follows:

• **Learning different perspectives and approaches:**

27 participants express that it was useful to learn different perspectives, approaches and methodologies of other disciplines during the IP course. Their responses reveal that the interdisciplinary work provided them with the opportunity to deeply understand the object of the project. One student mentions that it was particularly interesting to arrive at a common point of analysis with inputs from multiple disciplines which resulted in a holistic understanding of the subject of development. Another one states that the final projects also highlighted various expertise of students from different backgrounds. Six students (of

the 27) give examples in their responses, eg. how different disciplines see problems and in what aspects they complemented one another in their teamwork during the IP.

**• Learning teamwork, time and conflict management**

Nine students emphasize the challenging aspects of the interdisciplinary teamwork and how they learned to tackle with them. Different views may arise in a teamwork and time constraints may be stressful. Their responses reveal that during the IP course they participated, they learned to communicate and collaborate in order to produce the demanded work in a short time.

**• Learning in a multicultural work environment**

The IP course provided students not only with an interdisciplinary learning experience, but also with an international work environment. Nine students point to this aspect as a useful experience. Two students also point to the importance of working in a different planning context. One of them explains that conducting questionnaires at the work field and getting in touch with local people were useful.
The benefits of interdisciplinary learning experience in the IP with respect to the responses of students are summarized in the following figure:

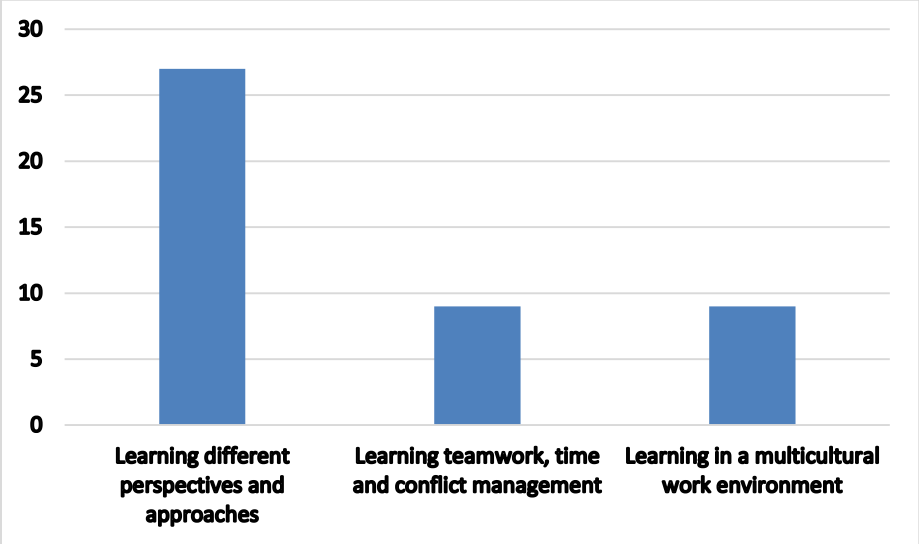

Figure 3-Benefits of interdisciplinary learning experience in the IP in students' views

*3.1.4 Disciplines that were productive to work with*

The participants were also asked which other disciplines they found it particularly useful and productive to work with. They were free to indicate as many different disciplines as applied. The analysis of the replies shows that both city planners and sociologists are indicated by 23 of the 35 participants. Architects and Geographers are indicated by 18 participants. Five of the respondents state that all of the disciplines involved were equally productive to work with.

The answers to this question was also analysed by separately observing the replies given by city planning students and students from other departments. 18 of the students of city planning departments cite sociologists as useful and productive to work with; 14 of them indicate geographers, 13 of them architects, and 12 of them city planners. Among those who were from other departments (non-city planning departments), 10 of them indicate city planners as useful and productive to work with; 6 of

them indicate sociologists, 4 of them architects and geographers. In short, it is interesting to note that those from planning and sociology schools are considered as particularly productive to work with.

### *3.1.5. Learning experience due to the international multi-cultural nature of the IP*

As described before, the IP Course was carried out in multicultural working teams with both students and teachers from different countries. The participants were asked whether they found this particular aspect useful, i.e. whether they learnt different academic perspectives from those coming from different countries. In this question no options/answers were offered to students and they were just asked to explain their experience and thoughts on this multicultural environment. Only three participants say that multi-culturality was not something they observed and felt strongly during this programme; but remaining 32 participants gave answers and made comments about what they took from this multicultural working environment. Their answers can be grouped under two categories: those who commented on the different academic perspectives they learnt from team-members and teachers coming from different countries; and those who commented on different teaching/learning models they realised that existed in different countries.

- **Different perspectives due to different country/cultural backgrounds**

Twenty-one respondents stress that it was a very enriching experience to realise that same topics were treated, understood, analysed and solved in different ways by those who came from different countries, because due to their cultural, social and political context they interpreted phenomena differently. There were similarities too, and seeing both differences and similarities between those from different countries and different cultures was considered as a valuable experience. Some respondents say that even the style of working, in terms of time management, creativity, effectiveness in team work, and visualisation of ideas would differ from country to country. One participant particularly stress that to witness this multicultural environment of working and to learn different perspectives from those coming from different countries and schools were in fact the most important opportunity that the IP provided. Below are some quotes worth highlighting:

> *"Naturally, the way of thinking on planning and also more general issues is different in different regions of Europe (or the world)... It was interesting to see what the hot topics are in some countries as people from these countries (sub)consciously pushed these agendas. So, in a way, one could observe "the evolution of (planning) thought" in real world practice."*

> *"Planning is vested in the culture of a country and this became apparent in the way different participants of the IP worked and also the solutions they brought forth. My own cultural background is known for its strong governmental role in urban planning, while other cultures have a different role for the government in planning. The combination of these views on planning were very interesting and made me realize not only that there are difference in perspectives on planning, but also to combine these views which can make a planning policy stronger."*

> *"It was very interesting to see that many of the students and professors shared the same concerns especially about the (real estate) "development" industry, politicians, and executive powers. It was helpful to see how different planners and architects in different parts of the world have dealt with very similar issues."*

- **Different styles of teaching, learning, and student-teacher relations**

11 respondents comment not on the variety of academic perspectives but the differences they realised in the teaching and learning styles, and in student-teacher relations due to different cultural backgrounds of those from different countries. Some comment on the differences in training styles and how different learning outcomes this could result in. It is stated by one participant that "in the IP programme, one could easily understand the differences of education systems in different countries". Two of them note that there were "different kinds of communication between teachers and students" in different countries. Most of them valued this realisation regarding the differences in teaching styles.

*3.1.6 Challenges*

Participants were asked whether they faced any challenges in working in an interdisciplinary and international environment during the IP; and if they did they were asked to choose among a number of possible answers. They were able to indicate as many challenges as applied. 9 out of 35 students state that they did not experience any challenges. The remaining indicate a number of challenges. As seen in Figure 4, the difficulty in communicating in a language that was not their native tongue, is indicated as a challenge by 10 students. This shows that rather than the interdisciplinary environment, the international context was found challenging. Following this challenge, the difficulty to reach a consensus in team work is indicated by 9 students as a problem they faced in this IP experience. This may not necessarily be related to the interdisciplinary aspect but to the students' familiarity with teamwork although only one of them state that this was their first time in carrying out a teamwork. The difficulty in understanding the approaches and perspectives of those from different disciplines is indicated by 7 students. Similarly, the difficulty in understanding different perspectives of those coming from different countries (due to differences in local context) is indicated as a challenge by 7 students. It is seen that 6 students found it difficult to explain to others their disciplinary approach and methods.

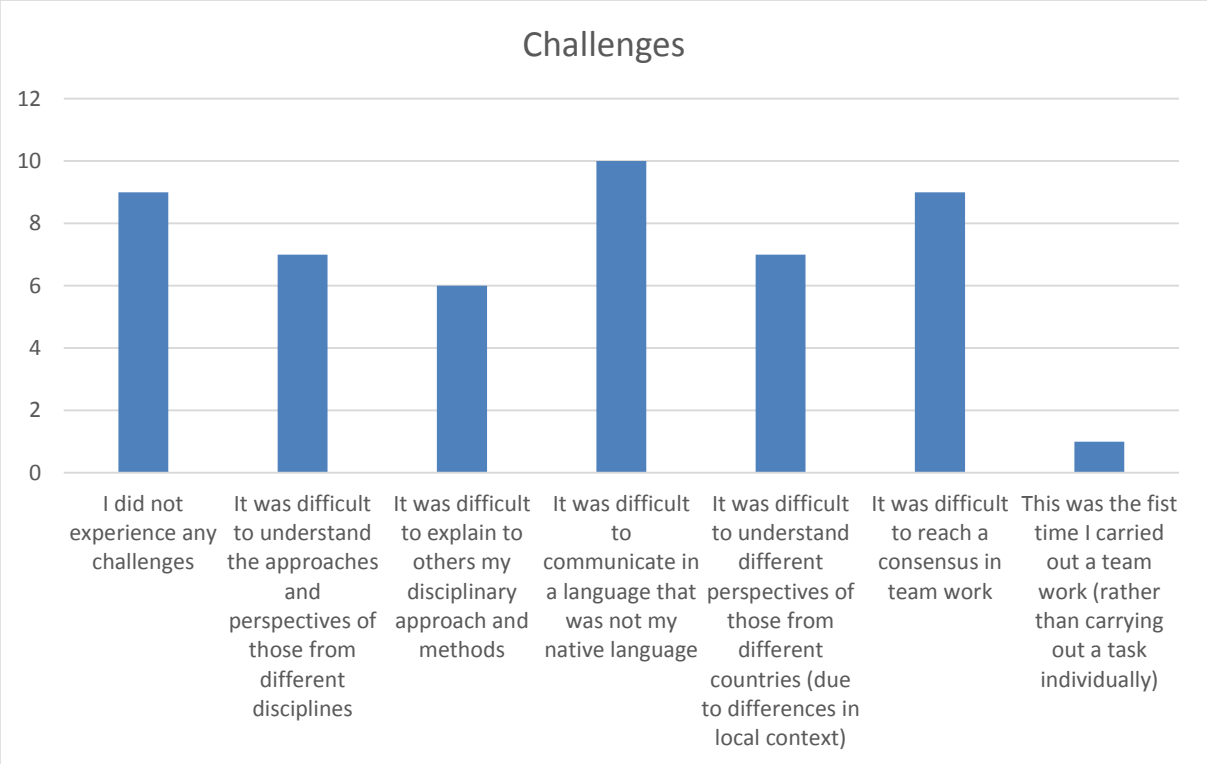

Figure 4-The challenges that students experienced in the IP

In spite of these challenges faced, all of the city planning students state in the next question that there should be similar programmes and courses in the city planning education curriculum to prepare students for interdisciplinary work. Similarly, all other students (those in schools other than city/urban/spatial planning) state that they found it useful to be involved in a city planning project and that the lectures and student projects in planning contributed to their own disciplinary perspective.

*3.1.7 The final product*

Finally, the respondents were asked whether they thought that working with people from other disciplines and other countries/contexts contributed to the quality and richness of the final product, i.e. the plans and projects that they prepared. Apart from only one respondent, who did not have an opinion on the matter, all participants said that they thought this interdisciplinary international environment contributed to the quality of the final product.

While about half of the respondents focus on the content and quality of the output in terms of richness, a variety of issues covered, in-depth solutions on certain aspects, such as architecture and real estate development, it is interesting to note that about one-third of the respondents comment on the way that the final product was easier to describe, and more realistic to implement. Those who made comments in this latter category stress that having addressed concerns of people from different disciplinary and cultural backgrounds, the final product was comprehensive and would be acceptable to a majority, and hence more easily implementable. Some of these respondents also state that because they had to explain why they made certain choices throughout the process to each other and to the rest of the IP, they learnt explaining things in simpler words so that both those from different disciplinary backgrounds and those with limited language skills would understand their argument. They state that this was a valuable contribution as explaining the proposed solutions in the simplest and most clear way possible was a challenge but once done it ensured a mutual understanding.

## 4. Main Findings and Conclusion

The questionnaire results show that the participants to the Intensive Programme held in Ankara valued their experience due to both the interdisciplinary and multicultural working environment. While a variety of the findings has already been described in the previous section, some of them deserve attention as they underline the potential contribution of such experiences in the academic and professional development of those who participate them.

According to the questionnaire results, the interdisciplinarity aspect in an education programme, such as the IP, enable the participants to better handle complex and multifaceted problems. The different perspectives in approaching a given problem result in different views and solutions that either require negotiating and consensus building or result in a richness of opinions that complement one another. The latter may sound more preferable although the former is also a positive experience since the questionnaire results show that this experience improves the participants' skills in team-working and conflict management. It is clear that reaching a consensus is amongst the major challenges of this interdisciplinary experience, but facing and dealing with this challenge is a learning outcome in itself as it contributes to a major skill and competence that planners need to be equipped with.

With regards to multiculturality, this aspect helps develop a better understanding of both differences and similarities between those from different countries and cultural backgrounds in approaching a given problem. Seeing different approaches is likely to enrich options when handling a problem, while witnessing similarities underlines the common problems that are faced by cities and planners throughout the world; and the realisation that planners try to solve these problems with similar understandings and

approaches can help reinforce the commitment of young planners to such approaches and solutions that they are being taught about. In terms of multicultural work experience, it should also be noted that language can be a clear barrier and a challenge. However, it can ultimately help the outcome of the project work too: the need to describe viewpoints in the most straightforward and clear way is not only a valuable skill to learn, but also a helpful contribution to the quality of the final product in terms of its clarity and presentation.

The final product in such working/studying environments is positively influenced by both the multiculturality and the interdisciplinarity. Both aspects seem to have an impact on the final outcome by making it richer, more creative and innovative. In addition, the interdisciplinary aspect is likely to force team members to address different viewpoints through the process of consensus building and hence the final product is more likely to be acceptable by the community. This is a finding stressed by many participants: they felt their final project was more realistic and implementable due to the interdisciplinary preparation process, highlighting a valuable learning outcome in such education programmes that bring together participants with different disciplinary backgrounds.

Based on the findings of this study, it is clear that incorporating such courses and programmes that provide interdisciplinary study settings into the planning curricula would significantly help prepare students for interdisciplinary work environments that they will inevitably work in. However, making such courses as integral parts of the curricula is not an easy task precisely because of its interdisciplinary nature: it would require different departments, such as city and regional planning, architecture, sociology, economy, political sciences, etc., to formulate a common course in which students from these different departments come together to tackle issues in an interdisciplinary study environment. Such cooperation between departments is not impossible, and has many examples in the shape of graduate interdisciplinary programmes. However, without attending a full graduate programme too, planners and those from other disciplines could come together for a specific programme or course, and ways and methods to enable this should be sought for.

There is no single method of creating such programmes and incorporating them into the curricula. The case described in this study is an example of only one possible format. The way in which such interdisciplinary courses are formulated and the degree to which they will be made integral to planning education would inevitably vary from country to country and from school to school. The local context is important both in formulating possible course/programme formats in a given curriculum, and in identifying which disciplines to create a cooperation with. Therefore, a global recipe is not being sought for and each school can explore possibilities for creating interdisciplinary learning environments within their own education programme. Having said that, some practices are global and may be formulated with a view to capture such interdisciplinarity. For example, there are many experiences with summer schools in planning departments, and they are also valuable in their international character, which can help equip participants with learning outcomes that were mentioned above in relation to multiculturality. Ensuring and encouraging the participation of those from different disciplines to such summer schools would help provide the learning outcomes regarding interdisciplinarity too. In addition, projects in the format of the programmes that were previously named Intensive Programmes and now currently referred to as Strategic Partnerships under Erasmus+ should clearly be encouraged and supported in planning education in view of the findings of this study since they can bring together both the interdisciplinarity and multiculturality experiences, which were shown to be valuable contributions for the academic and professional development of participants.

# COMPETENCIES REVISITED
## AN EDUCATIONAL APPROACH TO CONCEPTUALISE PLANNING AS A BOUNDARY DISCIPLINE

Lukas Gilliard and Alain Thierstein
TUM Department of Architecture, Chair of Urban Development, l.gilliard@tum.de

Keywords: Knowledge Creation, Planning Education, Boundary Discipline

*The paper presents a systemic view on the purpose and impact of planning education. We introduce a system model, which bases upon the assumption that the objective of planning education is equipping students with competencies to resolve current and future challenges. Planning education has always focussed on instruments for this purpose. Among other reasons, established statutory instruments have become less effective in steering urban development due to a shift of power from public towards private stakeholders, e.g. in terms of funding. Thus, we propose a shift from formal qualifications suited for public planning control towards a problem-based and impact-orientated approach. The educational term 'competence' serves hereby as a measure of employability.*

*The 'wicked' nature of planning problems distinguishes knowledge in planning. Knowledge is contextual and constantly transforming. It can however be deconstructed in a defined context. Then, we can assign an observable impact to a certain state of problem or intervention. These constructs of knowledge can help us to make informed decisions. The challenge is to apply and transform these contextual constructs to other settings. This requires proficiency in analysing, evaluating and creating constructs. Public planning control and its instruments consist of normative goals, which dictate the reason and extent of planning. In case of a problem-based approach, it is the role of a planner to recognise situations, in which his knowledge helps making an impact towards intended futures.*

## 0. Introduction

The paper presents a systemic view on the purpose and impact of planning education. The introduced system model serves as a foundation for a framework for designing 21st century planning curricula. A new approach to curriculum design in planning seems to be desperately needed as a rapid diversification in degree programmes over recent years demonstrate. In section 1, we trace back this diversification to fundamental changes in employment structure and a loss of importance of public sector as well as an increasing complexity of planning challenges due to the wickedness of social policy problems and the lack of an underlying disciplinary conception. As a result, educators have developed a pick-and-choose mentality selecting a variety of learning contents without any standards. The common ground of planning has shrunken down and employers are confronted by varying unlike qualifications.

In section 2, we hypothesise that a competent use of knowledge will become more important for employers than formal training in using statutory planning instruments. The concept of competency supersedes formal qualifications as measures of employability. The paper will investigate the term's use in context of European Higher Education Area (EHEA) and operationalize its meaning in order to be used as an aid for selecting the knowledge to be taught in class. We argue that hereby schools can design curricula with the intent to solve current and future challenges. This requires the selection of

‚powerful' disciplinary knowledge. Evidence-based content selection replaces hereby the existing normative pick-and-choose practice. This does however require conceptualising planning as a boundary discipline, in which evidence-based disciplinarity and impact-orientated transdiciplinarity complement each other.

Section 3 discusses potential implications for the educational practice. We question the existence of consecutive bachelor-master-degrees in planning as they focus on normative concepts with a significant lack of scientific evidence. Instead, we propose that schools should teach urbanism on a post-graduate level. Urbanism bases on all spatially relevant disciplines. Urbanism education then focuses on equipping graduates with the competence to combine constructs of knowledge from a variety of disciplines.

## 1. Research Background

### *1.1 Diversification of Planning Education*

The first professional degree programme in planning emerged in the early 20th century. "Initially just a few institutions offered planning degrees at postgraduate level" (Frank et al. 2014: 33). The education followed the ideology of an engineer-planner (Frank et al. 2014: 38). The University of Liverpool's degree in civic design among others at University of Karlsruhe and University College London were post-professional degrees founded around 1910 (Frank et al. 2014: 37). Students had been practitioners in architecture or civil engineering before. The development of these programmes is closely linked to the establishment of professional bodies and advanced vocational planning. The underlying mentality of planners as engineers goes along with early modernist planning theory.

Modernism stands at the end of the long-term believe of constant advancement. Many scholars have conceptualised this myth of modernisation, similarly to architectural theory, in form of movements or historical periods with distinct normative concepts. Albers (1993) describe four phases starting in the late 19th century with planning adopting to social, economical and ecological effects of industrialisation and ending with planning developing prospects for the future since the 1980s. Selle (1995) generally agrees with this conception, however, adding the notion that these phases each develop an own layer of knowledge, which continues to be relevant until today. Both scholars share the view of constant advancement. As "most planning practitioners and scholar lived primarily in 'national' planning policy cultures" (Healey 2012: 192), these concepts claim to have universal validity. Albers and Selle mainly draw their view from spatial planning practice in Germany. And indeed, German planning has developed a growing arsenal of instruments and legal mechanisms with the intent to prepare for current and future challenges. They all base on the German federal planning law (BauGB), which haven't had any major renewal, only several additions and remain in its core the same planning system. Putting urban planning into a wider context and looking besides statutory planning, we will however see major breaklines in planning practice. Schönwandt (Schönwandt 2008) identifies two of these breaklines (cf. figure 1). Until the mid of the 20th century, planning has been based on the idea of rationality. McLoughlin (1969: 81) describes planning as the regulation of errors appearing in a 'machine-like system'. Rational planning theory characterises cities as comprehensible systems. Planners can foresee and evaluate all possible developments and weigh up assets and drawbacks of each planning solution. The understanding of planning clearly stands in the tradition of engineering and hits its peak with modernism in the 1960s. At that time, "a critique emerged that the planning and design of the modern cities was blueprint of placelessness, of anonymous, impersonal spaces, massive structures and automobile throughways" (Ley 1987). Consequently, the community of urban thinkers abandoned the rational-modern idea.

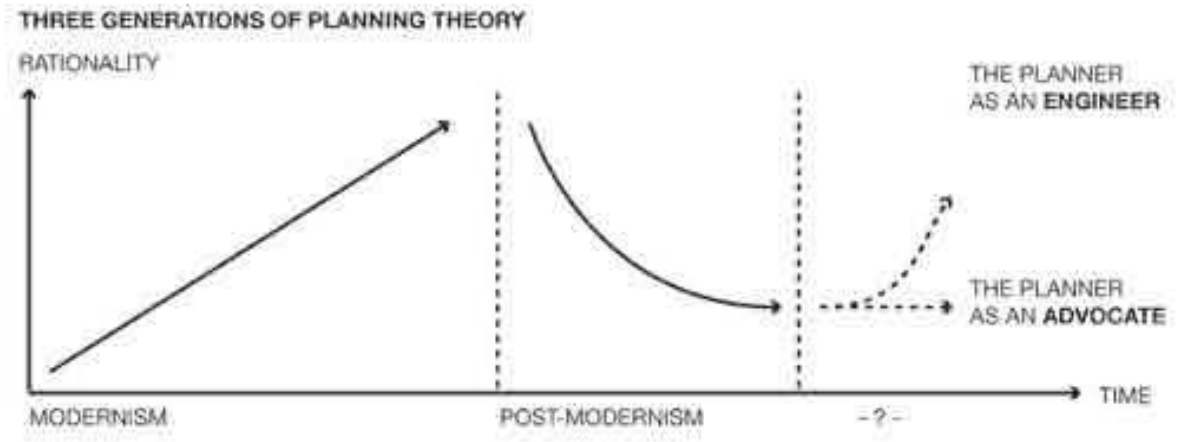

Figure 1. Three Generations of Planning Theory. Author's graphic

At that time, planning emerged as an independent discipline. Planning had "received a considerable boost […] as part of the reconstruction and rebuilding efforts post WWII" (Frank et al. 2014: 33). The growing demand for planning but also the growing critique of the engineer-driven modernist cities led to the establishment of the first independent planning department at TU Dortmund in 1969. The formation was in the time of the 'radical' 60s. Major societal changes occurred. So-called 'reform'-universities stood out due to flat hierarchy, autonomy of student administration and the decline of academic authority. In many ways, independent planning degrees adopted post-modern ideas and cultivated debate and critical discourse.

Schönwandt (Schönwandt 2008: 13) defines postmodernism by its critique of the rational planning theory. An underlying general theory of planning doesn't exist. The discourse has largely split within the architectural urban design and the planning community. Many architects rediscovered the city as a liveable urban environment trying to achieve the valued and appreciated qualities of pre-industrial urban form again (Ellin 1996: 11). Urban development in the suburbia remains however dominated by an automobile-friendly mode of planning resulting in massive urban sprawl in the US and a growing extent of functionally interlinked urban regions in Europe. Ellin (1996: 223) therefore concludes: "While contemporary urban design largely breaks form the modern project in theory, its implementation is nonetheless embedded in it." Many scholars try to overcome this contradiction in planning and design theory. At this point, Schönwandt (2008) identifies the second breakline and proposes fundamentals for a third generation of planning theory. He is not alone in his search for a new 'theoretical orientation' for planners. Innes (2014) for example considers "the dividing discourse of planning theory […] counterproductive".

Because post-modern planning failed to develop an underlying general theory, the recognition and acceptance of planning as an independent discipline remained in question. Planning degrees could neither claim technical nor scientific expertise. Instead, most curricula combined some core techniques of related disciplines with a normative debate about planning policy. A report of the American Planning Association (APA) from 2007 shows that independent planning degree led to a significant loss of speciality knowledge in many relevant fields (Hoch 2012: 130). An average APA graduate only obtains 50% of the knowledge about subfields such as infrastructure, labour force development and urban design compared to other peers with a more specialised education. After initial growth, the number of programmes stabilised with 9 degrees in 1999 (Frank and Kurth 2010: 27). Even in Dortmund, the current academic debate between leading figures of the architectural and the planning

department demonstrate the on-going dispute about the role and principles of planning (q.v. Höing et al. 2014; Altrock et al. 2014).

Besides the engineer- and the independent planner, a third model of planning education originated from social sciences such as geography, politics, or law (Frank et al. 2014: 84). Many geography programmes offer specialisations in the field of public policy, land division and urban planning. Similarly to the engineer-planner, the social science-planner can be regarded as an expert in its field, especially public law and administration. In Germany, this mode of planning education dates back the Prussian public service. Thus, its is primarily present in Northern Germany.

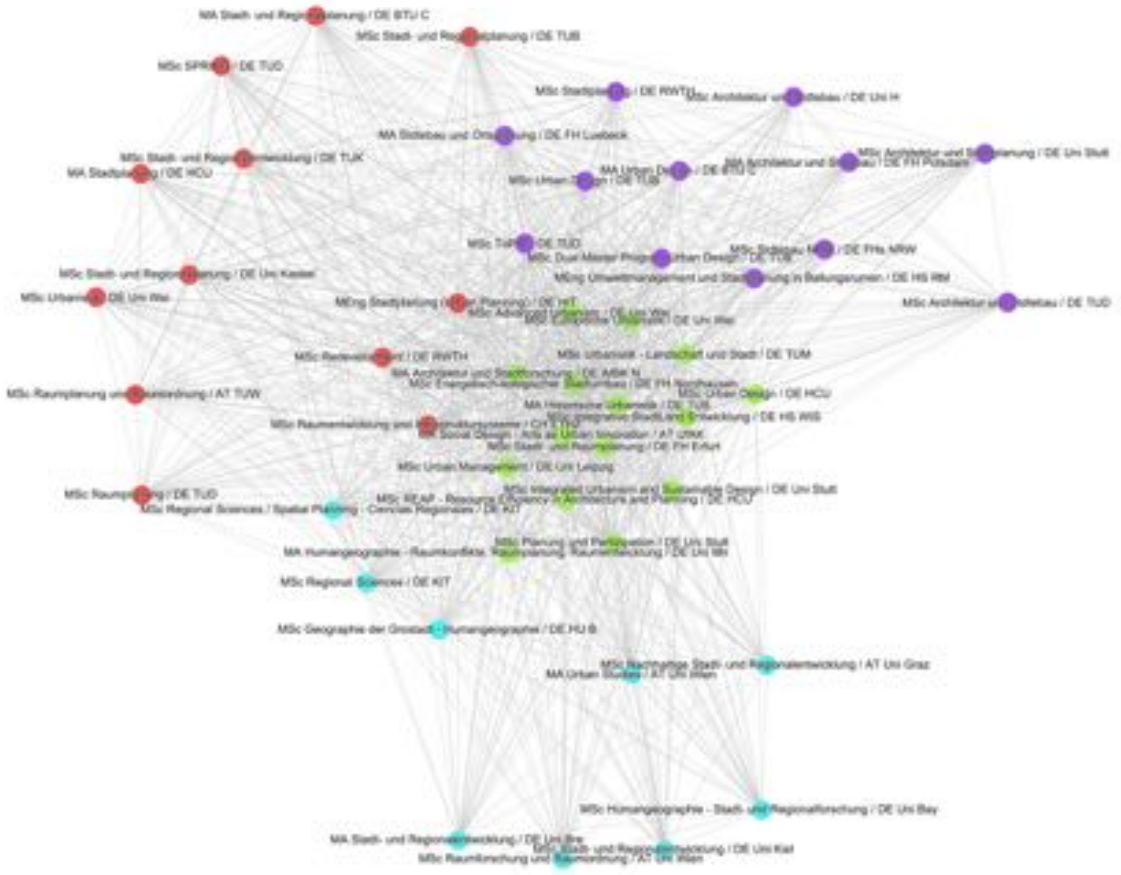

Figure 2. Network Diagram – Postgraduate Degrees in Planning – Proximity Represents Common Fields of Study Admission Requirements. Author's Graphic

Figure 2 shows the continuing presence of all three educational ideologies in the German-speaking countries. The network graphic bases upon the field of study admission requirements for postgraduate planning degrees. Our study includes all programmes explicitly addressing urban issues within their name. We collected data from study regulations from late 2014 to early 2015. Each node represents a study programme and the edges the number of common fields of study, which enable admission. The closer two programmes are, the more fields of study are shared as admission requirement. The results show that only a quarter of all graduates, which become potentially prepared for jobs in urban planning and design, come from universities with independent planning degrees. These are represented in red at the upper left corner. Independent planning degrees usually require an undergraduate degree in planning. As a result, they share less fields of study for admission with other degrees and are situated at the edge of the graphic. "Aside from the independent planning degree

programs, a plethora of new non-consecutive master's programs were also established" (Frank and Kurth 2010: 30). Degrees based in architecture and engineering are represented in purple and degrees in social sciences in light blue. Programmes, which are represented in green, allow access from a variety of undergraduate fields and can be considered as interdisciplinary in this respect.

In summary, planning is a diversified field of professionals with varying educational backgrounds. Planning roots back to engineering and social sciences and hadn't established itself as an independent discipline before the 1970s. Recently, many new planning degrees have emerged as part of a renaissance of engineering- and social-science-driven degrees as well as programmes, which are situated in between the boundaries of disciplinary fields. Today, we find a pick-and-choose mentality of content among educators. Instead of having standardised curricula, students obtain a variety of different competencies. Degree A may differ dramatically from degree B. One community of scholars may regard knowledge about urban form and composition as crucial (Höing et al. 2014), others promote focussing on the process of planning itself (Altrock et al. 2014). A recent empirical study by Christensen (2015) demonstrates also these different priorities within the group of planners. She finds out that practitioners regard „both process and outcome essential for planning" (Christensen 2015). Howe (1980) conducted a study about the perceived role of planners. 50% of American planners perceived their role as either technical or political. The other half does however classify themselves as 'hybrid' planners. The network of planning degrees shows a similar picture. The following two sections try to explain this present diversification.

*1.2 Shift of Power*

In recent years, planning has experienced a significant shift of power from public control towards private interest. Our planning system dates back to the beginning of the industrial society. Early planning theory - as outlines before - concentrated on mitigating negative effects of private industrial activities for living conditions. „Chaos has [had] entered the city" (CIAM 1933). Planners existed to bring order. This idea is strongly embedded in our statutory planning system based upon the separation of land-uses. Albrecht (Albrechts 2004: 754) argues, that these "established forms of planning [...] manage to ensure that undesirable developments do not occur, but [...] they are not able to ensure that desirable developments actually take place where and when they are needed".

„In the new knowledge economy, cities have found a new significance as nodes for innovation and communication" (Madanipour 2006: 180). Cities concentrate power, knowledge, communication and status (Danielzyk 2008: 36). „A sophisticated [private] market is interested in better-quality products [cities]. […] On the one hand, the process of economic liberalization has taken away much of the state's ability to shape localities directly, as production of space is essentially within the remit of the private sector. Hence, the private sector at the local and the regional level has found a more significant role in the governance of urban regions" (Madanipour 2006: 180). Today, public planning control has neither the financial power to shape our cities future nor the right instruments to steer private investments in their favour. Thus, planning shifted from a state-driven activity against private interest toward a competition for private investments. Madanipour (Madanipour 2006) sees this shift reflected in „the rising significance of urban design" as a private-sector planning approach. Especially in the UK, urban design has risen from a niche into the centre of the urban debate. Indeed, major structural changes in employment reflect the importance of private companies for our profession. Today, less than half of all planning graduates work in public administration (Böckenbrink, Greiwe and Weller 2013: 37). Independent planning education, which has always focussed on public planning control, becomes hereby less attractive for recruitment. These degrees usually equip graduates with state- or chamber-controlled diplomas. „The degree […] can be interpreted as one form of licensing" (Klein 2011: 256) to enter public service. The diploma ensures that the planning graduates handle statutory

planning instruments within the institutional and legal framework of our state. While the professional bodies still maintain their control over accessing formal planning service, an increasing number of jobs and planning degrees do not require or provide formal qualification. Innovative planning concepts are not the result of ‚cloning' of standardised planner.

Instead, „all employees must add value to the financial bottom line" (Brown, Hesketh and Williams 2002: 14). That requires leading and preparing students earlier and better towards top-level research and highly specialised practice. Universities implemented this target in form of a diversification of degrees on the postgraduate level. In the planning community, it has led to a renaissance of the engineer- and the social-science-planner. Engineering and social science departments have gained the opportunity to offer a wider range of specialisations at the postgraduate level. A single institute is able to conduct a small master's degree to make a mark academically (Kunzmann 2008: 17). The diversification of planning education is therefore closely linked to our societal desire for knowledge. "We wish for an authorisation of political [planning] decisions based on scientific evidence" (Lieven and Maasen 2007). Nevertheless, we "dismiss any type of technocratic governance" (Lieven and Maasen 2007). Planning history has demonstrated that cities are complex, hardly comprehensible systems. So, "we abandon the [modernist] idea that scientific truth about the future exists" (Alaily-Mattar and Thierstein 2014).

*1.3 Complexity of Planning*

Rittel & Webber (1973) argue that planning problems are fundamentally different from problems in science and engineering. Engineers are confronted with 'tame' problems, which can be solved rationally by finding the optimal solution. Planners are however confronted with 'wicked' problems. "In a pluralistic society there is nothing like the undisputable public good; there is no objective definition of equity; policies that respond to social problems cannot be meaningfully correct or false […]. Even worse, there are no 'solutions' in the sense of definitive and objective answers" (Rittel and Webber 1973: 155). 'Wicked' problems demand thinking differently about planning. Every planning problem is a unique 'one-shot operation'. There is no testing ground for social experiments. That means that the process of approaching a problem and resolving it has to be concurrent. Planning and designing to accommodate urban challenges is an iterative process with no 'stopping rule'. As we resolve one problem, we discover or even produce other problems. What we also produce at the same time, is a better situated understanding of a single planning problem. Thus, knowledge about 'wicked problems' is "localised, embedded and invested in practice" (Weber and Khademian 2008).

Knowledge can therefore not claim to be universally valid. Validity can only be constructed in a specific spatial and temporal context. We call these constructs of knowledge. Constructs of knowledge consist of the concept, idea or technique itself and of an observed impact. When looking at one construct a time, each of them is valid in itself. When comparing multiple constructs, they might actually contradict themselves. Especially the flow of planning knowledge across borders to developing countries such as China and its application in situ demonstrate that concepts and ideas cannot simply "be extracted from its context of invention, uprooted and 'planted' somewhere else" (Healey 2012: 190). For example, after Frank Gehry finished his work on the Guggenheim museum in Bilbao, planners observed a general economic and urban improvement of the area (Plaza, Tironi and Haarich 2009). The idea of the so-called Bilbao effect has travelled all around the world. Many cities hired star-architects to create their own 'Guggenheim'. However, the economic impact failed to appear (Scherer, Strauf and Bieger 2002; Jasmand and Maennig 2008). As said before, while one concept has a certain impact in one context, it might have a contrary impact in another (Girgert 2011). Nevertheless, these constructs exist and form the base of knowledge for planning academia and practice. This base of knowledge constructs is socially connected. People create knowledge, they share

knowledge, they adopt knowledge and they transform knowledge. Processing knowledge is the interplay of tacit and explicit knowledge (Nonaka, Toyama and Konno 2000: 12; Bentlage, Lüthi and Thierstein 2013: 48). Physical or ideological proximity are required for either sharing tacit experiences or combining codified constructs of knowledge. These process are responsible for the flow of ideas across borders. The constant creation and adaptation of constructs makes knowledge a dynamic network. Knowledge appears, it disappears and it transforms as part of resolving 'wicked' problems. The concept itself might take shape of something universal, its impact is however defined by the contingent of its context.

In summary, we have shown that planning education diversifies due to structural changes in employment as well as the nature of knowledge in planning. We argued that formal qualification can no longer guide educators in design planning degree programmes. In order to evaluate planning education, we will propose a system model looking at academia and practice.

## 2. Competencies revisited

*2.1 Systemic View*

In order to give structure to the diversified field of planning studies, we propose a systemic view (cf. figure 3) on the purpose and impact of planning education. The system model bases upon a linear input-activity-output-outcome-impact-schematic and two feedback loops. The underlying assumption is that educators intend to improve planning practice by ‚improved' education. Hereby, schools struggle with the discrepancy between established planning practice and state-of-the-art planning research. They have to balance between keeping students employable today and developing innovators for tomorrow. Time- and complexity-constraints furthermore hinder fulfilling both objectives, as programmes need to be feasible to study.

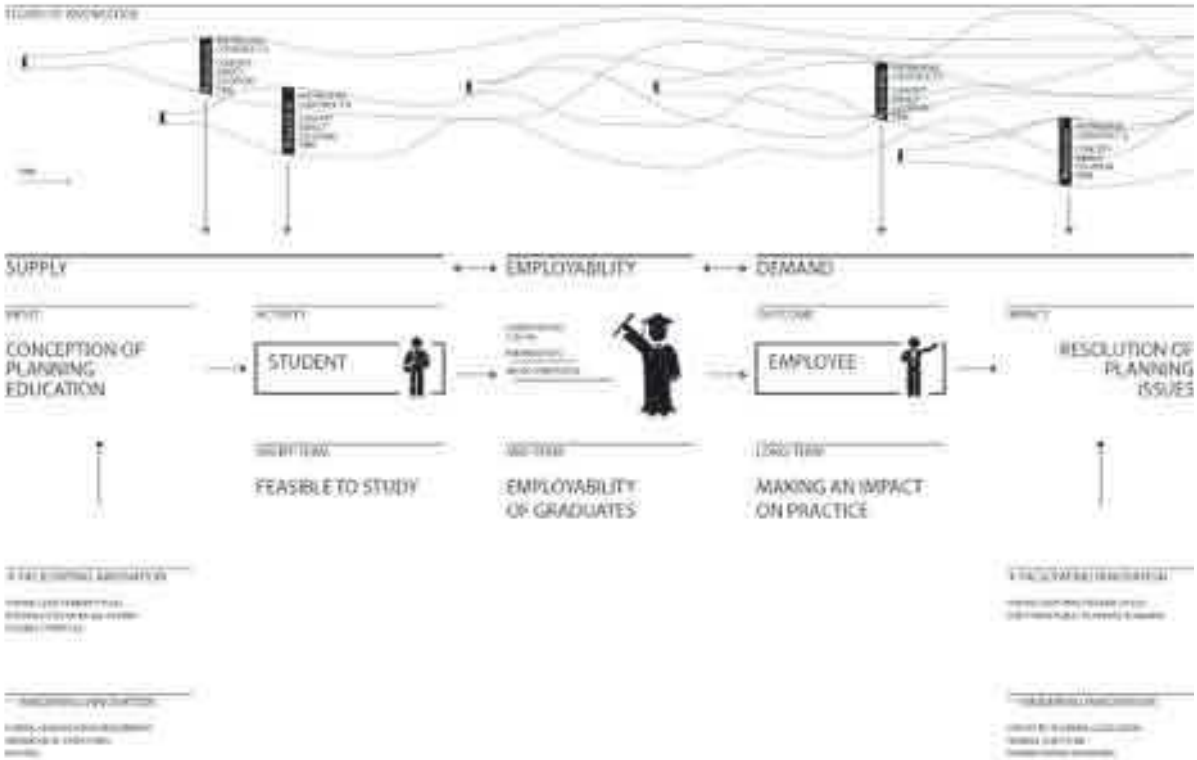

Figure 3: Systemic View on Planning Education. Author's Graphic

The left side of the model comprises academia, while the right side represents practice. The major tie between both parts is the central impact axis starting with designing and offering a planning curriculum (input), then putting graduates on the job market (output) and finally changing planning practice (impact). You might also look at this model in form of an supply and demand diagram, in which schools supply employers with graduates and vice versa. Employability measures hereby define the quality and value of graduates.

The first feedback loop is closely linked to the concept of employability, which we will elaborate on in section 2.2. We assume that programmes, whose graduate do not meet the job market's demand, have to change. Employers with unfulfilled demands will reorientate themselves and look for graduates from other fields - currently seen as part of the diversification of degrees. The second feedback loop is much more indirect. Because the underlying assumption of our model is the intention to change practice, education needs to be redesigned as soon as the intended impact on planning practice is achieved. This feedback loop relates to relevant issues in planning and the knowledge about them. As argued in section 1.3, constructs of knowledge gain and loose in importance over time. For example, the separation of land-uses has been a key strategy of modernist city planning for decades, which then got replaced by concepts of mixed use.

Both feedback loops have in common that they don't take effect immediately. Especially, the second feedback mechanism features a significant time lag. From the conception of a curriculum until graduation the first two to four years pass. Additionally, we need to add years until the graduate is in a position to actively change standard procedures and established concept. In a traditional work environment, we estimate that educators cannot expect an impact earlier than fifteen to twenty years after designing the course. Hierarchical structures in public administration slow down the way up the job ladder. The impact of education takes significantly longer than the rapid urbanisation process, today (cf. figure 4, Alaily-Mattar, Thierstein and Förster 2012). However, the shift of power and associated structural changes in employment have „given the educated classes greater economic freedom. This has enabled young knowledge workers to short-circuit organisational hierarchies to arrive in senior managerial positions often in their thirties" (Brown, Hesketh and Williams 2002: 5).

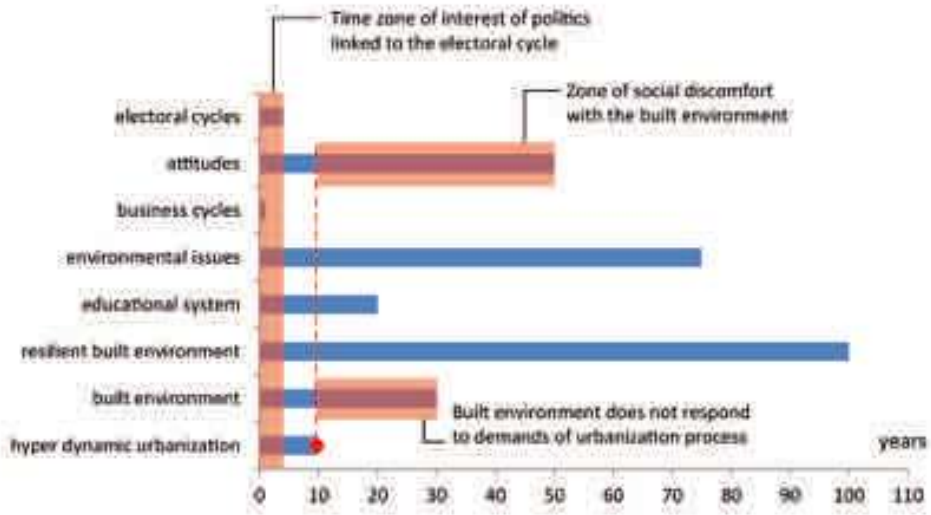

Figure 4. Time Lag of Various Systems. Source: Alaily-Mattar, Thierstein and Förster 2012

*2.2 Competencies as Measures of Employability*

„Employability is […] seen to reflect the shift away from the bureaucratic career structures" (Brown, Hesketh and Williams 2002: 4). Human resource departments examine „the personality package that candidates present to employers for evidence of competencies" (Brown, Hesketh and Williams 2002: 28) Personal attributes replace job-specific requirements. Applicants must present themselves as competent (absolute employability) and more competent than others (relative employability). Brown et al (2002: 9) call this the ‚duality of employability'.

The concept of employability bases upon personal attributes. These attributes are often described as competencies. Despite its common use, there is no clear-cut definition. The term's interpretation reaches from „the ability to handle a situation" (Keen 1992, 112, in: Stoof et al. 2002: 347) to „cluster of related knowledge, skills and attitudes" (Parry 1996, 50, in: Stoof et al. 2002: 347). Thus, the paper draws upon a constructivist framework for „understanding and using the concept of competence" (Stoof et al. 2002: 345). The idea behind this framework is, that the term competency is used differently depending on purpose and context. The term's definition is valid as long it is „adequate for the situation in which it is being used" (Stoof et al. 2002: 351). Therefore, the following definition is based upon Bloom's (Bloom et al. 1956) ‚taxonomy of educational objectives', policies developed by the European Higher Education Area (EHEA) and standards established by national practice. The definition will describe the internal dimensions of competency and the difference to other related terms.

Competence-based learning and assessment became policy in the EU as part of the Bologna process (Ministry of Science 2005: 63). The Bologna process is Europe's joint effort in implementing a single educational market based upon international transparency, recognition and mobility (Ministry of Science 2005: 57). Therefore, EU member states have agreed on common descriptors of learning outcomes. The ‚Dublin-Descriptors' use the word competence „in its broadest sense" (Flood Strom et al. 2004) leaving again room for interpretation and different national implementations.

Most countries however base their usage of the term upon Bloom's revised taxonomy (Anderson et al. 2001) differentiating between factual and conceptual knowledge (often referred to as knowledge or savior), procedural knowledge (often referred to as skill or savior-faire) and metacognitive knowledge (often referred to as attitude or savior-être) (Bulgarelli, Lettmayr and Menéndez-Valdés 2009: 37). The first dimension consists of knowledge about terminology, classifications and generalisations, principles, theories, models and structures (Anderson et al. 2001: 46). Procedural knowledge includes subject-specific skills, techniques and methods as well as „criteria for determining when to use appropriate procedures" (Anderson et al. 2001: 46) and metacognitive knowledge describes rather abstract concepts such as „awareness, self-awareness, self-reflection, and self-regulation" (Anderson et al. 2001: 55). Students can acquire different levels competence by ‚remembering', ‚understanding', ‚applying', ‚analyzing', ‚evaluating' or ‚creating' knowledge. Anderson (2001: 67) calls these the cognitive process dimension of competency. In summary, a competency consists of a construct of knowledge and the level of proficiency.

In practice, assessment and learning outcome descriptions always follow the same structure. The following examples are taken from module description of urbanism programmes in Germany. **Bold** phrases describe the construct of knowledge and <u>underlined</u> phrases the level of proficiency.

„After successful completion of the course the students […]
<u>know [better: recognizing]</u> different **dimensions of inspecting the city**: Forms of perceiving and appropriating the city (sensually, abstractly, structurally), morphology of the city,

are able to develop **a criteria check list for the city analysis** in view of the „city as a complex formation", the city as action field" and the „city inside one's head", methodological discussion,
know how to analyse the selected **forms of the city** according to plan material characterised by the relation of city and house, city and space, city and city (urbanity), city and infrastructure,
know how to analyse **the reality of the selected city area** by means of images, behaviour description, script, movie etc.,
are able to work with theoretical urban reflections: basics of analysing **statements on the city** (texts, conversations, interviews etc.), perceive and critically assess the content,
are able to **characterize** different **forms of the city** […],
are able to transfer **attitudes on the city to other contexts**" (Module descriptions appendant to: BTU FPSO Urban Design 2013).

„Examination consists of a 2-hour written exam as part of which the students have to demonstrate that they remember and understand **theories, mechanisms and impacts of the economic development of space and property** and that they are able to transfer **these** to a given problem. By transferring the theories the students show their ability to understand **popular forms of visualization and description of economic drivers of spatial change** in a specific case and to evaluate resulting **challenges for the urban development**" (Module descriptions appendant to: TUM FPSO Urbanistik 2015).

Both examples demonstrate that the level of specificity of each competence can differ. Some competencies apply to managerial, scientific or design work in general, some are specific to a profession or a professional sub-domain and others are only relevant to specific tasks. Best practice guidelines recommend, „learning outcome statements should be neither to broad nor too narrow" (TUM 2014: 7). Hence, most descriptions refer to the over-arching course content without specifying individual terminology, concepts and techniques, which can be learned in the course.

*2.3 Competencies as Guidelines for Course Content Selection*

The concepts of employability and competency are closely linked to a systemic view, which incorporates the employment sector as component of the educational system (Tchibozo 2010). Therefore, competence-based learning shifted the focus from learning content to learning outcomes (Bulgarelli, Lettmayr and Menéndez-Valdés 2009). This shift has been repeatedly critisised. Detractors of the competency term argue, „curriculum theory lost its primary goal - [to define] what is taught and learned in school" (Young 2013: 105). Willbergh (2015: 339) argues, that it is a normative question of selection, to which the concept of competence has added no value. Contrary to this opinion, we argue that focussing on learning outcomes as part of a systemic perspective enables curriculum design to select content based on employment needs and challenges in practice rather than normative concepts. The term competency stands at the interface between education and employment. Both sides of this system - the hiring human resource departments and the educating schools and universities - adopted the concept of competencies in order to bridge the gap between academia and practice. In summary, competence-based education does not neglect knowledge; it selects knowledge based on challenges in practice.

Although new career pathways have made the impact of education on the job market more immediate, the significant time lag still questions the relevance of taught knowledge constructs in the future. Detractors of the competency term again argue, „the problem of competency is that it assumes that what we judge to be criteria for success today will be stable and valid in the future" (Willbergh 2015: 338). Therefore, judgement on „competences requires the perspective of time" (Westera 2001: 83). Our system model reflects this perspective by conceptualising planning knowledge and issues as flows (cf. section 1.3). We argued that knowledge in planning can only be valid if deconstructed in its

unique context. The aforementioned time lack could therefore make acquired knowledge obsolete. However, we also argued that knowledge in planning is socially connected. Emerging new ideas base upon earlier and related concepts. Successful plans are often modifications of older planning proposals. Competent use of knowledge requires not only remembering, understanding and applying knowledge but also analysing, evaluating and creating knowledge. The employment market reflects this idea as part of the emerging knowledge economy, which is about the „exploitation of new knowledge in order to create more new knowledge" (Cooke 2002: 4-5). Although the relevance of certain constructs of knowledge may decrease, its importance as a basis for innovation and advancement is invaluable. Hereby, a competence-based selection process of learning content differentiates itself largely from one based on knowledge only. Knowledge remains one of the key input factors within the innovation process in spatial development (Bentlage 2014: 25), but the cognitive use adds an additional dimension overcoming the validity problems of knowledge in the future.

In organisational research, there is a general consensus that new knowledge is created by the combination of old knowledge (Schumpeter 1934; Nonaka, Toyama and Konno 2000; Wenger 2000). Our proposed conceptional system of education is therefore a learning system of innovation. The model consists of two cycles of innovation: a lead-thinker- and a lead-practitioner-cycle. The separation of innovation into two cycles takes into account, that while the underlying idea of our educational model is bringing innovation from academia into practice, our graduates innovate new planning concepts and ideas in practice as well. Von Hippel's lead-user approach strongly reflects this idea in management theory (Churchill, von Hippel and Sonnack 2009). The concept of competency picks up this idea in form that graduates obtain the ability to transform knowledge according to new challenges. A competence-based educational approach is hereby preparing graduates for innovation.

Consequently, educators have to select knowledge based on its potential for creating new knowledge in the future. This so-called ‚powerful' knowledge in planning consist of those constructs, whose intended impact is achieved in more places over a longer a period of time. In other words, powerful constructs are conceptual and procedural knowledge, which is successfully employed by planners in the past, today and most likely in the future. Young (2013: 107) argues that such knowledge is highly‚specialised' disciplinary knowledge. The underlying assumption is that „there is ‚better' knowledge, more reliable knowledge, knowledge nearer to truth about the world we live in and to what it is to be human" (Young 2013: 107). It is basically knowledge, which is based on stronger evidence and obtained a higher degree of consensus. You can usually find this kind of knowledge within the boundaries of academic communities, because members share "communal resources - [such as] language, routines, sensibilities, artefacts, tools, stories, styles, etc" (Wenger 2000: 229). Academics create evidence „on methodological grounds" (Faludi and Waterhout 2006: 9), e.g. by conducting systematic studies. Scientific standards such as accountability, falsifiability, or testability lend knowledge evidence (Davoudi 2006: 17). In other words, knowledge seems to be evident as long as the scholar's reasoning is reproducible and convincing, e.g. by empirical work. Hence, an important part of the education of planners is imparting specialised disciplinary knowledge for the „development of the evidence base" (UK Planning Policy Statement 12, in: Davoudi 2006: 17).

Planning practice is however „heavily influenced by events of the day" (Faludi and Waterhout 2006: 11). Situations are always unique with challenges occurring in different configurations. Planning requires improvising and innovating to a great extent. Hereby, planners can fall back on disciplinary knowledge, but they cannot resolve urban issues before combining different knowledge from multiple fields. The communities of practice literature calls this boundary work (Carlile 2002: 445). "At the boundaries, competence and experience tends to diverge: a boundary interaction is usually an experience of being exposed to a foreign competence. Such reconfiguration of the relation between

competence and experience are an important aspect of learning" (Wenger 2000: 233). Figure 2 showed three of those distinct disciplinary fields. The permeability for students switching between these fields is highly limited. Postgraduate independent planning degrees require undergraduate planning degrees. Postgraduate engineer-planner degrees demand a background in engineering. The continuing existence of all these fields demonstrate however the relevance for planning tasks. Hence, planners have to obtain the competency combining different disciplinary knowledge in order to resolve planning challenges.

## 3. Conclusions

In the beginning of this paper, we have outlined major challenges for planning education. We demanded structure for the diversifying urban discourse. Therefore, we presented a system model that describes the impact and purpose of planning education. The systemic view led us to conclude that we have to conceptualise planning as a boundary discipline - requiring disciplinary knowledge as well as the combination of knowledge across disciplinary boundaries. In contrast to other scholars, we do not propose a new general theory of planning (cf. Schönwandt 2008; Innes and Booher 2014). For us, planning is not a unitary discipline with a consistent set of concepts and procedures. Planning is rather the application of - often conflicting - scientific theories and ideas in order to resolve physical and social challenges in our cities. We reject the normative character of planning policy and embrace that the field of planning is complex. This complexity requires the joint effort of multiple disciplines and their different perspectives. No idea is superior over others. Knowledge derived from social sciences is equally important than knowledge from engineering. "In order to provide a sustainable response to […] challenges within society and urban space […] an approach involving all space-related disciplines is necessary" (Wolfrum and Schöbel-Rutschmann 2011). We therefore strongly agree with Howe (1980), when she argues that "the [planner's] choice of role should not be thought of as a choice between two conflicting ideologies of planning. Rather there are several dimensions of role which can be used separately or in combination".

„The emergence of transdiciplinarity […] signalled the need for new syntheses at a time of growing fragmentation of knowledge and cultures" (Thompson Klein 2014: 68). We call this boundary approach ‚urbanism' in order to differentiate it from planning. Independent planning degrees - with their expertise for public administration procedures (Hoch 2012: 130) - are only one community of practice within a transdisciplinary field of communities such as architects, landscapers, designer, engineers, geographers, sociologists and economists. The term urban-ism consists of two parts. The suffix ‚-ism' form abstract nouns of action, process or study (Oxford University 2015). The first part of the word hereby signifies the object of action - in our case described as ‚urban'. ‚Urbanism' therefore comprises all fields of action and study of cities such as urban planning, urban design, urban geography and so forth. Haas & Olsson (2014) recently asserted the term's emergence as part of the transdisciplinary debate about urban planning and design.

As a result, we question the central role of consecutive chamber-controlled bachelor-master-education in the field of planning. Today, professional bodies such as the German ‚Architektenkammer' or the British RTPI demand a minimum of four year consecutive ‚planning education' in order to work in the field of urban planning (Kunzmann 2008: 17). This hinders transdisciplinary work in practice, because companies and public planning departments are required to mainly hire graduates, who have acquired formal qualifications. As shown before, the development of livable cities does however require much wider knowledge, which students cannot obtain in established planning degrees. Hence, we propose educating ‚urbanists' at the postgraduate level. Here, education can base upon disciplinary fundaments. The goal of postgraduate education is then to further develop powerful key competencies

for the combination of disciplinary knowledge. This requires developing specific transdisciplinary didactics. We believe that this will be the major challenge for schools in the future.

# EDUCATION FOR SUSTAINABLE SPATIAL DEVELOPMENT: SOME REFLECTIONS ON TEACHING STUDENTS OF PLANNING AND RELATED PROFESSIONS

Michael Howes

Griffith School of Environment, Griffith University, Australia, m.howes@griffith.edu.au

TRACK 03: Responsibilities in Planning Education and Practice

Keywords: sustainability, education, planning

## Abstract

*In 1992 national governments committed themselves to pursue sustainable development at the Rio Earth Summit. Urban areas play a critical role in this commitment as: they are where the majority of the world's population is located and are growing rapidly; they have large and increasing ecological footprints; and, they host the infrastructure and industries that generate the lion's share of greenhouse gas emissions, pollution and waste. Urban and environmental planners can play a vital role in improving the sustainability of these areas, but how can they be best be prepared to face such a challenge? This paper examines how strategic changes can integrate the values of sustainability into built environment programs at universities. A specific case study is used based on a first year course in sustainability that the author convenes for a large and diverse group of undergraduate students. It is argued that in their future professional life, planning graduates have the potential to be agents of change by transforming the urban form as well as how the state interacts with the private sector and the community. This analysis is undertaken using the theoretical framework of ecological modernisation that underpins the idea of sustainability, offers a strategic pathway to transform public-private-community interactions, and approaches sustainability as a design challenge. The somewhat ambitious goal is to synthesise the empirical evidence, the practical experience, and theoretical framework into a coherent whole.*

## 1. Introduction

For more than two decades sustainability has been one of the stated goals of governments, businesses and community organisations around the world. Achieving sustainability, however, has proved elusive because the changes required cut across all areas of human endeavour (Howes 2005). Since most of the world's population, production and consumption is now located in urban areas, the role of planners is crucial. How then can universities best prepare planning students for the challenges they face with regards to sustainability? This paper addresses this question in a series of logical steps. The next two sections offer a brief history of sustainability and discuss the role allotted to planners and education. After that, an outline of the rise of planning education at Griffith University is given. This leads to a discussion of a series of courses that were designed to give planning students an understanding of sustainability. A case study of a new first year course on sustainability is then developed, which includes some of the practical lessons learnt with regards to what works and what doesn't. The paper finishes by taking a step back and using the lens of ecological modernisation to understand the transformations required in pursuing sustainability, the role of planners, and the elements that need to be included in their training. The underlying argument is that sustainability should be presented as a design challenge and taught by way of interdisciplinary problem analysis and problem solving exercises.

## 2. A Brief History of Sustainability

The rise of sustainability to international prominence can be seen as a process of institutional learning by governments around the world. By the end of the 1960s a rapidly expanding range of new social

movements was forcing environmental and social issues onto the political agenda (Howes, 2005). This led to new initiatives that expanded the policy focus from traditional areas such as security, economic management and welfare (Dryzek et al., 2003). During the 1970s the idea that economic, social and environmental issues were linked began to emerge. This process started with United Nations (UN) *International Development Strategy* in 1970 which linked economic development to a healthy environment. In 1972 concerns about the impacts of industrial development on the environment were the main focus of discussions at the UN Stockholm Conference on the Human Environment and this led to the subsequent creation of UN Environment Programme (UNEP).

A pivotal moment came in 1980 with the release of *The World Conservation Strategy* by UNEP, the International Union for the Conservation of Nature (IUCN) and the World Wildlife Fund (WWF). This introduced the concept of 'sustainable development' as a proposal to utilise ecosystem goods and services for the production of social and economic benefits over the long term (Howes 2005). The concept was elaborated by the World Commission on Environment and Development (WCED) in its final report, *Our Common Future* (WCED 1987) which offered what has become the most commonly used definition: "Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (WCED 1987, chapter 2, paragraph 1). The report included a chapter on the challenges facing the built environment (WCED 1987, chapter 9) which forecast the shift in the majority of the world's populations to urban areas. It also outlined some of the key sustainability challenges, particularly for cities in developing countries. Other sections of the report stated that there was a strategic role for education and institutional change in striving for sustainable development (WCED 1987, chapter 2, paragraph 16).

The idea was followed by the UN Conference on Environment and Development (UNCED), otherwise known as the Rio Earth Summit, in 1992 that produced a strategy for reforms across all sectors of society called *Agenda 21* (UNCED 1992). A commitment that appropriate education and professional training should be a priority appeared multiple times throughout the document (UNCED 1992). A whole chapter was dedicated to developing sustainable human settlements with urban planning mentioned as playing a key role (UNCED 1992, chapter 7, paragraph 7.19). National initiatives were developed to supplement these international commitments, including: Australia's *National Strategy for Ecologically Sustainable Development* (1992); the *President's Council on Sustainable Development* (1993-1999) in the USA; and, *Sustainable Development: the UK Strategy* (1994) (Howes 2005). The Australian strategy, for example, had a chapter dedicated to urban planning as well as a chapter on education and professional training (Ecologically Sustainable Development Steering Committee 1992, chapters 6 and 26 respectively).

By the mid-1990s there were international agreements and national policies committing governments to pursue sustainable development. These included recognition of the need to transform urban areas in which planners would play a key role as agents of change. Further, education and training were seen as a key supporting mechanism that would enable professionals such as planners to fulfil this transformative role.

## 3. Education, Planning and Sustainability

It is important to note from the start that education relating to the environment and planning goes back many generations before the rise of sustainability as an idea. One of the pioneers of environmental and planning education was Patrick Geddes in late-Victorian Britain which preceded the growth of 'nature studies' in the early part of the twentieth century (Palmer 1998). The term 'environmental education' was introduced with the formation of the International Union for the Conservation of Nature and Natural Resources (IUCN) in the late-1940s and promoted at the UNESCO (1968) Biosphere Conference in Paris. There has, however, been some convergence between the two streams of

environmental education and sustainability over the last few decades. The 1972 Stockholm conference mention previously, for example, generated a principle that stated:

> "Education in environmental matters, for the younger generation as well as adults, giving due consideration to the underprivileged, is essential in order to broaden the basis for an enlightened opinion and responsible conduct by individuals, enterprises and communities in protecting and improving the environment in its full human dimension ..." (UN 1972, Principle 19).

UNEP, another product of the Stockholm conference, co-founded the International Environmental Education Programme (IEEP) and its 1977 conference in Tbilisi set out the principles of environmental education that remain current to this day:

- Life-long learning;
- An interdisciplinary curriculum;
- The interconnectedness of society and the environment;
- The multi-dimensional nature of environmental issues (including the social, political, economic and technological aspects);
- Energy and material resource limits;
- Global and future dimensions;
- Critical thinking and problem solving; and,
- Values and ethics (Palmer 1998).

These Tbilisi principles were picked up in *Agenda 21* (UNCED 1992, chapter 36, paragraph 36.1).

The UN declared that 2005-14 would be the 'Decade of Education for Sustainable Development'. This entailed the acknowledgement of the need to promote values in the training of professionals that would help to transform society (Howlett, Ferreira and Blomfield 2016 forthcoming). There was a subsequent shift in emphasis from environmental education to education for sustainability amongst universities that had been developing such programs (Wilensky 2007). With the rise of climate change as one of the major threats to sustainability, there was a further shift in emphasis. The Australian Research Institute in Education for Sustainability (ARIES), for example, published a report in 2007 entitled *Shifting Towards Sustainability: Education for Climate Change Adaptation in the Built Environment Sector*. Disciplines such as planning, architecture and engineering were a particular focus of this report as their graduates can play a key role in climate change mitigation and adaptation. This was supported by professional organisations such as the Planning Institute of Australia (Lyth, Nichols and Tilbury 2007).

It should be noted, however, that there are ongoing debates about the role of planners in society and what should be included in their education. On the first point, one view is that the role of the planner is difficult to define (Wildavsky 1973) while another suggests that planning is akin to geography (Huxley 1999). This uncertainty spills over into debates about what and how planners should be educated. What should be the role of practice and practitioners? (Bolan 1980; Schön 1982; Rosier 2001; Watson 2002). What is the relationship of practice to theory? (Sandercock 1999; Sorensen and Auster 1999a; 1999b; Myers & Banerjee 2005). What should be included in the core of a planning curriculum? (Sandercock 1997; Huxley 1999). In Australia these debates are taking place in an academic environment of increased competition for scarce public resources, a shift to vocational training, and a growing tension between the demands of research and teaching (Davis 2006; Markwell 2007). Resolving such debates is beyond the scope of this paper, but they provide some context for the case study that follows.

By the start of the twenty first century education for sustainability was being actively promoted as part of the curriculum for planning students, amongst others, in Australia. The values and principles of sustainability were at the heart of these proposals in line with commitments within *Agenda21* and the *National Strategy for Ecologically Sustainable Development.* Such ideas have been injected into a somewhat turbulent academic environment where there remains considerable debate about the role of planning in society and the broader design of curricula.

## 4. Planning at Griffith University

The Griffith School of Environment is the latest incarnation of one of the four founding schools of Griffith University. The university began teaching in 1975 to meet the demands of the rapidly growing population and economy of South East Queensland. The programs at Griffith were deliberately designed to differentiate themselves from more traditional universities by being interdisciplinary and problem-focussed (Quirk 1996). The Australian School of Environmental Studies, as it was originally known, took this principle to its core by employing a wide range of both natural scientists (ecologists, chemists, geologists and mathematicians) and social scientists (economists, political scientists, geographers, sociologists and anthropologists). It was the first school of its type in Australia and remains the largest School of Environment in the country to this day (Metcalf 2000). A school of planning was created in 1993 that was then merged into a new enlarged school of environment in 2007. A new architecture program added in 2009.

Today the Griffith School of Environment has over 75 academic staff divided amongst six discipline groups: planning; architecture; marine science; society and environment; ecology and biodiversity; and, soil and water science. There are several research centres associated with the school, including: the Urban Research Program; the Environmental Futures Centre; the Griffith Centre for Coastal Management; the Centre for Environment and Population Health; and the Australian Rivers Institute. Most of the planning academics conduct their research within the Urban Research Program which also includes staff from disciplines such as architecture, political science, economics and law. The author has worked at the school since 2000 and was a founding member of the Urban Research Program in 2004. He is also the Head of the Society and Environment Discipline which is the team of social scientists and public health academics within the school.

In terms of teaching, the Griffith School of Environment offers undergraduate, Masters and PhD degrees in urban and environmental planning, as well as architecture, environmental science and environmental management. Since the start of 2014 almost all the degrees offered by the school require students to take an interdisciplinary first year course that was designed and taught by the author of this paper entitled *1043SCG Introduction to Environmental Sustainability.* This is the focus of the case study that follows and for convenience will be referred to as simply the ‘sustainability course’ from here onwards.

## 5. Background to the Case Study: Forerunner Courses

The current sustainability course has a long pedigree. Since its inception, the school of environment has worked through a series of different interdisciplinary first year courses that integrate the natural and social sciences. Three that were taught by the author have had a strong influence on the development of the current course: *1181ENV Sustainable Development*; *1301ENV The Global Environment*; and, *1161ENV Environmental Economics and Policy*.

The first course, *1181ENV Sustainable Development,* was created by the author in 2007 on the Nathan campus as a core for the environmental science and management students as well as an elective for the planning students. The original version of the course took a sector-based approach to sustainability. In the first few weeks the extent of interconnected environmental, social and economic problems was

outlined. This was followed by an exploration of the idea of sustainable development as a solution and a set of principles were defined. The remaining two thirds of the course then methodically worked through how these principles could be applied to understanding and addressing issues relating to cities, housing, transport, energy, healthcare and manufacturing. The course was developed further after being taken over by colleagues in 2009 to take a constructivist approach that promoted more critical thinking and reflection (Howlett, Ferreira & Blomfield 2016 forthcoming).

The second course, *1301ENV The Global Environment,* had been running on the Gold Coast for more than a decade when the author took it over in 2009. The enrolments grew to 360 with planning, architecture and environmental science the main cohorts. It took an issue-based approach, looking at land degradation, climate change, the loss of biodiversity, pollution, hazardous waste, and water issues. The approach was based on Earth Systems science and used the drivers-pressures-state-impact-response (DPSIR) analytical framework. This framework is used for State of the Environment reporting by the United Nations, the European Union and the US EPA, as well as both federal and state environment departments in Australia. Although it was interdisciplinary, the natural sciences played a strong role in understanding the issues.

The third course, *1161ENV Environmental Economics and Policy*, was jointly developed in 2009 by the author at the Gold Coast and his colleague, Dr Peter Daniels, at Nathan. Enrolments on the Gold Coast (where the author was teaching) consisted of 80-90 students, predominantly from planning. It took a discipline-based approach that was mainly social science but started with a review of key sustainability issues. It also touched on the DPSIR framework in conjunction with key economic and policy tools. Market theory was introduced, then environmental and social problems, such as pollution and climate change, were analysed as evidence of market failures. Economic tools such as contingent valuation and cost benefit analyses were then brought to bear on the issues discussed. This was backed up with a policy analysis of responses such as environmental regulations, taxes, tradable permits and international treaties. The course also considered sustainability as a new goal for macro-economic policy.

In 2014 all three of these courses were replaced by *1043SCG Introduction to Environmental Sustainability* that sought to learn from the experience of these forerunner courses, utilise the best elements of each and integrate them into a functioning whole (Howlett, Ferreira & Blomfield 2016 forthcoming). The development process took 18 months and was funded by a Griffith Learning and Teaching Grant (led by a colleague, Dr Henry Skates, from architecture). The relevant educational literature was consulted to provide a sound basis for the course design that was grounded on best practice. International resources were used in compiling the course content. A wide range of consultations took place, with experts from all discipline areas of the school represented. External expertise was also brought in, including the university's sustainability officer, the Griffith Institute for Higher Education, an information and communication technology expert, and two educational designers. The new sustainability course was launched in Semester 1 of 2014 (that ran February to June).

## 6. Case Study: The Sustainability Course

The first version of this new course had a modular structure. Module 1 (weeks 1-3) covered the state of the environment, introduced the idea of sustainability, then outlined its key principles. The underlying emphasis of the course was on a values-based approach to sustainability with the commitment to sustainable development at the 1992 Rio Earth Summit viewed as a change in values. Some time was spent explaining the connection between ethics and values using a matrix that ranged from anthropocentric to eco-centric on one axis and deontological to consequentialist on the other. Students were asked to locate themselves on this matrix in order to encourage reflective learning.

Module 2 (weeks 4-6) then used the DPSIR framework to explore environmental issues related to the lithosphere, the hydrosphere, the atmosphere and the biosphere. The approach in this module was largely that of environmental science. In module 3 (weeks 7-9), the focus was on the economy and natural resource management with specific topics covering market theory, market failure and ecological economics. The final module (weeks 10-12) focussed on society and the environment with topics covering culture, indigenous people, settlements and governance. Some conclusions were drawn in week 13 to bring these four modules together. The associated workshops were split between developing basic study skills and reviewing some of the topics covered in the lectures.

The course was completed by 526 students drawn from a broad range disciplines, but the largest cohorts were from planning, architecture, environmental management, science and engineering. There were also students from other groups within the university (including health, business, arts, education and law) who took the course as an elective. All students were surveyed at the end of semester (with a 39% response rate) to evaluate the quality of the course and teaching. This feedback was used to revise the course content and delivery for 2015. In terms of feedback, the students were very happy with the quality of teaching and the overall satisfaction rating placed the convenor in the top quartile compared to other large first year courses at Griffith. The overall evaluation of the course, however, was mixed. While the students were generally satisfied, the rating on the engagement in learning was close to the average when compared to similar first year courses. The student comments suggested that this was because the course appeared to be too general, they could not relate much of what was covered directly to their chosen profession, they wanted more of a focus on finding solutions to issues, and the workshops needed to have a stronger link to the lectures. The discipline-based modular approach also appeared to be a problem with such a broad range of different cohorts. Students majoring in the environmental and natural science disciplines, for example, enjoyed module 2 but did not engage as well with the economic and social elements of modules 3 and 4. The opposite appeared to be true for the planning and architecture students.

A detailed content analysis of the survey results was undertaken to identify points for improvement. The convenor then went back to the education for sustainability literature to find suitable innovations. A revised course structure was created and put through an internal peer review process with some of the best performing teachers in the school. The resulting new course structure was implemented in semester 1 (February-June), 2015. This new structure was much more integrated and focussed on fewer topics in more detail. The overall approach shifted to treating sustainability as a design challenge (something that had more resonance with the planning, architecture, engineering and science students) rather than a change in values. The principles of sustainability were still taught, but were used in an applied fashion to explain how they can guide the analysis and solution of problems on a week-by-week basis. The underlying idea was to focus on a key problem in the odd weeks, then work through sustainable solutions in the even weeks. A critical thinking component was added with students exposed to different environmental discourses that challenged mainstream views. Each of the environmental science, economics, policy and cultural studies elements were integrated into every lecture to provide a truly interdisciplinary approach to both problem analysis and problem solving. The resulting structure is in table 1 below.

The relevance of the course to each student's chosen profession was tackled in five ways. First, the lectures of week 1 finished with an explicit discussion of how each of the 11 most common professions being pursued by the students could contribute to addressing the state of the environment and striving for sustainability (these professions were: scientists, planners, architects, engineers, health professionals, business managers, policymakers, lawyers, educators, journalists and social scientists). Second, every lecture included elements that were directly connected to these professions either in analysing or solving a specific problem. This was followed up with 'hands-on' workshops that

included specific problem solving exercises related to the issues for that part of the course. Third, the students were asked to look up their chosen profession on the *Australian and New Zealand Standard Classification of Occupations* (ABS 2015), identify their key tasks, and design a professional e-portfolio targeting potential employers. Fourth, students were given a written assignment to work on over nine weeks that asked them to outline a role for their chosen profession in addressing climate change and how this would fit in with the broader pursuit of sustainability. Finally, specific case studies were used that involved a range of their professions along with some examples of what Griffith graduates were doing.

Table 1. Current Sustainability Course Structure

| Week | Lecture Topics | Workshop & Assessment |
|---|---|---|
| **1** | **State of the Planet** | |
| **2** | **Environmental Sustainability**<br>*5 Principles*<br>*Critical thinking: Earth systems & DPSIR* | Calculating your ecological footprint |
| **3** | **Resource Depletion** | Resource supply & demand |
| **4** | **Sustainable Materials**<br>*Principle 1: Intergenerational equity*<br>*Critical thinking: Biomimicry* | Preparing an e-portfolio for your profession |
| **5** | **Climate Change** | On-line study skills tutorial |
| **6** | **Sustainable Energy**<br>*Principle 2: Intra-generational equity*<br>*Critical thinking: Environmental justice* | Climate change & your profession |
| **7** | **Biodiversity Loss** | Mid-semester test |
| **8** | **Sustainable Food**<br>*Principle 3: Precautionary principle*<br>*Critical thinking: Green-collar jobs* | Valuing ecosystem goods & services |
| **9** | **Pollution** | Written assignment review & submission |
| **10** | **Sustainable Goods & Services**<br>*Principle 4: Polluter pays*<br>*Critical thinking: Ecological modernisation* | The benefits & costs of cleaner production |
| **11** | **Waste** | Urban metabolism & environmental impact assessment |
| **12** | **Sustainable Settlements**<br>*Principle 5: Triple bottom line*<br>*Critical thinking: Urban metabolism* | Waste reduction & sustainable living |
| **13** | **Conclusions** | |
| **15** | | End of semester exam |

At the time of writing this paper 11 out of the 13 weeks of classes had been completed. While the comprehensive end of semester student evaluation surveys had not yet been undertaken, a qualitative in-class survey had been collected in week 6. The feedback from this survey was very positive, more so than the equivalent one conducted in 2014. This, together with the verbal feedback being given by students to the teaching team, suggests that the new course design has addressed the weaknesses that arose in the original 2014 version. Overall, looking at sustainability as a design challenge, taking an

interdisciplinary approach to problem analysis and problem solving, and more explicitly relating the topics to the students' chosen professions, are changes that appear to have been well received.

## 7. The Bigger Picture: Ecological Modernisation

Treating sustainability as a design challenge is the underlying philosophy of the ecological modernisation which provides the theoretical framework that underpins the idea of sustainability (Howes et al 2010; Howes 2005; Howes 2000). It also offers a strategy for transformation that requires better urban design and therefore, by default, planners and related professionals who are taught by universities are seen as agents for change. This gives universities and academics an important role in training these professionals (Howes 2003). Creating interdisciplinary courses in sustainability such as the one discussed in the previous section is therefore an important element in fulfilling this role.

Ecological modernisation argues that although the institutions of modernity (i.e. democracy, the state, the market, and industry) have allowed and sometimes even encouraged unsustainable practices, they can be redeemed through a process of transformative change (Christoff, 1996; Mol & Spaargaren, 2000; Dryzek, 2005; Howes, 2005; Howes et al 2010). The goal is to decouple economic growth from environmental damage by the application of new eco-efficient technology and the redesign of institutions (Berger, 2001; Janicke & Jacob 2004; Dryzek, 2005; Howes, 2005; Huber 2008; Janicke 2008). This school of thought had its origins in Europe during the early 1980s, and two of its most prominent founders were Martin Janicke and Joseph Huber, although the pedigree of many of its component ideas can be traced back as far as the 1960s (Huber 2000 & 2008; Janicke & Jacob 2004; Janicke, 2008). Ecological modernisation ranges from the weak techno-corporatist approach that focusses solely on engineering solutions, to the strong reflexive approach that include the redesign of institutions (Christoff 1996). The state is cast in the role of a facilitator of change, with interventions designed to promote economic prosperity, social wellbeing and ecological sustainability (Howes 2005; Howes et al 2010). This provides an opportunity for planners to facilitate the redesign of the urban environment and act as the agents of change.

There are five key core themes of transformation in the strong version of ecological modernisation:

1. The redesign of technology to make it more eco-efficient and cleaner (i.e. less material and energy intensive, as well as less polluting);
2. The redesign of economic imperatives to provide incentives for change (e.g. pollution charges and taxes, with subsidies and tax breaks for sustainable businesses);
3. Political and institutional redesign (i.e. a shift towards a more consensus-based form of governance that encourages partnerships between the state, business and the community);
4. The redesign of the role of social movements to give them more influence in decision making (e.g. engagement with the environmental justice movement); and,
5. A redesign of public discourse, with greater recognition of social justice and sustainability in decision making (e.g. focussing on green collar jobs as a way to achieve the 'win-win' scenarios) (Howes et al 2010).

Planners can engage with each of these transformative themes (Dedekorkut-Howes et al 2010). They can design urban spaces and infrastructure to take advantage of eco-efficient technology. They can develop planning regimes that reward sustainable developments. They can participate in the establishment of more effective community and business partnerships to rethink new developments or revitalise older suburbs. They can establish more effective community engagement and consultation processes for planning decision making. Finally, they can disseminate information and engage in public forums to promote a more sustainable worldview. Training the students of planning to recognise these opportunities and their role as agents of change is therefore an important responsibility for universities and academics. The sustainability course discussed previously has been designed to make a significant contribution to meeting this responsibility.

## 8. Conclusions

While there is an international consensus that the pursuit of sustainability is a good idea, developing a strategy that can catalyse the necessary transformations across all sectors of society has proved difficult. Clearly planners have an important role to play in making urban areas more sustainable, but how to prepare them? Planning education and training has been developing for generations, and at institutions like Griffith University it has merged with education for sustainability within a broader school of environment. By design, trial and error a series of forerunner courses have led to the development of a new first year foundation course in sustainability that is taken by students of planning, as well as many other disciplines across the university. Finding ways to engage such a large and heterogeneous set of students has proved a testing. The current version of the course has adopted a number of strategies, such as treating sustainability as a design challenge that engages students in interdisciplinary problem analysis and problem solving. This approach is consistent with the theoretical framework of ecological modernisation and the idea of sustainability that it underpins. Such a strategy not only guides the education and training of planners, it also gives them a broader sense of purpose in assisting the pursuit of sustainability.

# HANDBOOKS IN PLANNING: FIVE THESES FOR TEACHING ACROSS NATIONAL BORDERS

Luca Gaeta[1], Umberto Janin Rivolin[2], Luigi Mazza[3]

[1] Politecnico di Milano, luca.gaeta@polimi.it
[2] Politecnico di Torino, umberto.janinrivolin@polito.it
[3] Politecnico di Milano, luigi.mazza@polimi.it

Keywords: handbooks, spatial planning, spatial governance

*Handbooks are assigned the task of presenting knowledge in a systematic manner for practical learning purposes. This is less immediate for spatial planning, a complex (and sometimes confusing) field of knowledge, also because of the different legal frameworks and cultural traditions in which it is practiced. Handbooks in planning are indeed used to refer the teaching to a specific national context, but this may lead to confusing the technical nature of planning with its institutional codification. The handbook recently published by the present authors in Italy builds on the assumption that planning education requires, first and foremost, that students understand its value as specific technical knowledge. From this assumption follows the distinction between 'spatial governance' and 'spatial planning', adopted in the handbook. The proposed contribution summarises the educational choices behind the handbook in five theses, which are discussed as a basis for teaching planning in an international perspective: 1) urban planning is a field of knowledge, teaching its technical aspects means teaching spatial planning; 2) to teach spatial planning we must explain why it is instrumental for the purposes of spatial governance; 3) the technique of spatial planning originated from recognisable matrices, the teaching of which lays the foundations for all subsequent learning; 4) also for teaching purposes, the technique of spatial planning can be traced back to zoning; 5) spatial governance is not a form of technical knowledge, but a political practice that may be taught insofar as it is necessary for understanding the effects of spatial planning.*

## 1. Introduction

"Spatial governance and spatial planning" is the title, translated in English, of the handbook published in Italy by the authors of this paper (Gaeta, Janin Rivolin & Mazza, 2013). Right down to the choice of title, the handbook was drawn up on the basis of three convictions: i) that teaching spatial planning is about passing on and contributing to the construction of specific technical knowledge, even more so if this is done using a handbook; ii) that for teaching to be effective, the technical nature of this knowledge must be pointed out; iii) that the institutional frameworks of professional practices do not provide a basis for technical knowledge, although they are useful for critically understanding its potential, limitations and moral implications.

With regard to these considerations, handbooks generally have different approaches:

a) the subject is usually approached in reference to a specific 'national' context (e.g. Gabellini, 2001; Cullingworth & Nadin, 2002; Cullingworth & Caves, 2009);
b) also for this reason, the nature of technical knowledge depends, explicitly or implicitly, on its institutional codification in that given context and, if the context is not given (e.g. Selicato & Rotondo, 2010; Weber & Crane, 2012), the nature of technical knowledge also remains vague;
c) the knowledge transferred – which comes from a field of knowledge including everything from administrative and procedural skills to urban design, from urban studies to public management – can rarely be described as 'technical' and at any rate is almost never 'specific'.

The above assumptions led to this new handbook being drawn up in four parts, which help to show – using concrete cases, detailed information, examples and exercises – issues that must be taken into

consideration for learning to take place without making exclusive reference to the Italian context, extending the scope to the ancient and contemporary experiences most suited to helping us understand the technical nature of our knowledge. The first part of the handbook shows how the main effect of spatial governance is that it reshapes the citizenship of those who live in the area subject to planning; the second part traces the historical matrices of spatial planning that have contributed to shaping contemporary technical knowledge; the third part sets out the main themes and methods of spatial planning that emerged over the course of the twentieth century right up to the present day; and the fourth and final part is dedicated to the institutional and procedural forms through which spatial governance, making use of spatial planning, currently operates.
This paper gives the reasons, in five theses, for the educational choices behind the handbook and concludes with a few considerations as to the relationship between teaching and civic progress.

## 2. Urban planning is a field of knowledge, teaching its technical aspects means teaching spatial planning

The political and technical practices used to order space play an essential role in all societies. No matter how many things may change in society in the future, it is certain that the ordering of space will always be necessary. Spatial planning meets this social need, although during certain periods it may not seem up to the task, and may seem like an uncertain and ineffective solution. This must be taken into account before any teaching can take place in our field, to stress the importance to students of the subject they're broaching, independently of the historical circumstances and the national and/or socio-spatial context of reference.
In this respect, it is helpful to avoid falling back on the Italian term *urbanistica* ('urban planning', see: CEC, 1997), which is still very much used in professional and academic jargon. This term – like *urbanisme* in France or *town and country planning* in the United Kingdom – is commonly used in Italy, because it was adopted by the national technical culture developed at the beginning of the twentieth century by the first disciplinary institutes (universities, journals, conferences etc.). The problem is that, due to the wide variety of subjects that have involved the ordering of space in the last century, these national denominations of the same technical practice have ended up covering a vast field of knowledge and disciplines with no real clarity as to where to draw the line; they describe bodies of knowledge that do not fit into a single framework due to the many objectives pursued and the differing jargons used. No teaching programme, even one extended over a long period of time, could satisfactorily cover the multiple subjects encompassed, for instance, by the field of 'urban planning'. Even if it were possible, such a teaching programme would end up evading or confusing, with an overly vast set of questions, the specificity of the technical knowledge that planners apply or should apply, that is to say spatial planning.
For these reasons, we decided it would be preferable, in drawing up the handbook, to use two interrelated terms that help to convey, more effectively than others, the political and technical functions of the ordering of space: spatial governance and spatial planning. By spatial governance, the handbook means the political decision-making processes through which choices about the ordering of space, i.e. defining and controlling the uses of the land, are made. By spatial planning, the handbook means the main technique that is available to and supports spatial governance. This terminological pair introduces order into the multifaceted field of 'urban planning' (or whatever term is traditionally adopted in distinct national contexts) and allows us to distinguish between techniques that actually do order space and the political processes that decide this order. Furthermore, the pairing of terms is a tool that can be applied to any socio-administrative and cultural context. That said, it must be stressed that the use of the term 'governance' should not conceal in any way the fact that only the 'government' has the ultimate power to dictate how land is to be used (i.e. to assign rights of transformation).

Whilst the traditional terminology takes both political decision-making processes and analytical and planning techniques into account, distinguishing between spatial governance and spatial planning allows us to separate two practices that have different characteristics and present different didactic issues, making them an effective combination for teaching. Given that spatial planning is a form of technical knowledge taught for practical purposes, this handbook describes it by tracing its theoretical and practical origins back to ancient times and above all through the last one hundred and fifty years of European and North-American history. This gives us the profile of a form of technical knowledge with deep and far-reaching roots, the main use of which is to assign and control the use of land, clearly demonstrating how this ultimately translates into social control and the re-establishment of the material conditions of citizenship in the area subject to planning.

## 3. To teach spatial planning we must explain why it is instrumental for the purposes of spatial governance

To pass on any technical knowledge, its technical nature must be defined and justified. In other words, a convincing answer must be given to the question 'what human practices gave rise to the need for such skills and why? Without this – as we will see – it is (more) difficult to teach how specific technical knowledge can or must be used and, above all, with what aims and responsibilities. In contemporary handbooks on spatial planning the question is usually avoided. The implicit answer these give thus tends to place the origin of technical knowledge in the institutionalisation of professional practices in the modern age, "as a technique used by the public authorities" (Marescotti, 2008, p. 1) to pursue aims "which are set out in legislation or in some documents of legal or accepted standard" (Cullingworth & Nadin, 2002, p. 2), ending up inverting the causal relationship between practical reason and institutional codification. In cases where efforts are made to define the technique outside a specific institutional context, the following ideological statement holds true: if spatial planning can be freely defined as "a process of formulating goals and agreeing the manner in which these are to be met" (Cullingworth & Caves, 2009, p. 6) or "an institutionalized social technology for systematizing knowledge pertinent for a particular kind of collective action and for marshalling the power required for its implementation" (Weber & Crane, 2012, p. 8), then it is also legitimate to deny its technical nature, teaching students that "the urban project – faced with an ever-changing local context – moves forward by trial and error, and (…) is not easily confined to a deductive logic established by a general plan" (Selicato & Rotondo, 2010, p. 2).

In actual fact, the need for spatial planning came about well before its institutional codification in the modern age, and referring back to the first experiences of it is essential to be able to correctly illustrate its technical nature. Plans have existed ever since human societies, in learning to permanently settle in a place, have needed to organise and control space, enclosing the area under their sovereignty and distinguishing, first and foremost, between space for public use and space for private use. Leaving the confirmations provided by archaeological finds dating back to the end of the Stone Age to one side, the first literary account to confirm the existence of spatial planning is notably given in Aristotle's *Politics,* in which the figure of Hippodamus of Miletus associates the application of the orthogonal grid with political constitution (Mazza, 2009). This association is made based on the political effects of the technical act of dividing land; in other words, on the "rights" this technique assigns or revokes.

In this respect, substituting *urbanistica* (urban planning) with *governo del territorio* (spatial governance) in the Italian Constitution under the 2001 reform has the undeniable, although probably accidental, merit of distinguishing political and executive responsibilities from the technical contribution that supports them, in the well-structured process that today regulates – 2,500 years on from the Hippodamean grid – the assignment of rights to the use and transformation of land by the State. Defining 'spatial governance' as the decision-making process by which political power assigns rights to the use and transformation of land, whatever the institutional context – ancient or

contemporary, of one State or another – in which this process is organised, is therefore necessary for defining 'spatial planning' as the technical tool for doing so.

## 4. The technique of spatial planning originated from recognisable matrices, the teaching of which lays the foundations for all subsequent learning

Any disciplinary knowledge, if it is to be consolidated, must establish an intellectual and professional genealogy. This is a task generally taken care of by the history behind the discipline in question, which is usually outlined in the introductory chapter of a handbook (e.g. Benevolo 2009; Cullingworth & Nadin 2002). By "inventing a tradition", in the words of Hobsbawm (1983), our handbook links the construction of technical knowledge with the aims pursued by spatial governance in the modern age, whilst also acknowledging its autonomy. Spatial governance changed between the nineteenth and twentieth centuries in response to the spatial effects of the industrial revolution, which made it necessary for the modern State to organise urban development with institutional ways of regulating land. Contemporary spatial planning culture took shape, in this context, through the application of models for ordering space established over time, i.e. by updating the original focal point of technical knowledge.

Recognising the matrices of spatial planning and understanding its aims is essential for learning technical knowledge. The matrices identified in the handbook correspond to the technical knowledge developed by three figures who pre-empted, in different ways, the characteristics and flair of the contemporary planner: Catalonian-born Ildefonso Cerdá, Scotsman Patrick Geddes and Englishman Ebenezer Howard. These men were highly committed in their day and determined to take action; they pursued interests and occupied positions in multiple fields of social practices. This did not stop them from contributing a specific set of theories, models and rules to our understanding of spatial planning that is still largely used to this day, albeit not always consciously.

Cerdá was the only one of the three who was educated in a technical school and integrated into a professional body, but took on administrative and political roles at different stages of his life. The focal point of his technical teachings, obviously more wide-ranging, was the design of the orthogonal road grid applied to the expansion of Barcelona, a design which he made into the cornerstone of a "general theory of urbanisation" (Cerdá, 1867). Placing the design of the grid and rules for building city blocks at the centre of his theory allowed Cerdá to provide technical solutions to the hygiene, economic and transport problems of urbanisation. Nonetheless, Cerdá's use of the design and rules, integral components of the plan, highlights his awareness about the effects of these on material rights of citizenship. Drawing on the rich repertoire of orthogonal urban roads (Malverti & Pinon, 1997), Cerdá associates them with an ideal of liberal and progressive governance, in which the very form of the city limits the accumulation of positional revenue and favours all forms of communication between citizens.

Geddes was a heterodox biologist, an advocate of the Spencerian concept of evolution who did not hesitate to make himself a social operator and then a planner without ever giving up on his intention to found a new science. His contribution to the technique of spatial planning was not the "survey, analysis, plan" formula that he himself, moreover, did not put into practice, but the way in which he demonstrated, using the examples of Scotland, India, Cyprus and Palestine, the close relationship between every process of spatial planning and the history and geography of a place. Geddes' technique was adaptive, sensitive to the unique characteristics of every urban culture, and focused on reinstating the harmonious development of nature and culture that was jeopardised by the industrial age. For him, the plan was above all part of a process of renewal of space and society simultaneously or, more precisely, of the evolutionary relationship between a community and its surrounding environment. In spatial planning, Geddes sought a way out of the dissipative development model that had prevailed up until then.

Howard was a self-taught man who moved from one profession to another, from one side of the Atlantic to the other. He was able to tap into the most varied of intellectual stimuli and bring them together in an ambitious programme for social reform. His contribution to the technique of spatial planning lies in the way he functionally deconstructed the industrial city, putting it back together according to a cooperative, balanced and hierarchical system for the use of land and mobility extended over the entire area. Using diagrams of the garden city, Howard maintained that the unbridled use of urban land was a source of conflict that disrupted peace in society. By establishing spatial planning as a tool for civil society (Hall & Ward, 1999), he contributed in a decisive way to its success in the twentieth century in the context of the welfare state.
In a nutshell, the technical knowledge of spatial planning was born from a combination of matrices that can be defined as regulatory, procedural and systematic respectively (Figure 1). Although they don't necessarily combine to form a consistent and exhaustive whole, these three matrices give students the essentials on which to build further learning.

Figure 1. Cerdá, Geddes, Howard: three matrices of spatial planning (sources: Aa.Vv., 1991; Ferraro, 1998; Hardy, 1991).

## 5. Also for teaching purposes, the technique of spatial planning can be traced back to zoning

Benveniste (1976) teaches us that the Italian word for rule, *regola*, comes from the Indo-European root reg- (the same as *rex*), which means to draw in a straight line, establish a right, in clear reference to the division of land. This founding etymology, so important to civil society, is useful for understanding that the rules for spatial planning can be seen above all in the boundaries it produces, and its technique can be seen in zoning. Whilst still in its infancy, the planning culture confused zoning with functional and social segregation, ignoring or forgetting that above its possible uses and effects, the division of land was the focal point of the technique. This handbook puts the student in a position to understand that the specific skill of spatial planning starts with and depends on the tracing out of boundaries.
Highlighting this paves the way for two considerable pedagogical opportunities. First of all, it shows that every technique that falls under spatial planning (e.g. sizing the extent of development, establishing and circulating standards, transferring volumetric rights, checking population density) is a specialisation in the technique of tracing out boundaries, combined with specific ways of regulating the use of land within the perimeters established by the plan, whether these already exist or are being created. The terms 'area', 'parcel', 'sector', commonly used in technical documents, all refer to the definition of boundaries without which indices and parameters would have no set meaning or be legally binding. Secondly, it helps us to understand that any technique that cannot be attributed to the tracing out of boundaries does not belong to the specific knowledge of spatial planning. This

distinction on its own is not enough to build systematic and communicable knowledge, nor does it mean that spatial planning should ignore the contribution of social and environmental sciences. The distinction is, nonetheless, useful for establishing the technical specificity of spatial planning, also preventing the student from mistaking it for a purely analytical skill. Obviously students should not be misled into a 'corporative' thinking (which is a risk that should be borne in mind), but to convey the real social utility of spatial planning it is important to allow students to recognise who we are, the technical culture we come from, and the knowledge we have.
Zoning, which is understood as a way of regulating the use of land through the tracing out of boundaries, is the most solid point of departure for the technical training of planners, regardless of the country and culture they come from. There's no one zoning model, this is actually a flexible technique that can be adapted to wide array of aims and situations. Indeed, it is applied in all cities, in the most varied political regimes, economic systems, climates and cultures, not without the support of the most radical liberals who, where in power, could not do without it. An ancient technique that is still used to this day, zoning bears the traces of the indissoluble relationship between land and citizenship. It is necessary, however, to learn to distinguish between the emancipatory use of boundaries, as authentic tools of citizenship, and their use for segregatory and discriminatory purposes (Jacobs, 1961; Somma, 1991; Chiodelli, 2012). In this sense, the moral implications of zoning are a lot more important than the aesthetic implications, and must be heeded in training students, because the autonomy of technical knowledge does not mean that it is without responsibility.

## 6. Spatial governance is not a form of technical knowledge, but a political practice that may be taught insofar as it is necessary for understanding the effects of spatial planning

In the first two theses we distinguished between the technical contribution to the control of space and the decision-making and executive responsibilities of political power. The two subsequent theses summarised the substance of the technical knowledge of spatial planning which, in theory, could be passed on even without referring to the nature of spatial governance in various institutional contexts. It is true, on the other hand, that the varied and significant issues and problems spatial governance finds itself up against – looking at just the last century this includes urban containment, the recovery of historical centres, the organisation of mobility, the protection of the environment and the landscape, reinforcing social cohesion and guiding local development, etc. – throw up just as many questions on method for technical knowledge, so much so that it is recommended that planning techniques be taught alongside decision-making processes and the ways in which the stakeholders involved participate in these.
Unlike that which is usually confirmed or implied by contemporary handbooks, however, it is important to emphasise that the national and regional characteristics of systems of spatial governance (more commonly labelled as the 'spatial planning systems'), the institutional forms and procedural tools through which this is developed in practice, the different types of plan for different administrative areas and the policies addressed do *not* constitute the technical knowledge of spatial planning. If this were the case, the need for contextualisation would risk obscuring the distinction between technical and political responsibilities. Rather, contextualisation is necessary to show that the aims and political effects pursued through planning are never 'absolute', but always linked to the characteristics and objectives of the system of spatial governance within which technical knowledge is applied.
Spatial governance is not a form of technical knowledge, but a political practice involving different types of knowledge, which more specifically takes procedural knowledge and the analysis of decision-making processes as its main points of reference. In practice, spatial governance consists in defining planning problems and deciding how to resolve them. An effective way of 'teaching' spatial governance to students is through case studies, insofar as these make it possible to describe and analyse decision-making processes. The handbook goes down this path, using concrete examples to

show the stakeholders involved in the processes, their actions and roles, their powers, and their links with active forces and interests involved in decisions of spatial governance in a given area. The case studies can be turned into 'games' in which the students take on the roles of the various stakeholders and try to find shared solutions other than those to have actually come out of the decision-making process. Among various other stakeholders, planners participate in the decision-making processes of spatial governance, as persons with a form of technical knowledge that sets them apart from the other participants. This knowledge must remain central to teaching, even though it is to be found in the context of the political processes in which it is used or represented.
We should add, to avoid any doubt, that it is useful to keep the distinction alive between technical and political responsibilities – more than to play down or downsize the responsibility of technical knowledge in influencing processes of spatial governance – to clarify that this responsibility does not end with the drawing up of plans, but extends to the contribution of technical knowledge, consciously or unconsciously, to the social construction of a system of spatial governance. Defining the technical nature of spatial planning also contributes, in this respect, to training professionals to be aware that systems of spatial governance are not formal, inanimate structures through (or against) which to unleash their individual creativity to improve the physical environment and human and social wellbeing (Healey & Hillier, 2008). Understanding that the control of space for the purposes of political, social and economic control does not follow, but pre-exists the formation of spatial governance systems, and is the founding purpose of these, is in other words essential for building technical knowledge that is conscious of its role in the progressive design of citizenship.

## 7. Conclusions

These last considerations allow us to conclude with a brief reflection on the specific institutional and political value of teaching in our field of knowledge. Indeed, the disappointment of political decision-makers and public opinion over the weak or contradictory response of spatial planning is well known.
The economic and social crisis of recent years, in particular, has led to public opinion becoming strongly detached from the idea of collective action and responsibility and from the idea of pursuing aims of public interest, which lie at the heart of the notion of spatial governance. The fiscal crisis and the further weakening of public power took away a clear and important part of the authority of spatial governance, which was not just to "do business" with urban transformations. So far, attempts to simplify spatial governance to make it more effective and transparent have often failed because public and private professional corporations take advantage of complicated and not particularly specialised procedures that increase the discretion of decision-makers but confuse responsibilities and facilitate collusion.
It is our conviction that, even without getting to the point of confusing roles and responsibilities, the difficulties referred to above are also the long-standing outcome of an uncertain method of teaching technical knowledge that lacks much-needed stability. Indeed, since spatial planning contributes to the progressive design of citizenship, it is not hard to believe that citizens who are confused or distrustful of planning are, in the long run, also the result of our specialists being trained in a way that is not targeted or selective enough. In conclusion, in the words of Beauregard (2005: 206), "a bridge exists from the technical knowledge that planners embrace to the institutional change that seems necessary for planning to be effective", and its foundations lie in university lecture halls.

# ADOPT A NEIGHBOURHOOD: WHEN PLANNERS MEET SCHOOLCHILDREN

Marco Picone[1], Filippo Schilleci[2], and Francesca Lotta[3]

[1]University of Palermo, Italy, marco.picone@unipa.it
[2]University of Palermo, Italy, filippo.schilleci@unipa.it
[3]University of Palermo, Italy, francescalotta@gmail.com

Keywords: youth, neighbourhood, Palermo

**Abstract**
*Throughout this paper we will present a project that revolves around the idea of the neighbourhood as an 'identity container' and aims at bridging the gap between traditional planning programmes and the new challenges linked both to the crisis of public spaces and to participatory planning.*
*During the last two years, our University has been working in cooperation with the Municipality of Palermo and many primary and secondary schools of the city on a project called 'La scuola adotta il quartiere' ('Schools Adopt Neighbourhoods'). Within the project, planning students from the University guided the schoolchildren (8- to 13-years old) to the discovery of their neighbourhood and its community. Planners also had a key role in helping their younger 'colleagues' in the proposal and development of collectively discussed renewal policies: for instance, some of them proposed an urban renewal intervention in the well-known and deprived ZEN neighbourhood, and this proposal was later approved by the Municipality.*
*This process caused a mutual beneficial effect: on the one hand, schoolchildren became more conscious of the idea and nature of their neighbourhood and of the notion of ethical participation. On the other hand, planning students began to concretely explore the social role they are called to play in our contemporary society, and the ethical dilemmas that every participatory project involves.*

## 1. Introduction

This paper revolves around the idea that active and ethical participation must include not only the adult part of the population, but also younger people. The paper stems from an action research held in Palermo during the last two years (2013-2015), and draws upon previous experiences that we have already documented (Picone and Schilleci, 2012 and 2013).
Being the result of the cooperative work of a geographer (Marco Picone), a planner (Filippo Schilleci) and a landscape scholar (Francesca Lotta), this article mostly deals with interdisciplinary topics. Particularly, we will build the foundations of our reasoning on three key aspects: the notion of neighbourhood (arguably the *ideology* of neighbourhood: Lefebvre, 1967; see also de Certeau, Giard and Mayol, 1994; Galster, 2001; Borlini and Memo, 2008; Moulaert *et alii*, 2010; Picone, 2010; Picone and Schilleci, 2012), the generic practice of participatory processes and their ethical implications (Sanyal, 2002; Watson, 2003; Lo Piccolo, 2008 and 2009; Campbell, 2012; Picone and Lo Piccolo, 2014), and finally the inclusion of schoolchildren and young people in participatory planning processes, along with its peculiar ethical consequences (Checkoway, 1998; Driskell, 2002; Dennis, 2006; Gulson and Symes, 2007; Sclavi and Giornelli, 2014).
We will then mainly focus on the third point, and describe in full details the two-years experience we held in Palermo. Within the project to be discussed, planning students have played an essential role, and this has compelled us to speculate on the repercussions of this involvement for our academic programmes. We will also relate the practical, political and ethical issues that arose from this experience, as this will allow us to debate the future guidelines of this project within a larger conceptual framework, based on the notion of ethical participation.

Throughout this paper, we will suggest a few answers to the questions we have incurred, which are briefly summarised hereinafter.

1) How do we need to theoretically redefine the role of neighbourhoods, considering the geographic specificities of neighbourhoods between different cultural areas? In other words, do Italian neighbourhoods (*quartieri*) work exactly like their Anglo-American (or French, or German, etc.) equivalents, or are there any peculiar differences that we must account for?
2) What sort of participation can enhance the active role of citizens in the peculiar Southern-Italian context, which shows a strong (if not complete) lack of collaborative approaches from local institutions? Is there a way to overcome the contradictory (or weak) requests by either institutions or disadvantaged groups, in order to design a shared and community-based redevelopment programme? How do we strengthen the precarious notion of public spaces, when these are almost entirely replaced with private areas, often controlled and managed by wealthy entrepreneurs?
3) Which ethical issues arise from the participatory practices we are employing, particularly if we want to include young people in those practices? Do we have to use particular techniques of inclusion, or just set easy goals, so that the youth can effortlessly grasp the main points of action? What is the role of planning scholars and, most notably, planning students in these processes? Should we—as professional educators—adapt our traditional teaching curricula to train students to work with under age youth? And do ethical issues arise from this decision? Moreover, is there any peculiar kind of planning tasks that students should be trained to deal with, or are planning students able to cope with all the steps included in managing these participatory processes?

## 2. Research Background

One of the authors of this paper, coming from a social sciences background, has spent some years (2003-2005) as a junior high school teacher before starting his work as a researcher. Drawing from this doubly privileged point of view (both schoolteacher and academic researcher), he was able to design a scientific research starting from the field notes and participant observations that he collected during those years. Most of the notes revolved around the condition of schoolchildren in deprived Palermo slums, and later led to the publishing of some articles on the infamous ZEN neighbourhood (Picone, 2011).

During the spring of 2005, a group of young Dutch planning students from the University of Utrecht came to visit Palermo. They asked us (the authors of this paper) to be guided in a visit to the most important places of the city, and we proposed them to visit the ZEN neighbourhood along with some 12-years old schoolchildren (Alaimo and Picone, 2009). The goal of this visit was not just to show a socially deprived slum within the city, but most notably to help the Dutch understand *how* that particular slum was lived, represented and performatively enacted by the local youth. This experience inspired a great deal of ideas on the role of young schoolchildren, if one wants to truly understand how some troublesome social realities work.

An additional experience that is worth mentioning as part of our research background is more directly tied to academic teaching. We have been teaching Planning and Urban Geography to young planners at the University of Palermo for more than ten years now. As part of our teaching, we have always led young planners in several inspections that called for both traditional planning analyses and social observation (Picone and Schilleci, 2013). As the years passed, we realised what an important role schoolchildren played in these analyses and observations: not only did they account as essential city-users and social actors for the future of the city, but they were among the most interesting cases when it came to studying the perception of a neighbourhood. In other words, data collected from schoolchildren were proving to be more and more significant.

One last element that we feel like discussing here is our research work on the notion of neighbourhood in Palermo. The Municipality has recently (1997) put the 25 existing urban neighbourhoods together into 8 larger land units, called *circoscrizioni*. Therefore, the city of Palermo is now divided into 8 administrative sub-regions, none of which has any peculiar element, be it social, historical or geographical, that can help its residents acknowledge or recognise it. Most citizens do not even know which *circoscrizione* they live in. We have claimed (Picone and Schilleci, 2012) that this approach is a failure in urban policies, as it completely denies or ignores the role of neighbourhoods in shaping urban identities. Thus, this lack of relationship between the citizens and the administration got us persuaded that schoolchildren and the youth in general are to be included in participatory practices, as we believe that childhood and adolescence are most suited for stimulating a political awareness of what it means to be part of a community, and therefore to be part of a neighbourhood.

## 3. Relevance and Objectives

Our research exploits the educational role of the university in our city: we consider education not simply as the transmission of technical knowledge to our students; instead, we are training planners and geographers as 'cultural mediators' whose task is—amongst others—to build bridges that can connect the different social actors and mediate negotiations in conflicting situations (Forester, 2008). It is not only a matter of understanding the different points of view of social actors, but also an ability to employ active listening (according to Sclavi, 2007, based on the work by Bateson, 2000), conflict resolution (Deutsch, Coleman and Marcus, 2006), and many other qualitative techniques (DeLyser *et alii*, 2010).

Therefore, our duty as professional educators is not only to deliver scientific ideas to our students, but also to train them as mediators. This means that the university leaves its ivory tower to 'meddle' in everyday conflicts. If we want to reach out to the world out there, there is no better way than to take an active role in the educational processes that include not only university students, but also the urban population as a whole.

So far, we can actually state that there seems to be a shift in the general attitude towards our project and ideas: whereas, at first, we experienced mistrust and scepticism—most schoolteachers, for instance, considered us according to the cliché of the academic researcher, the expert technician uninterested in delving into everyday problems—, the last two years have brought a significant change in the way the municipality and the schools perceived our role as academicians. In a sense, these projects help the university in accomplishing its third sector mission and, meanwhile, help schoolteachers and other social actors in understanding a core idea of urban studies, i.e. what it means to design a city in a participatory way.

The reason why we are inciting the university as an institution to this practical approach is that we are experiencing a profound need to reconsider the role of planners in our city and, more generally, in Italy. Apparently, all planners in Italy talk about participation, social inclusion and reducing the disparities between the rich and the poor. However, politicians generally misinterpret or blatantly distort these guidelines, by repeating the same *totem words* (like participation, inclusion, etc.) even in non-participatory and non-inclusive practices. Meanwhile, the integration of the young planning graduates in the labour market is becoming more and more complicated: «with the crisis of funding for planners in public government, the diffusion of planning consultants has drawn the attention of many architects and engineers, who are backed up by stronger and more powerful professional associations. This has caused many problems for young planners trying to find their way into public administration» (Lo Piccolo, Picone and Schilleci, 2015, p.53).

Since the condition of young planners is so frail in Italy today, reinforcing their position as mediators between the administration and the youth could somehow enhance their chances to be acknowledged as experts in a field of knowledge that neither engineers nor architects can adequately master.

There is one additional consequence to our research. Not only can young planners benefit from working with the youth, but the whole city could get some benefits as well. As we stated earlier, the population of Palermo seems to ignore the administrative boundaries and sub-regions disposed by the Municipality. By working on the connections between neighbourhood and identity, we are supporting bottom-up participation and social inclusion in planning processes, as we have discussed elsewhere (Picone and Lo Piccolo, 2014).

## 4. Conceptual Framework

In order to structure our research, we have drawn upon three concepts that we will present here: neighbourhood, participation, and including young people in participatory processes.

### *4.1. Neighbourhood*

It would take more time than we can use here to discuss all the scholarly positions on the notion of neighbourhood (Picone and Schilleci, 2012). For instance, Galster (2001, p.2111) has observed that «urban social scientists have treated "neighbourhood" in much the same way as courts of law have treated pornography: as a term that is hard to define precisely, but everyone knows it when they see it». In our research, the neighbourhood becomes an ideology[1] (Lefebvre, 1967) that is actually able to "save the city" (Moulaert *et alii*, 2010).

Now, one could say, why stressing the role of neighbourhoods, in an era that disregards spatial proximity in favour of virtual relationships (Borlini and Memo, 2008)? In other words, why should we still consider the neighbourhood as a significant scale of analysis and action, if we can easily keep in touch with our friends and family even if they live a thousand miles away from us? What is the point of putting neighbourhoods back to the centre of our discourse? The answer lies at the core of contemporary social and political life. We shall try to explain this concept by showing the link between neighbourhoods and urban governance in the words of some very influential scholars.

A few years ago, Patrick Le Galès (1998, p.79) described urban governance as the ability to integrate and shape local interests, organizations, social groups, and also as the ability to represent them outside the city, to develop more or less unified strategies of relationships with the market, the state, other cities and the other levels of government. In 2003 he claimed that governance is "the art of governing", and pointed out that Medieval European cities are one of the fundamental elements of modern European societies. They act as the melting pot of the social, political and economic organization of European Nation-States. European cities become the "incomplete societies" where new, multi-scale governance modes are structured.

We acknowledge that urban governance is particularly affected by the economic crisis, the neoliberal trends and the cosmopolitanization of our world (Beck, 2006; Harvey, 2009). Traditional urban governance is experiencing deep changes, with the private sector getting more and more predominant when compared to the public sector in crisis (Peck, Theodore and Brenner, 2012). This compels us to find new levels of interaction between the public sector and private social actors, especially if we consider the latter as more than the sum of wealthy entrepreneurs and politically engaged businesspersons. Here comes the neighbourhood: in our opinion, Michel de Certeau's idea of neighbourhood as the middle ground between the private sphere (the house) and the public one (the

[1] «Nous commençons par rappeler qu'il y a une *idéologie* du quartier, en déclin, mais qui n'a pas perdu son audience et son influence. […] le quartier n'est pas un détail accidentel, un aspect secondaire et contingent de la réalité urbaine, mais son essence» (Lefebvre, 1967, p.9). Lefebvre then actually debates the ideology of neighbourhood and proposes his own ideas on the topic, but we want to point out the importance of neighbourhoods in social sciences, as the author would acknowledge them as key elements for the comprehension of the city, just in the time when he was writing some of his masterpieces (like *Le droit à la ville*, 1968).

city) can prove particularly useful: «The neighborhood is, almost by definition, a mastery of the social environment because, for the dweller, it is a known area of social space in which, to a greater or lesser degree, he or she knows himself or herself to be recognized. The neighborhood can thus be grasped as this area of public space in general (anonymous, for everyone) in which little by little a *private*, *particularized space* insinuates itself as a result of the practical, everyday use of this space. The fact that dwellers have their homes here, the reciprocal habituation resulting from being neighbors, the processes of recognition—of identification—that are created thanks to proximity, to concrete coexistence in the same urban territory: all these "practical" elements offer themselves for use as vast fields of exploration with a view to understanding a little better the great unknown that is everyday life. […] As a result of its everyday use, the neighborhood can be considered as the progressive privatization of public space. It is a practical device whose function is to ensure a continuity between what is the most intimate (the private space of one's lodging) and what is the most unknown (the totality of the city or even, by extension, the rest of the world). […] The neighborhood is the middle term in an existential dialectic (on a personal level) and a social one (on the level of a group of users), between inside and outside» (de Certeau, Giard and Mayol, 1998, pp.9-11). Considering the neighbourhood a "middle term" between the public sphere (*the city* or even *the world*) and the private sphere (*home*) offers an insight on why neighbourhoods are still very important for the unfolding of the everyday life. They become even more important within the contemporary economic crisis, which impairs the role of public spaces.

Neighbourhoods, thus, play a key role in European cities, although there is a distinction to be made. In the Anglo-American context, a neighbourhood is not just a spatial entity: it is also a social network of people connected by common values, ways of life and geographic imaginaries. The Italian equivalent of neighbourhood (*quartiere*) seems pretty much focused on spatial categories. It could probably be translated with the word *district*, therefore losing most of its social connotations. Similar observations could be repeated for other countries, like Switzerland (Giordano, 2015). This means that the social role of neighbourhoods in Italy is something that must be rediscovered and enhanced by stimulating citizens to a greater awareness of the connections between neighbourhoods-as-spatial-entities and social communities. Neighbourhoods must be considered as 'identity containers' that set up the social bases of community life (Picone and Schilleci, 2012 and 2013), a notion that is quite common in the Anglo-American world.

### *4.2. Participation*

Discussing participation and the ethical issues that it provokes would probably require an entire paper or two. Henri Lefebvre (1968) was arguably the most influent scholar in introducing the notion of social inclusion. We have used Jürgen Habermas's (1981; 1989) theories of consensus and communicative rationality as a warning to the risks that participation incurs, and Patsy Healey's (2009) *caveat* on participatory democracy. In discussing the ethical implications of participation (Campbell, 2012) we have also tried to assess the notions of ethical compromise (Sanyal, 2002) and conflicting rationalities (Watson, 2003).

One of the foundations of our discourse is that participation is a set of qualitative techniques of action-research (deLyser *et alii*, 2010), with its own rules that must be followed, and yet, at the same time, adapted to the contexts in which we practice it. We have experienced participatory techniques within the last ten years in Palermo (Lo Piccolo, 2008 and 2009; Bonafede and Lo Piccolo, 2010; Picone and Lo Piccolo, 2014), although the Southern Italian condition is quite peculiar: «the context we are referring to differs for two main aspects: 1. The weakness of local institutions; 2. The consequential de-legitimization of the public administration (politicians and professionals) by hook (corruption) or by crook (violence/intimidation), which guarantees a general condition of inertia, inaction, inefficiency and mistrust» (Picone and Lo Piccolo, 2014, p.67). This does not imply that one cannot use participation in Palermo or in other unprivileged areas, but particular caution must be exercised to

avoid the trap of the municipal administration using participation in a poor, sometimes even unfair or utterly rhetorical way.[2]
Amongst the various participatory techniques that can be used today, we have chosen to investigate and employ Lawrence Susskind's consensus building (2014a) and 'serious games' (2014b) approaches, as they seem to work very well with the young age category of the people we have involved in our research.

### *4.3. Including the Youth*

In 1998, Barry Checkoway looked at the connections between the topics we have so far discussed, and distinguished five types of participation that involved young people and neighbourhoods: «"youth action" and "citizen action" in which people take initiative and organize themselves for social change; "youth development" which promotes the positive development of young people rather than only overcoming their deficits; "neighborhood development" through which people implement programs of their own at the neighborhood level; and "neighborhood-based youth initiatives" which emphasize youth participation and neighborhood development in the same single program» (Checkoway, 1998, p.788). Several years later, however, he emphasised the lack of any agreement on the basic idea of what youth participation is, or should be (Checkoway, 2011). There has actually been some debate on the role of young people in participation, both in general terms (Ward, 1979; Driskell, 2002; Gulson and Symes, 2007) and in very peculiar approaches, like the use of qualitative GIS (Dennis, 2006). However, there is a need for further speculation on this topic, especially if one considers how young people often have a very low interest towards the public sphere.
Regarding this particular topic, we believe that Italy has displayed a decent degree of attention towards the inclusion of young people in participatory processes. Most important in this direction was the work of Francesco Tonucci, whose book *La città dei bambini* (2005) marked a significant step in this field of research; in particular, Palermo has hosted several experiences in working with schoolchildren to include them in urban participatory processes (Pinzello and Quartarone, 2005). More recently, some influential social scientists have discussed how to apply qualitative techniques of participation to schoolchildren (Sclavi and Giornelli, 2014).[3]
Including young people in participation means facing several ethical issues. Despite the general agreement that participation is essential and valuable in contemporary societies, practicing participation with young people requires an additional amount of caution, as it is extremely easy to manipulate the young for unfair reasons. Supporting or opposing the realisation of a public park or a shopping mall, for instance, is not something that should be easily done without any political awareness of the pros and cons, as well as of the consequences it can have. Persuading schoolchildren of the goodness of a shopping mall could be a piece of cake, but it might foster the profits of wealthy entrepreneurs over the general advantage of the community as a whole. These ethical issues definitely deserve additional analysis, although some steps in describing the relationships between planning and ethics (Watson, 2003; Campbell, 2012) or geography and ethics (Valentine, Butler and Skelton, 2001; Valentine, 2005) have actually been taken. Virginia Morrow, who has recently related an experience she conducted in a town in South-Eastern England, aimed at grasping the perception of 12- to 15-years old school students about their neighbourhoods, points out the ethical issues she has faced: obtaining consent from young people, reporting back to the research participants, confidentiality and privacy, pseudonyms, and drawing out policy implications from the study (Morrow, 2008, p.53). Morrow's

[2] See for instance the Electronic Town Meeting experience in Palermo: the administration wanted to provide the city with a way to empower deprived social groups, but ended up (ab)using the tool in order to build consensus over its own pre-existing goals (Picone and Lo Piccolo, 2014, p.66).
[3] We would like to acknowledge Marianella Sclavi's role in diffusing the Anglo-Saxon tradition of participation tools in Italy. Her books (see Sclavi, 2007 for the English translation of one of her most well-known writings) have deeply influenced the scholarly approach to participation, active listening, planning for real, etc.

concerns are of utter importance, but there might be many more addenda, particularly regarding the possible misuse of the collected data for unforeseen or inappropriate political means.
Additionally, we want to stress that our action-research was based on *young planners* dealing with *younger schoolchildren*. We have coordinated the whole project, but it was our planning students who were actually getting in touch and working with their younger counterparts. This raises questions about the suitability of traditional academic planning education for working with schoolchildren. Most planning curricula in Italy fail to provide the students with competences for dealing with young children and involving them in participatory practices: social sciences in planning curricula still have to be strengthened, in place of the abundance of technical courses (both from architecture and engineering; see Lo Piccolo, Picone and Schilleci, 2015). In order to get our planning students ready for dealing with schoolchildren, we have shaped our courses so that they provide the tools and methodologies needed in such cases, including a particular attention to qualitative techniques of analysis. However, there are still issues that cannot be ignored: how to build positive interactions between young planners and children, the role of planners with regards to schoolteachers, the risk of dictating choices that are considered inherently better or more suited to solve urban issues, etc. Considering that our research is not over yet, we can only produce some initial insight on these topics; however, we are fully aware that more work has to be done on this subject.

## 5. Methodology

In designing the methodology of our research, we aimed at mixed-methods approaches that recognised «geography's new turn to synthesis and holism. […] The interdisciplinary nature of geography […] can foster a methodological hybridity in the mixing of qualitative and quantitative methods and methodologies» (Sui and DeLyser, 2012, pp.112-115). The scientific reasons for this choice are drawn from the contemporary debate on mixing qualitative and quantitative techniques of analysis (Crang, 2002; DeLyser *et alii*, 2010; Sui and DeLyser, 2012; DeLyser and Sui, 2012 and 2014; Alaimo and Picone, 2015). Particularly, from the various qualitative techniques of analysis we have picked qualitative interviews (McDowell, 2010), mental maps (Lynch, 1960; Gould and White, 2002; Coverley, 2006), *shadowing* and participant observation (Czarniawska, 2007; Sclavi, 2007; Alaimo and Picone, 2015), rhythmanalysis (DeLyser and Sui, 2012), planning for real (Gibson, 1991; Sclavi, 2002), and qualitative GIS (Picone and Lo Piccolo, 2014). We have mixed them with several more traditional quantitative analyses, both demographic and technical. Most of the techniques we have used were already presented in Picone and Schilleci, 2012. Before starting our action research with schoolchildren, we have trained our planning students in the use of these techniques through specific courses (including Social Geography and Planning Workshops).

## 6. Findings

In 2012, following the publishing of a book on the neighbourhoods of Palermo (Picone and Schilleci, 2012), our University signed a Memorandum of Understanding with the Municipality. This was aimed at studying the existing administrative partition of the city and proposing a new partition that would be more connected to community ties, to the sense of belonging to a place, and to the geographical and historical traditions of our city. However, the feedback from the Municipality has proved quite ambiguous. After an initial appreciation, in the last few months the administration turned to other partnerships and deprioritized our agenda. We have already remarked how the reason for that lies probably in the instrumental, rhetoric use of participation from the administration (Picone and Lo Piccolo, 2014).
In the meantime, we have started working with the Department of Education (*Area della Scuola*) of our Municipality, which deals with public schools. We have started cooperating on a project called "*La scuola adotta il quartiere*" ("Schools Adopt Neighbourhoods"). The project stems from a

previous[4] experience called "*La scuola adotta un monumento*" ("Schools Adopt Monuments"), which picks up abandoned, closed or otherwise unvisited pieces of the artistic heritage of Palermo and revitalises them for one week per year, with young schoolchildren guiding the visitors (parents, families, friends, tourists, etc.) to the discovery of those monuments.

It might seem that our project works exactly like the previous one, only that instead of a single monument the school would adopt an entire neighbourhood. However, something sets the neighbourhoods project apart, and it is the role of planning students. By signing an agreement with the Department of Education and with several primary and secondary schools of the city, we have arranged an internship programme for our students. After attending courses dealing with the techniques that best work with schoolchildren,[5] they would spend some months in the schools working side by side with schoolteachers on the notion of neighbourhood, on its boundaries and relationships with the other parts of the city, on their strengths and weaknesses, and so on. They would start their internship by asking schoolchildren the simplest, yet most complicated question: what is a neighbourhood? On that base, they would build the foundations of a research aimed at raising awareness of the social, urban and administrative implications of neighbourhoods in our city. Planning students have employed all the qualitative and quantitative techniques of analysis we have discussed earlier, by asking the schoolchildren to draw pictures and maps of their neighbourhoods, by taking them for walks in their neighbourhoods, and—towards the end of the internship—by asking them to design some changes that were suitable to improve life quality in the neighbourhood. Some renewal proposals were actually presented to the Municipality as the result of the cooperation between the University, the schools and the Municipality itself; one of these proposals (calling for a local renewal intervention in the ZEN neighbourhood) has been approved and funded by the Municipality (Brinch and Montalbano, 2015),[6] while others are still in the evaluation process.

The main outputs of the whole project were some weekends during which the young schoolchildren led all visitors in a guided walk through their neighbourhood. We had 26 guided tours in 26 different neighbourhoods over two years. For each of these tours, particular attention was paid in pointing out that the schoolchildren were not supposed to deliver history lectures or show any degree of academic knowledge; rather, they were simply called to show the visitors the neighbourhood according to their own perception. This caused lots of surprises when those visitors who were accustomed to only look for pieces of art were actually taken to secondary alleys where, for instance, an improvised soccer field had become a meeting point for the young—a proof of the need and desire for more playgrounds and public spaces. During the weekends, the schoolchildren would hand out some guidebooks they had written during the previous months, along with the planning students from the University. All of these guidebooks contain the shared definition of neighbourhood that the children have agreed upon, the emblem (a sort of stylised logo) of the neighbourhood (a result of a democratic vote to choose the best among the many emblems drawn by each and every schoolchild), a geo-referenced map of the guided tour, and a glimpse at the renewal projects proposed by the children for their neighbourhood. A few examples of these guides are shown in Figures 1-4.

[4] The project *La scuola adotta un monumento* started in 1992 in Naples, and was later brought to Palermo in 1995 by the *Fondazione Napoli Novantanove* (see http://en.lascuolaadottaunmonumento.it/, accessed May 16, 2015).

[5] During our first year (2013-2014), a grand total of ten schools were involved in the project (six were primary schools, with 8- to 10-years old students, while four were secondary schools, with 11- to 13-years old students). In the second year (2014-2015), we included thirteen schools (seven primary, six secondary). All these schools are inside the administrative boundaries of Palermo, quite evenly covering all the different city parts.

[6] As a consequence of the project, our students have produced almost a dozen degree theses on neighbourhoods and schools.

Figures 1-4. Pages from Neighbourhood Guidebooks (Cruillas, ZEN, Pagliarelli, Borgo Vecchio).

During the second year of the project, the presidents and councillors of the *circoscrizioni* were involved in the event. They first went to visit the schoolchildren to explain the role of the *circoscrizioni* within the city, and thus confirmed that almost no student (or teacher, for that matter) had a clear idea of what the *circoscrizioni* were. Then, they took part to the guided tours arranged by the schools, and played an active role in discussing and revitalising the notion of neighbourhood.

Even in this very brief summary of the project, it seems clear that planning students arguably played the crucial role of mediators between the administration (Municipality, *circoscrizioni*), social groups (schoolteachers and children) and the academic world. This was exactly one of the main goals of the project: to help planning students recognise their role as mediators, and to make them aware of the social function of planning today, but also of the ethical dilemmas that stem from participatory processes. For instance, many planning students had to face the aftermath of their internships, with schoolchildren still trying to keep in touch with them and inciting them to provide feedbacks on the renewal interventions they had designed together (precisely the "reporting back" issue addressed by Morrow, 2008). The renewal proposal for the ZEN neighbourhood, for instance, is the result of the schoolchildren's pressure on our planning students: in a sense, the children were afraid of being let down and abandoned after their inclusion in designing a better neighbourhood.

As a whole, we might state that this project had two major positive effects. First, it made young people more aware of what a neighbourhood is: not just as a place you live in, but also a community you live with. In a sense, it means working on the notion of ethical participation, with all the *caveats* we have discussed before. Second, it prepared planning students to the challenges of working with (and for) a community, with all the inner conflicts that may arise, and to explore their role as not just "urban technicians", but as active members of the community.

Naturally, there have been issues and situations that need additional thoughts and efforts. To name a few: the ambiguous role of politicians, the inability to fulfil these kinds of projects for a long time without proper funding from the administration (so far we received no funding of sort), the need to revise planning curricula within our universities to suit these projects, and many more. Still, we believe that the pros outweigh the cons.

## 7. Conclusions

In order to draw a few conclusions, we want to get back to the questions we have posed in our introduction, and provide a few answers to them. These are not state-of-the-art, of course, since the project is not over yet and we plan to collect additional elements of reflections in the future. Yet, some considerations follow:

1) Considering that Italian neighbourhoods are not mostly perceived as community-based places but as administrative districts, our project tries to build on the notion of neighbourhoods as "identity containers", places that host a sense of belonging. It is not a matter of mimicking the Anglo-American idea of neighbourhood, for it has its own peculiarities and issues; rather, it is a way to get back to the roots of what neighbourhoods are: places of proximity that bridge the private sphere (the individual) to the public one (the community), as de Certeau suggests.
2) The Southern-Italian situation is not easily solved with a magical formula. Criminal organizations, weak or corrupt administrations and an embedded distrust in everything that is public still exact a very heavy toll. However, the lack of state-centred funding (that have diffused political nepotism and corruption to unimagined levels) is also producing the paradoxical effect of stimulating bottom-up responses to the crisis. Many third sector associations are supporting participatory processes that enhance life quality in the cities. In this paradoxical context, the universities—and urban studies in particular—are called to play a major role in creating new forms of active citizenship and participation. This may also empower disadvantaged groups over wealthy elites, and revamp the notion of public spaces.

3) In order to face the ethical issues tied to participation with the youth, our educational system should strengthen the study of qualitative methodologies in planning. The contents of our researches, as good as they may be, are not enough if a strong methodological background does not support them. This is especially true when one works with young people and their naïveté. First, we—as urban scholars or planning students—must understand what participation implies, what it means to give feedbacks even when our research is done, how to politically support our claims and proposals. It is planning education's duty to teach our students the "how to" of participation, even more so when young people are included in participatory processes. This concretely means revising our planning curricula, maybe at the expense of some technical details that are best left to engineers, so that future planners are better prepared for the challenges posed by contemporary cities.

# EFFICIENCY OF USING URBAN SIMULATION IN TEACHING URBAN PLANNING

Pimenova E.B. (PNRPU), waitwels@mail.ru
Saveleva E.O. (PNRPU), ekaterina.starodubzeva@gmail.com

Keywords: urban planning , SimCity, teaching process.

## 1 Introduction

The city as an object of urban planning is a very complex and multi-component socio-spatial system. Taking into account full spectrum of elements composing an urban system implies such level of complexity and detailing which will never be achieved in practice. As a result, designers and urban planners are often forced to work with a simplified model of the city. All kinds of tools based on GIS and mathematical methods are gaining increasing popularity among foreign researchers in the field of urban planning. For example, a professor at University College London (University College London) M Bhatti in his book «Cities and Complexity» describes the various simulations based on such instruments as cellular automata and agent-based modeling, which provide the process of decision making in an interactive mode, i.e., observing an instant reaction of the virtual community on one or another project (Devisch, 2008).
However, that it seems to be an incredibly complex and "scientific" approach to planning in academic and professional environment, it is successfully used in entertaining industry for twenty-five years. SimCity (SimCity) - a computer game released in 1989 and marked the beginning of the genre of urban simulation. In SimCity player usually has no particular purpose, achievement of which the game ends. The player controls the city, serving as mayor. In players hands such tools as the construction of roads and communications, construction of the main public buildings (administration, schools, hospitals, etc.), as well as zoning tool. Zoning of the city - in the game is available three types of zones: residential, industrial and commercial - allows "mayor" to manage the development and construction of the city. Latest released version of the game based on the revolutionary mechanism simulation Glassbox, greatly enhanced the realism of virtual cities and the processes occurring in them. Since first version of the SimCity was released until now it is one of the most popular computer games and probably the SimCity introduced to the world of urban development more people than any textbook (Starr). But does it have an educational potential?

## 2 Training with urban simulation SimCity.

SimCity Developers originally considered the game as an opportunity to show how to "build" the perfect city, and betrayed the importance of its educational potential. Until now, the company producing the game consider educational institutions as one of the key audiences (Lobo, 2004). No other game has been used so widely in schools to familiarize themselves with the various elements of local government and raise awareness of the factors determining the decision of municipal authorities (we are talking about American schools). So not surprisingly appearance of free educational versions of the game, as well as various materials for teachers to use games in the classroom.
According to D. Lobo SimCity also contributes to the emergence of interest in geographic information systems among pupils and students. If you work with real GIS software packages, in the first place, it is often beyond the financial capacity of schools and universities, and secondly, is too laborious and time consuming, while using SimCity is available, and the ability to "play for educational purposes" was adopted with enthusiasm. At the end of this stage of examination it becomes clear that it's still a game designed primarily to entertainment purposes. Whatever it seems realistic, SimCity can not become a tool to solve real problems of the urban planner. To do this is much better suited specialized GIS packages such as ArcGIS.

The idea of using SimCity in university courses related to urban planning, can not be called a new (Adams, Haber, Minneri and Searle, Nilsson and Jacobson). Practical exercises using SimCity are often aimed at developing in younger students an understanding of how different systems interact with the city, including the economic, social and transport services, engineering, and others. Such understanding is necessary not only for the planning of the development of modern cities, but also for a more critical approach to evaluating the planning decisions taken in the past (Minneri and Searle).
In their article, Nilsson and Jacobson (.Nilsson, Jacobson, 2011, p. 36), make a review and pick out three main goals, which can be achieved using urban simulation in the educational process:
1. to develop in students a holistic understanding of methods of various city components interaction;
2. to develop skills in strategic planning and to ensure that students are aware that their decisions can have both immediate and long-term effects; 3. to develop in students more flexible, adaptive, critical thinking, decision-making required.
Study of P. Adams, associate professor and director of the Urban Studies, University of Texas, also has arguments in favor of using SimCity in the learning process. Adams setting was to conduct several experiments in the game. Results of the study was assessed by students essays and interviews. The course was voted the favorite project among the 48% of students, well ahead of the next eight projects.
It should be noted that in the literature frequently encountered arguments against the use of computer games, and in particular the urban simulation SimCity, in training. Some authors draw attention to the problems that arise when using SimCity in the educational process. For example, Lobo (Lobo, 2004) argues that, because "the city is not a toy", students get the wrong impression when using the games.

## 3 Experience of urban simulation programs PNRPU.

The article describes the results of the introduction of practical work using computer simulation in two training courses, which are taught at the Faculty of Civil Engineering PNRPU:
1. Planning and construction of settlements - the fourth year of specialty Discipline "Urban Construction and Management."
2. The theory of the spatial organization of the cities "TPOG" - the discipline of the first semester of the first year Master "Design of the urban environment."

### 3.1 SimCity in the course "Planning and construction of settlements".

For the course "Planning and construction of residential areas" was included practical training with urban environment simulator sim city. This program has allowed students to apply knowledge from the lectures on the example of the construction and development of various cities. Each student was offered his own version of the direction of development of the city, such as the city - business center, an industrial city, a cultural center, a city with a developed system of public transport, family city - with developed social infrastructure and leisure, etc. During realization of the task the students faced with the problems of a growing city, providing citizens infrastructure (such as housing, schools, shops, workplaces, public transport), environmental improvements, upgrading of dilapidated housing, construction of new roads. In addition to these problems, development of the city is influenced by the financial burden. During the game, student, on behalf of the mayor of the city, we have to decide what is best for the citizens in the moment, where to direct cash flow as adjusted taxes to give loans. To track how connected all the processes of urban life, and realize that if today to invest in the construction of the mall, tomorrow may not be enough for the construction of roads, ie forcing students to plan the city's budget and think through the stages of development.
Since the simulator allows us to develop the city to infinity, in the framework of the educational process has been put in the game for a period of 1 week, 1-2 hours a day. In reporting session it was necessary to state: the population, the problems encountered during the construction of city revenues

and expenditures on infrastructure elements, the state treasury, the satisfaction of residents, some important projects are constructed and whether the purpose of the job is reached.

According to the observations of students we can say that the use of the program is useful, because you can feel as a city manager and head of various departments into one.

In my opinion, the students begin to think that the city is a single organism, and all the services it should be organized and work harmoniously in solutions supporting each other, then the development of the city will be balanced. Individual work allows everyone to learn the program, reporting on the occupation at the report shows the independence of the work, whether the person is guided in the program, whether it uses the terms. Making work in a presentation allows you to organize the results to assess the progress of their work, learn summarize the final moments. A report of the group to stimulate the development of the city as well as possible in order to adequately represent "his" city. Just in the course of the assignment is a dialogue within the group to solve the problems of the city, but there is no uniformity of decisions, because the goals are different. I believe that the use of simulation of the urban environment will enable students to face the challenges of urban life, which do not even think to trace the interaction of processes, the knowledge gained to work on the model.

### 3.2 SimCity in the course "Theory of the spatial organization of the city»: Urban Utopias TESTED and Evaluation of historical models of planning the ideal city.

Discipline "TPOG" is read in the first semester of Master's "Design of the urban environment", and aims to familiarize the Master with the conceptual framework of urban planning theory and practice. Since all the students coming from the magistracy, have different basic education from the Faculty of Geography and state and municipal government to architecture, this course aims to "align" their understanding of the fundamental laws of spatial development and planning, environmental functions of building, structure and evolution cities. Handout built chronologically from antiquity to postmodernism. Practical work is to construct a city in SimCity according to one of the six historical planning model of the ideal city:

• Garden City Howard;
• Radiant City by Le Corbusier;
• Broadacre Frank Lloyd Wright;
• Linear City Arturo Soria-e-Mata;
• The industrial city of Tony Garnier;
• Sotsgorod N. Milutin.

On the job will have one month, during which students independently (outside of class) build their chosen version of the utopian city in the simulator. Results of practical work were presented in two forms:

1. A written report (1000-1500 words), including:
• a brief description of the main features of the selected urban development model;
• description of the city, built in SimCity for selected model;
• conclusions on the feasibility and effectiveness of the selected urban development model based on observation and experience "construction" of the city in SimCity;
• assessing the suitability of SimCity for the "implementation" of the authors of original ideas of urban development models (which is easy to implement, and what game limits);
• bibliography.
2. The presentation, including:
• diagrams and drawings of the model chosen, a brief description;
• screenshots from the game, showing the layout of the city and the aligned illustrating the findings of the report (figure 1-3).

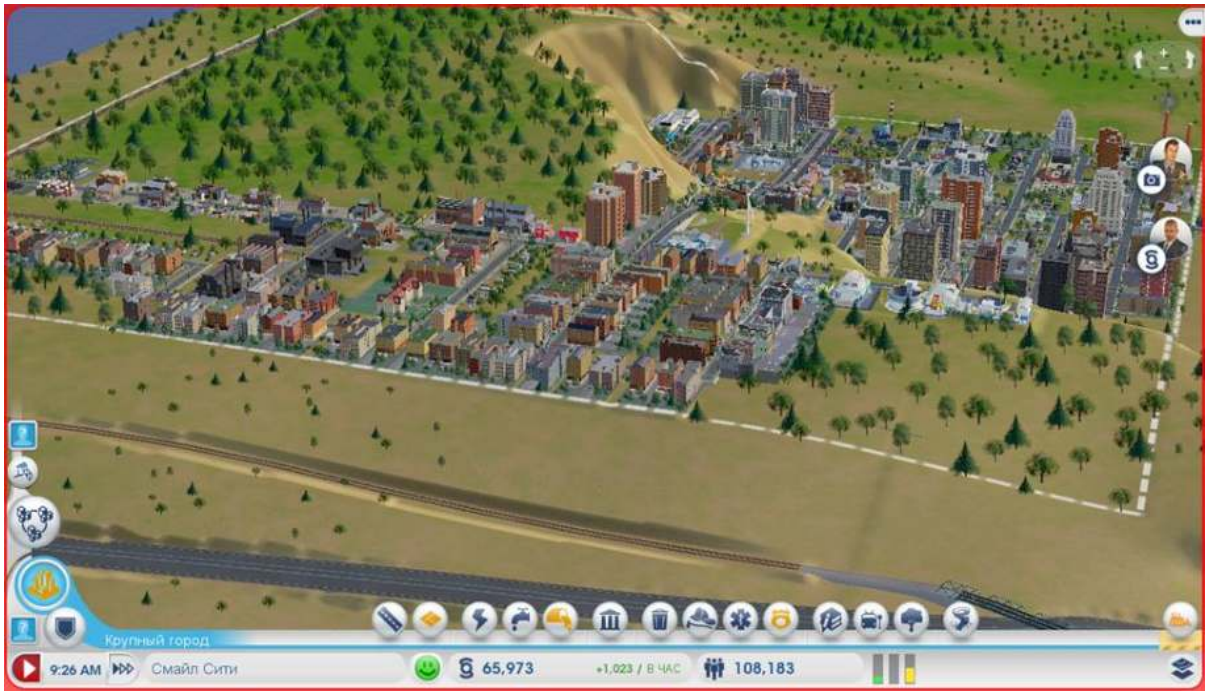

Figure 1. A city with a developed system of public transport

Figure 2. City budget

Figure 3. Population map

From the perspective of a deeper study of six urban development utopias project was an unqualified success. According to the task the students had to describe the basic ideas of the author of the selected planning model. Understanding that "the construction of" utopian city in the simulator requires a thorough comprehension of the original ideas of the author of the planning model led to more thorough approach to the analysis of these ideas, rather than with other forms of self-control work, for example in the preparation of the oral report.

## 4 Conclusions

Effectiveness of urban simulation in the educational process can be noted as follows:
1. Students gain new insights and skills in urban planning.
2. Students systematize the knowledge acquired in the lecture course, and past experience.
3. Students show skills of teamwork and mutual support.
4. Students with high interest are studies in the form of a game.

Keywords: Multi Criteria, Planning Stodio, GIS, Place-based identity, Multi-identity

Abstract

The planning process as is developed in a planning studio is a demonstration of a micro-cosmos of diver's concepts dealing with ideologies and identities seeking for acknowledgment and spatial recognition. In a modern world of multi and dynamic identities aspire of self-recognition of regions, towns and communities, a place-base identity becomes a core aspect, where dynamic identities and ideologies are something that we need to take into planning consideration. The planning process needs to give present solutions to places situated in a dynamic process of change. Where their place-base identity and self- recognition are changing, and the future of identity/identities is steel unclear.

These are the questions we asked in a metropolitan planning studio that give our students a chance to translate and transform their conceptual ideas to spatial policy plans. One of the aspects that considerably stick-out is the complex thinking of iterative top-down Bottom-up approaches. This approach can create a multi-dimension and coherent planning alternatives (where most of the alternatives combination are possible), and spatial solutions may arise from communities along their changing processes.

In this paper we present two alternatives spatial plan development in a studio course based on planning proses that embrace this line of thinking. The first alternative is based on an ARCView GIS model builder that assist in creating spatial locations in a region were each town and village can define their own spatial future and still be a part of a collective ideology. The second alternative simulates spatial locations for a mixture of future identities based on present identities and the different route each identity may take during its growth process and possibilities of identity that changes in time. The results of these two research planning processes were non-conventional, highly dynamic, aspire with complex plans, aside of highly applicability and flexibility addressing wide range of ideologies and identities.

## Introduction

This article discusses the outcome of a regional planning studio that deals mainly with the development of a long term comprehensive of a regional plan (50 years forward), and offers a multi-identity planning process developed by several student teams and allows reference for different and diverse communities and identities. This process displays product that combines conceptual pluralism and regional perspective of a bottom up planning approach based upon the integration of spatial information technology and multi-parametric analysis of regional planning.

In this course the students are dealing with a comprehensive planning which addresses complex and integrated questions of development, conservation, spatial justice, economy, transport, employment, demographics, and more. This is an intensive course that requires a high investment both on methodology and technic in a limited period of time. The course is built upon five phases: phase 1 reviews the current situation, Phase 2, individual planning concept development based on their ideological perceptions. Phase 3, students' team work for a comprehensive regional program development, Phase 4, students' team work for developing the spatial plan, and Phase 5, evaluation of the diverse spatial plans using by using analytical and political tools.

The studio methodology allows students to address different aspects of comprehensive spatial planning as part of their training as planners and as part of the formulation of a "professional voice" and planner identity. The students are required to develop a working model which answers their "professional voice" along with reference to the characteristics and constraints of reality. The planning work of is done in a given area, and each student's team provides an alternative. In the last part of the course, all the alternatives are being evaluated by the students and the pros and cons of each alternative and discussed.

A number of student teams have dealt with the planning dilemma that relates to the inflexibility of the planning process of representing multi-identities or societies/communities, and the difficulty of addressing differences between groups, types of identities or communities. Criticism in planning intensified as far as the real world has become more pluralistic, diverse and multi-cultural.

The question to address is - is it possible to combine differences between communities and types of identities that characterize the complexity and the pluralistic world where we live today in a coherent planning process which places the principle of multi-culturalism as a working model premise?

### 1.1 Multicultural premise in planning

In a global and dynamic world, one of the known trends is the growth of multicultural society. This trend is a challenge for planning. In the past, planning succeeded by characterizing uniform local cultural characteristics of a region, or characterize nationality with a common direction, alignment and commitment of a common vision. Today such definitions are much less common and much less agreed in a multicultural society, which is composed from a mosaic of communities.

Each community has its unique identity and unique needs for fulfilling its vision and goals. Communities need space and amenities for fulfilling shared values, but even communities with similar goals and vision will require different needs due to spatial differences and difference in local authority policy (Walters & Brown, 2004). The processes of creating a multicultural society are increasing, and the spatial outcomes are segregation, on the one hand, and integration on the other hand (Burayidi, 2000). However, both need a planning process which will identify its uniqueness in the first place, and addresses this uniqueness in a comprehensive plan (Hague, & Jenkins, 2005; Devine-Wright, 2009).

This Spatial diversity corresponds with the theories of multiculturalism (Goldberg, 1994; Sandercock & Lysiottis 1998), individualism (Healey, 1997; Bellah, et al., 2007), pluralism (Davidoff, 1965; Hayden, 1994), & cosmopolitan (Binnie, et al., 2006; Bloomfield & Bianchini, 2003). These theories point to the advantage of variety. However, in contrast to these theories that modern societies aim to adopt, we identify a lack of planning tools addressing multiculturalism, pluralism and individualism at the regional level.

Few cities, especially world cities, have succeeded in providing multiculturalism and hyper-diverse life for their population. Most regions and cities prefer to differentiate themselves from other regions and adapt homogeneous identity.

Therefore, planning is obligated to mitigate the negative elements and develop positive aspects of diversity. The negative aspects refer to aspects of segregation and closings, and positive aspects refer to the opening of possibilities, variety, choice, and the possibility of self-determination and self-expression. Under this approach, the goal of the studio planning process is to provide the optimal combination of diversity, on the one hand, and not to impose pluralism on the other hand.

### 1.2. Multicultural planning model in planning studio

Diversity and variety are addressed in planning by refining the diversity of land use. There is an increasing of urban usages in all planning fields: green areas of different types, residential textures, density levels and urban fabric types, variety of public service and mixed uses. This

increases the variety of types of usages as an outcome of the need to address more complex existence and a need for unique policy in a growing number of land parcels.

Currently there is a shift in the way urban planning process is developed around the world. This change occurs due to several transformation and changes: for example, technology change, such as implementing the GIS platform in planning (Talen, 2000). Development of new methods for planning as the Form-Based Code (FBC) that comes as an alternative to conventional zoning planning. At its base is the idea of a neighborhood or city as a whole, rather than its division by specific land uses (Parolek, et. al., 2008,). The Buffalo Green Code developed for using a new approach to guiding development. This new approach is called "Place-Base Planning", a way to shape the city by concentrating on the look and potential of places, their form and their character, instead of focusing only on conventional categories of land use. Using this code will map the entire city by type of place. This will be followed by a comprehensive zoning ordinance that will create a new set of rules to encourage development that fits with the desired character of the place (http://www.buffalogreencode.com/what-is-place-based-planning/)

As can be seen the studio projects reacts to these changes in the planning field, especially in a studio program. For example, the change in planning terminology developed as an outcome of a top-down planning thinking. The diversity in urban usages increases the variety of zoning types that serves as an answer to a complex wide variety of laws and building regulations. The planning process tries to cope with the wide variety of laws and regulation by developing innovative and creative terminology for those land use types. This zoning terminology is inherently general and relates to a wide variety of regions and plans. This terminology is not built to address place based planning. Zoning terminology in most planning processes is not an outcome of a bottom-up process but rather a given as a fact. Zoning terminology assumes that its richness of land uses can cope with the variety and complexity of the reality, and if not, the plan will reduce the variety to the existing terminology.

A bottom-up - place based planning process that addresses the existing and future variety in a specific area requires a different model of zoning; a model which will be flexible enough to develop appropriate spatial policy for different communities and different ideologies. But despite the high level of flexibility, the model should be generic based on space-based analysis. These specifications require a new planning model.

Classic Planning model is built as a double funnel or a sand clock. First, the information and knowledge are collected about the region. This Knowledge is being abstracted and simplified for representation of the urban systems. This knowledge is further being abstracted into planning principles, alternatives and finally a chosen alternative. The chosen alternative undergoes a process of expansion, deepening and developing of policy measures and spatial details which mature the process to a complete comprehensive plan (Altshuler, 1966; Hax, & Majluf, 1996; Chadwick, 2013).

To produce bottom-up planning that address's variety of identities and different ideologies, the "narrow waist" of the planning process should be expanded. Instead of single chosen

alternative, multiple alternatives should be reflected throughout the planning process taking place side by side from initial stages of data collection towards development of a comprehensive plan.

Different alternatives fits different ideologies and identities, provides a plan for the exact identity it serves. All plans have their own internal logic but at the same time an overall view that incorporates and integrates a comprehensive plan at a spatial level and a conceptual level.

This place based planning process creates a mosaic of programs at different levels, so every level will provide harmonious plan. The outcome plans will expose all communities and local identities, and in addition create links between communities and regions, between neighbors and similar neighbors at the same time.

Different levels of the region plan will address: a). the relationship between nearby places that share community life, and b). ideological or conceptual system between distant places. The last is similar to the concept of an ecological corridor that connects regions and creates ecosystem. This principle will be used to connect places of common ground ideology in the formation of an ideo-system which might be a knowledge base of similar conceptions.

This planning approach is based upon the use of GIS spatial information technology as an integral part of the planning process. This technology enables the development of multiple local plans of different characteristics and policy, in one region, and creates mutual connections between them. Spatial information systems are able to contain hundreds of attributes of information for all spatial objects and examine spatial adjustments between objects depending on spatial and functional relationship. A resembles approach can be seen at the “Bottom-Up GIS (BUGIS)” model developed by Talen, (2000), were understanding of residents perceptions and preferences of local issues is based on a GIS planning analysis of spatial complexity, spatial context, interactivity and interconnection.

This place based planning process fits ideology to an identity with an appropriate set of policies of its own and for neighboring communities. The methodology is based upon the development of an identity matrix and a generator/influences matrix, which defies the development characteristics for different ideology and identity as well as the mutual influences between different identities and between identities and their surroundings. The methodology may be expressed as a rigid and not flexible enough, however, the actual the reference to a wide variety of different parameters allows extensive and complex variation of the land uses, a view to the feature that encourage the plan flexibility.

Parallel to the development of the influence matrix generator, an extensive set of typical identities is being formed, as part of the planning process. This planning model concept allows representation of each identity's needs in the matrix. The set of identities represents the diversity of population in the region and also addresses future variations. Future variation of identities is being set according to current trends of global societies.

Major trends that have been introduced to the influence matrix generator represents a strengthening of self-definition based on nationality, religion, language, gender, education, economic capital, sexual orientation, marital status, and geographic identity. These processes increase the range of properties needs of society. It can be argued that the system is too rigid and categorically defines characteristics for existing and future identities; however, the opposite is true. The development of various land-use policies for an extensive set of typical identities increases the diversity across the region. This is a bottom-up planning which relates to the characteristics of the public in a complex and profound way. Furthermore, this type of planning creates a wide variety of residential, employment, education, amenities and leisure spaces and places. This variety fits the needs of the place, and also enables wide choices for future communities.

Bottom-up planning has an added benefit at the regional level. The classification and characterization of identities allow identifying opportunities and conflicts, communities' synergistic elements and possible collaborations. Identify opportunities, conflicts, synergies and potential collaborations during the planning process allows conflicts mitigation and region management in a way that encourage cooperation by development. These elements play a significant role in regional planning process that allows and supports a variety, and copes with regional challenges of economies of scale, efficient transportation, employment mix, variety of services and optimal spatial management.

The next chapter will demonstrate this place based planning methodology by demonstrating two examples of the studio course student's plans. The plans were conducted in different years and in different regions of Israel and illustrate each in its own way, the principles presented above.

## 2. Description of the planning process

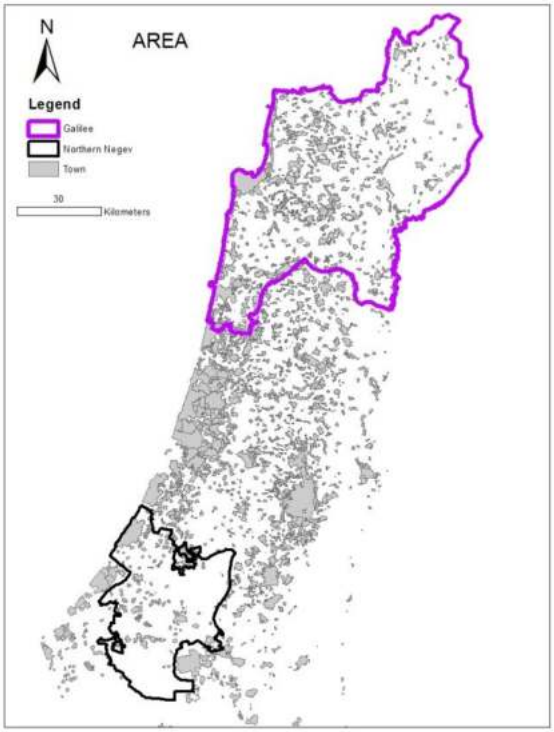
### 2.1. Two planning areas

The presented alternative plans are located in heterogeneous area, at the outskirts of metropolitan core areas, one at the north of Israel, the Galilee area, and the second at the southern area of Israel, called the Northern Negev region (see Figure 1). The Galilee area is characterized as a rural region having small Jewish and Arab towns, with traditional employment system of agriculture and traditional industry and rural villages. The Northern Negev region is characterized as an intermediate region between main three Metropolitan areas of Jerusalem, Tel Aviv and Beer-sheba, characterized by small and medium cities, traditional employment and life-style, diverse communities of Jews, Arabs and ultra-religious Jews.

Motivation for both planning process comes from a critical approach to the existing statutory planning that chose to ignore the variety of population and residence types in the alternative areas. The existing statutory plan defines most of the areas as rural, and ignores the complexity and uniqueness nature of both regions. The spatial policy suffered from a lack of reference of the

distinctive features that creates identity and internal unity. Towns and villages in these regions were scattered and separated with an absent of unique identity.

Figure1: areal map of the two alternative plans. המפה עוד תשתנה



## 2.2. Definition of existing and future identities in both regions

The first stage in the planning process includes definition of different identities and distinction between the identities in the region. In both alternatives current planning needs of various communities were examined and defined, however, in different routes.

The Galilee alternative plan provides a unique planning statement and individual treatment for each settlement in the space and the multi-dimensional connection between them. The idea was to create alternatives for people searching for a different lifestyle, and to provide a generic solution for the types of settlements that people are looking for. The models provide solutions for the differences that were identified, between the 'needs' and the 'wants' of people in search of alternatives to the conventional urban lifestyle. With that, the main emphasis was on developing models that offers the conditions that required for specific lifestyles which will provide maximum flexibility to the residents in accordance to their wants and needs. The idea was to categorize the existing settlements according to the model that was environmentally- and space-wise as the most appropriate.

Different community types were defined by their different characteristics of: population size, self-sufficiency ability, self-organization level, mix of employment types and typical local economy. The result was based on four different types of towns:

1) Ecological - According to research, ecological towns are viable only with small populations (up to 1000 residents). The distances to the city can be long because most of the residents work within the settlement. Also ,being located close to environmentally sensitive areas is based on the idea that these settlements have minimal environmental impact, and tourism makes up a significant part of their income.

2) Cooperative - distances from the city can be long because the towns can provide work ,food (from agriculture) and services.

3) Coexistence -the same as house in the countryside- Requires a community apparatus that is more complex and requires for employment in the settlement.

4) Country side - House in the countryside - The town can be larger, closer to the city and to employment centers

Each combination displayed different level of performance in each characteristic as can be seen in figure 2a.

The Negev alternative plan the students identified six different generic personal Identities in the region having different needs and characteristics. Identity characteristics were defined as parameters in multi-parametric matrix, for example: Jubel (identity) - a student and a farmer son, deliberating between staying and living in the farm or leaving the farm; Phatma- a yang Bedouin women; J'aklin- a single mother living in a small traditional town; Oleg- immigrant from former SSSR, work as an engineer; Raz- gay person how tries finding suitable community for his modern family; Sara-Rivka- ultra-orthodox women, a mother of five who works as a programmer. Each of these generic identities provided with possible future development of these identities as can be seen in figure 2b. Each of the ideologies and identities also have spatial characteristics such as transportation accessibility, access to employment; and social characteristics such as nationality, religion, gender, language, identity, education, marital status, economic capital and more.

This identity analysis has characterized the variety of present communities and their future development needs. The place-based planning process tries to cope with a range of future possibilities such as: strengthening existing traditional elements, or providing a mix of traditional and modern life, or drastic change and abandonment of social tradition and adoption of some of existing trends in Israeli society and a global perspectives.

The analysis refers to current trends in Israeli society and global trends which will be intensified in the future such as women's employment, the growth of a new family types, the blurring of gender, individualism, liberalism and education.

Each of the identities/idiologies has undergone a similar expansion process that tried to outline the future possibilities. Obviously this process cannot predict all directions of personal development, but the excruciating in this kind of thinking creates a vast mosaic of various mixtures which may characterize the majority of the population.

The next step of the planning process, includes characterization of the towns and villages which will provide the needs of the different communities such as: town size and type, occupations structure, social structure, regional identity and relationship to the natural environment are providing the basic elements of the identity matrix generator.

Figure 2: Ideologies in the Galilee and identities possible future development in the Northern Negev area

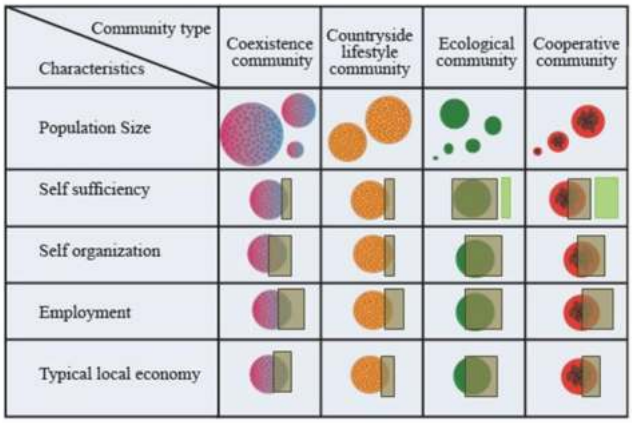


Figure 2a displays the categories of cities and towns the Galilee.

Figure 2b displays 6 main identities in the north Negev area and the possible future development these identities into 36 sub-identities

## 2.3. Development of identity matrix generator

The second stage of the methodology is based upon a generator of ideologies, and their characteristics of transportation accessibility, access to employment; and social characteristics such as nationality, religion, gender, language, identity, education, marital status, economic capital are translating to define the spatial environment for each community and type of: housing, employment, social relationship and spatial relationships between the different ideologies. These matrices are known as the '*identity matrix generator*'. The matrix contains ideology's types, which were identified in the first stage and future ideologies which were developed based on social trends. The Galilee alternative have developed the generator according to geographical characteristics, (see figure 3); and the northern Negev alternative have developed the generator according to social indicators (see figure 4).

To address the characteristics of each existing and future identity, towns and villages that may provide an opportune environment for communities and different ideologies were identified. This matching process was accompanied by a development of policy measures for required adjustments, which included an establishment of specialized employment centers, establishment of educational institutions; Entertainment directed toward the needs of types and communities. Policy measures also include an establishment of new settlements designated if required.

The implementation of this methodology for large area includes hundreds of different kinds of settlements has allowed specific reference to versatile ideologies, and different communities received an individual and specific planning (see Figure 5). Spatial distribution of towns and villages allowed a versatile identities mix for different communities and complex spatial pattern and differentiated spatial policy for different types of ideologies.

Figure 3: identity matrix generator for the Galilee Alternative

| distance from protected areas | Distance from employment centers | Distance from the city | Population size | |
|---|---|---|---|---|
| X | - | 5 km < | 1000 > | Cooperative |
| 3 km > | - | 5 km < | 400 > | Ecology |
| - | 5 km > | 5 km > | 2000 > | House in the countryside |
| - | 7 km > | 5 km > | 500-200 | Coexistence |

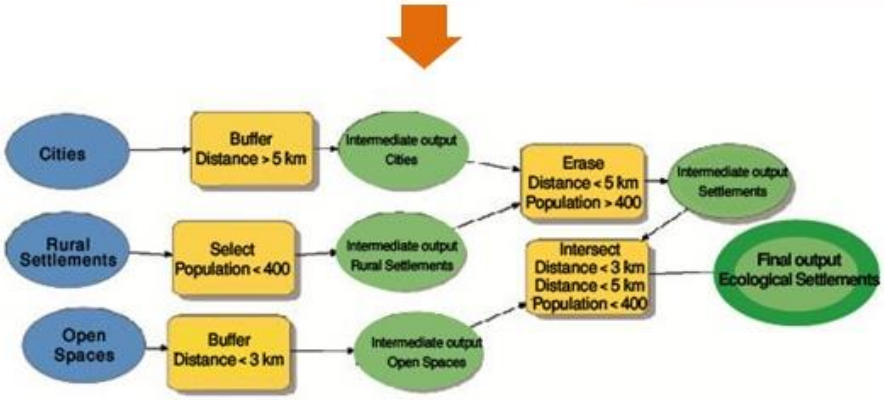

Figure 4: identity matrix generator in the Northern Negev Alternative

| Identity | Approximate Town Size | Community Type | Residential Type | Profession | Environment |
|---|---|---|---|---|---|
| G1 | medium | traditional | small app | services | suburb |
| G2 | very large | close | small app | industry | suburb |
| G3 | large | open | medium app | academy | city |
| G4 | medium | medium | house | tourism | town |
| G5 | small | traditional | medium app | free profession | village |
| G6 | very large | individual | medium app | free profession | metro |
| P1 | small | close | medium app | free profession | village |
| P2 | small | traditional | house | agriculture | farm |
| P3 | large | open | large app | academy | city |
| P4 | large or very large | multi | medium app | tourism | city |
| P5 | very large | open | medium app | hitec | metro |
| P6 | very large | individual | small app | cleantec | city |

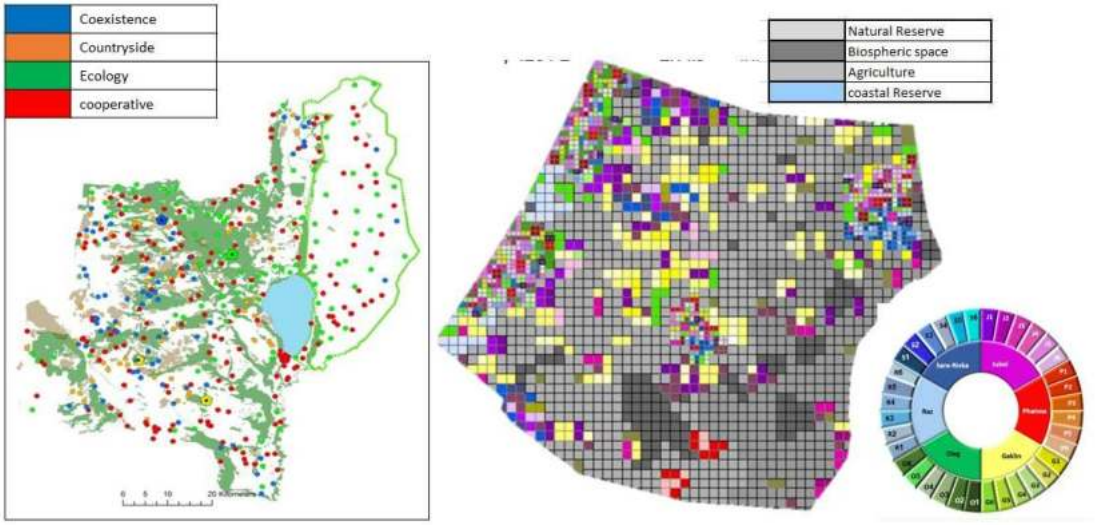
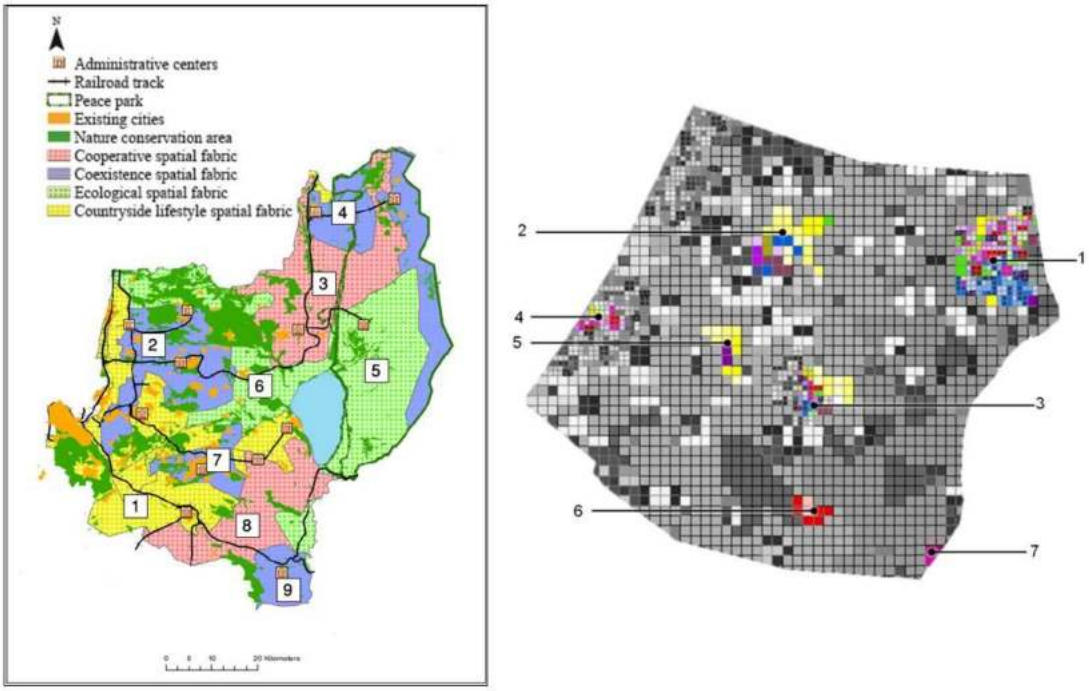
| R4 | small | open | cottege | tourism | village |
| R5 | very small | close | cottege | free profession | village |
| R6 | large | individual | medium app | academy | town |
| O1 | very large | individual | large app | hitec | city |
| O2 | metro | multi | small app | academy | metro |
| O3 | very large | open | large app | services | city |
| O4 | very small | individual | cottege | free profession | village |
| O5 | very large | traditional | small app | industry | city |
| O6 | metro | close | medium app | cleantec | metro |

Figure 5: spatial patterns of ideologies in the Galilee and the Northeren Negev alternatives



This pattern has supported a complex sub-regional division which provided opportunities for regional collaboration and cooperation, conflict recession, identifying opportunities and synergies between localities and communities. The product of this analysis allowed examining the spatial role of different communities in future situation (see Figure 6).

Figure 6: subdivision of spatial fabrics in the Galilee and opportunities and conflicts in the Negev



The Galilee alternative is addressing the northern part of Israel and defines the core areas which will assist in connecting towns and villages of similar characteristics and empower them in elements of economics of scale, transportation efficiency, employment mix, and more:

1. Core area for community towns in Carmiel
2. four 4. Core areas of mixed community towns in Maalot Tarshiha, Massada and Bet Shean
3. 7. and 8. are Core areas for agriculture based villages in Kryat Shmona, Shfaram and Kafar Kama
   5. and 6. are Core areas for ecological villages in Kazrin and Tiberious

The Negev Alternative is addressing the southern part of Israel and is pointing out opportunities and conflicts in that area

1. Religious – Secular conflict in the town of Bet Shemes
2. Social decline in an too homogeneous town of Kiryat Malahi
3. Social opportunity in a heterogeneous town near agricultural landscape of Kiryat Gat
4. Opportunity for heterogeneous town on a sea-shore in Ashkelon
5. Social conflict between old conceptions and new ones in the village of Nehora.
6. Opportunity for spatial interaction in new Bedouin village
7. Opportunity of ecological communities

This section indicates the possibility of exposing insights of the analysis related to the performance characteristics of the area, such as: problems, conflicts and synergies.

## 2. Discussion and conclusion

Both plans relate to the tension between planning at the individual level (community, ideology) integrated into a comprehensive planning. Both alternative plans indicate that vital and extensive information, that relates to ideologies and regional way of life, may be lost in a classic comprehensive planning approach, information that deals with the needs and desires of the individual.

Both alternative plans began by assuming that this information needs to be at the core of the planning process, and future approach to planning decision making and planning models should keep this information throughout the planning process up to the formulation of the plan (Ho, & Dey, 2010).

In both alternative plans, planning policy relates differently to various ideologies, and regional policies that point out on the different characteristics of the land uses in every location in the region taking into account the characteristics of existing and future types of ideologies in the

region. The plans tells personal stories about various ideologies found in the region, trying to deal with the different paths each identity will take in the future, by drawing alternative paths of diverse personal development of various identities according to global and local trends.

Future relationship between identities and between communities in the region is defined by the influence matrix generator. This generator defines the relationship between characteristics and the different ideologies and different types of towns/villages in the regions. This generator is a Geo-Social matrix that addresses the spatial needs of various ideologies such as: settlement size, proximity to employment, proximity to services, closeness to nature and more.

This planning methodology enables multi-resolution observation of the process. The methodology allows zoom in over different types of communities, and examining the conditions for their flourish, identify conflicts, regional opportunities and ways to resolve/Mitigate between communities in controversy. The methodology allows zoom out on overall connections and relations between communities, and address mutual influences. This multi-resolution observation provides multi-level solutions of spatial conflicts and identify spatial opportunities.

Such detailed approach to the characters of each identity can operate and manage due to use of Geographic Information Systems and the ability to manage and control hundreds, thousands or even more features in an attribute table. Attribute table allows a multi-parametric approach for all different identities with no need to reduce parameters. In the case presented here different identities were characterized by 17 different characteristics concerning in a variety of spaces: personal, cultural, social and spatial. This data have not been analyzed in a processed that lowered the number of variables, such as Cluster Analysis or Factor Analysis, on the contrary, processing the data increased the variance, and the analysis enhances and enriches the data.

Analysis of the spatial distribution of identities has identified spatial conflicts and opportunities, addressing and presenting a complete picture of the region and the policies derived for different identities. This multi-parametric analysis produced two very different alternative plans in their spatial structure however, similar in the way they address different identities.

Both alternative plans represent a vast variety of towns and village types, having complex spatial pattern which supports a variety of ideologies. Mapping the spatial distribution of different types of towns and village allows planners to connect and link communities of similar characteristics or complement characteristics.

This identification allows creating a regional planning dimension of connectors, bridges and links based on relationships, opportunities, conflicts and complementarity of diverse issues, that allows tailoring specific planning solutions as appropriate.

This regional dimension is based on the complex layout of towns and villages, and deals with questions of economies of scale and efficiency on the one hand and spatial diversity benefits management, conflict management, spatial opportunities arising from the diversity and complementarity of community needs of different housing types on the other.

# Community-based planning in a dynamic landscape development; a teaching experiment

Wim van der Knaap
Wageningen University, Land Use Planning Group; e-mail: Wim.vanderKnaap@wur.nl

## Abstract:

*In a four-week studio, second-year bachelor students get acquainted with an approach for an operational plan in a Problem Based Learning Environment. In the course set-up each student represents a stakeholder. Based on input, ideas and vision from stakeholders students try to create a development plan and process, after a landscape analysis and supported by a societal cost-benefit analysis. The students act and think as a (front stage) stakeholder but in the meanwhile doing (backstage) research and analyses, discussing and reporting from an academic point of view. This year, the Brainport Park Cooperative (BPC) in Eindhoven is central. The challenge in this year's studio is to mimic a community-based planning approach, central in the BPC approach. A core objective of the BPC is to offer space for development to all entrepreneurs, citizens or whoever wants to start and continue this to be beneficial for the community and for the landscape. The landscape is the theatre to host and induce developments. The community of citizens, entrepreneurs, visitors, NGO's, etc. are the actors. The (local) government should only restrict themselves to facilitate the necessary legal aspects. Because of the available four weeks it will be a pressure cooker situation; the students are either a representative of stakeholders, or one of the (key-)players in the area, with their own ideas and approaches. Are they capable while being a (relative) outsider of the area to be part of that community? Will they have impact on the area development? Is there a community-based planning framework to be applied related to a dynamic landscape development?*

**Keywords**: Community-based Planning, Dynamic Landscape Development, Student Participation, Transdisciplinarity

## 1. Introduction

In the curriculum of the Spatial Planning Specialisation at Wageningen University different courses are linked with external, non-academic questions. These approaches are often described as a Problem Based learning Environment (see e.g. Carsjens et al., 2013; van der Knaap, 2014) or as a Regional Learning Environment (Oonk and Gulikers, 2014). The course Studio Operational Planning is a course, halfway in the second year of the bachelor program. The studio covers a four-week full time educational period in which students should get acquainted to design a landscape development plan to become effective in a short-term period.

During the last five years a commissioner from outside the university was involved in the course. He or she presented a current societal issue as an assignment for the students and they (or their representatives) have interactions during the course with the students. Within the set-up of the Studio, each student represents an interest of a specific stakeholder. Based on their input, ideas and (interpreted) vision the students try to create a landscape development plan and a process plan based on a shared group vision, as well as a landscape and network analysis, together with a societal cost-benefit analysis. The students try to act front stage and backstage (Boyd et al., 2015); they have to act and think as a stakeholder (front stage) but in the meanwhile doing research and analyses, discussing, reflecting and reporting from an academic point of view (backstage).

We started this year to work with the Brainport Park Cooperative (BPC). This cooperative was introduced by the Education Project Services of Wageningen University, a service organisation

that mediates for external questions into the academic educational program. Projects via Education Projects Services can present a new perspective upon the issue at hand and provide interesting recommendations for the students as well as the involved stakeholders. We wanted the challenge of this year's studio to be to think about and stimulate a Community-based planning approach. This approach is at the heart of the BPC, it is the way the BPC is organized and functions. Given the only four educational weeks it have to be a kind of pressure cooker situation, maybe with the students being a representative of a stakeholder, or as one of the (key) players in the area, having their own ideas and approaches. Are they capable while being a (relative) outsider of the area to be part of that community? Will they have impact on the development in the area?

Community-based planning is extensively described in literature, for instance by Lane and McDonald (2005), Ansell and Gash (2008), Emerson et al. (2012), Opdam (2013) and Koontz and Newig (2014). Most of these articles describe a more theoretical approach and a governmental driven or at least initiated or induced process. The participation of the (local) community is only part of a more governmental approach. In the Brainport Park case the government is actually one of many participants, or even will not be part of the process at all, only for formalising legal aspects. One of the objectives of the BPC is to offer space for development to all entrepreneurs, citizens or whoever wants to start and continue this to be beneficial for the community and for the landscape. The landscape forms the scenery to host and induce developments. The community of citizens, entrepreneurs, visitors, NGO's, etc. are the actors to create the theatre. The (local) government should only restrict themselves to facilitate the necessary legal aspects.

In my contribution for the conference I want to share my findings around the link between Community-based planning, as a democratic approach towards landscape development, combined with time-limited educational activities, based on the developments in Brainport Park as an inspiring, actual case. The challenges, faults and limitations will be brought forward and discussed. How democratic can the process be? The BPC case is intended to be an educational environment for several years, so we also have the opportunity to build up a more solid research case around Community-based planning. We have to identify which elements can or might be important to be monitored. Suggestions are more than welcome. Other questions remain, such as: Can a second-year bachelor student already perform on that level in a landscape-community theatre, being inspired by his/her own ideas or as representative of certain stakeholders either front- or backstage? Is there a Community-based planning framework that can be applied related to the dynamics and democratic development of landscapes? Or is this impossible?

## 2. Background

There are several theoretical aspects to be considered in this process. First of all the aspect of Community-based planning (CBP) will be highlighted to some extent. There is an extensive amount of literature about CBP, but not so many linked to landscape developments, and especially with an ecological point of view (Opdam 2013). The Brainport Park Cooperative wants to specifically integrate ecological and economic developments in sustainable landscape developments. The paper by Liu and Opdam (2014) puts explicitly ecological landscape development central in a Community-based planning approach and is used therefor as a starting point in the first section. Next, social learning is often mentioned as an important element in a CBP process. To elaborate on this aspect, an overview paper by Reed et al (2010) will be followed. Another aspect linked to CBP is the ongoing debate about transdisciplinary research as a science-society interface to support knowledge development. This will be discussed in the third section and is largely based on a special issue about this topic in the journal Futures (Lawrence, 2015). A fourth aspect is the educational point of view connected to these three aspects, how to mingle this in an educational (academic) setting. This will be touched upon in the fourth section of this chapter.

Work in progress; please, do not quote

## 2.1 Community-based planning

The spatial planning process in the Netherlands (and also in other Western European countries) is gradually shifting from a top-down led structure to a governance model; from the national government as leading party towards local governments as initiator and facilitator (see among many others, van der Valk 2002; Roodbol-Mekkes et al 2012; Alpkokin 2012; Gerrits et al 2012; de Roo et al 2012; Olesen 2013; Opdam 2013). More and more other groups and stakeholders are included in this planning process, from being one of the partners to even become the major initiator. Community-based planning (CBP) is a next step in this process of further disentangling governmental control on landscape developments. According to Liu and Opdam (2014), community-based planning "*refers to a flexible, collaborative and adaptive planning system that intends to reshape the landscape according to the wishes of stakeholders for higher quality of life and long-term sustainability. It aims to achieve environmental sustainability while meeting social needs and societal values through landscape change*." They continue by stating that the conventional, linear planning approach should change into a more cyclic planning process, to stress "*a reflective and dynamic problem-solving process, in which re-evaluation of predefined goals according to the methodological feedback and monitoring results is applied.*" To obtain a smooth process it is essential to well coordinate the divers (collaborative) action steps in order to result in a long-term sustainable landscape change. They suggest in this sequence four main activities: objective setting, design, implementation, and evaluation. In each of these activities an environment for mutual learning and discussion is required. Also trust and respect for the decisions taken and the values of others is an essential element to create a more solid collaboration process and to share responsibilities.

Based on the commitment by stakeholders a very divers scope of interests and motives can be encountered, leading to diverging value perceptions and conflicting interpretations of the goal of the planning process. This requires that stakeholders are informed about the different (starting) values of the partners in the process and how these might change during the process. And this information also strengthens the process itself and can be supportive to resolve different conflicts that might arise. Now every involved stakeholder has to be clear about their own value perception, find common values and collaborate in order to reach the earlier defined goal(s). When the understanding of each other is growing the planning process evolves and this should also be beneficiary for the landscape development. These aspects can be identified as important aspects within a social learning process. In the next section this social learning process is elaborated more.

## 2.2 Social Learning

According to Reed et al (2010) there are many confusion interpretations about social learning. Sometimes only creating an environment in which people can learn from each other during a participation process is already typified as social learning. But only bringing people with different background together to participate at a specific topic is not enough. To indentify a process as social learning, there should at least be interaction from different backgrounds, with different values, perspectives, knowledge and experience, in which everybody is stimulated to be reflexive about their role, implicit suppositions and attitude. This should lead to new (social) outcomes, like improved trust, better adaptation behaviour and attitude, a stronger awareness of social relationships, etc. One has to be aware of the difference between individual and social learning. Each individual has the ability to learn also a result of social interaction with others or in a specific facilitated process like a workshop or a conference. But this does not mean that a social learning process is taken place. Reed et al (2010) argue that to be considered social learning, a process must: " *(1) demonstrate that a change in understanding has taken place in the individuals involved; This may be at a surface level, e.g., via recall of new information, or deeper levels, e.g., demonstrated by change in attitudes, world views or epistemological*

*beliefs; (2) demonstrate that this change goes beyond the individual and becomes situated within wider social units or communities of practice through social interactions between actors within social networks; and (3) occur through social interactions and processes between actors within a social network either through direct interaction, e.g., conversation, or through other media, e.g., mass media".*

A community-based planning process will contain these three characteristics as described by Reed et al, but are not necessarily a prerequisite for a good planning process. It seems however inevitable that during or after a such a CBP there will be new insights in how other partners in the process will be involved and participate (condition one), and also will result in changes in the environment, both the landscape and the social environment (second condition). The third circumstance (linked to interaction and communication) is however not so obvious in a CBP, but is necessary in order to bring the process a step further. A reflexive attitude (see eg. Howe and Langdon, 2002; Beunen et al, 2013; Van Assche et al, 2014; Lawrence, 2015 and related articles in that special issue of Futures) by each of the persons involved seems an essential requirement to support a good CBP process.

Next to the social aspects in CBP, also the knowledge component and its related exchange is important. There is in one way or the other always knowledge involved during the planning process. Who is providing for this required knowledge to feed the process? Is it coming exclusively from science and academic literature, or only from (local) stakeholders, including governmental agencies, or will it be a mix? Oonk and Gulikers (2014) reflect upon the current planning profession in which planners have to collaborate with multiple stakeholders from very diverse disciplinary background and with divers interests. They state that the planners have to " cross boundaries" as "*efforts by individuals or groups at boundaries to establish or restore continuity in action or interaction across practices"* (Oonk and Gulikers, 2014, p2). In this planning process it is impossible that one person is an expert in all disciplines and has enough knowledge for it. This person is in need of a collaboration with others to create new knowledge, that goes across boundaries, explicitly addressing the differences between the disciplines. A transdisciplinary research approach seems to offer an appropriate setting for this knowledge provision and exchange. This will be explained in more detail in the next section.

## 2.3 Transdisciplinary research

This section is mainly based on a special issue about transdisciplinary research in the journal Futures (Lawrence (ed.), 2015), which was published at the beginning of 2015. Lawrence (2015) in his introduction states that the integration of different types of knowledge and know-how is a core ingredient of transdisciplinary research. Klay et al (2015) recognize that people trained in different disciplines need to develop a common language based on a shared concern for sustainable development. They elaborate on the growing issue about the required knowledge transfer between science and society, in order to move forward in society as well as in science. It requires insights in and for (new) methods and processes that can be relevant for knowledge. This knowledge production has a role in several phases related to a planning process, such as the framing of the problem, the required analysis, and during the implementation and monitoring of interventions. At each phase there should be a cooperation between academics and non-academic participants, be it either professionals, institutions, politics, governments or civilians. This should also reveal hidden agendas of all the stakeholders involved, especially related to their power positions (Zscheischler and Rogga, 2015). Real transdisciplinary research and related projects are still rarely applied, especially with a focus to role of non-scientific partners. Therefor they question the underlying assumption about the added value of transdisciplinary research. There is also the possible lack of support by institutions and politics for the results of these processes (Lawrence, 2015). This could of course be well related to their power positions. Besides these critical notions, Lawrence (2015) also points to the ongoing debate about the meanings and uses of terminology, be it either multi-, pluri-, inter- or trans-disciplinary research. Zscheischler and Rogga (2015) come up with a European description of transdisciplinarity in which all involved persons (academic and non-academic) go beyond disciplinary boundaries by using a shared conceptual framework,

to address common problems. It has to be noted that all the papers in that special issue of Futures are having an academic as leading author (Lawrence 2015), although transdisciplinarity is about academic and non-academic working and learning together. This phenomenon can partly be explained by the academic writing tradition and its related pressure to publish.

## 2.4 Educational aspects

The articles in the special issue of Futures (2015) around transdisciplinarity are most of them concerned with (sustainable oriented) research and projects. There are two papers that deal with the educational aspects around transdisciplinarity, the paper by Boyd et al (2015) about performance aspects and the paper by Balsiger (2015) about costs involved and setting up a new framework in order to determine different types in transdisciplinarity. These two papers especially offer new insights to integrate transdisciplinarity into education. In the paper by Boyd et al (2015) the performance-as-metaphor, as described by Goffman, is used in a class room setting to elucidate transdisciplinarity in an environment not familiar with the approach. The theatre equivalent is applied to imagine different situations. The authors distinguish three elements that provide a starting point: (1) roles and interaction between the cast and the crew (2) the role of the audience and (3) the stage, including what happens front stage and backstage, and its settings. Involved stakeholders can play their role front stage, how they would react in certain specific phases like problem framing and analyses, based on a script they themselves have developed beforehand. Then backstage they can reflect on their role and of others and create on that result evaluations and formulate new intentions for a next performance. Especially in a teaching environment the front stage and backstage approach seems useful to reflect on in a group discussion and an individual reflection paper (Boyd et al, 2015).

Balsiger (2015) notices in his contribution that teaching transdisciplinarity is a costly task, which is overlooked very quickly. One of the forgotten aspects is the extra activities needed extra to the normal academic interactions, which are above the interdisciplinary actions required. First of all you need to cross boundaries within the academic disciplines, but also set up communications and events outside the academic world. This requires extra expertise about theoretical aspects, methodological and practical factors, in a team-like setting to educate the students and improve the relations with and knowledge by the other partners involved, which could cover a wide range of interests. Already at the start much time is needed to start up and maintain relations, to convince and involve different stakeholders to participate in a research environment, in which they have to be available at all possible moments during the educational period, which often covers a condensed period of time. Next to the content related part of a transdisciplinary activity, the management of the logistics and coordination also demand special skills, to indicate possible constraints and alternative ways of dealing with specific situations. To meet all these prospects and limitations Balsiger proposes a framework to support transdisciplinarity, using elements like integration, evolving methodologies and collaboration. He suggests four varieties to facilitate the choice of teaching options and to influence management. These varieties depend on the level of integration (shallow or more deeper) combined with two options for collaboration (narrow or more broader). He distinguishes soft transdisciplinarity (narrow collaboration with shallow integration), inclusive transdisciplinarity (applying a broader collaboration with a shallow integration), reflexive transdisciplinarity (having a deeper integration but a narrow collaboration) and the hard transdisciplinarity (a deeper integration and a broader collaboration). Balsiger illustrates one of these varieties with a classroom simulation exercise. He stipulates that simulations cannot replace the real activities taking place in concrete settings with real stakeholders facing complex problems. But it will give the students at least a view on different mechanisms that could be relevant in a transdisciplinary setting.

## 3. Case Study area and project in an academic teaching environment

The Brainport Park Cooperative (BPC) started in July 2014 by several entrepreneurs and stakeholders in the Eindhoven Northwest region. The area is around 2000 ha in size, embedded in the surrounding with the city of Eindhoven, the second national airport of the Netherlands and 'het Groene Woud', an area with a mixture for agriculture, recreation and nature elements between 3 larger cities in the South of the Netherlands (see fig 1). Central inspirations and notions within the cooperative are: co-creation/togetherness, honesty/transparency and a colourful approach. These motivations are mixed with four added value principles as returns of investments: inspirational, ecological, society driven and financial. The ecological aspects should be the main driver, economic considerations must not steer developments. The interaction between the involved stakeholders and the landscape should grow organic. The first goals were defined at the start by the local government. The BPC has to take care of building two (slow lane) bridges, one crossing a railroad track and the other crossing the highway A2, both should have great iconic values for the area. But the BPC wants more. They want to start and guide integral developments around a high tech campus/business area, support (new) agricultural use, create and maintain large and small ecological connections, manage roadside verges and support recreational objects. All these activities should take into account the different dynamics in time and place in the landscape scenery. Furthermore, these kind of developments should only be community driven and iterative/cyclic, not a top-down governmental driven activity. In the landscape theatre with some long-lasting elements (like roads, housing blocks, waterways, ecological structure elements), new short-residing elements should appear, thus creating a dynamic landscape based on a democratic input by many different actors and players in the theatre.

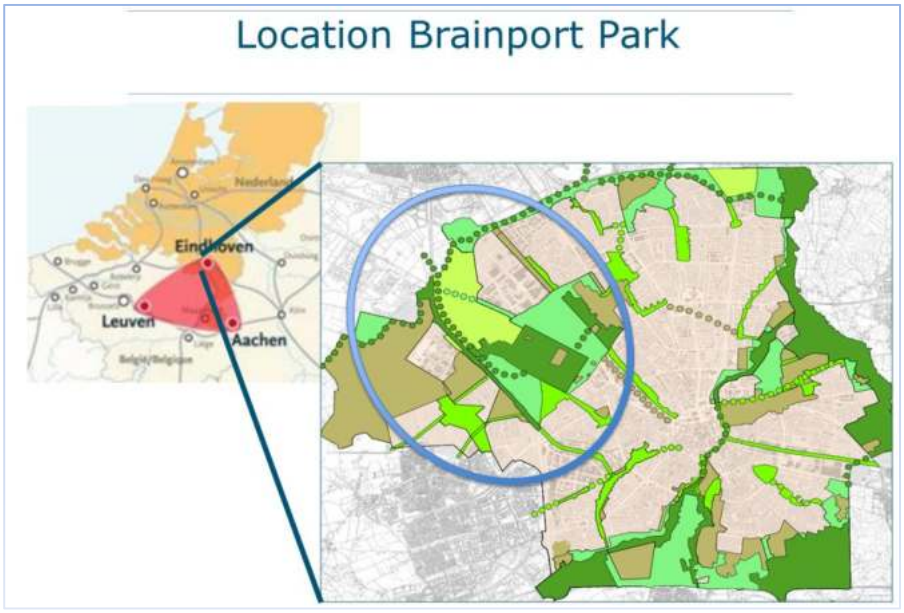

*Figure 1: overview of case study area (within the circle)*

In the course guide of the Studio Operational Planning (Van der Knaap, 2015) the following profile of the course is presented: "*the Studio is an in-depth planning course, focusing at integration of knowledge and skills presented in previous bachelor courses to support operational planning problems at a local to regional scale level. The course familiarizes the students with:*

- *gathering information on different scales and with different accuracy in limited time, to support qualitative and quantitative analyses of land use and landscape, including biophysical and environmental aspects as well as socio-economic aspects;*

- *developing ideas for further development in a region;*
- *executing a SWOT analysis to find out strong and weak points in the present situation and opportunities and threats for the future;*
- *making an integral plan for a specific region;*
- *making a detailed plan, including social costs benefit analysis, qualitative evaluations, financial arrangements, implementation process and participation options for that region."*

The course will engage the students with aspects of an operational planning process on a local scale. Within this process the students get the challenge to create a vision and its related plan for the case area, based on (interpreted) stakeholder ideas. The course is built around several planning elements, like spatial analysis, actor analysis, SWOT-analysis, development planning, detailed operational planning, sustainable planning and the natural step method. Together, these elements provide the students with a robust toolkit of methods and techniques to engage with several steps within a (participative) planning process. The students will have to integrate the methods and techniques that they learn during the course in several products and reports. Each theme that is discussed during the course will be integrated in at least one of the steps that will make up a final planning design and process description. Using group work integrated plans should be developed and underpinned with process and added value suggestions.

This year's assignment was to propose creative (impulse) ideas for the landscape theatre of Brainport Park, given the initial tasks for the BPC. Scenery and management to create connections (either physical or mental) between the park area, entrepreneurs, and (local) people (including visitors). These ideas should fit in a regional development and should be aligned with business model suggestions, like funding, money spent, income earned, merits. To deal with this assignment the students started with an area analysis, together with an actor and policy analysis and a visit to the park area. They also had a creative session in which they tried to come up with as many (extreme) creative ideas for the area as could be thought of. This was followed by a selection out of the these ideas and get them more focussed. Using a spatial-oriented SWOT analysis the students individually tried to locate the most optimal environment for their ideas, in which the current tasks of the BPC had to be included. The next step was to make an integrated plan, followed by a more detailed plan, for their ideas within the group of four students. The final part consisted of a social cost-benefit analysis (SCBA) of their integrated detail plans. This SCBA should incorporate next to a quantitative part also a qualitative analysis about the qualities for the landscape, environment and society. It should also consist of a suggestion of how to realise the plans, with financially as well as planning process suggestions. In this part the Community-based Planning theories could be well applied. The students ended the course with a reflection paper in which they had to describe the four weeks of education and how well they could perform with the presented structure and the given assignment. Most of the students were able to describe their, sometimes strong, learning curves and the omissions related to a Community-based Planning process. For the students it was the first time they had to deal with a practical oriented situation in which spatial impact and processes were central.

It has to be said that this year's course was not embedded in the theoretical background as describe in chapter two. In the theory chapter I wanted to describe some notions I had in mind when the Studio started, but without any direct translation from theory to a methodological and practical script. I wanted to keep a fresh mind as to how students might act in this new situation, without too many constraints, and perform in the theatre of education with what they had learned in previous courses.

## 4. Discussion and conclusions

In the introduction several question were put forward. In the previous chapters the theoretical and the educational aspects were highlighted a bit ending with the final remark in the previous chapter that theory about Community-based Planning (CBP) and Transdisciplinarity (TD) was not directly trans-

lated to a ready-made methodology framework for the students. The older framework still served as a kind of relict from the older (top-down) approach of the planning process. The Studio of this year was a learning curve for both the students as for the teachers involved. We wanted to see what could be useful and what should be altered given the CBP and TD impact. Especially if we want to use this case area of BPC for a longer period as an educational environment. We also wanted to focus on which elements might or can be important to supervise and monitor in this CBP-TD process. Based on the given theory in chapter two about social learning and transdisciplinarity in the class room, and the presented questions in chapter one, I would like to mention a few focus points, divided over two blocks. One about educational aspects and one more in general about the CPB-TD process, but with education in mind. Planning and design education need to bring forward a new generation of reflexive professionals, that is not only able to make plans and organise planning processes following the top-down planning approach , but they must also be able to objectify spatial planning practices and their own roles and responsibilities within these practices. Reflection can fuel and deepen debates about trends, deadlocks, drives and innovation.

The first point is related to the curriculum in which the bachelor students had to take this class and is related to the question if a second-year bachelor student can already perform on the required level in a landscape theatre. Students were very enthusiastic about working with a real life case situation and about converting part of their earlier gained knowledge into a solution that might be implemented or at least accepted by the practitioners. However, it showed during the course that the students, being in their second year, were not yet fully capable to deal with the kind of issues around CBP and a realistic exchange of knowledge with stakeholders. They miss a sound reflexive attitude to perform fully at the front stage and backstage level, as described by Boyd et al (2015). On the other hand they learn a lot from working in this kind of CBP-environment, even in the more distant way as is was presented during this year's course. In the next course there should be more and stronger attention to a direct interaction between stakeholders and students. The students missed more discussion with the stakeholders. That will also increase the exchange of knowledge much more. One of the critical points that the students brought forward, was that there was too little (and too late) interaction with the stakeholders. An option that has been discussed after the Studio by the students as well as the commissioner was to stay in the area for at least a few days and not for only one excursion day. This suggestion will unfortunately collide with the university program committee who only offers a one-day excursion for this course, which is in line with the remark by Balsiger (2015) about supposed expenses for a longer stay in the area in relation to management ideas on transdisciplinarity.

A second point that can be mentioned is the performance front stage and backstage, related to their knowledge and exchange of knowledge with stakeholders. By better explaining and experimenting within a short exercise with these two stages at the start of the course they would probably better perform on both stages. Then the students know how to write a script for their performance at the front stage. The students were able, in the end, to act backstage, but there is room for improvement and more profundity in their reflexive attitude. During the course the students were having difficulties dealing with all the different and new concepts. They also missed some content related knowledge about physical and social phenomena, which is offered later in the curriculum. A new set-up of the curriculum next academic year will probably overcome this lack of knowledge. The Studio is then scheduled at the end of the second year program.

A third point concerns the knowledge of the area and related possible interactions with stakeholders by students. To better act as a participant in the area, or as a representative of a stakeholder, it is important to know the area and the people how are active. It takes time to build up that knowledge and gain the required trust, in order to feel connected to the area and its people, mentally and physically, especially in a CBP-TD process. Four weeks is by no means enough; the students have scarcely time to reflect upon their impressions and the involved stakeholders are limited in their available time; over a longer period it will be easier for both groups. It will at least take more than two months, to be

better embedded in the area, the people and their hassles. During the evaluation session with the commissioner it was suggested to place the Brainport Park area more central in other courses as well, so the students can build up their area knowledge and stakeholders can get more acquainted with the students. This will definitely upgrade the students acquaintance, but it should be mentioned that students are also keen on very different sites to be central in a course. A differentiation in case study area over courses is also related to the place in the curriculum and the described learning outcomes. Other areas offer other and different items to focus on.

The more general related focus points are concerned with how democratic the BPC process can be. And is it possible to have a community-based planning framework that can be applied or linked to the dynamics and democratic development of and in landscapes? Or is it merely utopian and governmental thinking to have such a framework? There is still a stage manager (or name this position producer or facilitator) required to connect, support and inspire the many different actors and to introduce and facilitate new players and new dynamic developments (see also Axelsson et al, 2013). But (s)he can only act on the basis of community acceptance, being a member of the community, not through dictatorship or being an outsider. All actors involved exchange insights and experiences, learn with and from each other and create new types of knowledge. So when students are part of the actor group they must also be aware of their position and act accordingly. The learning curve for students might well be steep for them with only a few weeks, but for the permanent crew the activities of students should also have an added value.

In a paper by Axelsson et al (2013) suggestions are made for a set-up for a multi-level social learning framework that contains promising elements. They included policy development about sustainable landscapes and rural developments, learning about the related indicators and norms. They have based their set-up on 18 (forest-oriented) initiatives, mainly located in Sweden. A main difficulty was to secure systematic social learning and explicate it at different levels. They distinguish three levels, the local level where projects develop solutions to different issues. The second level consists of learning from these local projects. The third level is made up of general learning, based on experiences from multiple development initiatives and places, in which tacit knowledge is generalised and made (more) explicit. This kind of knowledge (new and its use) will be created when project results are assessed, in order to understand what did work and what did not, which issues were or are still important, where it could have gone wrong. The authors state that this learning process will benefit from transdisciplinarity, including the collaborative process and comparing results to theories and experiences in other places. They also put forward that there should be enough difference in the stakeholder group from sectors, levels, interests, background and learning experiences. All people should be open minded and willing to participate and represent relevant stakeholders. There should be applied a variety of methods, like reflections, discussions, self-evaluations, external assessment of the project and the local initiatives. One should keep in mind that when abstracting the learning process the contact with reality and local stakeholders should be kept. Also the persons included in the process should not be the 'usual suspects' that are at all these kind of meetings or the 'main/current' representatives. Also building trust is an important element to enhance collaboration (see also de Vries, 2014), while not overlooking the limited equity among the different actors and policies. The authors propose that the first step should be to focus on solving small and easy problems before tackling the larger ones. Maybe comparable projects from elsewhere can be an example.

Another suggestion is brought forward by Ayre and Nettle (2015) for a catchment area in Australia. They focussed on the dynamic process of how to combine and effectively manage diverse disciplinary perspectives and other knowledge(s) in a social learning process for practice and policy change. They come up with five different phases. The first one is to establish the imperative for integration. If there is not enough basis then don't start. The second phase consists of coordinating the different involved disciplinary and other knowledge commitments. The next step is to consolidate arrangements for integration. Take care that everybody agrees on norms and steps to make. The fourth

phase is to prioritise the outputs from the integration process. And then as fifth step start representing the outputs. These phases should be planned in a strategy, but there should also be room for emergent inputs as a result of iterative steps.

There is a great deal of overlap and communality between the different studies. It also shows that these kind of integration and transdisciplinary projects are complex, require good guidance and facilitation, and could be very well time consuming. The question remains how to integrate these sensibly in an educational environment with limited time. This adds an extra element in an already very complex process that is not easy to tackle. We will continue to explore this track of educational transdisciplinarity and social learning in the very near future.

Abstract:
*Planning has mainly focus on land, however new challenges arise from environmental planning in the sea. MARLISCO - Marine Litter in Europe's Seas: Social Awareness and Co-responsibility aims to raise public awareness, facilitate dialogue and promote co-responsibility among the different actors towards a joint vision for sustainable management of marine litter in European seas. By developing innovative mechanisms and tools, it targets to effectively engage, inform and empower society, reaching the widest possible audience.*
*Within this project a Video Contest was launched to encourage and provide the opportunity for youngsters to get in touch with the issue of marine litter and share their visions with a broader public. Youngsters were invited to develop and produce a short video expressing their views about marine litter, becoming agents of societal change. This challenge was taken by schools, as a curricular or parallel activity, approached from several or multiple disciplines. It has promoted critical thinking and active citizenship regarding a complex problem that affects everyone and is of the responsibility of all.*
*In this communication we present and explore the methodology and results of the video contest in Portugal within the several European countries, exploring the lessons learned.*
Keywords: Marine Litter, Education, Outreaching, Co-responsibility, Youngsters

## Introduction

MARLISCO - Marine Litter in Europe's Seas: Social Awareness and Co-responsibility aims to raise public awareness, facilitate dialogue and promote co-responsibility among the different actors towards a joint vision for sustainable management of marine litter in European seas. By developing innovative mechanisms and tools, it targets to effectively engage, inform and empower society, reaching the widest possible audience. Within the several activities of the project a Video Contest was launched to promote the opportunity for youngsters to get in touch with the issue of marine litter, share their visions with a broader public and reach wider audiences. Youngsters, in articulation with their teachers, were invited to develop and produce a short video expressing their views about marine litter, and submitting it to a national contest. This challenge was taken by schools, as a curricular or parallel activity, often involving a diversity of disciplines. The video development has promoted critical thinking and active citizenship of a larger educational community regarding a complex problem that affects everyone and is of the responsibility of all.

## Conceptual Framework

This paper deals with the video context of the MARLISCO project, an issue that develops within the context of science communication. Science communication has shifted methodologically and conceptually. The traditional one way communication has given place to “dialogic and discursive fora

that aim to empower people regarding the issues which might affect them and their communities" (Pidgeon et al., 2014).

From the literature in science communication and from working in the ground, it is clear that publics are capable of debating complex issues of environmental science, technology and policy given the right tools and the opportunity to do so (Renn et al., 1995 as in Pidgeon et al., 2014; Dietz, 2008 as in Pidgeon et al., 2014, Vasconcelos et al, 2013a, Vasconcelos et al, 2013b, Vasconcelos et al, 2012).

This new current is more adequate to the complexity of these contexts with (1) numerous interconnected elements combining technical, behaviour and institutional elements, (2) mixed a diversity of multiple geographical and temporal scales and (3) integrate national level science policy problems difficult to model " (Pidgeon et al., 2014). Due to this, policy issues are often called wicked (Tumpeny et al, 2009 as in Pidgeon et al., 2014; Rittel and Webber,1973) or postnormal (Rosa, 1998 as in Pidgeon et al., 2014) in the literature.

To overcome this, it is crucial to adequate the processes to promote change of the perspective of the society at large, and conquer participation in issues concerning the environment, in this case marine litter, a collective problem to what all of us contribute. As so, the direct mobilization, involvement and engagement can contribute to develop a continuous process focused in enhancing human knowledge, contributing for the generation of new adopted values, and to the creation of innovative tools targeting to the success of a project aiming the changing of attitudes and behaviour.

This is part of the component of environmental education (EE) of the project. EE is an ongoing process of training and education through which individuals and communities become aware of the environment in which they live, and acquire knowledge, skills, experiences, values and determination that makes them capable of acting individually or collectively in the search for solutions to environmental problems present and future (UNESCO, 1987).

It is essential to go through an educational process with the specific aim of "know how to do, know how to be, and know how to act, reflecting on knowing how to be, both at local level and in social terms" (Alves, 2001). This calls for experiential learning since it considers the individual learning process (Breunic, 2009) a process of learning through experience or better "learning through reflection on doing" (Felicia, 2011). This type of learning is different from the didactic one, where the learner plays a passive role (Felicia, 2011), because the idea is more to implement active learning, such as action learning, adventure learning, free choice learning, cooperative learning, and service learning (Itin, 1999).

Experiential learning is concerned with more concrete issues related to the learner and the learning context, a rather ancient concept that comes from Aristotles as written in Nichomachean Ethics "for the things we have to learn before we can do them, we learn by doing them". This idea lived up again in the beginning of the 1970s, with David A. Kolb development of the modern theory of experiential learning, drawing heavily on the work of John Dewey, Kurt Lewin, and Jean Piaget (Dixon, 1997). This was reinforced by Freire´s educational theory, defending that education should raise the awareness of the students so that they become subjects, rather than objects, of the world making them to think democratically and to continually question and make meaning out of everything they learn. In fact, Freire states that "...our relationship with the learners demands that we respect them and demands equally that we be aware of the concrete conditions of their world, the conditions that shape them. To try to know the reality that our students live is a task that the educational practice imposes on us (Freire, 1998).

Departing from the concept that knowledge is socially constructed (Freire, 1998, Berger et al., 1967) Freire states:"... knowing is a social process, whose individual dimension, however, cannot be forgotten or even devalued. The process of knowing, which involves the whole conscious self, feelings, emotions, memory, affects, an epistemologically curious mind, focused on the object, and equally involves other thinking subjects, that is, others also capable of knowing and curious. This simply means that the relationship called "thinking" is not enclosed in a relationship "thinking subject - knowable object" because it extends to other thinking subjects. (Freire, 1998). In this line he discusses practical and theoretical knowledge, calling the attention to the fact that believes are shaped into knowledge by discussion and critical reflection.

The idea of the video contest of the MARLISCO project is anchored in this conceptual framework. It is expected that by doing the teams increase their ocean literacy, reflect critically on the marine litter problem and come up with joint proposals enriching the responsive capacity of society. Targeting this young group has the advantage to create a dynamics that will transform society since the learners of today are the decision-makers of tomorrow.

The lack in the school program of issues related to the understanding of the way the environment and biodiversity functions contributes to the students' fractional and incomplete vision of nature. This understanding is essential to educate responsible and active citizens of tomorrow promoting future sustainability policies. Therefore the above approach to EE emerges as a possible response to this gap in the learning process. Being a type of education that aims to a more comprehensive learning, it should lead citizens to live in harmony with the environment, by understanding the dynamic relationship that exists between natural ecosystems and social systems, in order to lead to a sustainable management of natural resources, ensuring the welfare of future generations (Evangelista, 1992). For this, educational practice must therefore develop and enhance the capacity for action (Uzzel *et al.*, 1998). The school should, in this context, be seen as an active agent for the creation of change, rather than a passive transmitter of information.

The MARLISCO project aimed to sensitize all citizens of all ages, particularly the younger ones, to sustainable behaviours in relation to the sea, generating a multiplier effect to make them active agents to provoke change in their communities and extended family. Students addressed local and very specific issues, but of utmost importance on the world stage. This helped them to develop critical thinking and co-responsibility for the problems of local and wide scope.

## MARLISCO Project - Social Awareness and Co-responsibility

MARLISCO (*Mar*ine *Li*tter in European *S*eas: *S*ocial Awareness*S* and *CO*-Responsibility – is an European project funded by the European Commission in the context of the Seventh Framework Program for I & D. MARLISCO is a plan of action for mutual learning and mobilization that aims to raise society awareness to the issues and possible solutions of the marine litter. While involving universities, governmental agencies, environmental NGOs and industries the MARLISCO Portuguese team launched the project and worked on it for three years. The Portuguese team included a set of experts from the New University of Lisbon, and worked closely with a wide range of diversified professionals and experts from other entities.

Overall the MARLISCO project involved a partnership of fifteen countries (see figure 1) and twenty institutions namely: from the industry sector (plastic production, conversion and recycling), research (universities and research centres) and civil society (environmental NGOs).

Figure 1 – MARLISCO –countries involved

Marine litter has been identified as an emerging threat to the environment, human health and safety, as well as livelihoods. Originated from various land and sea based sources, it is a challenging and complex problem. Figuring out specific responsibilities is hard since these are unclear, and even the costs and consequences are unequally shared. It is clearly a problem without a unique solution that can be the same for all. It requires an integrated approach of articulated efforts. It is a global problem without boarders requiring solutions to involve partnerships of different sectors of society.

The litter ending up in the sea is a result of activities and attitudes of all of us, either directly or indirectly. Contrary to what is the general perception, according to the United Nations about 80% of marine litter is generated in land and only 20% result from sea activities. Its exponential growth results from prevailing production and consumption patterns and from human attitudes and behaviour in dealing with waste. MALISCO project has emerged aiming to deal with this issue.
Within the terrestrial sources we can list the general negligent abandonment of garbage (close or far away from the coast), the inappropriate disposal of objects at home (e.g., swabs push down the toilet), absence or overcharge of sewage treatment stations, failure in the management of collection, treatment and elimination of litter and products resulting from industrial activities. The garbage wherever it is left finds its way to the sea, through the rivers, sewage, by the wind, drained by the rain or by the tides. Extreme events such as the hurricanes and/or *tsunamis*, are also responsible to drain substantial amounts of garbage to the ocean. Marine sources include commercial fishing, leisure activities, shipping, military or of research navy, offshore oil or natural gas platforms and aquaculture.

MARLISCO overall goal is to raise public awareness, facilitate dialogue and promote co-responsibility among the different actors towards a joint vision for the sustainable management of marine litter across all European seas.

The main objectives of the MARLISCO project are (1) to increase the awareness of the consequences of societal behaviour in relation to waste production and management on marine socio-ecological systems, (2) to promote co-responsibility among the different actors, (3) to define a more sustainable collective vision, and (4) to facilitate grounds for concerted actions through the successful implementation of the Mobilisation and Mutual Learning Action Plan (MMLAP).

The main focus is to provide and evaluate mechanisms to enable society to perceive the impact of litter on the marine environment, to identify the land-based activities that are involved and collectively arrive at solutions to reduce that impact – in particular solutions that can be implemented locally but have a regional effect.

**Specific objectives**

1. To provide a review of current understanding of the sources, type, distribution and fate of marine litter in Europe's Sea. This will provide an evidence base to support appropriate actions and to provide a baseline against which change can be measured.
2. To provide an evaluation of key stakeholder perceptions of marine litter, assess current practices and potential solutions, and measure the effectiveness of the Action Plan at changing attitudes and perceptions.
3. To develop a web based portal to promote the Action Plan, provide a source of information on marine litter, stimulate discussion and disseminate the results of the Co-ordination Action.
4. To provide a platform for structured dialogue among the key stakeholders from industry, end users, science and society, in 12 European countries. This will help to identify and resolve barriers that currently retard the adoption of good practice.
5. To develop a video contest in schools in 14 countries around the European Seas in which children will be encouraged to develop short videos about the issue, embodying a multi-disciplinary process of getting in touch with the problem and addressing potential solutions as they see them.
6. To identify good practice and facilitate its adoption via a range of disseminating materials aimed at specific sectors and present them to evaluation during the stakeholder fora.
7. To increase awareness and empower general public and children through a series of national educational activities and innovative communication tools, while facilitating the integration of their views in the platforms of dialogue.

Source: http://www.marlisco.eu

MARLISCO has been developed by a consortium of 20 organizations from 15 European coastal countries (Italy, Holland, United Kingdom, France, Slovenia, Ireland, Romania, Germany, Cyprus, Bulgarian, Spain, Portugal, Turkey, Denmark and Greece). It encompasses the four European Regional Seas: North-East Atlantic, Baltic, Mediterranean and Black Sea.

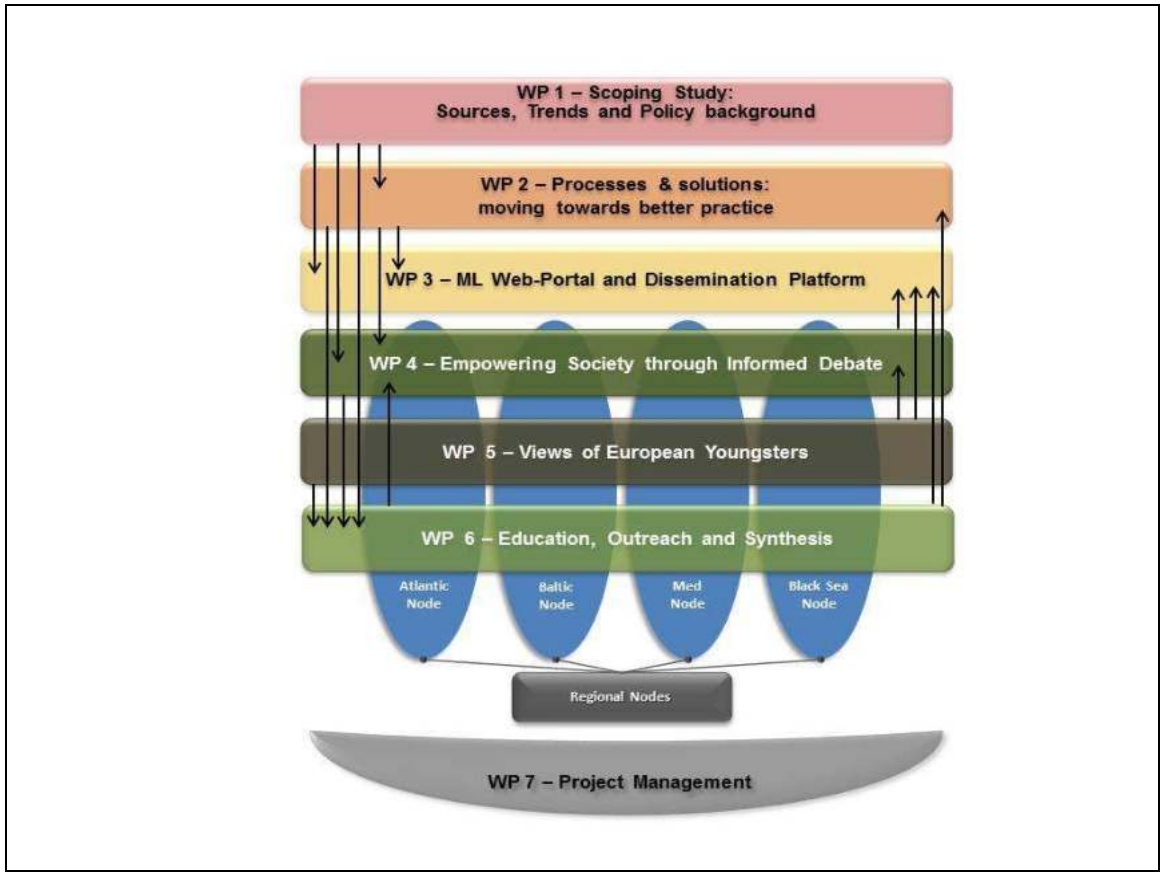

Figure 2 – MARLISCO Work Packages structure

MARLISCO is organized in 7 work packages (figure 2).

- **WP1** – Scoping study: sources, trends and policy background
- **WP2** – Processes & solutions: moving towards better practice (Best-practices collection and stakeholder survey)
- **WP3** – Marine litter web-portal and dissemination platform
- **WP4** – Empowering society through informed debate (National fora)
- **WP5** – Views of European youngsters (European video contest)
- **WP6** – Education, outreach and synthesis (several customized activities to raise social awareness about marine litter including MARLISCO exhibition)

The central idea of departure of MARLISCO project has been to develop innovative mechanisms and tools to effectively engage, inform and empower society, reaching the widest possible audience. MARLISCO activities include:

- A scoping study of the sources and trends regarding marine litter in each Regional Sea.
- A collection of best practices from all partner countries.
- A survey on the prevailing perceptions and attitudes of different stakeholders regarding marine litter.
- National debates in 12 partner countries.
- Diversified, tailor-made national activities including exhibitions, workshops, festivals, clean ups, etc.

- A European video contest for youngsters to collect their visions on the issue of marine litter and empower them as agents of change in society.

In Portugal the MARLISCO social awareness activities already involved more than 9000 persons. In this paper we focus in this last activity - the video contest – that, in Portugal generated 92 videos, engaging and mobilizing more than 600 students and teachers.

This has followed up the launching of the MARLISCO´s European Video Contest as stated in the MARLISCO site: "In 2013, the European Project MARLISCO challenged European youngsters to tell us what they think about the problem of marine litter in a short video" (http://www.marlisco.eu). For the overall project this resulted in 379 videos submitted involving 2 123 youngsters, from 118 schools. The best videos were selected by a national jury in each of the 14 participating European countries.

**The Portuguese Video Contest – youngster "hands-on" activity**

Supported by the project central idea - to develop innovative mechanisms and tools to effectively engage, inform and empower society, reaching the widest possible audience – the MARLISCO project launched an Europe-wide national-level video contest for schools for youngsters ( in Portugal 12 to 18 years old students were involved). Students were challenged to produce a 2 minutes video to manifest their ideas and propose solutions to the marine litter problem. It was expected that becoming aware of the problem could shift their own behavior. This was supposed to be done in teams of at least two students with one teacher/educator. Each student – teacher/educator team could submit as many videos as they wanted. The team had total freedom to decide the topic and context for the video as far as they addressed the following issues: 1) Why is the marine litter a problem? 2) Where does the marine litter come from? 3) What can be done to reduce the marine litter? 4) What have we done in our school or community about this problem? 5) Innovative ideas/solutions to solve the marine litter problem.

In sum, videos were expected to highlight several issues namely, the impacts of marine litter, consumer good practices to reduce marine litter, reporting an initiative developed in the school or in their community to better manage or reduce waste or the preparation of an artistic/creative work (for instances using material collected in a beach clean-up). The key was to pass a clear message on marine litter to a broader public. The videos selected in each country could be broadcasted in the national television (perhaps together with another video from another country), supported by a national celebrity to leverage dissemination and to reinforce the importance of the message.
Videos are encouraged to be shown in other public events, within the project or not. A final award for the team winners of each country was to travel to participate in the European Sea Celebration Day in Bremen-Germany. A final video compilation of all the video winners Europe-wide was prepared – "Voices of Young Europeans about Marine Litter" and broadcasted during this celebration in May 2014.

The evaluation criteria of the videos submitted were: adequacy of the topic, quality of the research shown, relevance and potential impact of the message, quality of the production, and creativity and originality of the video. In Portugal, teams were encouraged to find a catchy title and the videos were evaluated by a jury of four elements - the national coordinator of the project, the European coordinator of the Video Contest, a movie expert, a godfather of the video contest – taking into account the voting in the YouTube. The team had a substantial debate if this last component of evaluation was fair since it can be easily manipulated by asking friends to vote. However, one of the key objectives of the MARLISCO project was to widened up the diffusion of this issue, therefore recurring to the internet voting had a good potential to contribute to this.

The public voting had as basis the number of "Likes" in the MARLISCO YouTube and Facebook pages (the number of views did not count). The public voting period to decide the winner (finalists) was open to the public during 10 days (3 to 13 of March). The voting of the special categories ended one day before the launching of the best videos voting and it lasted approximately 2 weeks. The number of "likes" on Facebook and YouTube attained a total of 14292 (which count as points do decide de winner), though it had a total of 7195 views on YouTube and 61280 views on Facebook during the period of voting. The most popular video achieved a total of 2283 likes.

In Portugal to achieve a wide engagement and mobilization the Portuguese MARLISCO team did a wide diffusion through the website and the Facebook contacting more than 1 400 organizations directly. This effort paid back since thirty four (34) schools got involved and developed videos. Thirty one (31) submitted their videos. The 3 missing informed that either the videos developed did not have enough quality or that they did not had enough time to finish them. This was a loss of 11 videos not delivered, the process of producing the video was performed and was positive by involving teachers and students got involved in the theme during sometime around a concrete project.

Ninety two (92) videos were submitted for evaluation (figure 3). Some schools had more than one teacher involved and at least forty one (41) teachers got mobilized. A total of 458 students (2 teams/videos were composed by 50 elements each, the other teams varied between 2 and 10 elements, usually not more than 5 members because MARLISCO team announced that only could take 5 students to Bremen).

Figure 3 – Essays for MARLISCO Video development

MARLISCO Portugal offered a set of support services, but the most relevant was a Workshop in partnership with the Faculty of Beaux Arts of Lisbon University to technically support students and teachers teams. This workshop was organized in two sessions (November 4 and December 9, 2013). It registered 72 attendances (17 teachers and 55 students from 11 schools) (figure 4).

Figure 4 – MARLISCO Project workshop of technical support

The project team also provided financial support. Sixteen (16) schools requested financial support representing a total of 41 videos/teams supported. Some schools did not claim funding and the majority of schools did not use all the money. The financial resources were used to organize the award ceremony.

National Juries were set-up in the countries involved to select the best national video and winners. Wider public engaged fostering the dissemination of the videos, constitute an intermediary step in the video selection process to capture public support and preference, with a sub-set of the national videos going on "public voting" on Youtube. The exposing and sharing of these videos in social networks, such as Facebook, allowed for a wide outreach. Some of the videos have reached 1.000 "views" within the first week.

Due to the great amount of videos (92), a pre-selection was a must. Four members of the team viewed all the videos and fill in a table with a "yes, no and maybe" option to decide if the video should proceed to the next phase. The four evaluations were assembled: excluded the videos that had "no" from the four members, and included all the videos that had four "yes". The videos classified with "maybe" or the ones that were not consensual were discussed in a meeting to decide jointly. From the 92 videos 30 were delivered to the national jury (15 for each cohort). The second phase consisted in integrating the voting of the jury and the public (this one accounting for 20%) to get the final result. Only the TOP 10 (selected by the jury for each cohort) were submitted to public voting.

From these 20 top videos, not taking into account the age range, the most voted video by the public won the People's choice award. Moreover, as there were some good videos that were excluded in an earlier phase the team project decided to attribute some special prizes. These prizes (Informative, Animation, Character and Creative) were attributed by public votes.

Besides the initial sponsors for the Portuguese National Awards - Oceanarium of Lisbon, "Pavilhão do Conhecimento" (Pavilion of Knowledge) and "Kit do Mar" (Ocean Kit) - the MARLISCO Portuguese team decided to contact several companies that offer adventure activities (outdoor/sport/nature). These contacts were only developed after knowing the finalists, in order to request local companies from the same city of the finalist team. The result was very positive and all the companies contacted accepted, in a total of 11 companies that represented a total of 12 team prizes.

**Youngsters Portuguese Video Team Recognition**

The National award ceremony in Portugal - an event organized specifically to announce and deliver the prizes to the finalists' teams – was held on the 22th March in Lisbon Oceanarium. A total of 117 participated, being 70 members of the video contest teams (students and teachers), 20 guests (jury members, sponsors and high entities representatives) and 27 winning students and teacher of an additional contest that the Portuguese project team organized (MARLISCO Anthem Contest).
All the 15 prizes teams except for one participated in the ceremony. The missing team lives in Madeira Island and did not get financial support to pay for the travel expenses. However, we had one student from the Island of Madeira and two students and one teacher from São Jorge Island (Azores) that got some local support.

Figure 5 – Video Winer and the team Winer and MARLISCO Portuguese coordinator

The whole day ceremony event was filmed and also live streamed in the web, so that all schools, families of the students, and other people interested, could watch the ceremony. (https://www.youtube.com/watch?v=Vxp4EtT-5mA). All people present at the ceremony had free entrance in Lisbon Oceanarium exhibition and also in the MARLISCO exhibition of the Oceanarium at the time.

All awarded teams were called to the stage to receive their prizes, after showing the video and revealed the classification (figure 5). Besides the prizes offered by sponsors, MARLISCO Portugal also offered a simple kit to all students and teachers (MARLISCO bag, t-shirt, cap, certificate, bracelet, pin, small porcelain trophy (designed by an artist for this occasion). All teams also received a trophy to the school that was especially designed by an artist, inspired by the MARLISCO video logo.

The 2-days European Ceremony for the young representatives of the national winning teams took place on the 18th and 19th May 2014 within the 7th European Maritime Days Ceremony (EMDC). The delegations of youngsters were accompanied by the teachers that supervised their involvement in the contest and by a staff from the MARLISCO national partner. During the plenary session off the EMDC, MARLISCO was presented by the conference moderator and the Teaser of the MARLISCO Video Contest. Winners were publicly recognized, to an audience of 900 participants. One representative from each of the 14 national winning teams was called on stage to be greeted and receive from European Commissioner for Maritime Affairs and Fisheries - Maria Damanaki (2010-2014) an official recognition for their efforts. In total 86 youngsters, from 13 countries, with ages between 9 and 19 years old, took part in an attractive and interactive programme and had the opportunity to meet each other and share their experiences in an intercultural context.

**Reaching Collective Learnings**

The Portuguese achievements on the video contest were rather successful. Results show this. In fact, the number of youngsters engaged and videos produced was particularly high in Portugal. Of a total of 379 videos submitted by the 14 countries involved in the video contest (Greece did not have the video contest) Portugal contributed with 92 (24%). And out of the 2 123 students involved, 570 (27%) were Portuguese (Figure 6).

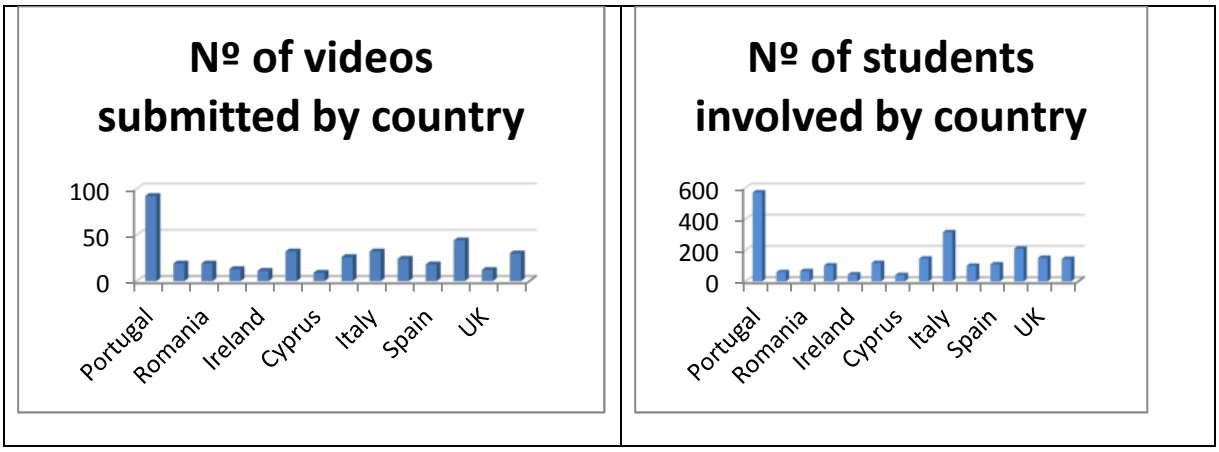

Figure 6 – MARLISCO Project – numbers of videos/students by country

The ones involved – students and teachers – worked towards a cause, researched on the issue, discussed and communicated. While doing this they improve their ocean literacy and developed critical thinking. More important than any of these numbers is the snowball effect, that has just started and that hopefully will give continuity and reinforce the movement towards overcoming the marine litter problem.

**Reflecting on Lessons for the Future**

The experience of the Portuguese team in creating emancipatory education, coming from previous projects, is well reflected in the results attained. MARLISCO project has constituted an opportunity to this team to further develop ways for wide mobilization and engagement of multi-generational groups (e.g., students and teachers). Nowadays the general concern of communicating science has been in the agendas but that requires tools to its implementation, this might be a way.

Involving, mobilizing and engaging a group in "hands on" projects of their own creates dynamic synergies that hopefully positively influences societal transformation by reshaping individual attitudes and behaviours, defend a cause, or contribute to improve collective learnings. Doing this may be the key to improving social attitudes and provide a way to mitigate or solve problems that look to us today as unsolvable. Substitution of generations will be the better judgement of the results of these efforts in shaping more responsible citizens.

Capacitating our complex and uncertain society to the challenges it has to face, turning the citizen into a changing agent should be a priority in any political agenda. Empowered, active and responsible citizens can be the key to transform society in a better place to live.

# TRACK 04

# Participation and New Governance: Ethics, Responsibilities and Commitments

## Track description

Co-chairs: **Louis Albrechts**, **Doris Gstach**

The academic ambition behind the concept of governance in spatial planning matters aimed at developing more inclusive and democratic urban and regional processes. For some it raises questions of the various actors' responsibilities. How can especially civic actors not only be empowered but made accountable? To which extent is a shared/participatory governance legitimated to compensate for the statutory rights and legal responsibilities of governments concerning the enforced decisions? Problematically, mainly in formalized processes a wide range of these relationships are being compressed into a one-size-fits-all concept of 'citizens' participation', which doesn't seem to provide the equal and reciprocal relationship between the state and citizens so much aimed for. Moreover, in daily practice emerging informal institutions and opaque networks in territorial governance seem to pose a challenge to democracy and to the democratic representation, accountability and transparency of decision-making processes. In addition the privatization of public services and public spaces fuel the danger that issues are replaced from an arena of public debate and decision-making into closed networks of elite representatives and technical experts who take upon themselves the right to resolve the issues at hand between each-other. So questions have to be asked about the legitimacy/democratic character of these processes. A crucial element in this respect is the way in which people are excluded or included in planning processes and the way the relationship between people – technologies of government – are organized.

# 'Capital' cities: marketisation, governance and the demise of planning

**Peter Brand**[1] and **Paul Watson**[2]
[1] Universidad Nacional de Colombia (Medellin campus), pbrand@unal.edu.co
[2] Past President, Planning Officers Society (UK), prw2013@gmail.com

**Keywords**: financial crisis, urban policy, spatial planning, governance.

**Abstract:** This paper examines the question of governance as a product of contemporary capital accumulation. Rather than focusing on formal arguments around governance (efficiency, civil society, democracy), a more radical approach is adopted in terms of governance as a strategy and means for opening up new areas and means for the circulation of private capital. In this sense all cities are 'capital' cities: cities of hegemonic capitalism. Theoretical analysis is developed at three levels: the macro-level involving the economic landscape following the 2008 financial crisis and the move towards greater central government intervention in regional and local affairs; the meso-level concerning political resistance and the legitimacy crisis; and the micro level concerning local reform and the debilitation of local government and planning. These issues are illustrated from experience in the Birmingham/West Midlands region in the UK. The impacts of the Scottish independence referendum and the re-emergence of English regionalism and the UK government's response to them are examined. It is shown how the restructuring of the regional and local planning system, formally aimed at greater local autonomy and community participation, is producing new fields of conflict and a weakening of public powers and democratic institutions, including planning as guarantor of the public interest. Governance, it is argued, is failing to provide the sense of cohesion and collective well-being for which it is designed. Against this, planning, both theory and practice, requires a new sense of political direction and social responsibility.

## 1. Introduction

One of the outstanding effects of neoliberalism has been the heightened profile of cities in global economic development. The dismantlement of international trade barriers and the conformation of new economic blocks and regulatory institutions gave the impression of a waning of the nation state, thrusting cities into to limelight as leading spatial players in the new global economic landscape. Cities, or city-regions, were held to be the new locus of economic power and control centres of globalised economic networks (Sassen, 2001, 2005; Taylor, 2005), and cities continue to occupy a central position in urban planning theory and practice, seen as the key actor in the restructuring of economies and the future competitiveness of nations.

Notwithstanding a reconsideration of the continuing importance of the nation-state in recent theorising of this geographical re-scaling process (Brenner, 2004; 2009), it was the global financial crisis of 2008 which demonstrated, in practice, the structural role of the nation-state. The financial crisis and its aftermath – the deepest economic recession since the Great Depression of the 1930's – have been the major issue in economic and social policy across Europe and North America. Rescuing the banking system involved a huge fiscal cost with dramatic consequences for cities, with highly differentiated effects across continents, between countries and within urban areas.

Whilst the effects on cities have been extensively documented, the implications for planning itself have been less thoroughly explored. A new round of austerity politics orchestrated by national governments gave a new shape to urban economic development policy, as well as accentuating spatial inequalities and provoking new forms of social protest (Harvey, 2012). A temporarily crippled banking sector and collapsed property markets sent crisis waves through the three-decade orthodoxy of property-led development and city entrepreneurialism. National governments turned to major infrastructure developments as a means to re-establish growth, and both economic and social policy became increasingly under the direction of central governments.

This paper explores the consequences of this process for urban governance and planning practices. Focusing on the UK experience, we highlight three aspects: greater direct intervention of national government in regional/urban affairs seen as of strategic to economic recovery, the reconfiguration of the institutional spaces of local government and community participation, and the consequent legitimacy crisis as expressed through social unrest and rebellion in the regions. The cumulative effect of these phenomena presents, we suggest, a major dilemma for planning, which has become so closely intertwined with business interests and property markets that has become unable to argue convincingly the public interest and exercise its legitimating function.

The paper first outlines the nature of the financial crisis, its geographical dimension and its implications for spatial governance. It then examines how these complex and uneven processes are unfolding in the Birmingham/West Midlands area of the UK, where regional planning structures have been dismantled in the context of severe austerity politics and, notwithstanding claims of 'localism', central government continues to dictate city and regional governance and resource allocation. This is followed by an examination of the rebellion in the regions, as exemplified and inspired by the Scottish independence movement. The final section reflects on the consequent demise of planning, locked into capitalist interests, devoid of any proper corpus of ideas, and unable to present an alternative, socially progressive outline of the future. The paper ends with a plea for planning to rediscover its radical roots and lead in addressing the decisive question of socio-spatial equality and sustainability.

## 2. The political economy of the financial crisis and urban planning

It is not our intention to detail the causes of the financial crisis, of which there are many excellent accounts concerning predatory lending practices, global financial instruments and the speculative culture of the finance industry. We focus instead on its geographical dimension and implications for state intervention at the local level. Indeed as Aalbers (2009) observes, the crisis was a particularly geographical phenomenon, whereby local/national housing finance markets acquired global significance through securitization, thereby implicating countries and regions not directly involved in the origins of the crisis in subprime lending in the USA. A decade of NICE growth ("non-inflationary consistent expansion") suddenly turned nasty (see Kitson et al., 2011, p.289). Economic growth turned out to have been based on unsustainable rates of consumer spending fuelled by a deregulated and speculative financial system, and the bubble burst through the housing and property markets.

The immediate response to the crisis was a huge state effort to rescue the banks. One or two went bust (Lehman being the most notable) but most were bailed out at a huge cost ($1.5 trillion according the IMF, cited in Kitson et al., 2011), which threw national economies into turmoil. National governments became embroiled in unprecedented levels of borrowing, public sector debt soared, and what to do about it became the defining question in the following years.

The immediate impact of the crisis hit cities severely, though unevenly, and with differential social and spatial consequences. In the USA, foreclosures were concentrated in certain cities and neighbourhoods, with particularly adverse repercussions for low-income and minority communities (Aalbers, 2009; MacLeavy, 2011), whilst in much of Europe the rate of foreclosures was lower but young and low-income families suddenly encountered even greater obstacles to entering the housing market as credit facilities dried up. The 'credit crunch' halted major building projects across Europe and parts of the Middle East, in Spain the bursting of the real estate bubble left a million new homes empty with no chance of buyers, and many investors, both large and small, personal and institutional, found their assets devalued or worthless.

It was not long, however, before governments and multilateral organisations were declaring the end of the crisis, arguing by the end of 2009 that the worst was over and that things were getting back to normal. This might have been true in the USA where (low) growth was restored fairly quickly, but in Europe things were different. Countries such as Greece, Spain, Ireland and Portugal, were forced to seek help from the European Union to meet debt obligations, and sustained negative growth or multiple-dip recessions haunted the continent. The European economy as a whole remains severely troubled. The effect on world trade led to falling growth rates in China, fears for growth in the emerging countries and a reserved outlook for the global economy as a whole.

From an urban perspective, a major consequence was that the hitherto cosy relationship between cities and private capital was severely shaken (Harding et al., 2010; Kirkpatrick and Smith, 2011). The model of property-led development, city entrepreneurialism, urban regimes, public-private partnerships, and so on, temporarily ground to a halt and will undoubtedly face reshaping in the future. This in turn poses some interesting questions concerning governance.

The notion of governance as a more horizontal, flexible, efficient and inclusive way of dealing with complex change had become established as the new orthodoxy of urban policy, through which the private sector acquired enormous influence and a high profile in urban development. Under the legitimating guise of governance there unfolded a vast array of privatisations, deregulations, restrictions on public investment and areas and forms of intervention. The fiscal pressures arising from the financial crisis, constructed and devolved to local state authorities, has resulted in 'fiscal bullying' and extremes of privatization, monetization and outsourcing in the US, Maywood, CA and Sandy Springs, GA being prime examples (Peck, 2012). In the UK, local authorities such as the London Borough of Brent and Suffolk County Council have proposed reducing the local state apparatus to the bare threads of a procurement procedure, involving the total commissioning of public services (including planning) from the private sector. However if the 'democratic deficit' of governance had already provoked concern amongst some academics, the radical proposal of total privatisation has also met with considerable opposition from citizens, and no such scheme has been implemented to date.

Governance also has a strong scalar dimension. Although much attention has been paid to the institutional arrangements concerning different actors in the development process, globalisation established the multi-scalar nature of those actors and the complex intersections of local, national and supranational interests and influences over policy decision-making and project implementation. But as Wissen and Brand (2011: 3) observe:

> The problem, however, is that mainstream political science tends to conceptualize the new spatio-institutional configurations in a rather static way. The contested process through which they are produced is often excluded from analysis. The same applies to their specific social content determined by the social relations of forces which are inscribed in the arenas of global and multilevel governance and which account for the strategic and structural

> selectivities of the latter. In short, the aforementioned political science approaches are more concerned with the *interaction* of pre-given spatial levels and less with their *production*.

These authors point out the much more process-oriented understanding of the spatial dimension of state transformation developed through the scale debate originating in radical geography, as well the renewed importance of the territorial dimension under conditions of financial and environmental crises. The work of Bob Jessop and Neil Brenner was especially influential in developing state theory under conditions of neoliberal globalisation. Governance practices could then be seen as emerging from the multi-layered intersections articulating local-global networks of economic and political power, as cities and city-regions emerged as key players in the global economy.

However the financial crisis has spurned a resurge of interest in city governance. As Keil (2010) observes, the state 'roared back' in response to the financial crisis. National governments were responsible for bailing out the banks and coping with the fall-out that followed. Dealing with the huge levels of public borrowing led to widespread spending cuts which directly affected public sector employment (shrinkage, wage cuts and reduction of pension entitlements) and focused on social policy (welfare provision and social services and programmes) as prime targets of the new round of austerity politics. The financial system and its bonus culture remained largely untouched, along with tax benefits for the wealthy and large corporations. Public indignation over the injustice of it all led to the Occupy movement, the 'indignados' in Spain, and widespread protest in Greece and Portugal.

Austerity again became the keyword in fiscal policy. Austerity itself is nothing new, having been a recurrent feature in times of economic crisis (Levitas, 2012) and an inherent feature of the different phases of neoliberalism characterised by a permanent state of fiscal restraint and market oriented selectivity (Peck, 2012). Peck argues that the current crisis has produced a more revanchist state and systemic austerity, leading to a 'cumulative incapacitation' of the state. This political agenda was eagerly implemented in the US and UK, and imposed by multilateral finance institutions on countries more reluctant to follow the orthodoxy of austerity. More recent calls by the IMF to relax austerity programmes have fallen on deaf ears in the aforementioned countries. As Krugman (cited in Peck, 2012) asserts: "The austerity drive isn't really about debt and deficits ... at all; it's about using deficit panic as an excuse to dismantle social programmes." Similarly, Chang (The Guardian, 2013) argues that in the UK "... the coalition government isn't as stupid or stubborn as it appears. It is sticking to its plan A because spending cuts are not about deficits but about rolling back the welfare state. So no amount of evidence is going to change its position on cuts".

We argue in this paper that it is also about reshaping spatial planning to facilitate, compensate for and legitimise state retrenchment. It is worth recalling Harvey's (2005) reading of neoliberalism as accumulation by dispossession, a class project involving a sustained attack on the working class and increasingly the middle class, growing social inequality and the concentration of wealth and power. Each crisis sharpens the neoliberal resolve. Austerity measures are rolled out with a (class) vengeance, against economic logic and policy alternatives, and used as a motive to reduce the living standards and life expectations of the poor, and further concentrate wealth in the hands of a privileged capitalist aristocracy.

The unfolding of neoliberalism is frequently improvised, experimental and contradictory. This is equally true in the case of local spatial planning, where formal planning structures and procedures have long been held to be an unnecessary restriction on development. In times of crisis, city planning may be called upon to deregulate and re-regulate simultaneously and intensively, paving the way for renewed circuits of capital accumulation through urban development whilst attempting to reconstruct convenient forms of social stability through notions of place and community. The following sections examine these processes as central

government tightens its grip on local government as an instrument for the administration of national economic austerity.

## 3. Governance and planning practices in the West Midlands, UK

Like most of Europe, the banking system in the UK was heavily implicated in the 2008 financial crisis. The major banks were obliged to recapitalise, merge or were effectively nationalised, a rescue operation that cost the government an estimated £120 billion. As credit facilities and confidence dried up, there was in a sharp fall in economic output, rises in unemployment and the sedimentation of the legacy of huge public borrowing would dominate economic policy.

The financial crisis – who was to blame and what to do about it - was at the centre of the May 2010 election. The Conservative party formed a Coalition Government with the minority Liberal Democrats on a platform of ruthless austerity. Reducing public debt was the ostensible and obsessive economic goal. There were some tax increases (VAT to 20%, additional capital gains tax and a 50% rate for high earners) and a public sector salary freeze subsequently capped at 1%. However, the overwhelming strategy involved drastic cuts to public spending. Social programmes provided by local authorities, and local authority spending in general, itself heavily dependent on central government, were prime targets. In the first round of spending cuts, whilst the average central government department saw its funding cut by 11.2% between 2011 and 2015, spending on local government was slashed by 26.8% (Joseph Rowntree Foundation, 2012).

In Birmingham, the UK's biggest local authority at the centre of the West Midlands region, this means job losses (another 2,100 forecast for 2013 and up to 7,000 by 2017) and the reduction of services to the core. According to a city report "The extent of the future financial challenge facing Birmingham will change the landscape of local government not only in Birmingham but nationally – we will have to decommission a number of services" (Birmingham City Council, 2012). A survey of 81 local authorities carried out in March 2013 found that planning services in most areas were in line for large cuts, especially in big cities such Manchester (54%), Portsmouth (49%) and Liverpool (35%) (The Guardian, 2013a). Sir Richard Rogers was prompted to warn that this would undermine the government's localism policy (designed to devolve planning decision-making to community groups) and leave the development industry to control the agenda (The Guardian, 2013b).

The financial crisis was exploited by the Conservative-led Coalition government to substantially dismantle the strategic planning system. Regional Spatial Strategies (RSS) had been introduced by the previous Labour government in the 1990s to govern and indeed form part of the statutory development plans for individual local authorities. RSS were developed by Regional Assemblies (of local authorities) and addressed in a holistic way, with short, medium and long term horizons, matters including housing provision, employment growth, the future of towns and cities, and inter- and intra- regional transportation, with an explicit agenda for social, economic and environmental change. Alongside RSS, a Regional Economic Strategy (RES) was developed by Advantage West Midlands, one of the Regional Development Agencies established and funded to act as the delivery arm of central government in UK regions. Together they provided a clear and consistent framework and priorities for investment which addressed need as well as opportunity, delivered by public institutions in an evidence-based, open and transparent way. The locally set explicit agenda for urban renaissance was radical, realistic and realising positive results (West Midlands Regional Authority, 2010).

These strategic planning structures and processes were immediately abolished by the Coalition Government in 2010, a move echoing the abolition of the Greater London Council

and Metropolitan County Councils by the Thatcher government in 1986. While still in opposition, the Conservative Party policy paper "Open Source Planning" determined to "... abolish the entire bureaucratic and undemocratic tier of regional planning..." (Conservative Party, 2010: p.2). Upon taking office, funding for these regional institutions was immediately cut off, Regional Development Agencies were closed down and the statutory basis for the abolition of RSS was included in the Localism Bill which became law at the end of 2011. However the Localism Act also included a 'Duty to Cooperate' designed to ensure that all bodies involved in planning work together on issues of more than local significance. It was a last minute and reluctant recognition of the need for some kind of supra-local strategic planning, certainly sitting uneasily against the views of the Conservative Secretary of State who had said that "…the whole concept of regional economies is a non-starter and (regions are) arbitrary dividing lines across the country for bureaucratic convenience" (Pickles, 2010).

The Duty to Cooperate remains at best an unproven mechanism as yet unable to coordinate effectively policy issues such as planning for climate change, housing and transport (Planning Officers Society, 2012: Royal Town Planning Institute, 2015). In the meantime, local areas are left to the vagueries of the market as effective control of development is prejudiced by a 'no plan' context wherein major decisions often fall at appeal to the central government's Planning Inspectorate.

The Localism Act also transferred judgement on infrastructure planning to the Secretary of State, supported by a Major Infrastructure Unit located within the Planning Inspectorate. This represents a radical scalar differentiation and the disconnection of infrastructure and regular planning (Layard, 2012). The lie that is the rhetoric of localism was finally revealed by the Growth and Infrastructure Act of April 2013 which inter alia transferred to central government (the Planning Inspectorate) decision-making on large-scale commercial and business development.

At the sub-national level, central government strategy was to replace coordinated regional policy and management with private sector led Local Enterprise Partnerships (LEPs) charged with articulating and delivering local aspirations for economic growth. These one-dimensional, business-led bodies, formed by geographical groupings based on local authority administrative boundaries but with no direct public accountability, have over time been given real power and influence over policy and resource allocation. In another echo of the 1980s, Enterprise Zones (EZs) with a relaxed planning regime were also created. These measures have resulted in tensions with local authorities, heightened by competitive bidding for limited government funds, and provide little prospect for balanced or effective treatment of regional imbalances.

In the case of the West Midlands, the boundaries of the LEPs reflect not economic geographies but political marriages of convenience at the time of their creation. The continuing Balkanisation of local governance in the West Midlands and the eschewing by LEPs of cross-boundary spatial issues, indeed of spatial planning of any form, has led to an increasingly incoherent and inefficient approach to the region's challenges and opportunities. This issue is well exemplified by the lack of strategic planning around the proposed high speed rail link between London and Birmingham known as HS2. The proposal has seen a sustained effort towards exploiting the economic opportunities presented by the development of new internationally-connected stations, but little coordinated planning regarding local connectivity to the stations or the regeneration needs of the wider urban area.

The fact that the West Midlands conurbation is split between two LEPs in no way helps. Indeed the "divide and rule" strategy of central government is demonstrated by the influence & control it exercised over the agendas of individual LEP Growth Strategies (which set out priorities for local investment) and its requirement that they be submitted to and approved by

the Coalition Government to form the basis of negotiation of "City Deals" on local responsibilities and funding.

In this speculative, competitive, divisive and privatised winner-takes-all context, the losers will continue to suffer from a competitive disadvantage now institutionalised by local governance reforms and financing.

## 4. Unrest in the regions

Tensions arising from intensified central government intervention and the concentration of public and private investment and wealth in London and the south-east, produced unrest in the UK regions. The Conservative-led coalition government paid little attention, confident in its close relationship with the London-based finance and media industries, and its stranglehold over local government through tight fiscal controls. Austerity politics, it seemed, could be implemented with a minimum of local government opposition and maximum of regional inequalities. The facade of participatory governance provided by the Localism Act could legitimate the socio-spatial chasms opening up across the under-developing cities and regions.

There was, however, some expression of concern from the largely neoliberalised planning establishment. The Royal Town Planning Institute's (2012) 'Map for England' initiative produced information on the differential spatial impacts of public policy, while a Town and Country Planning Association report demonstrated that England is "[…] one of the most polarised of the developed nations [... ] There has been no sustained attempt in the last thirty years to fundamentally rebalance the economic geography of the UK" (Town and Country Planning Association, 2013). The pro-business organisation Centre for Cities' (2014) report showed that for every twelve jobs created between 2004 and 2013 in cities in the South of England, just one was created throughout cities in the rest of UK. Commenting on the report, David Sparks, Chair of the Local Government Association commented: "We can't ignore the evidence that some of our great cities are being held back by being denied the sort of autonomy enjoyed by equivalent European cities" (The Planner, 2015: p.6). His comments reflect the position of the English Core Cities Group, established in 1995 by eight major English city authorities (Glasgow in Scotland and Cardiff in Wales were admitted in 2014). These city councils are also members of the pan-European Eurocities network, a group co-founded by Birmingham City Council.

Calls of this type for more regional autonomy fell on deaf political ears until the referendum on Scottish independence. As the 18 September 2014 date loomed, a surprised political establishment became alarmed at the strength of popular support for independence. Scotland had been particularly badly affected by 35 years of neoliberalism (demonstrators in Glasgow danced on the streets at the news of Margaret Thatcher's death), and disenchantment with Westminster was running strong. At the last minute the three major political parties joined forces to counter the independence vote and the referendum was defeated, partly on the basis of promises of the devolution of substantial new powers and fiscal resources.

The Conservative-led coalition government had already been awakened by poor performance in the 2014 European Parliament and local elections, especially in less prosperous areas, and was under pressure from MPs for England to address issues of accountability and control. Following the Scottish referendum both main political parties offered promises of more investment and powers to England's outlying cities, and the Coalition government's offer of 'Devo Max' to Scotland was followed by 'Devo Manc', an agreed package of powers and resources devolved to Greater Manchester (Birmingham's competitor for the title of England's Second City and immediate neighbour to the Chancellor's constituency) unveiled in November 2014 and promoted as a model for how other City Deals might be shaped. However, the promise of a new 'Northern Powerhouse' must be seen against the effects of

macroeconomic policy which according to Liverpool's mayor Joe Anderson has seen cities "absolutely battered by the government's austerity measures and cuts" (The Guardian, 2014).

These devolutionary packages within England have many strings attached, most noticeably the requirement of elected mayors (as 'executive officers') and continuing Whitehall (central government) influence and control of local agendas. A good example of this is the Northern Transport Strategy (Department for Transport, 2015), prepared independently from local spatial planning processes (Planning Resource, 2015). Other City Deals currently being negotiated are similarly being centrally determined. The Edinburgh region of Scotland, for example, has put together a package for investment in transport, housing, economic regeneration, energy and digital connectivity which according to the Leader of Edinburgh Council Andrew Burns will build on their strengths and tackle "persistent pockets of inequality" that "threaten to hold the region back", but which has to be agreed by the UK and Scottish governments (The Planner, 2015, p.7); and in Cardiff the local Business Council will be subject to review (by central government) to ensure that it is "fit for purpose", with the Leader of the local council Phil Bale saying that the city has to take part in the deal or "risk being left behind" (The Planner, 2015). In the West Midlands, exploration of governance options for the conurbation continues but in a fraught climate created not only by rivalry between competing LEPs but also by a central government review of Birmingham City Council (Kerslake, 2014).

There was, however, a significant difference between the specialist, business-oriented regional initiatives and the Scottish independence movement. Whilst the first argues for more autonomy to pursue the international neoliberal urban agenda, the latter is, to a large extent, a popular political reaction against it. The resentment against the both Conservative and Labour neoliberal governments was far from quashed after the 2014 referendum , and in the May 2015 General Election, an overwhelming 56 of the 59 Scottish parliamentary seats were won by the Scottish Nationalist Party, whose campaign was based on anti-austerity politics and social policy reform.

As the new Conservative government sets out on another and more severe round of welfare cuts, with Scotland immune to a degree, the future of the English regions will hinge around the equation of central government, market-led capital investment and increasing urban poverty and inequality, with the bogus participatory mechanisms of New Localism entrusted with the task of providing legitimacy to the whole process. Where planning stands and what stance it adopts is far from clear.

## 5. Conclusions

It is clear from both theoretical and practical viewpoints that, in the UK, the 2008 financial crisis brought with it not only enormous economic upheaval ('creative destruction' from within the finance sector) but also political opportunities for neoliberalised governance. Ironically, the deregulated excesses of speculative international finance capital resulted in even greater political influence of capitalist interests in national economic and social policy. The effects over cities and regions have been considerable and threaten to shape territorial politics in the immediate future, as separatist/regional movements combine with fracturing political parties and landscapes.

Spatial governance, we argue, needs to be understood in this macro-political context. Governance is not simply a matter of administrative procedures re-enacting the immediate, superficial concerns of 'stake-holders', but the re-engineering of the mechanics of power and capitalist interests as they operate at spatial different scales. Governance is a neoliberal ideological form whose function is to legitimise the uneven distribution and social effects of contemporary capitalism: 'good governance' is what is good for capitalism, its mantra.

For many years now planning in the UK has shared this mantra, articulating its spatial dimension and property market interests to, it must be recognised, some positive effect, at least before the financial crisis. Since then, the sharp edge of capitalism in crisis has thrown the professional tenability of 'good planning governance' into disarray. In practical terms, the combination of centralised government intervention with weakened local regulatory powers has accentuated the vulnerability of local government, increasingly dependent on or hostage to both central government and private capital. When the specifically planning considerations outlined in this paper are put into the context of austerity politics and all its social injustices, then city authorities are facing a veritable legitimacy crisis.

In our view, the notion of 'fuzzy boundaries' tends to obscure the political nature of current governance practices, and facilitate a neutral position from within planning. Just as in the Scotland case it was politics that challenged the neoliberal austerity orthodoxy, the planning profession needs to rediscover its progressive reformist and radical roots, and address issues of equity and ethics in professional practice at all spatial scales (TCPA, 2015). In particular, the reintroduction of critical theory into planning schools curricula will be essential for addressing present problems and future challenges.

# PUBLIC CONCERNS ON SHANGHAI URBAN GOVERNANCE AFFAIRS: AN ANALYSIS BASED ON GOVERNMENT MICROBLOG DATA

Jinqing CHEN [1], Jing HAN[2], Tingting QU[3], Feng SHAN[4]

[1]Department of Urban Planning, Tongji University, shanghai, China, 4539326@qq.com
[2]Research Center of Human Settlements Environment, Shanghai Tongji Urban Planning & Design Institute, shanghai, China, hjbm333@163.com
[3]Technology Department, Zhuhai Huafa Cultural Industry Investment Holdings Co., Ltd., zhuhai, China, ottcat@qq.com
[4] Department of Urban Planning, Tongji University, shanghai, China, 32019386@qq.com

Keywords: Urban Governance Affairs, Public Concerns, Shanghai

*This paper builds a database of urban governance affairs through making textual analysis of all microblogs published in June and December 2014 by Shanghai Municipal Government official microblog account "Shanghai City". The public concern on urban governance affairs is reflected by netizens' attitude to Shanghai City's updates, and measured by the volume forwards. By this means the public concerns on urban affairs are known, which provides important decision-making basis for better listening to public's will and responding to their needs when the government allocates resources and sets priorities. The result shows that: (1) in content, the public concerns are mainly focus on leisure activities and traffic condition, then daily life information. Governance and policy matters are rarely concerned; (2) in attributes, people are highly concerned about the forthcoming events, rumor refuting and life services, but pay little attention to policy news except for housing, entrance test, holiday and car license auction related policies; (3) in specific affairs of most concern are entrance exams, leisure activities, health and hygiene, weather variations, city images, films and TV programs, food, traffic, car license auction, sports and holiday etc.*

## 1. Research background and purpose

### *1.1 Research background*

Chinese cities are experiencing two significant transformations: (1) the stage of urban development. China has entirely stepped into the middle-late period of urbanization. In this context, new demand emerges--from pursuing economic growth to emphasizing the quality of economic development, which is entirely distinct from what was before the 50% node. (2) the composition of citizens. The old generation fades while the next generation rises. The post-40s and post-50s retire from the stage of social management. The post-60s and post-70s become the social dominants. The post-80 and post-90s turn into the leading component of social forces and carries the city's future. The growing-up environment and living conditions of the new generation are completely different from the old. They have unique concerns and needs on urban affairs. Their mainstream demand varies from the pursuit of material possessions to the high quality of life. With the two changes interweaving, a structural change is taking place profoundly in the public mainstream demand for urban governance and services.

These two changes occur in a new context--widespread use of Internet and rapid rise of new media. New media perceived public demand for the government. By effective use of the new channel, the government can be more keenly listen to the latest pulse of the community and the people's will.

The existing researches do not give sufficient considerings about the desires of the new generation citizens (post-80s and post-90s), and lack quantitate analysis (e.g. by microblog data method). The previous works on new media and microblog are mostly focused on the aspects of online public opinion, social interaction, public participation, information dissemination, network marketing, social governance, etc. They see microblog as a channel of public participation in politics, but not regard it as a "mirror" to show urban governance affairs.

Shanghai is one of many Chinese cities experiencing two major changes in the new context. Its economic development leadership decides it walks in the front row of nation-wide in these changes. Research of Shanghai is representative and has a great meaningful reference for Chinese urban researches.

*1.2 Research questions*

This research aims to capture the online hot issues of the public concern which reveal the "mainstream opinion" about the urban governance affairs, and provides important decision-making basis for better listening to public's will and responding to their needs when the government allocates administrative resources.

The research objectives can be summarized into 3 specific questions:
(1) What contents of affairs are most concerned about?
(2) What types of affairs are most concerned about?
(3) What characteristics do the most concerned issues have?

Furthermore, what public needs and expectations on urban government's management and services do the three questions reveal?

**2. Research design and data**

*2.1 Research design*

This paper's objectives are achieved through the studies of the governmental microblogging content and public responses to them. We make textual analysis of the "Shanghai City" microblogging messages to obtain prototype data on urban governance affairs. "Shanghai City" is the official microblog account of Shanghai Municipal Government. Its microblogs cover all aspects of urban life, and can be used to represent a variety of citizen-related affairs. Launched on China's popular Twitter-like service platform Weibo.com in November 2011, "Shanghai City" has been in operation more than three years, published more than 20,000 tweets, and accumulated more than 500 million followers. Its influence has consistently ranked within the top five governmental microblogs of China. The characters of publicity, officiality, maturity, universality and quantity of "Shanghai City" make the reliability and validity of research data is guaranteed.

This paper uses the forwarding amount of microblog to measure people's concern on urban governance affairs. The logic is that: if a microblog is forwarded, the forwarder is concerned about the content of this microblog; once a microblog is forwarded, the larger the forwarding amount is, the more public concerns the forwarded microblog has.

*2.1 Data*

We take the year 2014 as our study year, and choose microblogs published in June and December (to cover the first and the second half of the year) as research samples. The total number of valid microblogs is 1394. The forwarding amount is 180,373, where maximum forwarding amount of a single microblog is 4901 and minimum is 6. Each microblog is forwarded 129.4 times on average. The research data distribution is shown in Figure 1.

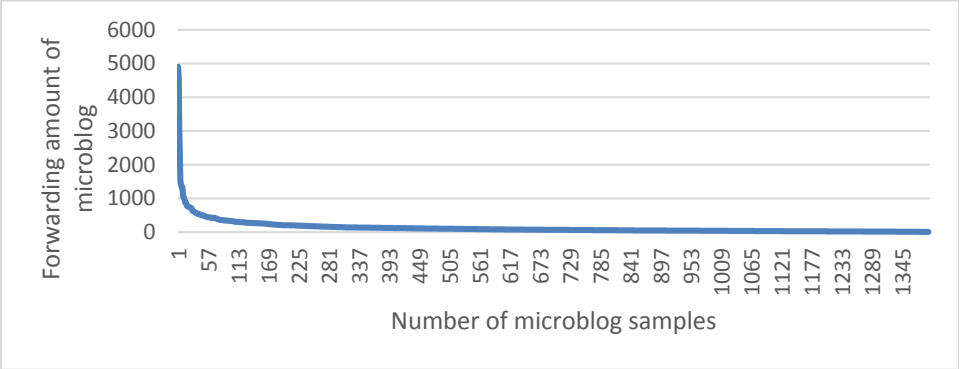

Figure 1. Data distribution of the microblog forwarding amount

## 3. The characteristics of affair content

### *3.1 The category of urban governance affairs according to content*

Depending on the content, urban governance affairs of the study are divided into 7 categories and 32 subcategories. The average concerning amount of each subcategory is shown in Figure 2. For the 7 categories, leisure activities and transportation are the most concerned affairs, then daily life information. Governance policy, weather and other affairs draw less attention. For the 32 subcategories, entrance exams, carnival, city image, housing policy, car license auction as well as health and hygiene are highly focused issues by people. In details, the microblog with the title "News: Essay theme of 2014 Shanghai college entrance published!" has been re-tweeted 4901 times and becomes the most concerned microblog among the entrance exam related affairs; the microblog "Oriental Pearl New Year's Eve countdown: 20 tickets waiting for you" has been forwarded 2474 times and ranked top in the carnival related affairs; the microblog "Photo: Shanghai Center stunning lighting" gets the most re-tweets of 3073 in all city image related affairs; the microblog "News: 2015 holiday arrangements announced" is the biggest concern in holiday related affairs with the forward amount of 1332.

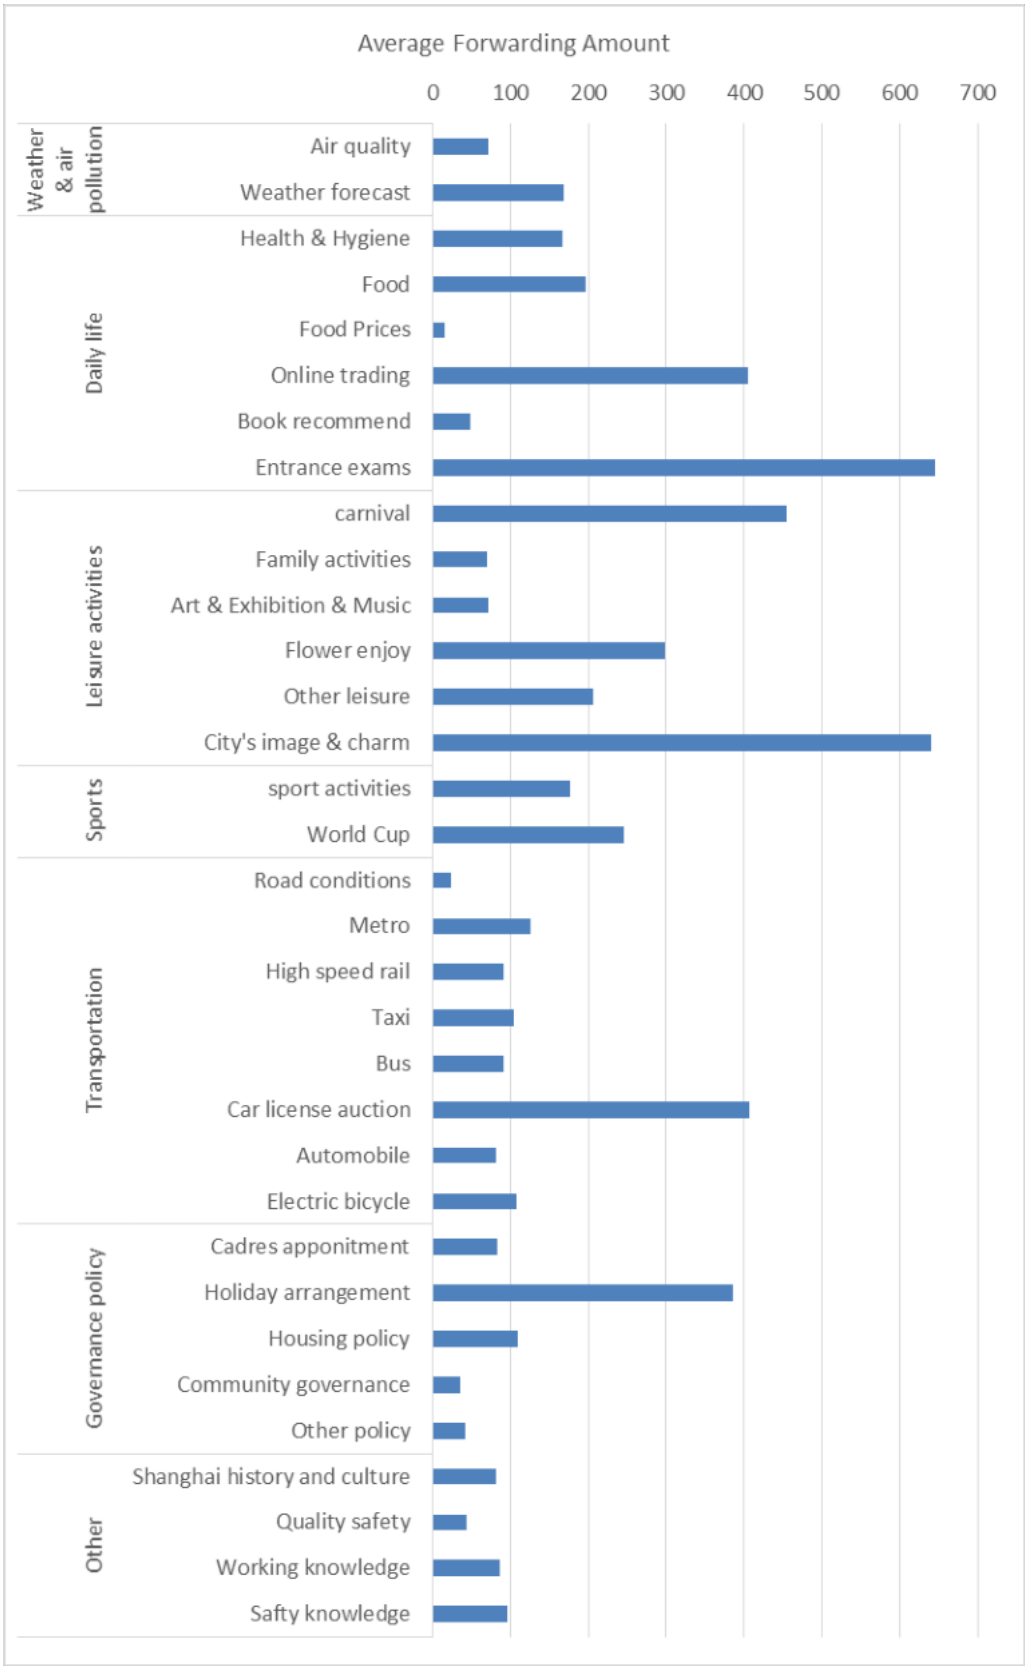

Figure 2. Categories and average forwarding amount of urban governance affairs

*3.2 Some interesting phenomena*

In the case of weather forecasting and variation, people's main concern is the sharp weather changes, especially the dramatically cooling or rain. If there appears "zero ", " minus ", " snow " , "Storm "

and other similar words in weather forecast related microblog , people forward them several times higher than usual . For instance, the average forwarding amount of weather forecast microblog is 135 , but the one with the title " Storm hits Shanghai from tonight! It is expected to continue until the day after tomorrow morning" is forwarded 761 times.

In the case of air quality, public concern is generally lower with the average forwarding amount of 72. But that does not mean people are not concerned about air quality, because when the air quality deteriorates (e.g. PM2.5 reaches high level), the public will pay much attention. For instance, the microblog entitled "This morning severe pollution: the highest temperature is 13 degrees, New Year's Day fell to freezing point" get 208 re-tweets. Showing awareness on air quality indicates that Shanghai people tend to purse more refined life quality.

For food and book, there are totally 61 book related microblogs (1 post per day) and 166 food related microblogs in sample. Their average forwarding amounts are 49 and 166, and their maximum forwarding amounts are 260 and 569 respectively. That is to say, food receives more attention than book. This result shows that in Shanghai "eat goods" outnumbers "reading people". The public usually are more concerned about where to eat good food rather than what good books come out.

For leisure and flower, Shanghai people have a unique interest in flower. For example, the microblog titled as "This weekend Guyi Park lotus exhibition: 60 tickets waiting for you!" gets 1070 forwarding amount, ranking 11th in the highest forwarding microblogs. This reflects that enjoying flowers is one of the important interests for Shanghai people's leisure activities.

**4. The characteristics of affair attribute**

According to information attribute, urban governance affairs in this study can be divided into six categories, in descending order of the degree of public concern is events information, rumor refuting, life services, news and report, culture and history, policy issuance (see Figure 3).

Rumor refuting affairs are highly concerned, indicating a strong public desire for accuracy of information. It also reflects a side of the information problems of the transforming Chinese cities. In the past, the degree of information openness was relatively low. But in the present, rumors spread quickly and easily on the Internet. People have a great need for disclosed and reliable information. For example, the microblog entitled "Rumor: 'Shanghai will cancel the property-purchasing limitations', Shanghai housing restriction policy has not changed" quickly gets 330 times re-tweets. It not only reflects that housing has become a matter of general concern of the public, but also mirrors that the public are less informed of the policy of the city government. In addition to the establishment of the government's future rapid rumor dispel mechanism, more effort must also be made to increase transparency in policy making and radically reduce the spread of rumors.

Governance and policy affairs are rarely concerned, indicating that people are not enthusiastic about the city governance. This may be involved in the possibility and convenience of the participation. When the public feel less likely to participate, they would have thought that the it is little to do with them and so choose to "ignore" them. For example, the microblog entitled "2015 My words to Shanghai" gets 1342 re-tweets. It said, "as long as the desire is send to 'Shanghai City', the selected aspirations will appear on the big screen of Lujiazui Citigroup Tower in the evening of December 31th". In sharp contrast, another microblog entitled "2010--2014 annual selection of model workers in Shanghai start! Raise your hand to participate!" receives only 8 forwards. The gap between the two is that the public think they may be involved in the former but they cannot be rated as model workers in Shanghai.

Despite the governmental issuance information is generally not as hot as others, the entrance examination, holiday arrangement, housing policy and car license auction etc. affairs which people think are directly related to their vital interests are closely watched by the public. For example, the microblog entitled "2014 Shanghai college entrance examination scores a two announced!" is

forwarded 1516 times; the microblog labeled “URGENT: 2015 holiday schedule announced!" wins 1332 re-tweets; another microblog headlined "Car plate new regulations released: driver's license must be submitted next month!" is forwarded 847 times.

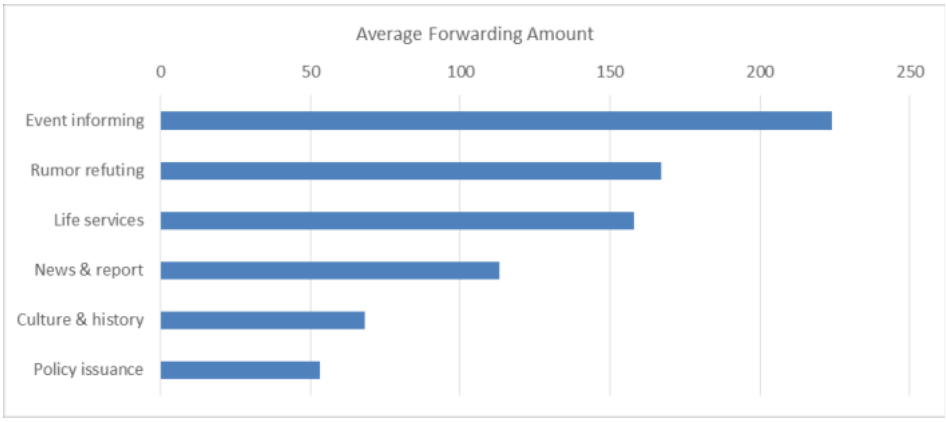

Figure 3. Public concern on urban governance affairs by different attributes

## 5. Analysis of the concerned affairs with high frequency

This research regards the microblog forwarded more than 500 times as the high-frequency microblog. There are 45 such kind microblogs in our statistic, accounting for 3.23% of the total. Their forwarding amounts are 46749, coming to about one-fourth of the sum number. By the data, entrance exam affair appears most in the high-frequency microblogs, along with leisure activities, health and hygiene, weather variation, food, films and TV programs (see Figure 4). Moreover, entrance exam affair also has the largest forwarding amount, followed by leisure activities, health and hygiene, weather variation and city’s image (see Figure 5).

According to the above analysis, the high-frequency affairs in the government official microblog reflect several things: (1) affairs related to children’s education and future destiny (entrance exam in this study) are dominantly the most concerned things of citizens; (2) leisure activities, health and hygiene, and weather variation affairs are stably and everlastingly watched; (3) City image affairs have big forwarding amount but emerge less in the high-frequency microblogs, suggesting that this topic is strongly cared by the public and the government should give more effort on enlightening the city’s image and charm; (4) traffic condition and car license auction affairs attract great attention, meaning that Shanghai’s transportation is not satisfactory; (5) the active performance of online trading affairs remarks that Internet has becoming a major channel of public buying and spending.

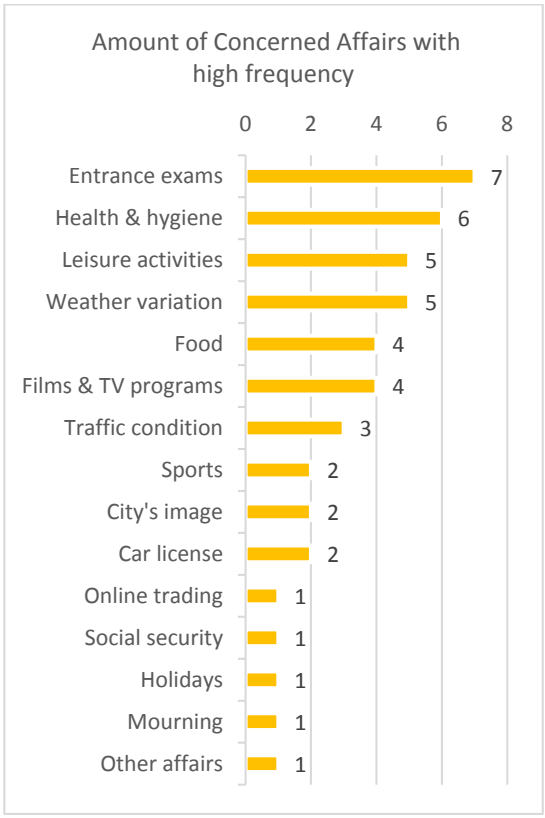

Figure 4 Amount of Each Concerned Affairs with high frequency (Unit: piece)

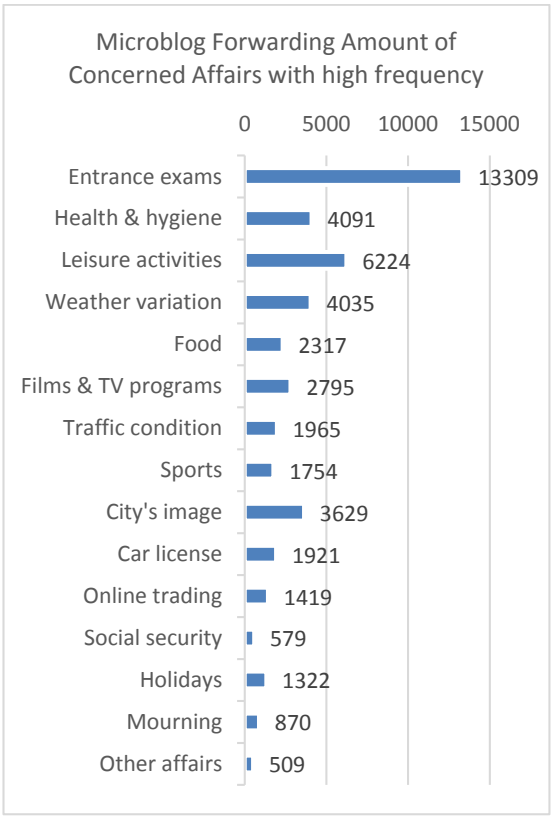

Figure 5. Forwarding Amount of Each Concerned Affairs with high frequency (Unit: time)

## 6. Conclusion and deficiency

This paper reveals three characteristics of public concerns on urban governance:

(1) In content, the public concerns are mainly focus on leisure activities and traffic condition, then daily life information. Governance policies, weather and air quality are rarely concerned;

(2) In attributes, people are highly concerned about the forthcoming events, rumor refuting and life services, but pay little attention to policy news except for housing, entrance test, holiday and car license auction related policies;

(3) In specific affairs, people show most concerns on entrance exams, leisure activities, health and hygiene, weather variations, city images, films and TV programs, food, traffic, car license auction, sports and holiday etc.

These characteristics indicate that Shanghai government should place more administrative resources in the following fields to meet the needs of the public: increasing the number of high schools and universities as well as enhancing the quality of higher education, providing enough leisure spaces and recreation facilities, shaping the city's image and charm, improving the traffic condition, optimizing the online trading environment, and making better services of food, sports, weather, etc. related affairs.

Taking into account the age structure traits of Internet users, data in this paper mainly reflects young people's concerns and demands. To fully grasp the needs of every age group, other approaches (e.g. telephone interview, questionnaire survey, etc.) should be taken to make supplementary and comprehensive analysis.

# THE CONFLICTS AND DILEMMAS PRESENT IN THE FAVELAS OF RIO DE JANEIRO, BRAZIL: NEW RESPONSIBILITIES AND NEW FORMS OF PARTICIPATION.

Rachel Coutinho-Silva[1]

[1] Graduate Program in Urbanism, Federal University of Rio de Janeiro, rachelcc@acd.ufrj.br

Keywords (maximum 3): favelas, urban violence, citizenship

## Abstract

*The Government of the State of Rio de Janeiro is putting forward a new ambitious program of pacification and slum upgrading in some favelas in the city of Rio since 2008 – the Pacification Police Units (UPP). It aims to recover the territories once controlled by drug dealers, establishing a program of peace building and institutional reconstruction together with the construction of basic infrastructure and public services. In the favelas with the UPP program, one can observe new urban dynamics, such as new services and commercial ventures, upgrading of homes, expansion of informal real estate, new touristic, leisure and sport activities, which generate new jobs, income and new perspectives for dwellers. On one hand, these new socioeconomic dynamics strongly restructure and redesign the favelas; on the other, the absence of a planning body that coordinates the several ongoing projects, together with the precarious infrastructure and the ominous presence of the police force, diminish the potential gains. The UPP generates new responsibilities and new expectations towards public safety and quality of life in a population now with more income and consumer power, demanding a more effective public response and new forms of participation. As long as these demands are not fulfilled, new conflicts and new forms of resistance appeared in these communities. The objective of this paper is to analyze the progresses and setbacks of the UPP program, focusing on the rising conflicts and dilemmas, taking as case studies two communities in Rio de Janeiro: the Complexo do Alemão and the Pavão-Pavãozinho-Cantagalo.*

## 1. Introduction

The Government of the State of Rio de Janeiro is putting forward a new ambitious program of pacification and slum upgrading in some favelas in the city of Rio since 2008 – the Pacification Police Units (UPP). It aims to recover the territories once controlled by drug dealers, establishing a program of peace building and institutional reconstruction together with the construction of basic infrastructure and public services. In the favelas with the UPP program, one can observe new urban dynamics, such as new services and commercial ventures, upgrading of homes, expansion of informal real estate, new touristic, leisure and sport activities, which generate new jobs, income and new perspectives for dwellers. On one hand, these new socioeconomic dynamics strongly restructure and redesign the favelas; on the other, the absence of a planning body that coordinates the several ongoing projects, together with the precarious infrastructure and the ominous presence of the police force, diminish the potential gains. The UPP generates new responsibilities and new expectations towards public safety and quality of life in a population now with more income and consumer power, demanding a more effective public response and new forms of participation. As long as these demands are not fulfilled, new conflicts and new forms of resistance appeared in these communities. The objective of this paper is to analyze the progresses and setbacks of the UPP program, focusing on the rising conflicts and dilemmas, taking as case studies two communities in Rio de Janeiro: the Complexo do Alemão and the Pavão-Pavãozinho-Cantagalo.

## 2. Conceptual framework

My analysis is based on the theoretical propositions of five authors: Anthony Giddens' notion of reflexive modernity and Ulrich Beck's notion of risk society; Henri Lefebvre´s concept of urban praxis and of the ideology of urbanism, as well as his scales of socio-spatial reality; Michel Foucault´s discussion of order as an expression of power and his notion of power network; and Paulo Freire's pedagogical proposition towards the liberation of the oppressed. In this particular paper, I will also refer to Bruno Latour's concept of actor-network-theory in order to understand new social relations being formed in favelas.

This paper is part of a broader research project – "Urbanism in the Risk Society: planning and design strategies for integration in areas of social and environmental conflict and vulnerability" – funded by the Brazilian National Research Council (CNPq) and Chagas Filho Foundation for Research Support in the State of Rio de Janeiro (FAPERJ).

The research focuses on 4 case studies which encompasses 4 favelas in Rio de Janeiro:

- Comunidade Santa Marta; South Zone of Rio de Janeiro, District of Botafogo; Middle-Class District;
- Morro da Providência; Downtown Rio;
- Morro Pavão-Pavãozinho; South Zone of Rio, Upper-Middle Class District;
- Complexo do Alemão; Northern Zone of Rio de Janeiro, close to the International airport.

## 3. The Context of Urban Violence in Rio de Janeiro

Urban violence has doubled in the last 20 years in the whole world, according to UN-Habitat data, and it is expected that in the next 5 years half of the world's urban population will be a victim of some sort of crime. The increasing crime rates are a problem for cities in the Southern or in the Northern hemisphere. In the latter, petty crimes increased between 3% and 5% annually from 1970 and 1990 in the cities with a population with more than a 100.000 inhabitants. In Latin American and in Brazil, urban violence is growing not only in informal areas, but also in several formal districts of cities. In Brazil the mortality rate linked to urban violence continues to grow, increasing from 59 deaths in 100.000 inhabitants in 1980 to 75,2 in 2002 reaching 90 deaths in 100.000 inhabitants in 2003.

The city of Rio de Janeiro used to be one of the most violent cities in Brazil, in which the rates of mortality from external causes (traffic accidents and violence) rose from 59 deaths per 100,000 inhabitants in 1980 to 75.2 deaths in 2002 and 90 deaths in 2003, affecting mostly the male population between 15 and 19 years and the population in low-income squatter settlements. With implementation of the pacification program, homicides rates from violence have substantially decreased to 10 deaths per 100.000 inhabitants in 2013.

The city presents an interesting case of the dialectical relationship between urban violence, social exclusion and spatial segregation. Urban violence contributes to new forms of segregation and increases the vulnerability of socially excluded groups. Rio de Janeiro also presents an interesting aspect of proximity between low-income squatter settlements and the traditional middle class and upper class neighborhoods, which also makes urban conflicts more visible. This socio-spatial conformation, the result of a historical process of urban occupation and a peculiar geography, encouraged urban policies that are often contradictory and ambiguous.

In Brazil, favelas have become vulnerable areas because of the lack of infrastructure, its housing conditions and the absence of state institutions. In Rio, the illegal drug business found a strategic location in the favelas, with its labyrinth urban pattern and poor accessibility. The favelas are usually located in hilly areas which further contribute to difficult the police actions or raids in those areas.

Urban violence in the city of Rio de Janeiro starts to grow from the late 1980s, with the increasing concentration of income, socioeconomic inequalities and the fiscal crisis of the State. From the 1990s on, violence grew as a consequence of the entry of large drug cartels in the city. Having the slum as local marketing of illicit drugs, drug traffickers inherit a clientelistic relationship from other illegal activities that existed before in the favelas, mainly the "jogo do bicho" (animals lottery).

In 1985, there were 377 slums in Rio de Janeiro, which concentrated approximately 1,800,000 inhabitants, representing 32% of the city population. The number of slums and slum population has grown steadily over the years. In 2005 there were 750 favelas officially recognized by the city. Some slums are in contiguous clusters that form the so-called complex of slums. According to the 2000 census, the city of Rio de Janeiro had a total of 5,857,904 inhabitants, of whom, approximately one-fifth (18.65%) lived in favelas. The Instituto Pereira Passos (IPP), the planning office of the City of Rio de Janeiro, (IPP) estimates that the population living in favelas and illegal subdivisions is approximately 406,000 inhabitants. The area occupied by favelas in the city in 2004 was 41%.

In the case of Rio de Janeiro, the expression divided city (Ventura, 1994) designates the city divided between formal and informal areas. Some authors reject this term, because they believe it feeds the collective imagination of Rio de Janeiro as a violent city. This perception of the city as violent contributes to spatial fragmentation and social exclusion, and the diffuse feeling of fear and insecurity. Milk argues that "the representation of Rio as a 'divided city' strengthens symbolic connections between poverty and crime in the city' slums." The numerous episodes of violent clashes, massacres, and rebellions in the city are increasing from the 90s, and have contributed to the isolation of citizens in their condos or ghettos. It also creates a false opposition between the poor living in the hilly favelas and those living in the so-called asphalt communities (morro vs. asfalto), between slum dwellers and middle class, between gangsters and the police, which contributes to the symbolic level for the urban chaos. Thus a vicious circle is created, where the media and the private security industry benefit from this state of fear among citizens, which further contribute to the perpetuation violence, shifting the focus from the real problem, i.e., the poverty and social exclusion.

This representation of fear and insecurity contributes to intolerance and individualism, undermining the foundations of urbanity. The cariocai spirit has always been guided by solidarity, warmth and joy. In the collective imagination Rio de Janeiro is a city with a democratic spirit and integrator of different races and social classes in their urban space. Places, such as the beach and cultural and sports activities such as samba and football, are places that congregates different groups. In the street corners, one can see different segments gathering for a beer in the popular bars. Thus, the sense of insecurity and fear contributes to increase the social and physical boundaries between rich and poor and between the formal and informal areas. It also contributes to the reduction of the civil rights of favelas inhabitants, since in these areas dominated by drug trafficking, citizenship and public safety are incompatible from a conservative viewpoint. The crackdowns against drug trafficking are almost always surrounded by arrests and indiscriminate killings, where police clashes with armed drug gangs. In this scenario the residents of these areas are those who suffers the most. These police raids are being conducted systematically since the early 90s. Instead of producing the decrease in crime rates, it has had the opposite effect and contributed to its increase. It also contributed to the emergence and strengthening of private security apparatuses in illegal slum areas, the militia, who in the name of protecting the residents, has taken control of basic services such as bottled gas distribution and transportation (usually vans and motorcycles) and also access to illegal cable television, therefore creating another parallel power. These militias are formed by retired police officers and express the fine line between legal and illegal power.

The phenomenon of police violence is not new in the city of Rio de Janeiro. Holloway shows how the police was created to serve the elite and aristocratic classes, and not the common citizen, since

the nineteenth century. The author argues that civil society has always supported the brutal actions of police repression (Holloway, 1993). Police violence and its repressive methods, rather than contributing to reduce urban violence, has triggered processes of resistance and social exclusion.

## 4. The program of pacification police units in the city of Rio de Janeiro (UPP)

The city of Rio de Janeiro is hosting two mega events: part of the Soccer World Cup, which already occurred in 2014, and the Olympic games of 2016. Because of the magnitude of these events, the State Government or Rio de Janeiro with the support of the City Government, are putting forward new public safety programs in the favelas. Drug dealers, mostly in the form of cartels, dominated the majority of these squatter settlements.

Until 2008 the majority of urban projects for favelas focused only on the improvement of public spaces, with little concern for the problem of public safety. In 2008, the Department of Public Security of the government of the State of Rio de Janeiro launched a new program called Pacification Police Units (UPP) aiming at dismantling the drug gangs that controlled the territory of almost all the slums in the city of Rio de Janeiro. This program aims to inaugurate a total of 40 UPPs in favelas of Rio and encompasses up to April 2014, 37 favelas. The first UPP was established in the Favela Dona Marta in November 2008. According to the official description of the program, the UPP "intends to establish a new model of public security and policing which aims at promoting closer relationship between the population and the police, as well as strengthening social programs. Another goal was to recover territories controlled by drug dealers and to promote social inclusion of the poor inhabitants of these areas."ii

The UPP program takes its concept from the international peace building programs implemented in countries where there is an institutional and political crisis, usually after civil war. There is a difference between peace enforcement and peace building. The first is based in the imposition of peace through military occupation. The second one is based on the reconstruction of state apparatus and social rebuilding of democracy. Brazil has a solid experience on peace building since it has been a key actor in UN actions in Haiti.

The UPP program intends to generate peace in these highly vulnerable areas. The first phase of the program is the occupation of the favela (after a military action of invading these communities, arresting the drug dealers, or in most cases, expelling them) with the establishment of a physical unit of the police in a strategic place where it can oversees streets and movement of come and go. The second phase is to gradually bring social services and public institutions into the favela. In this phase there is the creation of the social UPP (UPP Social) -- the counterpart of the municipal government.

The UPP tries to reinforce public safety through a 24-hr control of the favela space. The police personnel designated to serve in the UPP receive a special training, which includes courses on social skills and on how to establish a positive attitude.

Since the UPP program is very recent the first studies about its degree of success are starting to appear. The majority of analysis deals with the UPP Dona Marta because it is the oldest. Before the UPP, an important favela upgrading program was already been implemented, with a very important equipment being created: the inclined tramway, a sort of elevator that transport people and goods from the lower to the upper part, or vice-versa. More than half of the dwellers of Comunidade Dona Marta are in favor of the UPP. They resent the ominous police presence, which although better trained, still intimidates the dwellers.

## 5. New internal dynamics in the favelas

So far, 38 favelas or “complexos” (adjoining favelas forms a complexo) received the UPP program. The results are diverse. In some favelas, mainly at those located in the Southern zone of the city

(inhabited by the wealthiest classes), the UPP program is succeeding in bringing violent conflicts to a minimum level. Comunidade Dona Marta, Complexo Pavão-Pavaozinho-Cantagalo (PPC), Chapéu Mangueira, among others, showed a decrease in the crime rate in general, particularly in the homicide rates. In others, such as Complexo do Alemão, Complexo da Maré e Rocinha still suffers from violence and armed confrontation between the police and drug gangs, which usually affects civil population.

### a. Complexo do Alemão

The area that encompasses the set of adjoining favelas, known as Complexo do Alemão is considered a neighborhood by the city, for statistical purposes. It is located in the Planning Area 3, in the Northern zone of the city, which is traditionally a working-class area. It has an official population of 69.143 inhabitants and has 4 UPP's: Nova Brasília, Fazendinha, Alemão and Adeus/Baiana. An important structure of transportation based on cable cars was put in place in 2011.

This transportation structure had a profound impact on the landscape of the favela, when seen from a distance, from people who transit in car in the main expressways of the city. But, more important, has also a very important impact on dweller's daily life, since it goes over the rooftops of the houses. The cable cars together with the 4 UPPs have prompted a cycle of tourist influx to the favela, attracted by the curiosity to visit an informal settlement, but also to enjoy the wonderful views of the city one has from its several observation points. As a consequence, a new internal urban social and economic dynamic is installed in the favela. Just as an example, the Complexo do Alemão and its cable car is the second touristic attraction in the city right now (the first is the Sugar Loaf hill), receiving 8.400 visitors per day in the high season. 12.000 people access it in one day, 70% being visitors. The cable car is free for favela dwellers; but it only costs R$ 5.00 to outsiders, while the Sugar Loaf costs R$ 62.00. As a result of the increase in safety and in the numbers of visitors, a series of new restaurants, bars and hostels are being opened. Commerce has also benefitted from this dynamic. Another important aspect is that the value of real-estate (mostly informal housing or buildings) is increasing with concerns over a gentrification process.

NGO's and "coletivos" (informal association of artistic and cultural groups) are increasing, as well as many cultural groups and associations.

### b. Pavão-Pavãozinho-Cantagalo

The area, known as Comunidade Pavão-Pavãozinho-Cantagalo, is located in the Southern zone of the city, in a traditional area inhabited by the middle- and upper-middle classes, in Planning Area 2, close to the touristic areas of Copacabana and Ipanema. It has an official population of 10.338 inhabitants, and has 1 UPP. The connection between the neighborhood of Ipanema and the upper part of the favela is made through a public elevator opened in 2010. Like Complexo do Alemão, one can observe new internal dynamics as a result of the pacification and the improvement in accessibility. The public elevator represents a direct connection from the General Osório station of the subway (in Ipanema) to the top of the hill. The views of the beaches of southern Atlantic coast of Rio are also splendid, and its location next to Ipanema and Copacabana has attracted many visitors. Dwellers have seized the opportunity, and opened new commercial and service ventures, such as, bars, restaurants, hostels, B&B in the favela. PPC shows an impressive number of NGOs, "coletivos" and cultural groups, that have many programs and actions in the community.

## 6. Associations and new forms of participation

One can see that many types of associations, formal and informal, public, non-governmental and private, are appearing in these communities. These groups stimulate new forms of participation and new forms of representation of favelas problems and demands. One can also observe that the use of digital media and its apps, such as Facebook, whatsapp, google, is increasing, as well as the use of

crowdsourcing, crowd mapping, and so forth. These represents new forms of assembly as well as new forms of communication. Pamphlets and printed ads and posters refers to new forms of manifestation or resistance, and also to humorous criticism of the new structures and projects going on in these communities. If these will represent a real voice or a real participation in the public arena and in the city is something to be observed and analysed.

## 7. Conclusions

The UPP program has brought some benefits to favelas, as well as pitfalls. Among the main benefits, one can see that favelas are more safe and secure, and that homicides rates have a decreased and that the State has regained territorial control of favelas; at the same time, local economy have been stimulated, as well as entrepreneurship with new commercial and service activities appearing, which, in turn, stimulated local tourism.

Despite the positive aspects, one can verify that there is no empowerment of local communities, no citizenship awareness program. Most policies are top-down, reflecting a State assistance approach. Moreover, UPP maintains a 24-hr surveillance and control of the territory, and shows an ostensive presence of armed police.

One can also observe that new forms of association are appearing in those communities, and with the easy access to digital media, have prompted new forms of assembly and manifestations. Whether these will be favourable to a more inclusive environment and to a more democratic participation is something to be verified.

# NEW SCENARIOS FOR LARGE-SCALE TERRITORIAL GOVERNANCE IN ITALY

Rosalba D'Onofrio[1], Michele Talia[2]

## Abstract

The last twenty years have seen a general erosion of trust in the efficiency of local-scale planning and its continued use alongside new planning tools to coordinate large-scale policies. The solutions developed in the Provincial Territorial Coordination Plans (Italian: Piani Territoriali di Coordinamento Provinciale, PTCP) have seemed able to control the main criticism, which is linked to various aspects, including: land consumption and the compromise of natural resources; the drastic worsening of the energy balance and the changing landscape; infrastructure network congestion; and the aggravation of hydrogeological risks.

The increasing economic crisis and the need to cut governmental costs have accelerated the process that led to Law 56 in 2014 (regulations regarding metropolitan cities on the union and fusion of municipalities). This law redefined the roles and function of the Province, and the importance of the PTCP will therefore possibly be degraded in the future. Cutting back the political heft of the Province has sparked a reflection on how to redesign the map of territorial planning without triggering traumatic solutions to maintain continuity. The strategic plan of the Province of Teramo represents one of the first experiences in this direction in Italy. This tool aims to define a new model of territorial governance that is capable of ensuring a substantial equilibrium between responsibility and self-determination of the subjects most directly involved in territorial transformation.

Keywords: multi-level governance, large-scale planning, strategic planning.

## 1. Introduction

Since the end of the 1990s, Europe has been home to a generalized restructuring of multi-level governance which has occurred neither by making governance more effective and more capable of responding to the needs of citizens nor, especially, by rationalizing and reducing public costs in an era of general economic recession.

This action has often assumed the form of a consolidation or a reduction in the weight of local governments in favour of the national government (Baccetti, 2011). It is a form of recentralization dictated by the regions that is more economic and financial than administrative and functional. Above all, it reduces the number of variously denominated local intermediate governments that act as mediators between the cities and the regions (Bertrana and Heinelt, 2011).

In most European countries, the reform of intermediate local governments has often been implemented within a greater overall reorganization of the relationships between the centre and periphery in a marked redistribution of powers among the different levels of territorial government. This reform movement was sparked by decision-making processes that kept the central focus on, for example, a search for the best size of territorial government (region, province, or municipality), governmental problems in metropolitan areas, or the need to achieve greater efficiency in administrative activities and the rationalization of policies and services.

The political debate has not overlooked the contribution from numerous research centres, which have compared the policies implemented in different European countries in order to identify possible points of agreement. Among these studies, we point out those regarding the functions attributed to the large scale (Hooghe and Marks, 2001). Also of interest is research on the level of fiscal and

political/administrative autonomy that intermediate entities have when interacting with the central government (Bertrana and Heinelt, 2011).

The combination of these studies has shown that, in relation to the organizational characteristics assumed by the central administration, intermediate entities tend to take on different profiles:
- characterized by 'self-government', in virtue of greater federalization in the distribution of powers, as occurs in France, Italy, and Spain;
- inspired by a 'multi-purpose administration' in service of higher levels of government, according to a model seen in Poland and Belgium;
- oriented towards a greater influence of actions, as in Germany, where the *Landkreise* (though with a wide variety of cases) carry out coordination, supervision, and even financial tasks compared to the cities, but which are in turn subject to supervision by the central government.

In all the cases examined, the reform of local intermediate government has occurred within a general reorganization of the balance of power between the centre and periphery. In Italy, in contrast, reorganization of the Province is 'going it alone'. For incidental political reasons (a wave of 'antipolitics' and growing public opposition to political costs, etc.), a very sudden reorganization of only the intermediate government has taken place that overturns its historical identity, introducing a new second-level elective mechanism and reigniting the ever-present doubt if in Italy there is effectively a place for large-scale planning (Talia, 2013).

## 2. Conceptual Framework. Reorganizing the Intermediate Entities in Italy

In recent years, numerous legislative attempts have been made to reorganize intermediate entities in Italy. As a first step, the proposal for constitutional reform (Laws no. 4439 and 4506 in 2011) has revolved around a push for 'regionalization' in which the Regions were given the responsibility of revising the provincial precincts. The possible establishment of new provinces was conditioned on exceeding a minimum size threshold and on the absence in the regional territory of a metropolitan city. In both proposals, the legislation reiterated the basic functions of organizing and planning vast areas of the province and the role of coordination and collaboration among the municipalities in managing network services.

In 2012, the Monti government's Legislative Decree no. 95 (the so-called 'spending review') reopened the discussion. In lieu of the suppression and unification of the provinces set out in the original text of the law, the subsequent Decree no. 188 set out a general reorganization through an announcement that had previously been shared with the local communities and the redefinition of their functions. In addition, the suppression of provincial additions along with the unification of the existing provinces was confirmed. However, the end of the Monti government and the suspension of parliamentary activities in light of the political elections in February 2013 made it impossible to enact Decree no. 188, which was subsequently declared unconstitutional.

Finally, the third phase was the presentation of a bill called the 'Delrio Reform' (after the minister for regional affairs who signed the initiative), which, after a parliamentary procedure of some months, was converted into law (Law no. 56/2014). In the text, the transformation of the Provinces into second-degree organs was confirmed, its functions were cut back, and above all, the role of large-scale entities was recognized to serve the municipalities. This reignited the reform initiative to reinforce the community barycentre within local autonomies, with the result of 'municipalization', though within a framework of strong connection with the regions.

In fact, this reform aims to reduce the powers and functions of the Provinces, cancelling the elective councils and instituting ten metropolitan cities: Turin, Milan, Venice, Genoa, Bologna, Florence, Bari, Rome, Naples, and Reggio Calabria. It proposes an autonomous model based on two territorial levels directly represented by the respective communities and therefore elective in the first degree: the Regions and the Cities. While for the metropolitan cities the institutional aims and responsibilities are defined in detail (for example, the adoption and annual updating of the strategic plan for the metropolitan territory,

general territorial planning, structuring of coordinated management systems for public services), the potential role of the large-scale entities for the portion of territory that does not fall under 'metropolitan city' is rather unexplored.

And yet in Italy as in Europe, the so-called intermediate regions[1] provide an important contribution to the economic growth of the country, accounting for at least 50% in Italy. In this situation, forms of governance are often developed that guarantee greater efficiency in terms of economic development, natural resource management, provision of public services, and access to public funds. And it is in these areas—not metropolitan areas—that the logic of development linked to the 'places' should be encouraged (Barca, 2009), thus closing the gap between the reform of autonomy, administrative federalism, and development policies. The model of institutional reorganization moving forward in Italy should immediately see and understand the potential precisely of the intermediate, non-metropolitan regions in a perspective of improving and shortening the territorial government chain (regarding decision making, time, and relationships among subjects and among plans), in view of developing coherent innovation of territorial and city planning and design in order to redefine new policies for local development (Barbieri, 2014).

## 3. Conceptual Framework. Large-Scale Planning in Italy

This debate, already underway for some time, has become even more heated with the latest legislative provisions applicable to reconfiguring the institutional structures in Italy (L. 241/2011, D.L. 95/2012, Art. 17), and it contains interesting elements for rethinking the actions of territorial government. Starting in the 1990s with Law 142/90 and the responsibility given to provincial administrations in directing large-scale plans[2], it has been agreed that the Provincial Territorial Coordination Plan (Italian: Piani Territoriali di Coordinamento Provinciale, PTCP) should take care of reorganizing territorial complexities and therefore favour the association between physical/environmental factors of a territory, infrastructure needs, and economic pursuits. This is a task that should have necessarily gone beyond the community's understandable tendency towards parochialism or the inevitable tendency towards regional simplification. Not only due to the dictates of Law 142 was it adapted to the provincial dimension and the original role of programming entity that was entrusted to the Provinces. At the same time, this coordination action implied a hierarchical approach between the Province and the City, and the difficulties that quickly came to light in the connection and integration of actions between the overarching level of government and the municipal realities pertaining to the provincial territory are probably due to this marked asymmetry.

This was the situation for the so-called 'first-generation' provincial plans, which were rather anchored in a traditionally hierarchical vision and trickle-down effect in planning levels, even if the methodological approaches adopted were rather different from plan to plan. While some were characterized as large, more or less systematic frameworks of knowledge, others almost exclusively proposed a system of protection and limits, especially for the landscape, and others still were characterized by their prevalently strategic structure (Pomilio, 2014). These three tendencies in reality are combined differently within each plan, but the general impression is that these plans use only part of the potential inherent in the coordination role assigned by Law 142/1990. In fact, in most cases, provincial planning still seems to struggle to develop adequate methods and tools to guide transformations, manage negotiating tables, and coordinate community and sectorial planning according to an organic, shared vision.

[1] According to the definition by OSCE, intermediate regions are those in which the population living in urban centres varies from 10–50%; it also includes mid-sized cities. These regions make an important contribution to the economic growth of the country (estimated to be about 64% of the aggregate growth of the OSCE area).

[2] We recall that the concept of large-scale government is well presented in national regulation, at least starting with the urban-planning law 1150/42, which in Arts. 5 and 12 respectively defines the Provincial Territorial Coordination Plan and the inter-municipal General Regulatory Plan.

After these pioneering experiences, a second generation of large-scale plans was then developed thanks to the reform of Title V of the Constitution (constitutional law no. 3 of 18 October 2011), which assigned responsibilities at the regional level in a different way and aimed to complete the course of regulatory innovation that would create the conditions to fully enhance the potential of provincial coordination. In this new phase of applying the PTCP, the keywords became 'subsidiarity', 'governance', and 'strategic dimension'.

The balance of this second season of territorial planning is rather complex, and it should keep in mind the relevant peculiarities that characterize the different territorial and regulatory contexts. In any case, however, the most recent PTCPs seem to understand the potential of the vast area, developing the capability to align themselves with the problems expressed by the territories, such as settlement dispersion (sprawl), the discontinuity of the environmental networks and the fragility of landscape resources, and the incompleteness of the infrastructure network, implementing a growing propensity to exercise a multi-level system of plans (Talia, 2013).

All of this, however, has occurred without the appropriate limits, in that the considerable directions and directives (in addition to knowledge) that very often accompany the plans have not been supported either by adequate administrative powers or financial availability enabled by the transfer of national, regional, and municipal funds. In addition, the reduced effectiveness of these planning instruments is enhanced by the lack of representation of *weak* territories, which are also commonly 'warehouses' of great environmental and landscape heritage. The consequence is that territorial coordination plans have not always completely understood themselves to be the instrument of a possible, beneficial strategy for development and territorial cohesion, especially in intermediate regions.

Nor does this potential seem to be understood by the recent Delrio Reform. In line with redesigning the institutions and responsibilities, which in the provisions of 2011–2012 were concentrated at the provincial level, only on paper is a role of coordination of large-scale territorial planning on behalf of the province confirmed. While confirming the skills of the province and metropolitan cities in matters of territorial coordination and planning, the bill does not square with the experiences of the last twenty years. In particular, the perspective of a new model of institutional governance does not inspire an authentic impulse to renew the current planning model in terms of goals, methods, tools, and procedures to apply to territorial governance. This is not even so when overcoming the traditional municipal limits obtained thanks to the advent of the Community Union would lead to prefiguring a new way of planning the territory and the city with new plans and programs conceived and designed through co-planning process according to a trans-scalar government approach.

Decision making to promote a structural planning model on the territorial level that is strategic and does not conform to vast areas ought to have served as a not-to-be-missed opportunity, especially due to the timely concurrence of institutional reform with the reform of the National Urban-Planning Law (Lupi Bill/2014, 'Principles in matters of territorial public policies and urban transformation'), which would have substituted Law 1150/42. But it was not to be, and the Lupi Bill was inexplicably forgotten after the intense participatory phase unexpectedly concluded in September 2014.

At the moment, there is a continuing delay at the central level, which has been interrupted only by some local experiences such as those we present here. While awaiting a new model of institutional reorganization, these experiences represent an attempt to shorten the territorial government chain (regarding decision making, time, and the relationships among subjects and among plans), without the simplification automatically transforming into a power vacuum, but favouring the redefinition of local development policies. As a consequence, they would also allow for better administrative efficiency that can be translated into greater simplicity and efficiency for citizens, economic activities and services, and which is definitively capable of ensuring real competitiveness in sustainable growth processes.

## 4. Analysis and Discussion. First Experiments in a Non-Metropolitan Area

### 4.1 Characteristics of the Provincial Territory

Situated on the north-eastern edge of the Abruzzo Region (in south-central Italy), the Province of Teramo has a territory characterized in part by mountains (which extend to within the Gran Sasso-Monti della Laga National Park and include two of the most important peaks in the Apennines: the group of Gran Sasso Laga d'Italia and the Monti della Laga chain), in part by hills (where the main historical settlements are located), and in part by valleys and the coast (occupied by a continuous, dense settlement system).

A population of about 290,000 lives on a total surface area of 1,951 $km^2$, distributed in 47 municipalities. With the exclusion of Teramo (provincial capital with about 50,000 inhabitants) and a few other urban centres, the territory is characterized by the presence of a network of tiny towns: about 30 municipalities have fewer than 5000 inhabitants, of which 17 have fewer than 2000, most of which are situated in mountainous areas.

There is, therefore, a stark imbalance between the different settlements in favour of the coastal and mid-hill areas, which are more equipped with services and economies favoured by the presence of production and seaside tourism. This comes at the expense of the different small communities in the high-hill and mountain territories, which, while very rich in natural, historical, and environmental resources, suffer from progressive depopulation due to the poor local economies.

## 4.2 Draft of the Provincial Territorial Coordination Plan

The Provincial Territorial Plan (PTP), which is still in effect, represents the fruit of a political/administrative season that has now passed. In spite of its relatively recent date of approval (2001), it constitutes the success of a plan-creation process that had already begun in 1991 with the adoption of programming directives that have progressively faded in their incisiveness over the years. Not surprisingly, drafting of the 'Report on the state of activating the provisions of the PTP' made in 2008 therefore revealed the substantial incapacity of the plan to respond to criticism made by the provincial territory, which has been even further accentuated in the last decade.

In particular, the report made clear that the PTP—while correctly inspired by the principles of protecting natural, historical, and cultural resources, and rationalizing the settlement model—did not offer a vision 'of the future', that is, mobilize the main energies available. Nor did it appear able to develop that institutional collaboration (between region and province on the one hand and between the province and local entities on the other) in the absence of which territorial government was destined to lose a large part of its orientation capability.

In this perspective, the decision by the provincial administration (2011) to promote the drafting of the new PTCP aimed to take advantage of the main opportunities offered by a new generation of large-scale planning that could integrate the most traditional limiting approach with the themes of developmental sustainability and with a new planning culture. In confirming a trend that characterized the formation of most new-generation large-scale plans, the preliminary document of Teramo's PTCP subdivided the provincial territory into areas and sub-areas. The objective was two-fold. On the one hand, it wanted to highlight a closer relation between strategic directions to be pursued in the long term and territorial partitions denoted by substantial geographic homogeneity. On the other hand, it wanted to favour the consolidation of planning directives and systems of relations aimed at overcoming the traditional limitations imposed by community borders, pointing at the unitary presence of historical/urban-planning phenomena, dynamics of current development, landscape variety, and definitively, the habit of working together on behalf of public administrations that the current territorial design would seem to show, at least in the most fortunate experiences.

In this perspective, the identification of three main geographical areas certainly aims to favour a closer dialogue between the PTCP and the new Regional Landscape Plan of Abruzzo currently being drafted, but they will also be capable of supporting the official presentation of special territorial projects,

with which the technical/administrative experience acquired in recent years can be developed and investigated.

The division of the provincial territory into sub-areas is identified in the preliminary document of the PTCP using SWOT analysis (strengths, weaknesses, opportunities, threats). The analysis considers the positive and negative aspects both within and outside the territorial system and thereby manages to identify a series of actions to enhance the resources present, minimize the causes of slow development, obtain the best advantage possible from external opportunities, and finally, cancel the factors that can threaten achievement of the objectives.

In constructing a support tool to define development strategies for the provincial territory, the preliminary document sets out a strategic vision organized by each of the territorial sub-areas (identified with reference to the different systems: landscape/environmental, settlement, production and tourism, and mobility) and specified in a series of strategic guidelines. These allow tendential scenarios to be developed, which are especially useful in preventively simulating the impact of different intervention policies, and therefore in enabling public debate on the proposals of the plan.

Finally, the preliminary document identifies a repertoire of strategic projects that necessarily correlate multiple areas, and which aim to promote a course for reinforcing the role that the territory derives from its geographical location, its history, and the important environmental and landscape heritage it possesses.

## 4.2 Provincial Reform and Drafting the Regulatory Modification of the Existing PTCP and the Strategic Plan

After the decision in 2011 to begin drafting the new PTCP, and following the reform of intermediate levels of territorial government in Italy carried forward by Law no. 56/2014, the provincial administration of Teramo decided to adjust its aim. While awaiting a definitive settlement regarding the institutional and regulatory framework of reference, the Province decided to define partial acts, documents, and 'interlocutors', such as, for example, a regulatory modification to the existing PTP, which aims to ensure greater concreteness in the new design of the plan on some decisive questions, such as:

- counteracting land use;
- modifying the zoning rules for new urban settlements;
- an innovative discipline to regenerate the anthropized territory and the landscape;
- the predisposition of a strategic plan, in which this new act of territorial governance would be situated.

In the wake of a law emanating from the Abruzzo Region in the spring of 2014[3], the Province then launched the regulatory modification of the PTCP/2001 and the 'Strategic Plan for Environmental Sustainability and Land Use'. The intention was to 'play in advance' and therefore not to submit passively to the effects of the inevitable resizing of intermediate entities on super-municipal (but also local) policies in matters crucial for planning large areas. Rather, the aim was to turn such institutional reorganization into an opportunity to plan large areas, protect and enhance the landscape, contain land use, and mobilize all available energies (Sargolini and Talia, 2011) to overcome the profound economic and social stagnation.

### 4.2.1 The Regulatory Modification of the Existing PTP

Drafting the regulatory modification of the strategic plan relied on synthetically assessing the state of the provincial territory made when drafting of the preliminary document and evaluating the resources, opportunities, and critical factors that characterize the different territorial areas and sub-areas and which

[3] Regional law 24/2014 'Framework law in matters of enhancing agricultural areas and containing land use'.

have allowed a useful screening to be made in order to establish development scenarios in the strategic plan.

The questions addressed looked at containing land use and the quality of the settlement system, the opportunities offered by the territorial project, the establishment of a new discipline for environmental networks and ecological compensation, the 'rediscovery' of the primary sector, and the enhancement of the agricultural territory.

*Quality of Settlement Systems*

As for the first of these themes, the search for new city borders and counteracting sprawl refer to the loss of the city edges and its unlimited growth in an overall framework in which the explosion of urban forms makes it ever more difficult to recognize local communities.

In the area of Teramo, the theme of the border and urban edge assumes particular importance, especially due to the tendency of the coastal territory and main river valleys to present accentuated sprawl especially in the first chain of coastal hills and the intermediate hill systems, and due to the threat of urban centres of different sizes merging together, thus losing their identity and recognisability.

The reconstruction of a system of interpretive relations of design and rules for these territories also pertains to large-scale planning, where a profitable link is developed with other local urban-planning instruments. As a consequence, the regulatory modification of the PTCP lists a series of actions aimed at delimiting the settlement systems and conferring environmental and landscape quality on the existing settlements, which in the peri-urban agricultural area and the passages of discontinuity of the settled areas are proposed as obstacles to merging together the built areas and favouring the adoption of interventions to reconstruct the environment and landscape. New settlements would be authorized only if they were replaceable with interventions of functional reconversion or to make the existing fabrics denser.

*Opportunities for the Territorial Project*

A new level of aggregating local entities into complex territorial systems has been hypothesized. These may constitute a permanent 'laboratory' for the preparation of territorial projects, which, thanks to co-planning procedures to be developed within planning conferences, can act as important activating agents of new territorial quality and new proposals for improvement.

In the regulatory framework proposed, the area plan orchestrated within the planning conference is the 'tool to specify the discipline established by the PTCP, which is entrusted with coordination of the planning and programs of institutional subjects'. Through the area plan, planning large areas can rely on a strategic, flexible, and adaptable framework of reference, and long-term scenarios can be defined and projects developed to be realized in the short to medium term.

Despite being unbinding, the area plan contributes to identifying means and times to activate the strategic guidelines, with the effect of drawing attention to some primary objectives:

- land conservation and the protection of unbuilt areas and the landscape, with measures that subject new building to the recovery of decommissioned areas;
- enhancement of the agricultural territory, even with respect to a possible use of cultivation for energy production;
- the activation of policies aimed at economic improvement, with provisions in defence of sustainability and local identities, acting to check activities that consume a lot of land or have great repercussions on mobility;
- actions to contain speculative anthropic transformations, selecting those activities that are capable of ensuring the quality of settlements or reinforcing the economic structure of the area.

In subjecting the mobile border between city and country to monitoring, the new regulatory layout offers a very useful input for local administrations that intend to base their idea of the city on understanding the processes that lead to metropolitan growth. In particular, the regulatory modification indicates the most appropriate forms of institutional collaboration designed to allow effective

application of equal territorial distribution, the active protection of the environment and the landscape, and the search for a close connection between equal distribution and environmental compensation. For this, experimentation of 'green warehouses' is established, along with the formulation of a chart of the works for compensation.

*Centrality of the Open Territory*

The regulatory modification asks the municipal plans to deal with arguments that have never been dealt with before, but which contribute to a capillary improvement of the territory and the opening of new perspectives for local development. This is the case for hydraulic and seismic safety, promoting alternative energies and bioarchitecture, searching for new ways of using the territory and the landscape, integrating the tourism resources of the coast with those inland, and adopting measures to adapt to climate change (energetic efficiency of buildings, making urban lands more permeable, increasing green roofs to counteract the heat island, etc.). There is a wide range of objectives destined to create a sizeable impact as much on disciplinary innovation as on the confirmation of a new cycle of development under the banner of sustainability, with important effects in the confirmation of a new culture of governing the open territory.

Beyond dedication to reorganizing unbuilt urban areas and the relevance of buildings within the peri-urban agricultural areas and passages of discontinuity, the City, when forming and/or updating its own urban-planning tools, should produce a 'Charter for Agricultural Land Use' defining the potential, actual uses, and worth. All of this also lies within the scope of verifying how the possible removal of peri-urban agricultural terrains destined for new settlements can slow sprawl through actions to mend the urban network, facilities, green areas, and the residential and productive functions surrounding the existing centre.

Among the measures more generally aimed at the open territory, some devices dedicated to the river system echo experiences made in recent years in Europe and beyond. Such is the case of the Landscape Contracts and River Contracts. These are proposed as tools for voluntary, negotiated strategic planning. They do not bind urban-planning choices, but this does not limit their potential in becoming an opportunity for building consensus related to a strategy of territorial development implemented by more prescriptive tools.

Due to their negotiable nature, the contracts favour a change from sector policies—such as securing the territory or river requalification—to integrated policies of landscape improvement. They contribute to transforming the strategic scenarios of the PTCP into shared views to enhance the river and basin systems, agricultural landscapes, settlement systems, and the mobility and tourism networks, which, by defining local development models, can lead to 'added territorial value'.

*Enhancement of the Agricultural Territory*

With the aim of enhancing and protecting this complex reality, the regulatory modification identifies 'agricultural areas of significant economic worth as an invariant of the provincial territory', whose quality is verified with the aid of a 'Charter for Agricultural Land Use' prepared by the communities when drafting or updating their own urban-planning instruments. This step is fundamental in strategically identifying the definitive limits for building, but also to promote the adoption of measures for preventive environmental compensation according to values and parameters that the community urban-planning tool is required to fix.

These measures are also particularly important in favouring the integration of agriculture within the urban circuit, coherent with the approach called *agri-urbanism*, which is proposed to unite what was traditionally separated.

### 4.2.2 The Strategic Plan

The guiding idea that inspired the 'Provincial Strategic Plan for Environmental Sustainability and Containment of Land Use' is characterized by a significant break with the dynamics that have denoted

the phase of the most intense transformation of the Teramo area. It prefigures a new paradigm that brings up for discussion the myth of virtually unlimited quantitative growth that has been pursued up to now.

The perspective indicated does not necessarily imply the choice of a future of degrowth, but rather marks the possibility of adhering to a model of stationary development that is dynamic at the same time. According to Giorgio Ruffolo's metaphor of the open lake compared to the pond (Ruffolo, 1994), it offers the opportunity to follow a path that leads to important objectives under the profile of innovation and quality.

Such a scenario assumes a notable change with respect to the most consolidated behaviour in past years, but it can nevertheless take hold of some elements already present in the local context. For example, low demographic density leads to less settlement pressure and therefore a substantial balance between the factors that contribute to the consumption of scarce resources and the agents that contribute to their reproduction. But the notable size of the protected areas and the existence of a dense multi-centre network of small and medium cities, which have not impeded the spread of building sprawl can contribute to a valuable reference in view of policies to contain urban growth and the greater synergies between inland areas and the coastal strip.

Prefiguring a virtuous course that makes the local development model of the mountain and hill areas compatible with the integrated territorial project of the more urbanized areas, it is necessary to hypothesize a learned combination of settlement and production formulas that support the search for new values and orient a change in lifestyle, consumption, and production.

In this framework, the strategic plan proposes to creatively reinterpret the role assigned to each territorial system, ensuring that the productive fabric can rediscover new opportunities in the economic framework of local development, with applications that range from quality agriculture to cultural and natural tourism, and from handicrafts with greater added value to the advanced service sector.

With a desire to give new impulse to the potential expressed by the different territorial areas, the strategic plan therefore suggests moving in different directions, which are clearly recognizable even if they are closely related:

- acquisition of a more favourable positioning in terms of competitiveness and innovation on behalf of all the components of the Province of Teramo;
- the claim of new centrality in territorial care, to be interpreted not only as an ethical imperative to be assumed for the safety of citizens, the settlement structure, and the landscape, but as an extraordinary opportunity for a change in lifestyle and consumption;
- the promotion of initiatives appropriate for counteracting de-industrialization and defending the most qualified and innovative production;
- the launch of initiatives for territorial recapitalization that still view the city as an important engine for development.

Under the procedural profile, organization of the provincial territory into six complex territorial systems represents the best size for promoting these objectives and experimenting with processes tending towards constituting new Community Unions. Such activities should customarily be entrusted to the planning conferences, which ought to favour participation by the cities and the management bodies of the regional protected areas in the planning process. Therefore, a model plan and dialogue is activated that can more concretely be translated in the drafting of Planning Agreements or Programme Agreements to initiate works and interventions.

As for the implementation of the plan design that was delineated with this strategic plan, recourse to a series of instruments is set out that entail overcoming the narrowest administrative limits (by definition municipal) that have up to now constituted significant dead weight for the traditional plan. Beyond the Landscape and River Contracts already mentioned above, the strategic plan foresees the formation of area plans (which the PTC already considered) and especially the strategic projects, which instead are introduced for the first time by the strategic plan and the regulatory modification.

While the area plans are destined to recreate the possible conflicts deriving from the main settlement choices made by the Cities (zoning of the buildable areas, localization of the urban facilities,

development of the infrastructure network, etc.), the strategic projects instead allow greater complexity. This is demonstrated by the fact that large-scale planning is not proposed simply to correct 'errors' and the dysfunction to which the urban-planning discipline can succumb when it cannot overcome the more reductive or sectorial approach. The strategic projects that were developed for this strategic plan, in fact, are proposed to implement some medium- and long-term views with a transverse approach that should develop the capability of orienting the choices and investments of public and private subjects.

In the formulation introduced by the regulatory modification to the PTCP, six strategic projects were identified that implement the fundamental refinements of the long-term vision at the base of the strategic plan:

1. *Coastal city*, where improvement of accessibility and sustainable mobility will serve as an opportunity to modernize the infrastructure networks, requalify the landscape, and improve urban competitiveness;
2. *Production and development*, in which the specialization of economic activities can be pursued thanks to the strengthening of territorial provisions and the rationalization of the settlement choices;
3. *Ecological and landscape network*, with interventions aimed at strengthening the ecological networks, securing the territory, and realizing projects for landscape improvement and environmental compensation;
4. *Tourism*, with initiatives aimed at strengthening the sector by diversifying the accommodation offered, integrating different circuits (sea, mountain, art city), and making tourist fluxes less seasonal;
5. *A new agriculture*, with measures that associate the reinforcement of the agricultural and food system with the implementation of modern agricultural business and infrastructure development;
6. *Territorial equipment and service management*, aimed at developing the secondary transverse infrastructure network (connection between the coast and inland areas) and consolidating the structure of territorial accessibility.

## 5. Conclusions

The particular planning experience presented here and the character of eternal transition that our country and the Abruzzo Region have now been experiencing for many years could justify suspending judgement related to the possible successes of a strategic document and a regulatory modification whose efficacy ultimately depends on the survival of the Province. And yet the first tests made by the Province of Teramo upon presenting these new devices to public opinion and the principle stakeholders have demonstrated that in daily practice the territorial disciplines are still forced to rely on the autonomous urban-planning that now for some years has constituted the only and most concrete alternative to an opposition to progress (Talia, 2009).

It can be agreed that the validity of each new procedure should very probably not be measured by singling out its capability to harmonize with the golden principles of coherence and appropriateness inspired by the system of existing planning; rather it should be measured by its ability to provide quick responses, analysis tools, and decision-making assistance that can be used in that 'visible navigation' that increasingly characterizes the concrete exercise of territorial governance.

Along these lines, one cannot help but underline the fact that the basic inspiration guiding the drafting of new tools by the Province of Teramo significantly evolved amid the administrative, political/cultural, and planning context in which new proposals for territorial and socio-economic protection, requalification, and enhancement should be matured and not discounted. In contrast, this resolute change in step requires a marked debureaucratization of the routines used to implement the plan and the adoption of behaviours characterized by a preventive evaluation of the effects of each decision, and, as a consequence, also a rigorous verification of the results to be expected.

In favouring this point of view, correct management of the planning conference will be a determining factor, not only regarding the formulation of functional rules that should guarantee the balance and protection of the interests legitimately represented by these new organisms, but also regarding the assumption of a role of promotion and oversight by the Province. It is the Province under whose jurisdiction lies the care for that area of collective use and values coinciding with the super-municipal scale and which, in the opposite case, would risk not being adequately protected.

As can be seen, the slow transition towards a planning system that is more polarized on the regional and local scales assigns the Province with the responsibility of witnessing and safeguarding the relevant needs, but under weak control. To be completely fulfilled, it requires supporting institutional discussion and collaboration with collective learning and cultural growth in order to be successful in mobilizing different interests and growing sensitivities, even in the absence of authoritative or coercive mechanisms.

The course described can naturally become too long and complex for the effective leadership abilities expressed by the Province's political and technical/administrative frameworks. For this reason, it is convenient already in the initial phases to aim for other qualifying content in the Teramo initiative, as in the case, for example, of some strategic projects that seem capable of appealing to sensitivity that is already present in many local communities regarding questions about the vast area (calling to mind the coastal cities or the ecological and landscape network).

But even before initiating planning processes that are complex and connected to wide, effective sharing between the institutions operating in the provincial territory, it may be worthwhile to trust a new regulatory and operational framework that was established to ensure that the 'construction' of new large-scale governance would assist the timely application of several very innovative devices. At the same time, however, these devices need to ensure positive results already in the short to medium term.

The numerous provisions range from the introduction of new zoning rules to environmental compensation (green warehouses) and the provision of passages and elements of discontinuity in the settlement fabric. As well, particular emphasis is placed on the obligation for communities dedicated to forming a new urban-planning tool to make available a 'Charter for Agricultural Land Use' aimed at, among other aspects, establishing a careful perimeter of the existing settlements and consequently at favouring the systematic containment of land use.

In the perspective described, the changes brought to the planning system are not limited to promoting greater awareness in governance actions on behalf of the local administrations, but rather introduce some corrective actions in the new urban order that have been confirmed in the last decade even in the Teramo area, laying the basis for more ambitious public policies with which to re-establish that constant dialogue between agrarian and urban landscape that sprawl tends to cancel out.

# Public Participation in Norwegian Physical Planning – revisited

Helge Fiskaa

## Abstract

Ten years ago, I published about article Public Participation in Norwegian Physical Planning (Fiskaa, 2005), which this paper follows up. Since then changes have occurred in Norwegian planning act and practice. The new Planning and Building Act from 2009 emphasized the ambitions and requirements for public participation. At the same time, Norway has an explicit right for private developers to promote zoning plans, unlike at least the other Nordic countries that still have a public planning monopoly.

Thus, one may assume private developers in Norway to influence the content of plans decisively although the municipal council has the authority to approve them. Previous research project indicate that developers communications about plans are mostly towards the municipal planning department and other public authorities, with less regard for public participation.

This paper examines the present status of public participation in Norway, enlightened by a case study of 140 zoning plans decided upon by the city council in Trondheim in the years 2012-2014. The study shows that public participation in the meaning citizen participation beyond the act's minimum requirements is rather seldom. Moreover, when neighbours, other inhabitants and civil organizations oppose to plan proposals or forward alternative proposals, their meanings are for the most not taken into account. This fact is most obvious concerning private promoted plans, and must be a challenge for planning authorities that have the superior responsibility for open and democratic planning processes.

Key words: Planning system, public participation, private plans.

## 1. Introduction

The article in 2005 gave three recommendations to the preparation work on the Norwegian planning and building act concerning public participation. Firstly, a planning program should be introduced for all planning matters, as even small plans may turn out to be controversial. Secondly, public participation should be organised at the very beginning of the process. Thirdly, the planning authority should be responsible for establishing the planning program and leading the planning process, which would give the planning authority an undisputable place behind the steering wheel and thus increase the chances for real public participation and plans more in accordance with public interests. An underlying question for this article is if these recommendations are taken into account or not.

In Norway, public participation is on one hand regarded as an inevitable part of the planning process and on the other hand, market forces seem to challenge participation, which gives reasons to investigate participation related to political and planning ideology. Why and how has participation in Norwegian physical planning developed over time and what are present status and challenges? Which kind of actors participate and to what degree? What are the outcomes of public participation in planning?

The request for public participation in Norwegian planning has roots in citizen's protests and actions around 1970 against the then authorised form of planning, which was, in the opinion of many, authoritarian and top-down, a "game" between planners and (some) politicians, following an instrumental rational approach (Amdam and Veggeland, 1998). The municipality had monopolistic responsibility for planning and was supposed to co-operate with public agencies, organisations etc. who had interests in the planning task. Interest for participation from other than municipal and other public bodies and those with business or owner interests was not very conspicuous, and limited to public scrutiny of plan proposals with opportunity also for citizens to put forward their remarks.

The protests, which were often in the form of demonstrations and actions, was a reaction against undesirable consequences of the policy of economic growth, industrialisation, and centralization (Furre, 1991). The criticism was concrete in the sense that it dealt with loss of jobs in rural areas (Skjeggedal, 1988), and negative environmental consequences as unfortunate effects of urban growth, such as building on agriculture land and natural areas, and urban renewal and road projects, which inhabitants meant would deteriorate old neighbourhoods, etc. The protest promoted alternative values such as sprawled settlement structure (Fiskaa, 2009), local communities, historical continuance and environmental protection. The criticism was also theoretically directed against methods in modernistic planning and the "value neutral" expert role in physical planning (Ellefsen, 1993).

Gradually planning became more locally oriented, incremental and focused on local environmental issues. From the late 1970s, the authorities accepted citizen participation as part of the planning process. Planning theories about bottom-up and garbage can planning arose (Amdam and Veggeland, 1998). From the 1980s' neo-liberal ideas' belief in market forces and the idea of new public management, have strongly influenced Norwegian politics, as in most western countries (Mydske *et.al.*, 2007) The regulative and controlling public sector came under pressure when liberalization, privatization and deregulating became major political goals (Falleth & Hansen, 2011). The fundamental purpose of public planning as such came under discussion. Today private developers provide most local plans, at least in the cities; in contrast to countries like Sweden, Denmark and Germany where public planning monopoly is still in effect. By this planning changed character with less emphasis on public long-term preparation and control, and was more incremental and project oriented. In most cases, developers have the main responsibility for plan implementation, often in the form of development agreement with the municipality, and have thus a leading role in urban development (Røsnes 2008). Thus, they may have a considerable influence on master planning as well. Planning literature described a change from public governing to

governance, which in practise exists in the form of public-private cooperation giving market actors a stronger position then traditionally (Fimreite & Medalen, 2005; Nyseth, 2008), and with little attention to citizens participation.

After this presentation of the political and historical background, the paper accounts for conception of public participation in Norwegian context. The main section of the paper presents a case study of public participation in zoning plan processes in the city of Trondheim. At the end, the paper discusses the present situation and current trends, with some reflections on future participation in planning, including a recommendation to authorities to strengthen the requirements to openness and democratic planning processes.

## 2. The conception of public participation in Norwegian planning

Three main arguments legitimate public participation in Norway: Participation will (1) enhance knowledge about the situation and give a better basis for creating favourable solutions, (2) it will give affected people opportunity to control that all factors are taken into consideration and thereby give legal security for them, and (3) participation is as a democratic right (Medalen, 1999). Implicit, participation has a purpose of advancing fairness and justice (Innes E. & Booher, 2004). Public participation is a means to fulfil the basic purpose of public planning and interventions, namely to correct the free market forces in order to provide common goods, hinder overexploitation of limited resources, control external consequences, and to contribute to fair distribution of goods (Sager 1991).

The Norwegian term *medvirke* for participation means to take part, contribute, co-operate, and indicates thus an active form of participation. Related to Sheryl Arnstein's Ladder of Citizen Participation (Arnstein, 1969), which has been adapted to Norwegian planning as shown in figure 1, participation should mean real co-operation and influence. Everyone should know they could influence the shape of their community (Bedford, Clark & Harrison, 2002). Public participation can include all parties or actors having any interest in or for the planning case, although one primarily thinks of citizens' participation.

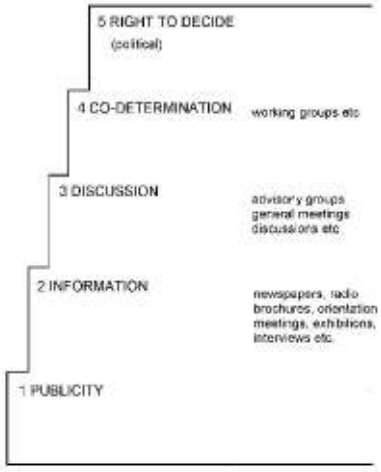

Figure 1. Different degrees of public participation range from one-way communication (1 and 2), via two-way communication (3), up to active participation and co-operation (4), and right to decide (5), which is the responsibility of political boards (Adapted from NIBR/TØI, 1980).

The parties might be directly and indirectly affected persons and organisations as owners, property developers, public agencies, neighbours, other inhabitants, interest groups etc. The purpose of participation is to obtain better plans, in that meaning that most people accept them. A well-performed participation process can contribute to moving a problem from disagreement and unknown solution in the direction of agreement on goals and solutions (Sager 1991). Brabham (2009) claims that Norwegians are more

apt to be involved in public planning due to a general expectation of transparency in government and due to Norwegians' generally high rates of activity in political parties.

### *2.1 The Act's requirements*

Most physical planning takes place in the municipalities, although the counties shall provide regional plans, which will normally not be specific on localisation and land use, and the state may prepare and approve state plans for securing national interests or projects. The municipalities shall prepare and approve a master land-use plan for the entire area, and eventually land-use plans for parts of the municipal area. There are two types of detailed plans. Area zoning plans, which are meant for defining land use in some detail, will normally cover a rather large area. The municipality is normally responsible for preparation of this plan type. Detailed zoning plans are meant for further clarification of the design within the actual area, and is normally used for concrete projects. Private bodies, developers, organisations and other authorities are entitled to put forward plan proposals, often called submitted plans.

Some allege that the prevailing Planning and Building Act's has strengthened the requirements to public participation. However, the present principal wording *"... shall facilitate public participation. ...."* seems weaker than the former act's statement *"... make an active effort .... at an early stage ...to inform the public ... "*, and *"... an opportunity to participate actively ..."*. There are concrete minimum requirements to participation for the different plan types, which the new act has just slightly changed.

According to these requirements, inhabitants and other may promote their views and arguments at two stages of the planning process: Firstly, at the commencement of a planning work, affected public bodies and other interested parties shall be notified, and the proposer shall publish a notification. The act does not describe real participation at this stage, but common practise is to invite both public agencies and citizens to questions and comments. For a zoning plan that may have substantial effects on the environment and society, a planning programme, including arrangements for public participation, shall be drawn up. The programme proposal shall be circulated for comments and presented for public scrutiny.

Secondly, the planning authority shall, if they wish to proceed the process, present the plan proposal for public scrutiny and, at the same time circulate it to central government, regional and municipal authorities and other public agencies, organisations and institutions affected, for comment. Landowners, lessees, other rights holders in the planning area and directly affected neighbours shall be informed of the planning work. This hearing gives citizens and organisations a right to forward their remarks and proposals, most often in written form, which the municipality shall consider and eventually incorporate in the plan. Some state and county agencies and neighbouring municipalities are entitled to object on plans within their sphere of responsibility. The last step is the municipal council's eventual adoption of the plan; however, an objection to the plan may cause a final decision by the ministry.

### *2.2 Actors, arenas and planning process*

Generally, one can divide actors in planning in four or five groups: planning authorities, politicians, developers, and citizens (Nordahl, 2006). In addition, other public agencies have an important role in most planning matters. Planning authorities has the assignment to produce plans and advice others promoting plans. In the present situation when other than the planning authority prepare and promote most detailed plans the public planners are most often reduced to executive officers who steer the plan through the formal political decision-making process (Falleth & Hansen, 2011).

Politicians are rarely involved in the planning process *per se*. Their task is formally most often limited to participating in the decision-making process in the actual political committees and boards. This is in

line with the logic of New Public Management with a clear division between politicians who set the wider regulatory framework and public administration staff who administers and implements planning decisions (op. cit.). Citizens may be individuals or organizations; neighbours and other persons or groups affected of or interested in the planning matter. They may represent different and conflicting interests and views. When opposing plan proposals they often meet the arguments of being selfish and not looking at common interests.

Other public agencies are for the most state agencies representing specific sector interests. Most important is the County Governor, who is the Governments representative in each county and responsible for several planning interests. The County Authority has the assignment to take care of several regional interests and coordination with regional planning. Neighbouring municipalities are entitled to participate in planning that might affect them. Public bodies have the right and duty to take part in planning when it concerns their sphere of responsibility; if they do not they may lose the right to objections. The use of objections has escalated over the years, and is under discussion because of severely delaying planning processes; a problem for Norwegian planning is lack of coordination between state sectors, which hamper and retard planning processes. Steps are going to be taken in order to diminish the problem.

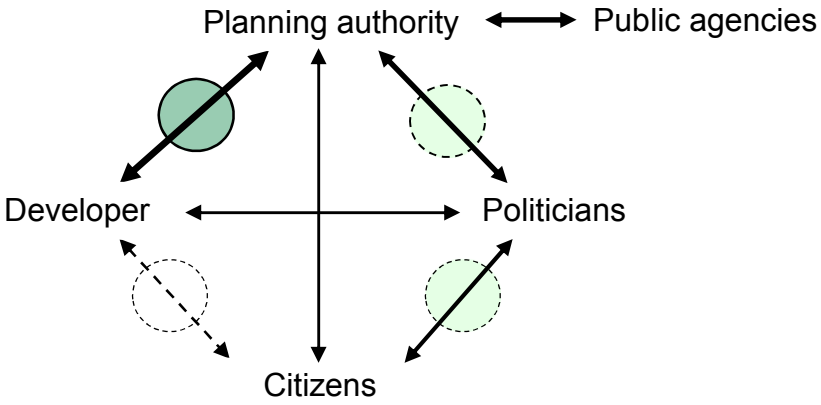

Figure 2. Actors in the planning process for a private promoted zoning plan. Full circle indicates a formal statutory meeting and dotted circle eventual meeting. The thickness of arrows indicates the strength of contacts between actors (adapted from Nordahl, 2006).

The Planning and Building Act prescribes one specific meeting between developers and the planning authority at the commencement of a planning process, often referred to as preliminary conference or advance meeting, where the planning authority gives advices for the content of a plan. The act do not prescribe any other arenas in which other actors can meet, but occasionally the developer has meetings discussing plan matters with affected sector agencies. The ministry advises to arrange information and discussion meetings, and eventually other means of more active public participation in large and complicated plan tasks. Falleth & Hansen (2011) found that participation beyond the minimum requirements are rather seldom.

### *2.3 The challenge of public private cooperation*

A question concerning coordination and collaboration is about the relationship between public bodies, private interests and people in general. The emerging of public-private cooperation implies a number of dilemmas about the purpose of planning and the public's and the inhabitants' role in community development. As a fundamental purpose of planning is about safeguarding those matters and public interests that

free market forces do not take care of, the motives are to provide for what is desirable and to hinder unfortunate side effects of individual and private actions (Vigar *et al*., 2000; Røsnes, 2005). In addition to the right for developers, which have substituted the traditional public responsibility for preparing project implementation, may threaten public interests. Crucial questions are about the transparency in the process and negotiations taking place parallel to the planning work. Parallel and closed negotiations, and may be lobbying as well, may lead to early informal decisions on plans and thus short-circuit the planning process (Garnåsjordet, 2000). Thus, negotiations upon plans and agreements for plan implementation may lead to pre-binding and exclusion of lay citizens and third parties from information and influence in an early and decisive stage of a planning process until the final hearing of the proposal (Røsnes, 2005; Falleth and Hansen, 2011). The procedure for development agreements is the same as for a zoning plan, giving opportunity to real participation at the stage of public scrutiny. It is paradoxical to give third parties the right at a late stage when the possibility to real influence is modest (Wøhni, 2007), which citizens find unsatisfactory (Schmidt et. al., 2011).

Falleth & Hansen (2011; 2014) have found that the performance of governance has given private developers a stronger position in planning and development at the sacrifice of public control and third parties influence. The planning administration and local politicians appear to value participation as an import part of the democratic decision-making process. Developers are far less likely to view public participation as an important part of the planning process. They rely to a greater degree on an economic rationale with planning seen more as a necessary administrative control before construction can get under way. Their survey reveals further that most municipalities have set up procedures for interaction with developers. The developers have mostly interaction with planning authorities in the form of closed meetings and direct contact. They have also considerable interaction with local politicians, especially direct contact. Community organizations also have more or less contact with politicians and planning authorities, for the most direct contact. Developers and local organizations have to lesser degree interaction, and then most often direct contact. Politicians mean suggestions from and contact with community actors influence the planning result to a higher degree than contact with developers, contrary to the view of planning authorities. Both local organizations and developers mean contact influence the plans to lesser degree.

## 3. The survey

This article is based on a recent study of all 140 zoning plans approved by the City Council in Trondheim in the years 2012 to 2014. They are all proposed and processed according to the prevailing Planning and Building Act of 2008. Six of the plans are area zoning plans and 134 detailed zoning plans. The size of the plans varies considerable, covering from around 700 square metres up to more than 200 hectares. Most of them concern housing or other buildings, but there are variations from roads, recreation areas, to a wind farm etc., and even a shooting range. Of the 140 plans, 84 are private plans provided by developers or landowners. Fifty-six plans are public. The town planning department was responsible for 15 of them, three of them in cooperation with private developers or Public Roads Administration. Other municipal bodies, as for example the municipal property department and the municipal administration for transport (The environmental package) are responsible for 32 plans prepared by private consultants. The Public Roads Administration was responsible for seven, and other public authorities for two plans.

### *3.1 Method*

The survey is a cross-case survey dealing with many examples and rather few questions. The method is supposed to give reliable results. However, equivalent studies in some other municipalities may have given different results. It is a document study of case documents for the plans. The main documents are easily accessible at Trondheim municipality's web page. They include the written presentation of cases and plan maps provided for political treatment during the process. The survey examines the documents

at two steps. The first step is the announcement of commencement of planning work and the following treatment of the proposal in a planning committee, in Trondheim called building committee, who decides if the plan proposal shall be presented for public scrutiny and circulated for to public agencies and organisations for comments or not. The committee may accept the proposal, reject it or make changes in it. The second step is the committee's considerations of received scrutiny comments and eventual objections. Also at this step, the committee can accept the plan, reject it or prescribe alternations. A major revision requires new presentation for public scrutiny and circulating for comments. After the committee's acceptance of the plan, the final step is the City Council's decision upon approbation of the plan. The survey do not analyse this step because a final decision will be accordant to the second step.

The written presentation to the treatment in the committee and city council gives a description of the plan proposal and the consequences of it, and a summary of meetings during the process and, comments received from public agencies, organisations and inhabitants, and the judgment of the comments. However, the presentation does for example not always account for all internal meetings concerning solutions within the planned area, or eventual informal steps. Thus, vital decisions may have been taken behind closed doors, not least in the crucial early stage of the process. Due to lack of time available, no other documents are scrutinized or involved persons interviewed.

In addition to these statutory minimum requirements for public participation, it is of interest to look for supplementary arrangements, for example information and discussion meetings, what kind of arrangements, the purpose, participants etc.

Comments may be irrelevant or not dealing with the real matter of the plan proposal, for example circumstances that the plan does not affect. There may be some misunderstandings behind a response, for example about what the plan really regulate. In several cases, especially public agencies just report that they do not have any comments to the plan.

Comments may be taken fully or partly into account, or be rejected. Comments fully taken into account may concern one or more plan elements that are all accepted as reasons for revision of the plan. If partly taken into account the comment deals with several issues, and some lead to plan modifications and others not, or the arguments are accepted to a certain degree and the plan are revised modestly. If rejected, none arguments and views are accepted. The case study follows this classification.

Respondents are grouped in three categories. One is neighbours and other individuals, groups as for example residents' associations, or companies nearby or inside the planned area, directly affected of the plan. Another group is organisations often representing, as for example environmental protection organisations, and citizens generally who are interested in the planning matter, some specific interests. The third group is public authorities, which most often represent one or more specific public interests.

Responsible for the plans are divided in two groups, public authorities and private developers and landowners. As the number of plans produced by the municipal planning department is very low, there is a risk for random results, which may be reduced within a greater group.

### *3.3 Step one –at the commencement of a planning work*

Although the act does not prescribe a process for following up the announcement of the commencement of a planning work, it seems common that public agencies react and give their comments. They may comment on elements in the plan and propose solutions, and can notice a possible objection to the plan. Many inhabitants and organisations also ask questions and put forward their views and remarks that has to be considered by the planning authority.

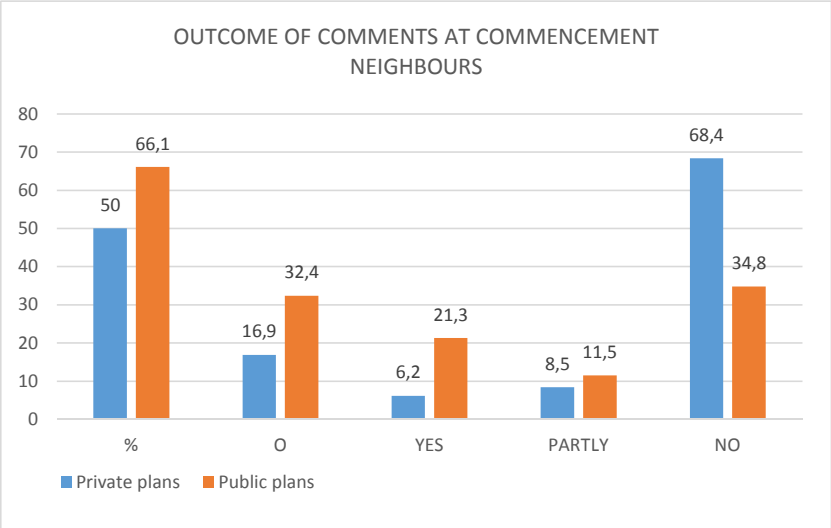

Figure 3. The outcomes of the building committee's considerations of received comments from neighbours after the commencement of the planning work.

Surprisingly many neighbours reacted to the planning work already in the first stage. As much as ¾ of publicly and half of privately promoted plans were commented upon from one or more neighbours (%). Despite limited announcement, people seem to be aware of planning initiatives. This is opposite to former findings where participants in a participation project meant that invitation to participation happened too late in the process (Schmidt et. al., 2011).

When it comes to the result of the planning committee's considerations, they found one third of the comments to public plans and sixth part to private plans not actual or relevant (0) which may indicate more trust to public agencies than to private developers. One third of the comments to public plans were taken fully (YES) or partly (PARTLY) into account and just 15 % of the comments to private plans. The higher rate of positive response to comments to public than to private plans gives the same indication. One third of comments to public plans and two third to private plans were rejected (NO). The high rate of rejections of comments, especially to private plans, indicates that private promoting plans are less sensitive to neighbours' interests and views than public agencies. It seems that major principles for the content of the plans have been determined at a very early stage of the process. In addition, one explanation may be that private plans most often deal with new dwellings in already urbanised areas, which often lead to worry among people for reduced quality of view, outdoor areas, traffic safety etc.

Other citizens and organisations, for the most organisations, commented to nearly one third of the private and more than forty percent of the public plans. Although lower figures than for neighbours, this is in fact a high share, as one would think that people outside the actual area more seldom would be concerned about the planning. The high share of not actual comments for both private and public plans, about a third, indicates also that many involve even if they are not sure that their views are relevant. On the other hand, the figures for fully and partly acceptance for comments, in all around 40 to 45 % and a little higher for public than for private plans, indicate that many promote important arguments and views.

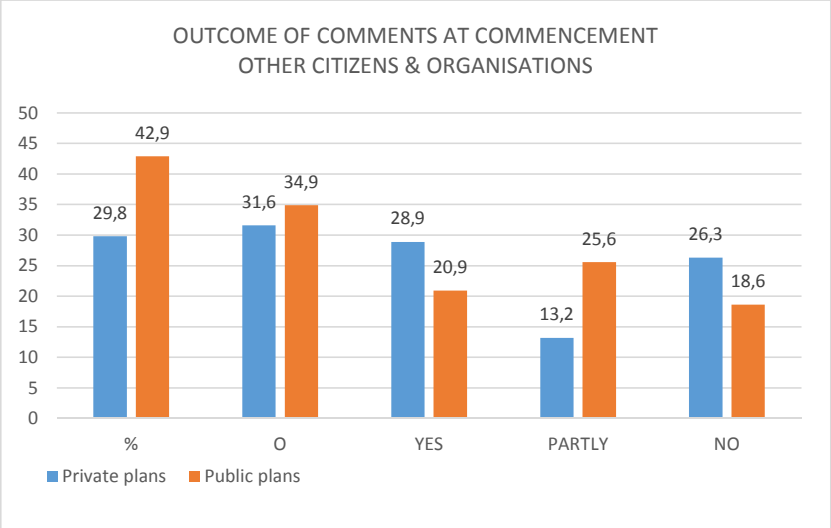

Figure 4. The outcomes of the building committee's considerations of received comments from other citizens and organisations after the commencement of the planning work.

The higher score for public plans indicates that public agencies are more open for inhabitant's meanings and proposals than private developers are. One can have the same interpretation of the higher share of rejections to private than to public plans. Although higher figures for acceptance and lower for rejection then is the case for neighbours, the figures for other inhabitants also indicate that basic principles for the plan design are fixed at the very start of the planning work.

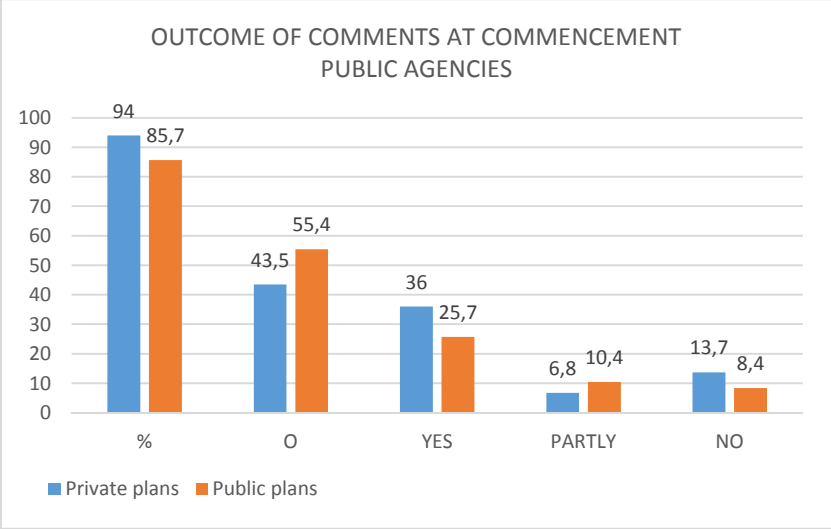

Figure 5. The outcomes of the building committee's considerations of received comments from public agencies after the commencement of the planning work.

Several public agencies, especially at municipal and regional level, have responded to the commencement of planning work, in almost all cases. The obvious reasons are that all relevant agencies receive a direct information of the commencement and public bodies are according to the act obliged to participate in the planning. The high share of irrelevant or not actual comments, most to the private plans, is due to many responding that they have no comments at this stage.

Of the relevant comments, the most are taken fully or partly into account, a third for public plans and a little more for private plans. Thereby only about one tenth of the comments are rejected. All together, the figures tell that public sector agencies have a considerable influence on the planning. This may base on strong political traditions for many public sector interests' strong power, and in addition, they often represent rather concrete and practical issues that have to be taken into account. The right for public agencies to make objection to plans may be a kind of pressure for making revisions in a plan proposal.

*3.4 Step two – at the public scrutiny*

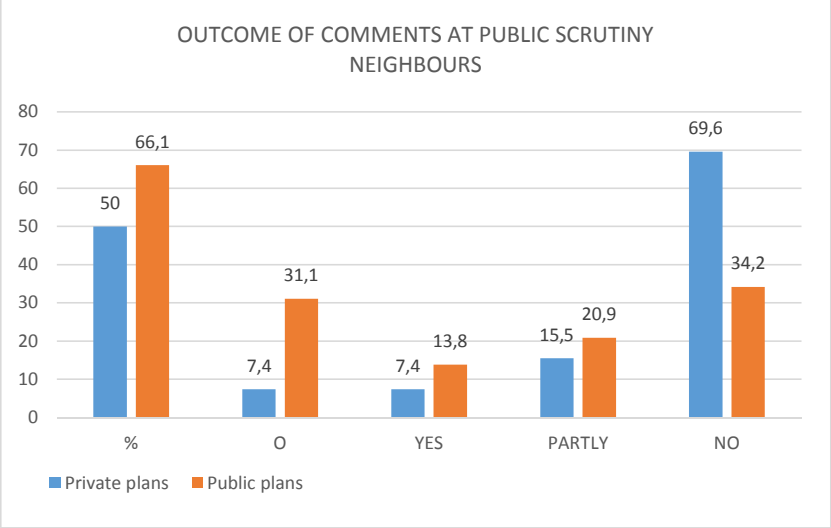

Figure 6. The outcomes of the building committee's considerations of received comments from neighbours after the public scrutiny of the planning work.

Neighbours commented to the same share of plans at the stage of public scrutiny as at commencement of the planning work, namely half of the private and two third of the public plans, but the total number of comments is noticeable lower. One should anticipate more comments and a higher rate as the act's requirement to information at this stage also include other right holders, lessees and directly affected neighbours, and they are explicit invited to react. An explanation may be that at least some remarks are taken into account and made some neighbours satisfied at the first step, though this argument seem to be inconsistent with the high share of rejected remarks at the first step. May be many simply have given up to protest. The rate of not actual or relevant comments is about the same for public, but considerable lower for private plans than at the stage of commencement. Anyhow, these comments are probably expressions for many neighbours' fear for being negative affected. One find about the same figures for fully or partly acceptance for the comments for both public and private plans as at the commencement phase. So also for the share of rejected remarks, nearly 70 % for private plans, which indicates that the solutions are to a high degree already fixed and the will to listen to neighbours is rather limited.

Other citizens and organisations have commented at the same share of private and some higher share of public plans at public scrutiny than at commencement of the planning. The difference may be accidental, although many organisations have received direct information about the scrutiny, but the high shares may indicate that many are dissatisfied with the outcome of their comments at the first stage. The share of not actual of relevant comments is about the same for public, about one third, and some lower, about a fourth, for private plans than at the commencement phase. The rather high shares may indicate a fear for being negative affected, like the neighbours.

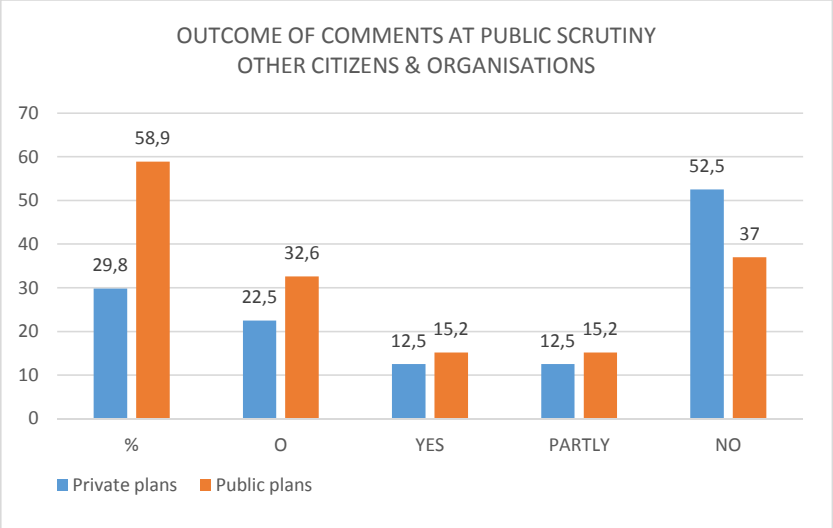

Figure 7. The outcomes of the building committee's considerations of received comments from other citizens and organisations after the public scrutiny of the planning work.

The rates of positive outcome, one forth for private and one third for public plans, is considerable lover than at commencement stage, and the percentage of rejected comments, more than a half for private and a third for public plans, are considerable higher than at the first step. These figures too, demonstrate that the main parts of the plan content are determined in forehand of the public scrutiny process. Probably only minor less problematic and alterations are implemented in the plans, either fully when a comment was about a small detail or partly if the comment was meet only to a certain degree. A major revision of the plan would cause a new procedure of circulation for comments and public scrutiny, which would delay the process.

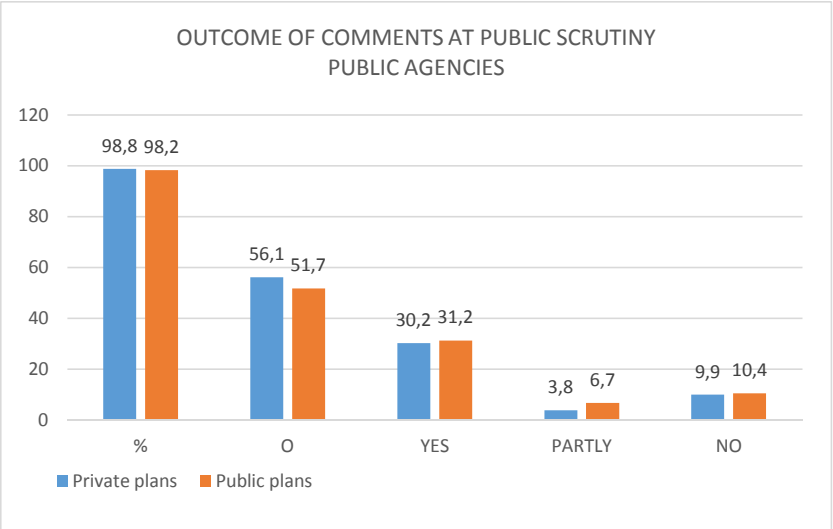

Figure 8. The outcomes of the building committee's considerations of received comments from public agencies after the public scrutiny of the planning work.

Public authorities have commented to almost all plans, and more than half of the comments are not actual or irrelevant, some more than at the commencement phase for private plans. As at the first step, many public bodies answer that they do not have any comment to the plan. About one fourth of the comments are taken fully or partly into account, a few more for public than for private plans. Just about 10 % of the comments are rejected. In addition to the political traditions of strong public sector interests, public bodies announced objection to all together 66 of the 140 plans provided the comment was not accepted. Almost all these plans were revised; one after formal mediation by the County Governor, and one was approved by the ministry. In a few cases, the revision was so wide-ranging that a repeated scrutiny was necessary.

The city council adopted all plans according to the planning committee's decision, not always unanimously. Planning tasks often lead to discussions and disagreements.

*3.5 Other arrangements for public participation*

Some other arrangements for public participation are performed, most often in forehand of or during the public scrutiny. The written presentations of the cases for political treatment give only limited and partly inaccurate information about what arrangements are performed and the outcomes. Developers have held several internal consultation meetings with various public agencies in order to clarify technical and other questions, but the accessible documents give very little information. For fairly many plans the proposer have arranged external meetings, some of them limited to information meetings which strictly speaking cannot be recognized as real participation. However, information about the plan may give people a basis for formulating comments at a later stage.

Some of the meetings were limited to specified groups of participants, for example landowners or schoolchildren, and some were open for all interested parties or for neighbours and nearby residents. In some cases, there have been arranged on-site inspection for public agencies, neighbours and others affected. Except for one example of a workshop for some public agencies and a few representatives for neighbours, no more active forms for participation than meetings have been performed. The scarcity of information about those arrangements make it impossible to give any analysis of the outcomes.

Table 1. Number of plans and the share where additional public participation arrangements were performed, grouped after plan responsibility.

| Plan responsible | Planning dep.<br>15 plans | Other municipal<br>32 plans | Other public<br>9 plans | Private<br>84 plans |
|---|---|---|---|---|
| Number of plans | 6 plans | 9 plans | 3 plans | 19 plans |
| Percentage | 40 % | 28,1 % | 33,3 % | 22,6 % |
| Percentage municipal | 31,9 % | | | |
| Percentage public | 32,1 % | | | |

As table 1 shows, public agencies are most interested in arranging at least some kind of external meetings beyond the act's minimum requirements. The municipal planning performed meetings etc. in 40 %, all municipal agencies near to 30 % and not municipal agencies one third of their planning tasks. All together public sector arranged some additional participation measures for nearly one third of their plans, compared to private developer's less than one fifth.

## 4. Some conclusion

The ten-year-old article underlined the risk for matters decided upon before announcing the start of planning, and a need for initiating public participation early in the process. The recommendations to the then ongoing work on the new planning and building act was in the first place to introduce a planning program for all planning tasks, including a program for public participation, not limited to plans that are supposed to have major impacts on the environment as even small plans may turn out to be controversial. Secondly, the participation should be organised at the very beginning, and thirdly, the planning authority should be responsible for establishing the planning program and leading the planning process, even when a private developer has taken the initiative. This would not limit the developers' right to initiate a plan, but by giving the planning authority an undisputable place behind the steering wheel and thus increases the chances for real public participation and a result more in accordance with public interests.

The legislator did not follow these advices. On the contrary, the act introduced a new rule that gives developers a legal right to apply for building approval simultaneously with the commencement of the planning work, which strengthens the planning system as project-led. It seems obviously that when performing the project design and planning, and in addition, negotiating on a development agreement simultaneously the main content and design of a plan will be fixed, mentally and economically, at an early stage, may be already at the preliminary conference between developer and the planning authority. The developer will usually make project preparations ahead of this meeting and confront it with the planning authorities' information about paramount plans and requirements, and thus seek for some kind of acceptance for the first sketches. Many politicians have a sense of obligation to advance negotiations on development agreements and preliminary conferences (Hansen and Falleth, 2011), which will influence their opinion to the plan.

The survey demonstrates clearly that private developers have strong power in the planning process. However, public agencies have a considerable influence on the content of plans; only one tenth of their comments were rejected, and internal meetings between developers and public agencies were held to clarify solutions in many cases. Public agencies have traditionally a great influence, and if necessary, they can force developers following requirements by announcing objection to the plan, which was the case for almost half of the plans.

The picture is quite different when it comes to neighbours and other citizens' influence. Although surprisingly many individuals and organisations have delivered their comments in both the initiating and the scrutiny phase, the comments are to a high degree rejected. This outcome is most obvious for private plans, and concerns most neighbours to a higher degree than other citizens and organisations. Possible conflicting interests and views among neighbours may account for some of the rejections, but the rates are still high and indicate strongly limited will among developers to adjust to third parties' opinions and interests.

Falleth and Hansen (2011) have found that the planning authority interact primarily with developers, and at a very early stage of the process, and less more with third part, which is contrary to what most planning literature ascribe. Surprisingly they also found a high frequency of interaction between politicians and the community actors, but at later stage of the process. Other surveys indicate the same (Wøhni, 2007; Schmidt *et al*., 2011). This survey cannot confirm these findings, but the high rates of rejected comments to especially private plans indicate that it is the fact. When politicians are involved at a later stage than the planning authority, it might be too late for them to prescribe major alterations in the plan.

In the present situation neighbours and citizens have to work very hard to influence planning decisions leading to fundamental revisions of the premises of the project (Innes & Booner, 2004; Schmidt *et al*., 2011). There is obvious a need for a more transparent and democratic planning that involve citizens more and give them real influence. A solution could be to restore the former public planning monopoly, for example in accordance with the Swedish system where the planning authority shall give a plan answer (planbesked) to developers if an area shall be subject to planning. The planning authority shall have the leading role in planning processes, and thereby a clear responsibility for performing citizen participation. At present, such solution is probably too radical politically in Norway. A more careful way could be to require planning program, as mentioned above, for all zoning plans, like in Finland, provided by the planning authorities. At least one could make the commencement phase clearer as a first step of participation with invitations to deliver comments in line with the principles for public scrutiny.

Keywords: civic participation, social network analysis, urban development Munich

*Urban development more and more depends on the cooperation of public authorities with civic and private sector actors. Public budgets are scarce, the tasks at hand and the related investment volume are immense. Planning as tabula rasa without concerned stakeholders is a rare exception. As a consequence, politicians, users, neighbours increasingly call for serious and effective involvement and participation.*

*When setting up citizen participation processes one key question is: Who shall be addressed? To what issues and in what areas of the city? Beyond the usual suspects, we often find a fragmented landscape of various actors that – explicitly or implicitly – involve themselves in urban development. The paper presents the results of a research project investigating the fragmented landscape of actors in the city of Munich, Germany. Three research questions guide the empirical work: 1) What does the civic and private sector actors' commitment to the urban development of the city look like? 2) What shared activities and shared spatial and thematic interests potentially bind these actors? 3) What is the correlation between the civic and private sector commitment and the activities of public authorities?*

*The empirical research is based on a quantitative and qualitative content analysis of public communication. The collected data is analysed in respect to actors, spaces and issues. A quantitative network analysis reveals the linkages between the divers range of actors. The results are visualised in maps and diagrams and will be discussed in a focus-group workshop with key actors of the revealed network.*

## 1. Introduction

Urban planning is a social activity, done by people for people. In that kind of people's business a broad range of actors is to be involved and addressed: users, providers, property owners, investors, public authorities, politicians and all kind of other stakeholders in the public, civic or private sphere. From the planner's view, theses different actors can be conceived in a multi-level perspective: Planning actors encompass individual planners, teams of planners and planning organisations. In most cases different planning organisations interact and cooperate in a constellation that is embedded in an institutional context. This multi-layered 'planning world' is part of the 'life world', where the 'arena' of stakeholders, political bodies and decision-makers and the public shape the 'agenda' of planning issues, interests and topics (Förster 2014) (figure 1).

In a very basic understanding, the activity of planning can be conceived as a cycle of different process steps that involve both, the planning and the life world. The planning model of the third generation according to Schönwandt (2002) (Figure 2) incorporates a systemic perspective that purposefully avoids any idea of 'rational planning'. The limitations of perception, reasoning, communication and action are an integral part of that model. From a systemic perspective, system processes and system structures mutually influence one another. Consequently, any planning activity has an effect on the performing actors and the target groups that shall be addressed. Conversely the mind-set, interests, skills and resources, organisational structures and social networks of the actors involved shape the scope of planning actions.

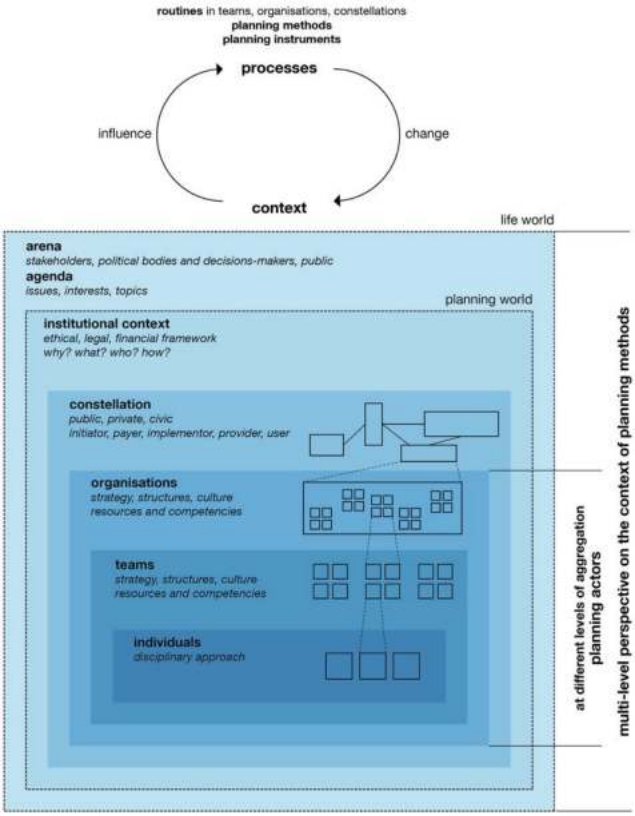

Figure 1. A multi-layer perspective on the actors involved in planning (Förster 2014).

In planning research and practice, big efforts have been undertaken to improve planning techniques and procedures. But there is only little knowledge on the perspective and motivation of the actors involved. Any planning routines, planning methods and planning instruments are only as good as capable and dedicated actors – be they planners, politicians, citizens, users, operators, investors et cetera.

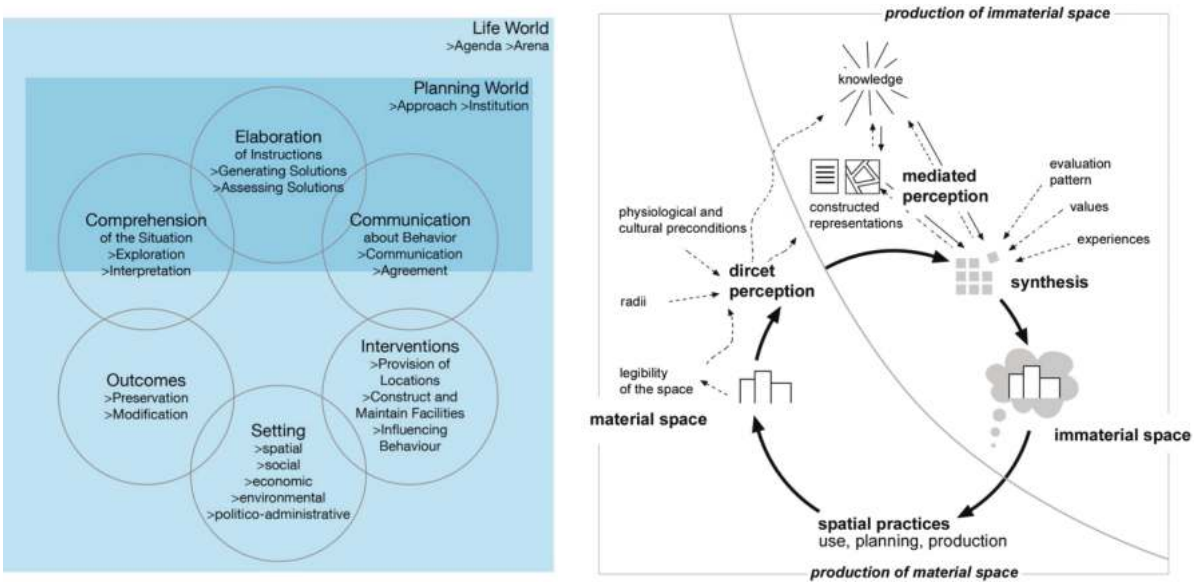

Figure 2. Planning cycle according to Schönwandt (2002) (left)
and Petrin's concept of the production of space (2008) (right).

This paper follows an actor centred research perspective. It focuses on the public commitment and involvement of civic, private and public sector actors in urban development. Specially, the paper

focuses on the public debate on the city – that has to be distinguished from actions taken in the city. From the systemic perspective, planning activities in the city and the way of talking about the city are interrelated. The 'planning cycle' can be interpreted to the circular 'production of space' according to Petrin (2008) (figure 2). The production of immaterial space by perception, mind-sets and discourse prepares the production of material space when spatial practices such as use, planning and production take place. Correspondingly, urban planning is no technical endeavour that can be conceived and implemented according to a target-means matrix but it is inseparably linked to the city and urban society as a whole – and to its public discourse. With the focus on the debate on the city the paper investigates the role – the potentials as well as limitations – of public discussion and reflection on urban development and planning.

In Germany, we see a growing awareness and demand for citizen participation in all kinds of urban and regional planning projects in recent years. Currently planning practitioners and researchers develop and evaluate new participation formats. At the same time, they have to recognize the limitations of activating new target groups to the public debate on urban development – beyond the usual suspects. In the German parliamentary democracy, citizens have only rarely the opportunity to make use of direct democracy instruments. Therefore civic, private and public organisations, associations, clubs and actions groups have an important moderating role in addressing the citizens and in shaping the public opinion.

The involvement and participation of civic and private sector actors in urban development can be understood as a resource for urban development and planning. Relevant actors come from different spheres such as environment protection, trade unions, professional organisations, trade associations, monument protection, education, youth groups et cetera. These very different organised actors show structures of interaction and cooperation that have gradually evolved over time and cannot be reproduced intentionally. These network-like structures serve as a capital for urban development. They facilitate the flow of information and provide for short links and direct communication among a broad range of stakeholders.

**The Munich Case**

'Let's talk about the city!' This appeal could be heard at least 500 times within the last three years in the city of Munich. Invitations to public events were advertised on the Internet as well as in newspapers, flyers or on the radio. The estimated number of events spread by social media or word-of-mouth is much higher. In Munich, we are seeing a lively debate on urban development for many years now. On the one hand, this debate is the result of intended citizen participation around current urban development projects and programmes – planned and implemented by public authorities or private investors. On the other hand, the debate is the expression of publicly articulated comfort as well as discomfort in a continuingly growing and changing city.

The city of Munich is known for an active involvement of citizens in urban planning. The civic association 'Münchner Diskussionsforum für Entwicklungsfragen e.V.' was founded in the 1960s in opposition to the on-going transformation of Munich to a car-friendly city. Since then, the 'Münchner Forum' supports the public debate on current issues of the development of the city. Besides, there is a broad range of other associations and groups that raise their voice to issues of city development and planning. Today, this gradually grown 'landscape of participation' in Munich is facing the challenge of a strong and lasting population and job growth with all the related issues such as transport and social infrastructure, social integration, densification of existing neighbourhoods and enhancement of green areas. When trying to tackle these challenges in the public debate, urgent issues are:

1. How to get an overview over the fragmented landscape of participation?
2. What organised actors support a long-term perspective on urban development – beyond the 'not in my backyard' attitude?
3. How to use that knowledge to build up new coalitions and alliances for change?

This paper presents the intermediate results of an exploratory study investigating the fragmented landscape of actors in the city of Munich, Germany. The paper sets the focus on the empirical work with the methodology applied and the interim findings in respect to actors, spaces and issues. The results raise questions to further research on the 'landscape of participation' in Munich, to the methodological approach and to the implications for theory. With the presentation of an exploratory study in the early phase of a research project, the paper provides a first sketch that inevitably remains incomplete in many facets of theory and methodology.

## 2. Methodology of the empirical study

The aim of the empirical study is to reveal Munich's 'landscape of participation' – that is defined as the public debate on the city including the actors involved with their structures of cooperation as well as the urban spaces, urban issues and urban projects that debate is related to. Three research questions guide the empirical work:

1. What does the civic and private sector actors' commitment to the urban development of the city look like?
2. What shared activities and shared spatial and thematic interests potentially bind these actors?
3. What is the correlation between the civic and private sector commitment and the activities of public authorities?

The empirical research is based on a quantitative and qualitative content analysis of public communication. The starting point is the identification of public events of communication such as panel discussions, workshops, excursions and exhibition events that reflect on the development of the city and region as a whole or on individual spaces, projects or issues within the city. These communicative events are collected ex post from a period of January 2012 to December 2014. In retrospect, all events were included that were detectable from an Internet search. As the personnel resources were limited, the survey was restricted to face-to-face communication and excluded all kinds of communication on the Internet and social media.

With that definition at hand, data was collected in relation to five dimensions of communicative events (figure 3). The first dimension relates to the actors such as initiators, hosts, people taking part in discussions, organisations providing the room for the activity or financing the event. Actors can be distinguished between civic, private and public – they operate as organised actors or individuals. The second dimension points to the format of the communicative event. Third, communicative activities are collected and analysed in relation to current urban development projects in the city. Fourth, the public debate has a spatial dimension when activities relate to distinct areas within the city from a very local to a district scale or beyond. The fifth dimension explores different issues of urban development that are debated on.

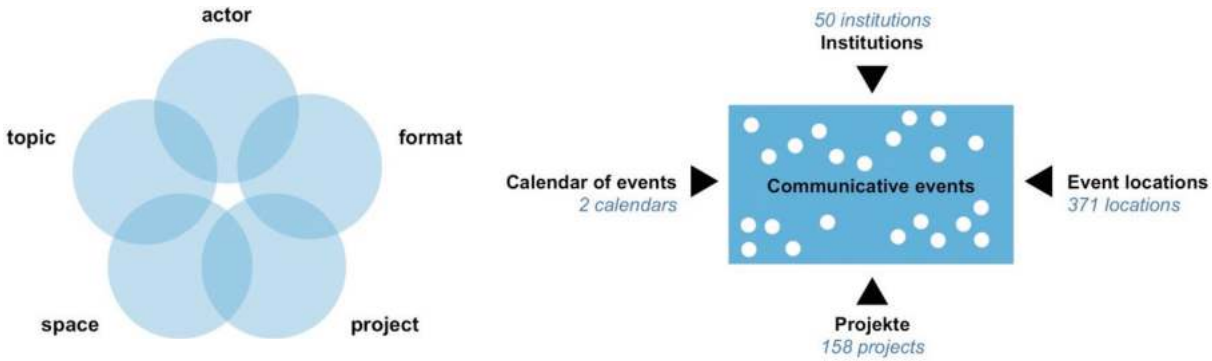

Figure 3. Five dimensions of communicative events (left)
and research strategy for the collection of data (right).

These five dimensions shape the object of investigation and the collected database of this study. The overall population of communicative activities from 2012 to 2014 is unknown. In order to consider as many activities as possible within that time span, the research strategy built upon four perspectives: The internet search started from 50 institutions already known as participants in the public debate, considered 371 event locations, looked for 158 official projects within the city and investigated into two calendars of events (figure 3).

Starting from that basic definition and the research strategy, the first part of the study is based on a quantitative analysis of the collected data. Quantitative analysis is organised in five phases:

1. Basic content analysis to decide whether an activity is taken into consideration or not
2. Profound content analysis of the selected activities and feeding into an Excel database
3. Quantitative analysis in Excel, GIS, Matlab, Gephi and visualisation of the results
4. Qualitative evaluation of the quantitative results
5. Interpretation

The second part of the study was a qualitative focus group workshop. The actors identified in the quantitative research were invited to discuss, validate and complement the intermediate results. Visualisations were a key to stimulate the joint discussion among the participants. The research team got involved in the 'landscape of participation' itself. With the preliminary results at hand, the researchers provoked a lively debate among the participants.

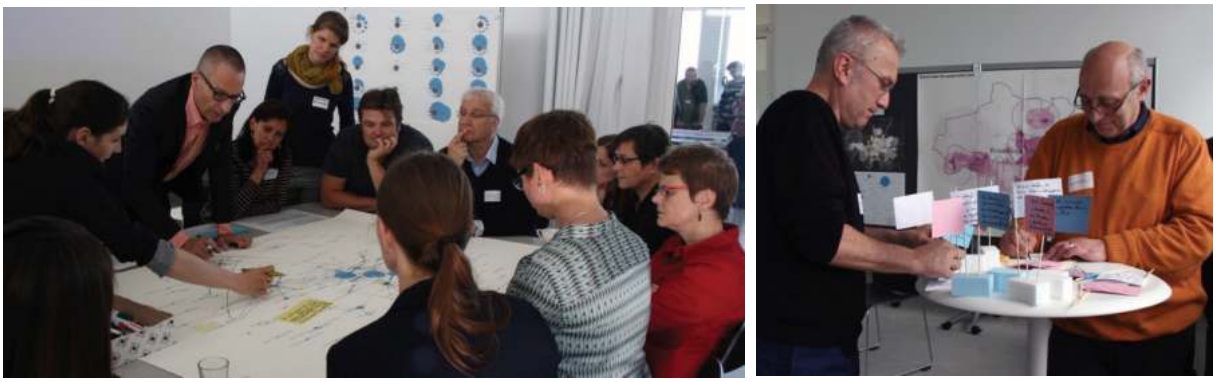

Figure 3. Impressions of the focus-group workshop.

The look back on the last three years of activities was combined with a look into the future. How can the current involvement and commitment of the various actors be used to tackle the challenges of the growing city of Munich? In the workshop research had a positive, enabling effect for the actors involved. They sharpened their awareness for new linkages, synergies and coalitions within Munich's 'landscape of participation'.

## 3. Results

The Internet search identified 510 communicative events within the last three years that were fed into the database. 209 different actors organised these activities. Another 624 actors cooperated in these events as discussion partners, moderators or experts. The formats of the public communication are dominated by public discussions with 34 per cent, followed by excursions with 20 per cent, presentations with 19 per cent and exhibitions events with 13 per cent. Workshops as the most interactive format are applied only in 5 per cent of the events. Civic actors contribute to 49 per cent of all activities, private and public actors each to 34 per cent. More than two third of the communicative activities are not directly linked to a distinct project of urban development. This is equally true for public as well as for civic and private actors. The dataset is further analysed in relation to actors, spaces and topics the public debate points at. The exploratory empirical study focuses on pattern analysis within the quantitative dataset, an approach very different to a representative survey.

### 3.1 Actors

The first focus of the quantitative analysis is related to the actors involved in the public debate. The organising actors can be ranked by their amount of activity (figure 4). This ranking shows three main actors who organized the most of the public events: the municipality of Munich ('Landeshauptstadt München') with its different departments, the adult education centre ('Münchner Volkshochschule GmbH') and the civic association 'Münchner Diskussionsforum für Entwicklungsfragen e.V.'. The remaining actors have a much lower frequency of events.

Figure 4. Ranking of the most active actors.

A quantitative network analysis was applied to the collected database in order to reveal the structures of cooperation and communication of these actors. The actors are represented as nodes. The size of the nodes indicates the number of public events in which the actors took part. In the first step of the network analysis, the joint organisation of a communicative activity is interpreted as an edge between two actors. The thicker the line, the more events were organized by two actors. The network of the 209 organising actors – the 'producers' or 'makers' of the public debate – is shown in figure 5. The second step of the network analysis also incorporates the other 624 cooperating and participating actors (figure 6). In that network, the edges represent a joint participation of two actors in a public event.

The network of the 'makers' of the public debate can be read on three levels (figure 5): On level 1 the three main actors form the central cluster and are connected to each other. Each actor also possesses its own small cluster that links to further actors. The role and position of Munich's adult education centre is the result of the annual programme of 2014/15 with the focus on urban development issues. Despite the large number of organised events, it is rather weakly cross-linked within the network. The adult education centre tends to be a cosmos of its own. Level 2 comprises actors with fewer organized events – such as 'Stiftung Federkiel' or the 'Technische Universität München' – but that still operate close to and well connected to the central cluster. Beyond that, level 3 of the network shows 'satellites' around the central area. On this level we find very small networks of actors jointly organising public events and even actors that are not linked to any other actor at all. So in that network of the 'producers' we observe a tension between the main players in the centre – the 'usual suspects' – and a broad range of further actors that are only loosely or even not connected to that centre.

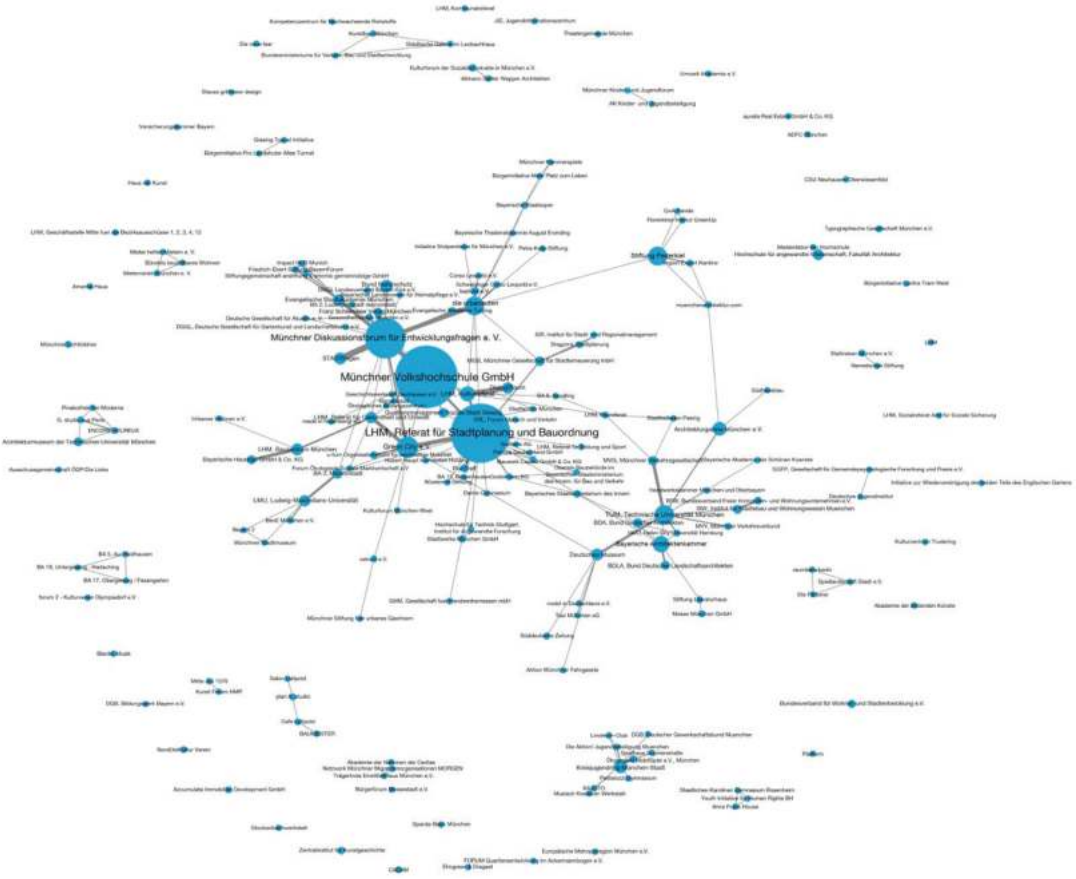

Figure 5. Network analysis of organising actors.

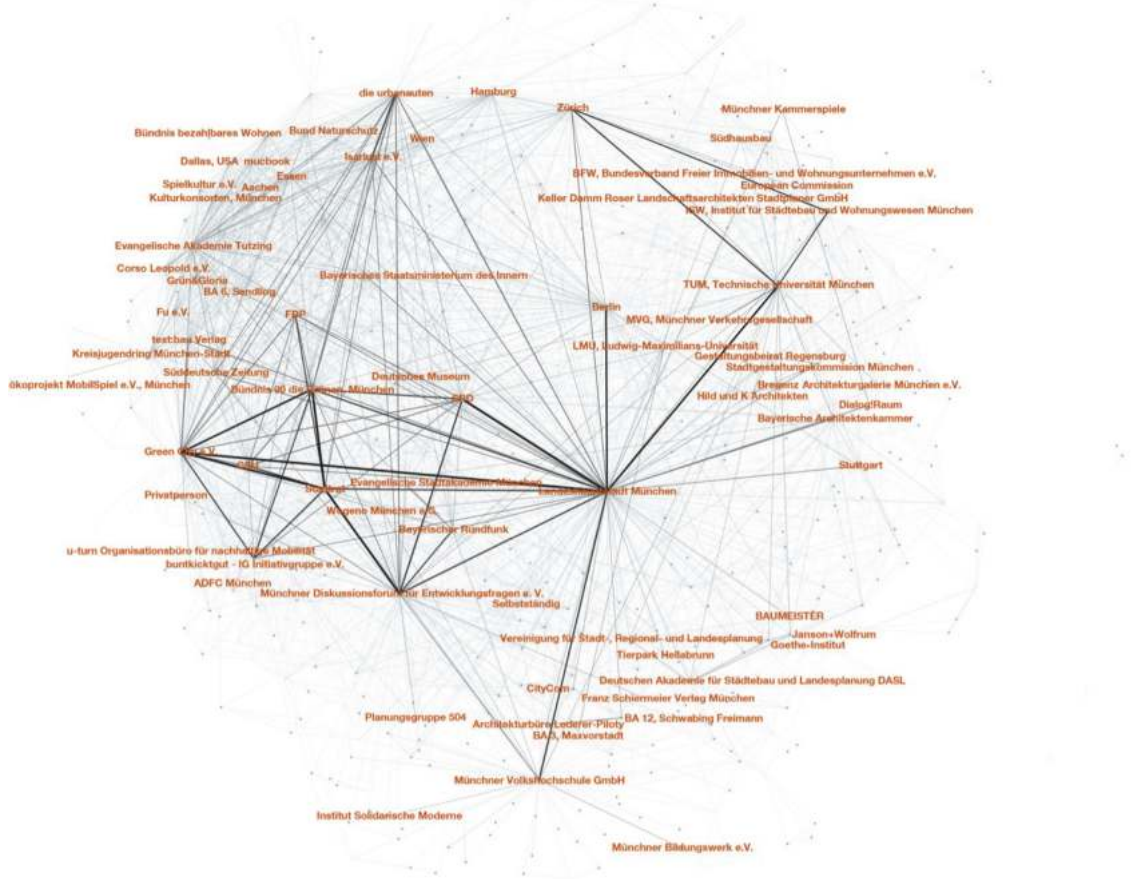

Figure 6. Network analysis of participating actors, strongest connections are highlighted.

In contrast, the network of the cooperating and participating actors shows a very dense structure (figure 6). The participants that join the debate from politics, the media and also from outside Munich connect the different clusters of the organising network. So the different 'makers' of the debate involve the same addressees, be it decision-makers, experts or disseminators. These act as 'connectors' within the 'landscape of participation' and thus have an important role for the exchange of knowledge and the negotiation of different perceptions, concerns and interests.

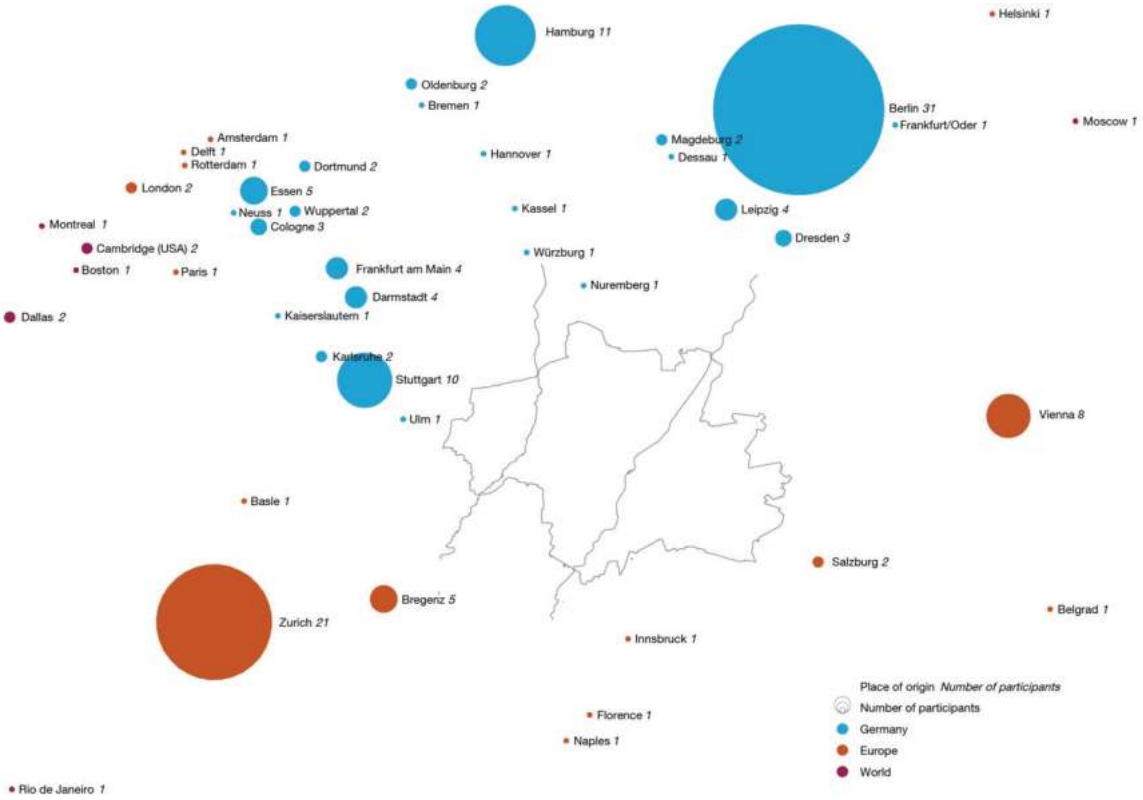

Figure 7. Actors involved in the public debate from outside Munich.

In a further step of the analysis we identified all contributors to the public debate that come from outside the City of Munich. We assume that external input is important for the quality of the dialogue and debate within a city. Otherwise, there is a risk of a 'lock-in' situation in the debate that hinders city planning from further development. The debate in Munich indeed shows a broad range of participants from other cities in Germany, Europe and even from all over the world (figure 7). The main focus of the cross-city exchange is on the city of Berlin as the capital of the Federal Republic of Germany as well as on the neighbouring cities such as Zurich, Stuttgart, Bregenz and Vienna. In the public debate on the city actors in Munich look for expertise and best practices much more frequently within the German-speaking south, southwest and southeast including Switzerland and Austria than in the north and northwest of Germany.

In the focus-group workshop the research team confronted the participants with the results of the quantitative network analysis. It became evident that in many cases the self-perception of the actors differs considerably from the outside perception of the research findings. First, this reaction can be interpreted as the surprise effect when giving a systematic overview on the so far hidden landscape of participation and cooperation. Second, the gap in perception points to limitations in the dataset and analysis. This is the case for the activities of the 25 district committees within the city of Munich. Their regular meetings that are in principle open to the public were intentionally excluded from the research. However, in the self-perception of the political actors, these meetings provide for a constant discussion of local issues on urban development. Another limitation points to the availability of data. The ex post search includes only those communication events with information still available on the

Internet. We have to assume a lot of public events to be advertised by social media or flyers only – all these kinds of events are not represented in the dataset. Third, the difference between self-perception and the revealed 'landscape of participation' might indicate deficiencies in the communication strategy of each actor. This was exactly the discussion that was provoked in the workshop. Each actor began to reflect on its own position within the network and discussed the reasons of the gap in perception.

## 3.2 Spaces

The recorded events of the public debate are further analysed with regard to their spatial dimension. What spaces of the city is the public debate related to? In the public debate on urban development awareness might not be spread equally throughout all districts of the city. There might be hot spots and white spaces of the debate. The debate might even be very general and not point to any specific areas within the city. The spatial dimension of the debate is a key in order to assess the relation between the civic and private sector commitment and the activities of public authorities. It also helps to estimate the relation between the awareness and commitment for overall, strategic issues of the future development of the city and the need for action and implementation in specific urban situations.

In order to capture the spatial dimension of the debate, each communicative event was assessed in terms of the area within the city to which it is related to. The challenge was to map spatial references that in most cases have no administrative borders. Lots of communicative activities point to rather 'emotional' or 'informal' areas of the city that can hardly be described with a fixed outline. The awareness and public debate on these areas often refer to historical identities or emotional neighbourhoods that are hardly comprehensible for an outsider.

From the assessment of the individual event we built up a GIS database that allows for a spatial analysis with regards to actors, topics, formats and projects. This database comprises 120 different spatial shapes as the areas the public debate focused on within the last three years. These shapes refer to different spatial scales within the city. Some of the communicative events point to individual buildings or restricted areas with a definite address. Others refer to whole streets, formal and informal quarters, administrative districts as well as quite fuzzy areas with vague names such as "the edge of the city" or "East of Munich".

The analysis reveals 215 of the 510 identified public events that point to the city as a whole. So there is a large debate on the city without any specific spatial reference. On the one hand, this can be interpreted as broad public interest in urban development beyond individual interests in particular areas. On the other hand, the overall debate might be too general – and maybe also too academic – and therefore miss sensitivity and awareness for distinct spatial situations within the city.

Figure 8 shows the overall spatial pattern of the public debate with reference to distinct areas within the city. The 'creative quarter' is a current urban transformation project that attracts the most public events. The relation between the city of Munich and its region or agglomeration is ranked number two. On the map we find numerous other events with reference to urban projects within the city. In total we recognize a lively debate in the districts adjacent to the inner city. In these areas we often observe spatial transformations processes caused by the constant growth of the city and the enlargement of central functions of the city center. Furthermore these areas have a high share of a long-established population that actively contributes to the public debate. In the north of the inner city we find three areas in close vicinity to one another: the art district, the creative quarter and the Olympic Park with its different facilities. Here, the map reveals potential for new spatial links and synergies in the public debate.

Another spatial focus relates to the Isar river, where a big renaturalization project has been realized within the last 10 years. In the inner city the regain of the riverside – today a car-dominated area – as public space for pedestrians and cyclists is a big issue. The growing city of Munich also shows clearly visible spatial dynamics in the outskirts. In the north, west and east big housing areas are going to be realized within the next 5 to 30 years.

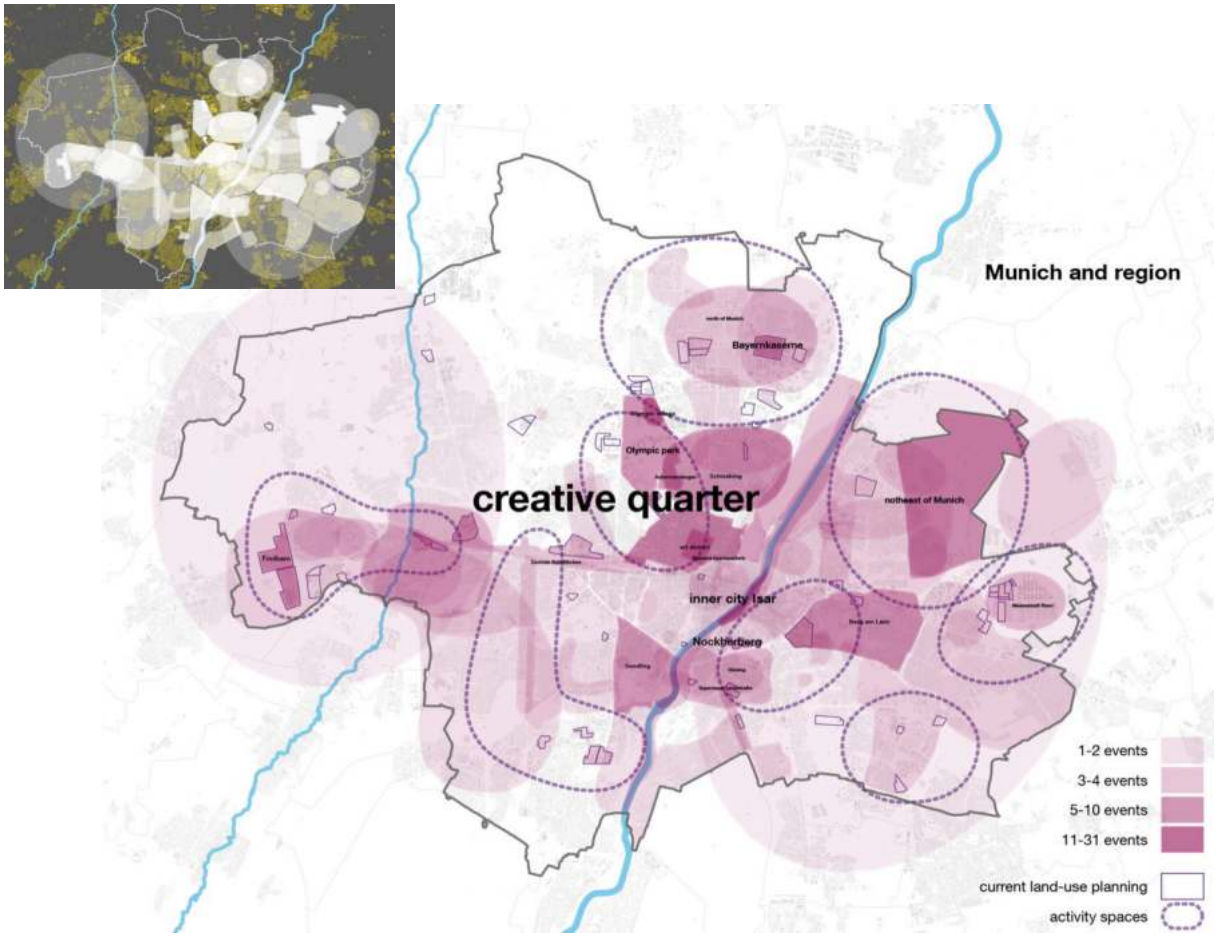

Figure 8. Spatial dimension of the discourse on the city of Munich.
Top left: Spaces that are excluded in the public debate.

The spatial analysis also reveals those areas of the city that are not talked about: the northwest, the south and southeast. These areas were the starting point for the discussion in the workshop: Why are some areas in the city not as interesting as others? Who takes care of the seemingly forgotten parts of the city? Especially in the southern part there seems to be a mismatch between the ongoing dynamics of spatial transformation and the limited awareness in the public debate. In the south, the banana shaped 'activity space' set by the urban development strategy 'Munich Perspective' (Thierstein et al. 2010) is almost empty.

The city of Munich is currently running numerous brownfield development projects of vacant barracks and industrial areas. At the same time, big urban expansion areas are on the way in the west and east. In order to breathe new life into these upcoming city quarters there is a need for constant involvement of civic, private and public actors. Instead, in these areas citizen participation is often limited to individual events. In many cases public awareness and interest get lost in the long-term transformation process. The lack of attention and care in these empty spaces raises the awareness that existing civic, private and public commitment in other areas of the city is an important resource that cannot be reproduced easily. Nevertheless, planners often feel that temporary users, action groups and local associations disturb and slow down city planning.

The participants of the workshop also discussed the relation between the residents' identification with their neighborhood and their readiness and interest to participate in the public debate. In a growing and constantly transforming city, the feeling of belonging is a valuable good – especially for those residents who arrived only recently. In return city planners have to ask themselves what spatial scales shall be addressed in the public debate on the future development of the city in order to draw attention and commitment among the intended actors.

### 3.3 Topics

The quantitative analysis thirdly relates to the topics that are raised in the public debate. Based on the information available on the Internet, the communicative events of the database are analysed in respect to the issues involved. This qualitative content analysis reveals 22 different categories. Most events refer to two or even more categories at the same time. So the different issues of urban development are discussed in close relation to one another. City planning, housing and culture are the most frequently debated topics.

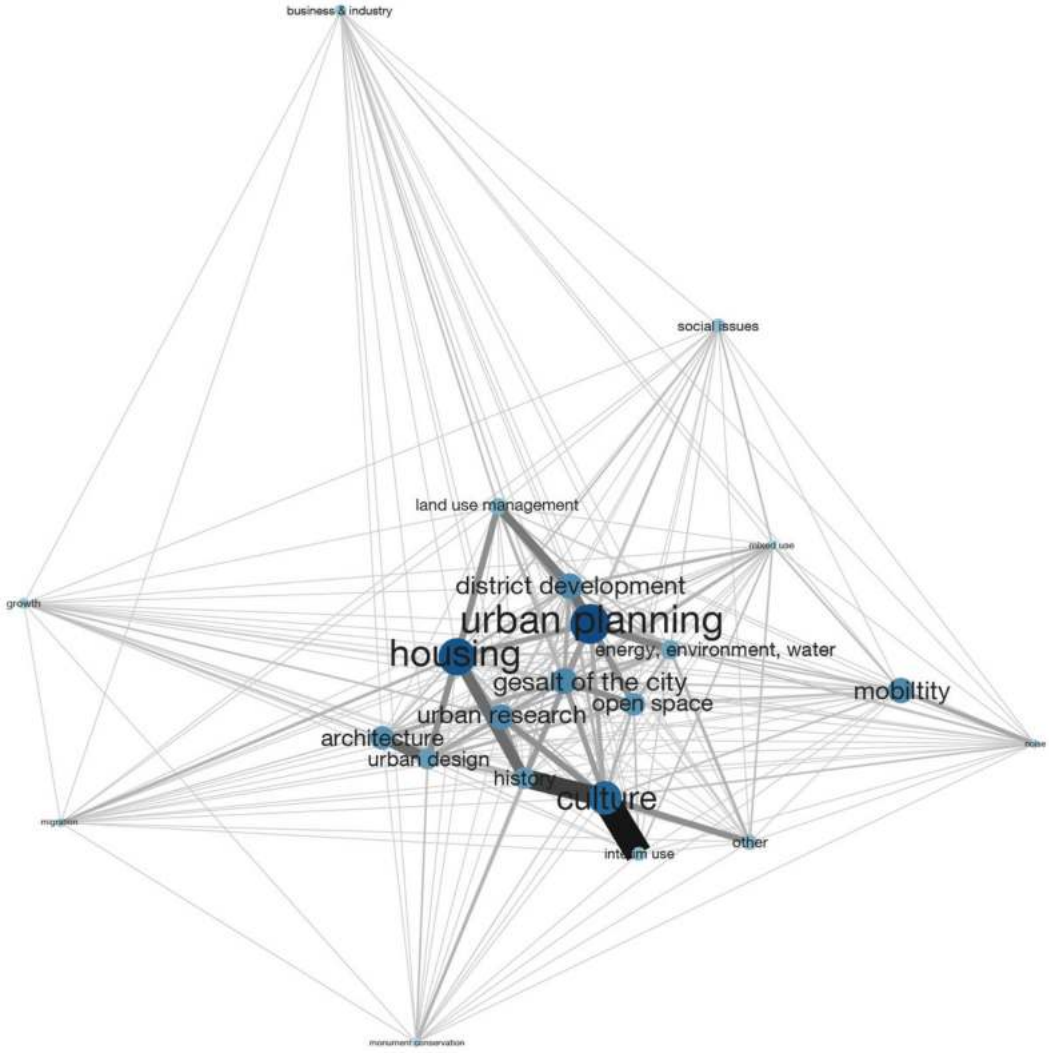

Figure 9. Network of topics talked about.

A quantitative network analysis shows the proximity and distance of the different topics in the public debate (figure 9). The size of the nodes indicates the number of communicative events that deal with a topic. The weight of the edges refers to the amount of events that combine two topics. The network reveals a core of about 12 particularly closely connects issues. The gestalt of the city is placed in the center of that core with an especially high degree of networking. Open spaces show an almost equally central position. So gestalt and open spaces are particularly intensely discussed in relation and dependency to a broad range of other important issues. In contrast functional topics such as mobility, social issues or business and industry are mostly discussed one-by-one. Here, from a thematic point of view, a less integrated perspective dominates the public debate. The rather isolated position within the thematic network is especially critical for the urgent issue of mobility. The development of the transport infrastructure in combination with the changing mobility demand is a crucial topic for the growing city-region of Munich. This issue demands for a debate that also integrates the spatial dimensions of housing and jobs at the spatial scale of the functional city-region.

According to the thematic network, the important issue of culture can be read in two ways. First, there is a strong link to history. This relates – amongst others – to the importance of Munich as a center for art and culture in the beginning of the 20th century that is still present in the self-image of the city today. On the other hand, there is a lively debate on the conditions of contemporary artists and cultural workers that desperately look for available working spaces in the city. Interim uses – so far only marginally offered within the city – are of considerable potential for the promotion of the arts and the creative economy in the Munich region. The analysis of the actors involved in each topic show that the issue of culture has the specific capacity to bind and activate a broad range of different actors beyond the 'usual suspects' (figure 10). The department of arts and culture of the city of Munich only ranks 8 in the list of the most active actors that debate on the issue of culture.

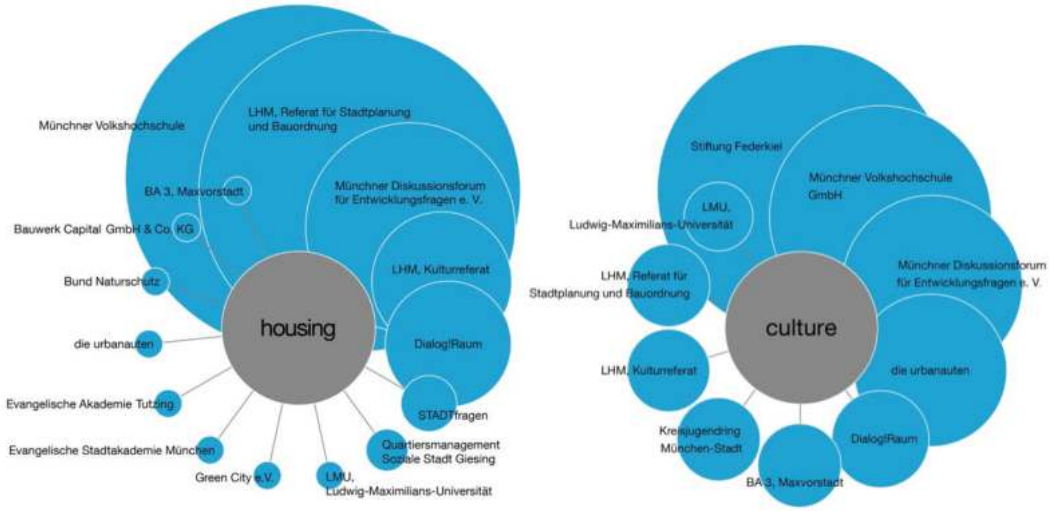

Figure 10. Actors related to topics in the public debate.

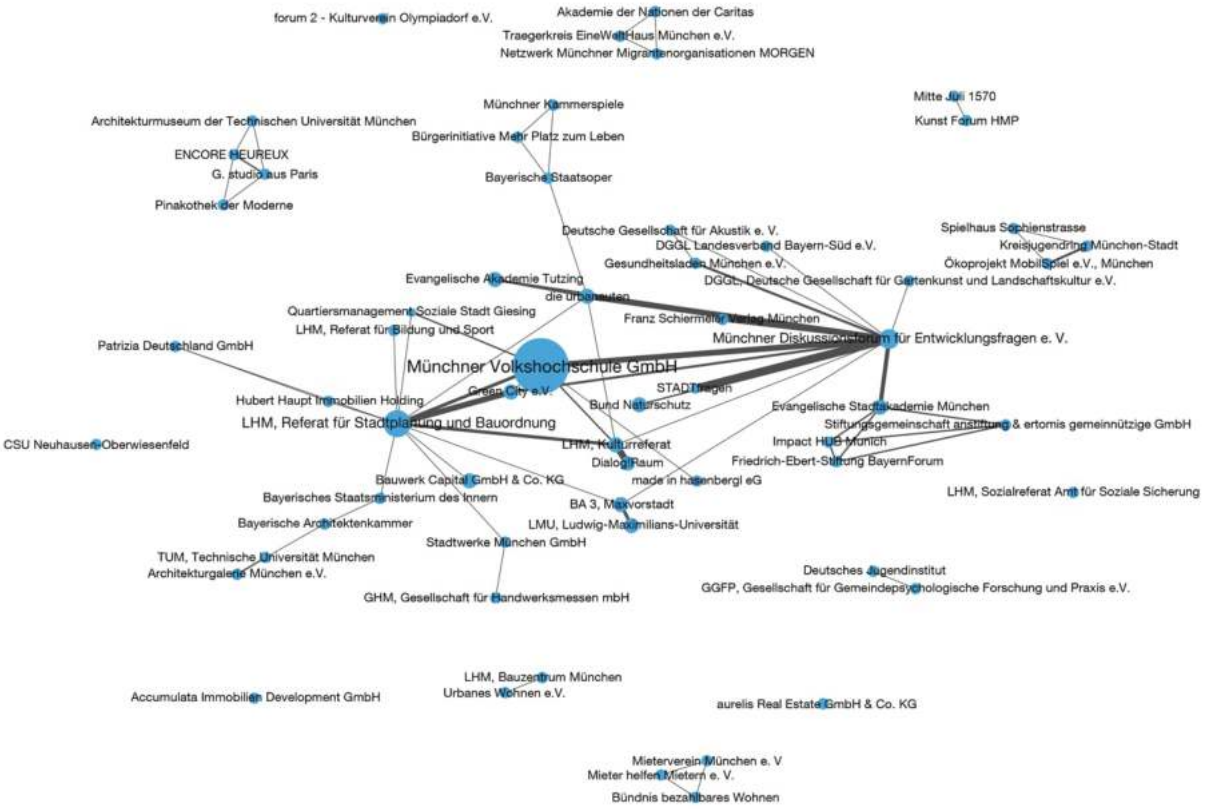

Figure 11. Network of the actors cooperating on housing issues.

The network analysis specifies the cooperation structures of the actors involved in each topic (figure 11 as an example for the housing issue). This analysis reveals very specific constellations of actors that go beyond the general perspective as presented in chapter 3.1. When looking for synergies between the different actors involved in Munich's 'landscape of participation', specific potentials can be drawn for each issue. Moreover, the thematic perspective on the cooperation of the different actors helps to identify issues of urban development that might bring in new actors and perspectives and thus new resources of civic, private and public commitment.

## 4. Conclusions

This paper proposes an actor centred research perspective on urban development and planning. It takes the public debate on the city as a starting point for the investigation of the 'landscape of participation' within a city. The involvement and participation of civic, private and public actors in urban development with their respective network-like structures are regarded as a resource for urban development and planning. From a systemic perspective there are important interdependencies between the public debate on the city and the actions and implementations taken in the city. The paper presents the methodology and intermediate results of an exploratory empirical study on the 'landscape of participation' in the city of Munich. This working paper sketches out preliminary empirical results based on a rough theoretical background. Both theory and the empirical work have to be further elaborated in future research.

**Consequences for the city of Munich**

The city of Munich shows a lively scene of actors involved in the public debate on the future of the city. Within that debate, the quantitative network analysis reveals the dominance of three main actors in the center of the network and a broad range of much smaller networks as well as individual actors in the periphery. These 'satellites' are only loosely connected or even not connected at all to the core of the network. The three main actors include the department of urban planning and building regulation of the city of Munich as well as the initiative 'Münchner Forum' and the adult education center – both receive financial support by the city of Munich. Thus all three key 'makers' of the public debate on the city are directly or indirectly influenced by public interests. The 'Münchner Forum' – founded in the 1960ies – today shows ageing members and the generation change proceeds only slowly. The adult education center of the city of Munich is the biggest of its kind in Germany and offers a highly diversified program for different target groups. Nevertheless it traditionally addresses the – mostly female – middle class over 50-years-old. So one major challenge for the 'landscape of participation' of the city of Munich is: How to expand the core of the network to new target groups? The actors on the periphery of the network already represent these more divers cooperation partners with their respective audience.

The analysis shows, that thematic actor-networks are a key in order to address new partners and audience to the 'landscape of participation'. Culture turns out to be a vehicle for the discussion on the self-image of the city – that also influences other issues of urban development. The study reveals a broad interest in an overall debate on the city beyond distinct projects of city planning. In contrast, functional perspectives such as mobility, social issues or business and industry seem to be rather isolated in the public debate with only few links to other issues. Overall, the discourse is very much dominated by the department of urban planning and building regulation whereas other departments play only a minor role. In order to develop a future perspective for the growing city of Munich, it seems to be crucial to identify new thematic approaches to the public debate – beyond city planning and urban design on the one hand and beyond pure functional approaches on the other hand.

Additionally, die spatial analysis demonstrates a need for the orientation of the public debate towards a spatial scale in between an overall perspective on the city and individual urban projects within the city. The 'activity spaces' identified in the urban development strategy 'Munich Perspective' (Thierstein et al. 2010) provide such a spatial scale that relates to people's everyday home range including living, working and leisure time.

**Conclusion of the general approach of the research**

The empirical study proves the strength of the quantitative research approach in order to give an overview over the so far hidden 'landscape of participation'. Visualisations of the quantitative dataset with diagrams, networks and maps are a key to uncover that landscape and an important starting point for a joint debate with the actors of that landscape.

The combination of three analytical foci with actors, spaces and themes turns out to be a 'magic triangle' for improving the public debate and participation in a city. Additionally it seems to be crucial to link the actor-centered research approach with a spatial perspective on urban development. In the focus-group workshop the spatial dimension of the quantitative analysis with its related visualizations opens an entirely new perspective for most participants. In future research, the spatial analysis should be elaborated further. The spatial footprint of the public debate on the city with its thematic characteristics could be analyzed in relation to social and economic patterns and their related dynamics as well as urban development projects and programs within the city.

The link of the quantitative analysis with the experience and knowledge of the actors involved in the focus-group workshop is a crucial step in the case study. The research team involves itself in the 'landscape of participation'. Research enables the actors to reflect on their position within the public debate and the related actor-network. The confrontation of the self-perception of actors with the outside perception of the research results simulates a lively debate. This methodological approach fosters learning processes among the actors of Munich's 'landscape of participation'. This kind of collective learning is an important premise to develop new synergies and alliances for the growing city and thus go beyond the 'usual suspects'.

**Limitations and need for further research**

The presented case study has an explorative character. There are important limitations of the quantitative approach: The dataset includes only those communication activities that can be detected by an ex post Internet search. All communication events within the last three years that are not documented on the web any more are missing in the analysis. Furthermore the research was restricted to face-to-face communication and deliberately excluded all communication on the Internet and in the social media – even though we know, that this kind of communication is of growing importance for the public debate on the city. The discussion in the workshop revealed that important actors within the city of Munich are systematically ignored in the analysis. These include international companies such as BMW and ADAC as the most important automobile club in Germany. These actors powerfully act behind the public stage but avoid the public 'talking about the city'.

A quantitative network analysis does not inform on power structure on principle. Nevertheless, power structures are crucial when trying to assess the relation between the debate on the city and the actions taken in the city. Beyond the relations of the organized actors, the personal networks of the key players might exert major influence on urban development in Munich. This would demand for an ego-centered network analysis.

From the empirical perspective, the Munich case study calls for further qualitative research – e.g. with interviews and another focus-group workshop – that complement the quantitative findings. Furthermore, this single case study should be embedded in a comparison with further case studies on the 'landscapes of participation' in other cities. A further elaboration of the theoretical framework is necessary in order to answer the question: How does the debate on the city actually influence urban development and planning? The relation between 'talking about the city' and 'acting in the city' has to be conceived in more detail.

Keywords: Governance, democratic theory, Brazil

## Abstract

*Participatory planning has become an ever more common practice in Brazil and many other Latin-American countries, at least in the case of more progressive local governments. Although significant progress has been made regarding the expansion of public participation in local policy making and planning processes, rising discontent can be observed in these countries with – especially young – people occupying streets and public squares, expressing their dissatisfaction with the shortcomings in service provision and infrastructure, as well as with increasing corruption, as recently happened in 2013/14, in the run-up to the Soccer World Cup in Brazil. In spite of an apparently consolidated democratic regime established in the country, deficits of democratic legitimacy are becoming evident in an increasing complex society demanding renewed interactive governance practices able to provide social justice and sustainable development. In this paper, we intend to analyze the potentials of post-liberal theories on democracy (Sørensen & Torfing, 2007), which share the assumption of the insufficiency of representative institutions of liberal democracy for tackling adequately with contemporary challenges, to contribute to the development of new territorial governance approaches able to develop "more inclusive and democratic urban and regional processes", referred to as a crucial governance challenge by the co-chairs of this track. Emphasis will be given to evaluate the capacity of those approaches to incorporate public interests and concerns with public goods in political decision making and planning. The Brazilian case will serve as reference to illustrate the theoretical considerations.*

## 1. Introduction

Liberal democracies have suffered important transformations and faced significant challenges in the last decades. The recent financial, economic and social crisis, environmental and humanitarian disasters as i.e. recently the "refugee crisis" in the Mediterranean, as well as the decay of the urban conditions, primarily in the developing countries, reveal a limited state capacity to deal adequately with such complex multifaceted or wicked problems, whereas growing popular protests, from the so-called Arab Spring, the Occupy Movement, the Spanish "Indignados" to the Brazilian protest from June 2013, indicate deficits of democratic legitimacy in the developed as well as the developing world. "Something is going wrong" (Judt, 2010) according to Tony Judt, for whom we live in an age of progressive insecurity, which not only affects the state's capacity to act, but calls into question social peace itself: "We have entered an age of insecurity – economic insecurity, physical insecurity, political insecurity. ….. Insecurity breeds fear. And fear – fear of change, fear of decline, fear of strangers and an unfamiliar world is - corroding the trust and interdependence on which civil societies rest" (ibid., p.23).

The loss of political legitimacy by state agencies and by liberal-representative democracy, based on an

increasing public discontent with politics and the politicians, and with the fact that a growing part of the population seeks to satisfy its necessities primordially by means of the market (Crouch, 2004, p.9), has resulted in a situation that political reforms are back on the political agenda, in Brazil and other parts of the world.

Though, in the Brazilian case we assist currently a quite blurred, confusing and increasingly explosive situation with militant right-wing groups calling for the return of the military regime, economically threatened middle classes demanding impeachment of President Rousseff and calling for strict clampdown against corruption, at the same time as politically debilitated left-wing activists protest against welfare cuts and the decay of the urban infrastructure and basic public services; and, amongst these quite different social groups manifesting their political discontent, young violence-prone black bloc protesters destroying public equipments and infrastructure and challenging and attacking the state security forces. These kinds of manifestations are symptoms of a decrease of the state's steering capacity and of a decline of democratic legitimacy of prevailing governmental practices.

Besides the recurrent concerns about the possibilities to alleviate poverty and maintain or amplify de progress made in terms of social security, which in the case of Brazil is still very fragile and precarious, and the debates around the conditions for renewed type of developmentalism, in general considered as necessary and desirable to counter the negative effects of neoliberal reforms (Bresser-Pereira, 2015), we are also confronted with a situation of increased transnationalization of economic activities, a growing relevance of supranational structures and processes for national and local politics.

In addition, we are facing diverse menaces of our ecological systems that result from our incapacity to handle politically the challenge of the dilemma of the common goods. Our unsustainable production and consumption patterns generate grave impacts in the long run and produce uncertainties and risks of disasters, being climate change only the most emblematic of theses dilemmas, but having in common that these problems escape the logic of the current political systems of decision-making and of planning practices. Many political questions seem to become politically undecidable.

In such a context of increasing "complexity, dynamics and diversity of modern societies", according to Kooiman, "new forms of diverse, dynamic and complex governance [are needed], which are to be based more on interaction, than on the 'do it alone' attitude of traditional institutions" (Kooiman, 2002, p.78). Thus, neither a return to the models of centralized planning and authoritarian state action of the past, nor a revitalization of the neoliberal policies of fiscal austerity, deregulation, minimal state, privatizations and tax reductions, seem reasonable options in view of the challenges at stake, as all of them proved inadequate to promote sustained development, to reduce the growing gap between rich and poor in society, to preserve nature, and to guarantee good quality of life for all.

Particularly, the sustainability challenge, which requires a radical change in our consumption patterns and an active citizen engagement, makes it unavoidable to rethink more deeply the state-society relations and the organization of the state itself, ascribing a more decisive role to civil society and citizens and, consequently, to the local and regional levels of power in sustainability seeking political strategies.

The institutions of liberal democracy, based on the national territoriality as basic unit of public action, appear to present difficulties in facing such kinds of complex and multifaceted challenges, calling into question not only our development model, but also liberal democracy itself and its capacities to contribute to a development model in line with the principles of sustainability. Therefore, it's about calling into question the preparedness of our current democracy to incorporate the dimension "future" in current decision-making. As Otfried Höffe (2009, p.10) puts it: "people do not only cherish hopes

[that communities assume responsibilities for the future]; but they are right, because this is exactly for what communities are responsible: to ordinate the way humans are living together, and not only in the present, but also giving shape to it related to the future"

While we observe in Brazil the strengthening of a research agenda concerned with how to reconcile state capacities with political or democratic capacities within development strategies, placing emphasis, on the one hand, on the design of institutional arrangements able to produce desired political results (Gomide & Pires (eds.), 2014; Gomide & Pires, 2014), on the other, on the analysis of diverse innovative institutional arrangements that aim at handling with the challenge of sustainability (Abers & Keck, 2006; Jacobi, 2005 e 2006; Frey, 2001), the attempts trying to better understand the interrelations between the dimensions of democracy, development and sustainability are still quite rare, at least in Brazil. And particularly, we are lacking approaches able to incorporate the fact that we face today a strong tendency towards a post-liberal condition, where "the political-democratic capacity, concentrated on the level of the nation state", which from the aftermath of the Second World War until the heights of the social-democratic era still accomplished to control the power of the business interests, as far as these have still been strongly subordinated to the authorities of the nation state, is suffering significant decline due to the transnationalization of political and economic relations (Crouch, 2004, p.17).

In this paper we are proposing to contribute to the ineluctable revisiting of the democracy concept in view of the particular challenges posed by the aspired development *with* sustainability. We are starting with Calame's consideration of a "profound analogy existing between the current governance crisis and the crisis of our models of development" (Calame, 2009, p.22). On that basis, we suggest the necessity to reassess the roles and patterns of interaction between state and civil society, which happen basically in three different ways: by means of traditional mechanisms of political intermediations as political parties, civil society organizations and voting (including plebiscites and referendums); by means of new (in fact, not anymore that new) arenas of intermediation as policy councils, public policy conferences, public budgeting, public hearings etc.; and finally, through means of governance or policy networks, interwoven by structures and practices of participatory democracy. Here our proposal is to go beyond mere representative forms of liberal democracy, reflecting the process of redemocratization and of deepening of democratic practices in Brazil in the last three decades.

Based on the debate on the insufficiency of representative institutions of liberal democracy for tackling adequately with contemporary challenges and on experiences in participatory governance in Brazil, we intend to contribute to the development of new territorial governance approaches and their potentiality to come to "more inclusive and democratic urban and regional processes", and to evaluate the capacity of those approaches to incorporate public interests and concerns with public goods in political decision making and planning processes.

## 2. Theoretical approaches on democracy

The discussion on theoretical approaches on democracy will be done in two stages. First, we start from the assumptions evidenced in the introductory part about the limits of liberal democracy. On the basis of the work of Sørensen and Torfing (2007), we present and discuss different approaches of post-liberal democracy in order to develop a theoretical perspective in line with the requirements of sustainability. In a second step, we propose a realignment of these theories in three groups of strategic arrangements – modernizing, deliberative, and finally, militant or contesting – with the intention to evaluate their appropriateness for imagining possible transformative processes in post-liberal contexts, as well as their implications for thinking sustainable ways of development.

For Sørensen and Torfing (2007, p.234), liberal theories of democracy share the idea of democracy "as a political system in which the members of a territorially defined political community – i.e. a nation state – govern themselves either through direct citizen participation or through the election of representatives". According to them, two types of theories can be distinguished in the liberal tradition of democratic thinking: *aggregative theories*, characterized by principles of equal division of power between citizens and the guarantee of individual liberties; traditional institutions of representative democracies, in that sense, ensure political equality and individual liberty. By contrast, *integrative theories* place emphasis on the common good to be achieved by a rational deliberative process, in order to overcome traditional, merely power-guided forms of political struggle. Democratic institution's purpose lies in developing "a sense of communality and obligation to act in the interest of the common good among the citizens" (ibid, p.235).

Whereas the first group of theories places emphasis on the individual acting in defense of his own particular interests, the second group stresses the importance of community and therefore the role of civil society acting on behalf of the common good. In an analogous manner, we can distinguish models of liberal and republican citizenship, as discussed by Dobson (2009): whereas the former one places emphasis on the protection of individual political rights in view of the State, considered a potential threat to individual liberty; the latter advocates the idea of an active citizen, endowed with civic virtues and with commitment to his citizens obligations and, therefore, acting in favor of the collectivity and the common good as crucial parts of republican citizenship.

Both theories of liberal democracy share the idea of clear separation between the State and society, an assumption which, yet, seems less and less appropriate or viable to be maintained in the post-liberal context. Correspondingly, the recent statement of one of the main Brazilian philosophers Renato Janine Ribeiro (2014) that "good politics in our time […] requires the separation of the public from the private", given with the very understandable worries related to the historical legacy of Brazilian patrimonialism, marked by the appropriation of public resources by private interests, might be called into question due to a growing de-facto interlacement between the state and society and between the public and the private.

This general relational complexification has provoked the emergence of new governance practices and of policy networks which represent special challenges for liberal democracies: "Governance networks represent a threat to democracy because they undermine the borderline between state and society" (Sørensen & Torfing, 2007, p.234). At the same token, environmental risks, which require both changes of our consumption patterns as well as the mobilization of society and its citizens, turn ineluctable the politicization of aspects of social life that traditionally have been ascribed to the private sphere. From an environmental point of view it's becoming decisive society's capacity to expand the concepts of the public sphere and of citizenship itself, as proposed by the conception of ecological citizenship (Dobson, 2009).

In view of these supposing threats to the notion of a liberal democracy, characterized fundamentally by the strict separation between State and society, new theories of democracy has appeared, designated by Sørensen and Torfing as post-liberal democratic theories. Those not only accept the new opacity that characterizes the relation between State and society as given and recognize the limits of the nation state as primordial or exclusive arena of democracy and the exercise of citizenship, but they also seek new constructive theoretical paths to think the possibility of new, more daring, democratic practices of participation in public policies and planning, based precisely on governance networks, pinning hope on "governance-driven democratization (Warren, 2009). "Hence, post-liberal theories of democracy search for new perceptions of democracy, and new institutions of democracy that do not take the existence of a well-defined homogenous nation-state and a sharp demarcation between state and

society as their starting point" (Sørensen & Torfing, 2007, p.236).

This means that we are in a situation where it is essential to revisit democratic theory considering the inevitability of intensified interaction between the State and society, as well as of improved institutional and procedural articulation between different scales and levels, from the global to the local. This need of increased articulation refers most notably to the intermediate scales, which generally are badly served by representative institutions. This is the case on the regional scale, between the local level of the municipality and the state level, after all in metropolitan regions where competitive relations used to hinder effective cooperation; but also between the state and the national level, where we very often lack a reasonable interstate cooperation. This has became recently very evident in Brazil where we face intense interstate and intermunicipal conflicts around the use of the scarce water resources. Yet, similar problems of lack of horizontal cooperation we find on the international level where conflicts around resources in a context of increasing scarcity tend to sharpen conflictive relations; and finally, on the global scale where the weak institutionality hinders arriving at reasonable agreements about global environmental problems.

Sørensen and Torfing (2007) distinguish the following four theoretical approaches to post-liberal democracies:

## 2.1 Competitive democracy

This theoretical approach aims at reformulating the concept of competitive democracy, based on elite domination, in accordance with Max Weber, however, having as its main representative Joseph A. Schumpeter (1950). For him democracy can be understood, basically, as a method to select political leaders and therefore as a means to regulate the struggle for political power between interest maximizing individuals: "the democratic method is the institutional order to arrive at political decision where individuals acquire decision-making power by means of competitive struggle for popular vote" (Schumpeter, 1950, p.428).

However, authors like Eva Etzioni-Halevy[1] reject the idea that it's possible to bring forward these kinds of struggles within the representative institutions of liberal democracy. She instead places emphasis on the central role exercised by sub-elites or semi-publics in order to balance the power relations between elites. Social movements and other societal agents are acting in a gray zone between the public and the private sphere, endowed with capacity to exercise social control over dominant elites between elections. Though, according to Etzioni-Halevy, citizens can overtake an active role in public policies, without becoming themselves political elites. So within the overall Schumpeterian framework of a competitive or realistic form of democracy they envisage democratic gains in the post-liberal contexts due to the emergence of counter-elites and to extent that the traditional elites loose part of their previous predominant role in the political society.

Still embedded in an overall competitive framework, Paul Hirst (2000) highlights the role of voluntary, self-regulated associations, within a radically decentralized administration, which favors a "competition between providers and consumer choice – without making service access so dependent on the ability to pay" (Hirst, 2000, p.29). In accordance to Sørensen's and Torfing's interpretation of the Hirst proposal, it's the state, who tends to define "the overall political goals and financial frames (...), while the task of the associations will be to produce public services in competition with one another" (Sørensen & Torfing, 2007, p.238). Of fundamental importance are the mediating consociational institutions engaged in promoting a process of negotiated governance aiming to

[1] Etzioni-Halevy, Eva. The Elite Connection: Problems and Potential of Western Democracy. Polity, 1993.

establish consensuses, and balancing power relations between the different hierarchical levels, without eliminating competition, contestation and coordination, considered crucial elements of the model.

However, this approach, despite taken as given a competitive institutional environment, establishes an important distance and a clear distinction, by pinning hope on the "pressure for democratization in the wider society" and a "radical administrative decentralization, removing tasks from central, local, and quango governments" (Hirst, 2000, p.29). Notwithstanding, and particularly when we take into account the traditions of oligarchical power relations in many developing countries, new questions arise in this context about the possibilities of a real democratization of such "organizational society", which under such circumstances could easily invigorate already existing elitist patterns of exercise of power.

## 2.2 Outcome democracy

The "empowered participatory governance" approach of Fung/Wright (2001; 2003)[2] is inspired by Jürgen Habermas' deliberative model of democracy, at least in the sense that institutional arrangements should favor an effective exchange of arguments, even so the authors adopt a much more pragmatic attitude, by stressing that the quality of democracy depends much more "on its ability to produce desired outcomes through various forms of coordination" (Sørensen & Torfing, 2007, p.239), more than on the democratic legitimacy of political decision makers. The three guiding lines of the proposal comprise, first, the idea that institutions should be designed with the primordial objective to solve concrete problems, in order to handle quite practical aspects in situations that affect people's normal course of life; second, that participation should be constructed from the bottom upwards, considering particularly the "stakeholders" considered relevant for decision-making, upwards to the public authorities; and third, that there should occur effective power sharing in order to guarantee mutual respect between the participants and a deliberative way of problem-solving. Habermas' influence becomes evident in the expectation that deliberation and balanced negotiation are supposed to contribute to the achievement of consensus and to avoid the eruption of conflicts. Hence, whereas Habermas' model conceives deliberative democracy as something quite demanding in terms of the necessary communicative competences from part of the involved subjects, Fung e Wright (2001, p.7) pin their hope on the "energy and influence of ordinary people, often drawn from the lowest strata of society in the solution of problems that plague them". The democratic ideal they defend is output-oriented in the sense that its fundamental *raison d'être* consists in "ensuring that all citizens benefit from the nation's wealth" (ibid., p.5).

Similarly output-oriented is the democratic theory of Iris Marion Young (2000)[3]. She relates democratic quality to the characteristics of political processes, considering them appropriate only in so far as they are qualified to produce just solutions. For her, there does not exist anything like a "common good". Hence, the only way to identify if the results of democratic processes can be considered just consists in verifying if the procedural arrangement and structure favors the possibility of fair negotiational interaction. That's why it is essential to create democratic institutions and procedures able to produce just results for those citizens affected by the decisions. In order to ensure procedural justice, conditions of equality and non-domination as well as the stimulation of continuous interaction have been guaranteed in the deliberative processes; and they have to be guided by the general principle of reasonability. However, Young does not ignore the imminent empirical risks of exclusion of voices and of lack of transparency and procedural publicity, risks that have to be explicitly opposed and minimized.

[2] Fung, A.; Wright, E. O. (eds.) (2003). Deepening Democracy: Institutional Innovations in Empowered Participatory Governance. London: Verso.
[3] Iris Marion Young. Inclusion and Democracy, New York: Oxford UP, 2000.

In another work, Young (2001) criticizes the concept of deliberative democracy as defended by Michael Walzer and Jürgen Habermas, as far as they, as she puts it, presuppose unity as a condition for deliberation, that is, as something preexistent in society (Walzer), and therefore democratic practice can be interpreted as an ongoing process to "restore an interrupted consensus" (Young, 2001, p. 374). And even in the cases of authors that conceive "the unity not as starting point, but as the aim of political dialogue (ibid.:375), Young notices unity-guided democratic discussion, and in the common appeal for seeking the "common good", which these approaches usually share, the risk to entail mechanisms of exclusion. She proposed, on the contrary, a form of communicative democracy sensitive to the huge cultural differences and social segmentations that characterize contemporary societies. Difference should not be envisaged as something to overcome, but rather as an important resource, which has to be democratically valued. For her the necessary minimal unity of a communicative democracy consists rather in three basic conditions: significant interdependency, formally equal respect, and concerted procedures" (ibid., p.376-7). "Such a theory of democracy requires a broad and plural conception of communication, which includes the expression and extension of common understandings, where they exist, and the offering and recognition of meaning that is not shared" (ibid., p.386), paving the path to the agonistic theory of democracy which will be addressed further down in this article.

## 2.3 Community democracy

The model of a community democracy maintains relations with the integrative theories of liberal democracy, in so far as it places emphasis on the collective dimension proper to communities and in detriment to individual interest. Public discourse is seen as main mechanism of integration: "In a democratic society citizens are linked together by open dialogue and public debate taking departure from a shared sense of connectedness and collective identification" (Sørensen & Torfing, 2007, p.241). Community democracy derives from the criticism of competitive or economic democracy, which "ignores the centrality of a bourgeois-humanist tradition: that any form of free (non-despotic) government demands a strong identification from part of the citizens" (Taylor, 2002, p.15); apart from necessity of "a strong sense of belonging to the political community, shared by all" (ibid., p.31).

Thus, although, in accordance to Taylor (ibid, p.21), the first democratic condition is "*unity*", he even so sustains that the state is not anymore in conditions to play this unifying role of ensuring group identification, i.e. "(the) identification that defines the group of individuals that belong to a given polis" (Sørensen & Torfing, 2007, p.241). Therefore, it's up to the modern democratic society to define its collective identity, "a difficult and never to accomplish task" (Taylor, 2002, p.33). The demands for the members of a community are consequently quite high, as the citizens have to act in different contexts and scales, from the local level of the neighborhood to the global, where he is supposed to engage in discussing and solving planetary problems. According to Michael Sandel (1996[4], apud, Sørensen & Torfing, 2007, p.242), "such a politics requires citizens who can think and act as multi-situated selves. The civic virtue of our time is the capacity to negotiate our way among the sometimes overlapping, sometimes conflicting obligations that claim us, and to live with the tensions to which multiple loyalties give rise".

Thus, the main challenge consists in the construction of democratic institutions able to promote a process of constructing collective identities and orientations in a context of growing identity fragmentation and diversification. In accordance to Sandel and March/Olsen[5], it becomes crucial the

[4] Sandel, Michael J. Democracy's Discontent. America in Search of a Public Philosophy. Cambridge: Harvard University Press, 1996.
[5] March, James G.; Olsen, Johan P. Democratic Governance, New York: Free Press, 1995.

dissemination of "reasoned debate (that) leads to the construction of shared stories of past, present and future that render meaningful collective behaviour possible" (Sørensen & Torfing, 2007, p.242). By means of such narratives democratic rules and norms are constructed, as well as "logics of appropriateness in and between political communities" (ibid.). Thus, it's up to democratic institutions to contribute to the establishment of bridges between political identities, narratives and communities, creating conditions of political and democratic citizen empowerment. The risks related to such kind of approach is related to the possible exclusion of identities and minority groups from such dialogues, that some become empowered, whereas others end up disempowered, withdrawing from the public sphere and from collective dialogue; that is, there are risks of a relapse to traditional community practices, more hierarchized, insensible or ignorant towards diversity and towards social and cultural minorities. Difference, thus, should not be envisaged as something menacing community, but rather as a "welcome addition" (Taylor, 2002, p.42), which enriches the community itself: "We are intended to understand each other, and this mutual understanding is growth and fulfillment" (ibid., p.44).

## 2.4 Agonistic democracy

Agonistic democracy turns against consensus-oriented approaches, which often ignore, from this perspective, the existence and centrality that political conflicts play in the advancement of democracy. It combines a democratic perspective of conflicts with a cultural understanding of the nature of human action. Instead of transforming enemies in comrades (consociational model), advocates of an agonistic model of democracy as Chantal Mouffe[6] and William E. Connolly[7]), defend the pursuit of institutional arrangements and political practices which provide legitimate forms of expression for such conflicts, and that allow for an emotional confrontation, open to diverse groups with different identities, ideas and interests. For Mouffe (2006, p.173), antagonism has an ineradicable character, whereas liberal democracy had neglected the decisive role of political discourse in politics. This discursive power shapes the identity of actors, their worldview and the scope of legitimate action and, thus, has to be regulated democratically. The approach likewise turns against competitive democracy insofar as it contests the idea that political agents are basically moved by rational cost-benefit calculations, and instead stresses that "politics consists of battles between competing discursive images of society, its borders, and the identity of those inhabiting it" (Sørensen & Torfing, 2007, p.244). The main task of democratic institutions therefore consists in "transforming antagonistic friend-enemy relations into agonistic relations, whereby people disagree on substantial and procedural issues but respect one another's right to voice dissimilar opinions" (ibid.).

Albeit recognizing the centrality of political conflicts, agonistic theory places emphasis in negotiation, as this compels hostile actors to communicate, and by that way, getting a more nuanced comprehension of the other, bearing therefore resemblance to Young's communicative democracy. Connolly, in a recent book, highlights "heightened patterns of sensitivity", "the creative element in social movements and democracy", associated to a "politics of democratic activism situated on several sites" (Connolly, 2013, pos. 416 e 484), as essential aspects to counter "neoliberal fantasies". Emphasis is given to the emotional confrontation of adversaries – groups with different identities, ideas and interests – what determines the possibility to reach "conflictive consensuses" (Mouffe 2007, p.69).

Notwithstanding the similarities to Young's proposal regarding the expectations related to deliberative and communicative processes, the main difference of the "agonistic perspective" consists in the expectation regarding the possibility of "a profound change of existing power relations and the

[6] Mouffe, Chantal. The Return of the Political. London – New York: Verso, 1993;
_____. The Democratic Paradox. London – New York: Verso, 2000; ver também: Mouffe (2007).
[7] Connolly, William E. The Ethos of Pluralization. Minneapolis: University of Minnesota Press

creation of a new hegemony" (ibid, p.70). In conditions of high conflict potential, the best protection against totalitarism would be the recognition of the political and contingent character of the common good. Hence, agonistic democracy advocates the repoliticization of democratic decision-making processes. The limitations of this approach might be more related to the maintenance of such agonistic situations – always bound to given conflict situations – whereas an unduly conflict aggravation could imply in the return of antagonistic "friend-enemy" relations, bringing about further destabilization and augmented societal violence, as for instance recently witnessed in Brazil. By contrast, there could also occur a transformation of such agonistic disputes "into rational technocratic problem-solving discourses that evaporate any chances of democratic contestation from competing discourses" (Sørensen & Torfing, 2007, p.245).

## 2.5 Comparing the theoretical approaches

This very brief revision of some of the approaches of post-liberal democratic theories, based to a large extent on the proposal of Sørensen and Torfing (2007), represent a first attempt to systematize theoretically these different approaches in order to guide our reflections about the democratic conditions of development processes aligned with the principles of sustainability. Albeit a quite significant range of differences and divergences identified in these theoretical concepts of democracy, there are likewise several overlaps and possible approximations which allow to establish a dialogue between these theories, making the interfaces between them possibly the most interesting aspect of such a conceptual confrontation.

Despite a clear emphasis on the calculist dimension of both the competitive and the outcome or substantive democracy – the latter maybe to a minor degree – cultural aspects cannot be totally neglected as there is evidence that the ideological discourses influence the structure of interests of the involved agents, the sub-elites (Etzioni-Halevy) or the collective organizations of society (Hirst). The competitive democracy, on the other hand, is also related to "*outcome democracy*", once the main argument Schumpeters in favor of competition within the political realm – therefore its characterization as economic theory of democracy – was precisely its alleged superior efficiency in generating results, that is, in promoting governability (Lenk, 1972, p.40).

With regard to *outcome democracy*, it is also obvious that the capacity to create desired results (Fung & Wright) by means of cooperation depends in turn upon cultural conditions, the dominant discourses in society, and upon the values disseminated by those discourses. By the same token, the negotiation about how to understand justice in the realm of communicative democracy and the development of a sensitive capacity concerning differences and the other (Young), depend on an intercultural approximation which requires more than rationalization, but rather involves capacity of empathy and thus cultural transformation.

Correspondingly, more culturalist theories do not reject completely the question of interests, rather they understand them as being part of the cultural dimension. It seems quite reasonable to assume that in societies of a more individualist culture – we can take as example the Anglo-Saxon cultures – calculist rationality has a major weight in politics; and certainly it's not mere coincidence that the theories of rational choice gained more followers and dissemination in this cultural context, whereas in more collectivist cultures, the cultural particularities of each nation or community should have a greater explanatory force to understand the dynamics and characteristics of political processes. Hence, agonistic democracy does not ignore the importance of negotiation and, consequently, the possibilities of reason in politics. The maintenance of continuous discursive contestation and the struggle for an alternative hegemony might inclusively derive from rational and conscious considerations, above all in heterogeneous societies, from part of minority sectors or from those sectors at the lowest level of the

social pyramid, insofar as such an emotional confrontation might be considered the most effective and maybe the only way to achieve their instrumental goals.

At the same token, the adherents of community democracy might recognize the need to resort to arguments of an instrumental and interest-oriented rationality, inasmuch as the set of values that assumingly unites the community turns out too fragile and civic virtues not sufficiently developed in order to achieve the desired consensuses. The *individual interest properly understood*, in the terms of Tocqueville, seems to provide an adequate basis for reconciling individual interests with collective interests or goods.

## 3. Strategic approaches of democratic sustainable governance

In view of such complex interrelations we want to suggest a distinct typology which considers specifically the challenges of sustainable development and which therefore starts from three different strategic approaches of democratic governance aiming at sustainability, that is, three possible paths to sustainability under democratic conditions, all of them attempting to avoid the authoritarian path for sustainability as conceived by authors like Ophuls (1977) with his conceptions on ecological authoritarianism.

The first proposal, more aligned to the *status quo*, and certainly the hegemonic model in contemporary democracies, we could denominate as of democratic-ecological modernization. This approach originates from liberal democracy and from the principle of instrumental rationality, but assumes elements of competitive post-liberal democracy, by valuing the involvement of new sub-elites (Etzioni-Halevy), whether they are representatives of universities or generally from civil society, or representatives from the productive sector. The knowledge and resources such actors potentially contribute with, as well as the influence they exert are seen as crucial to attain democratic-ecological modernization in view of the challenges of sustainable development. The approach incorporates also elements of deliberative democracy, the negotiation of consensuses, at least inasmuch as they do not contest the structural fundaments of capitalism and representative democracy. These are considered the pillars of progress and development. In the field of sustainability, this position corresponds to what Lee (2006) dominated as classical environmentalism, put into practice with relative success in the developed countries. The emphasis is placed on the advancement of "technological solutions and mitigations that permit the economic activities to be continued, while avoiding or limiting the damage to humans and ecosystems" (Lee, 2006, p.15). Thus, the mitigation of such local environmental problems is directly related to the enhancement of wealth in those countries (Lee, 2007, p.13) and does not call into question the foundations and the basic guiding principles of contemporary capitalism. Concerning global ecological problems, it is yet a limited strategy as it does not allow thinking in solutions for the transformation of our current predatory and unsustainable lifestyle.

In accordance to Jänicke (2001): "the concept [of ecological modernization] describes, in its original version, the huge segment of possible environmental improvements which could be achieved by technological progress going beyond end-of-pipe approaches, but without involving more far-reaching structural solutions". In contrast, the two other approaches aim at structural changes of the existing system, considering the current political and economic systems limited for facing the challenges of sustainable development, thus adopting a more radical perspective of "strong sustainability"[8]. Such a

[8] From an ecological perspective, "strong sustainability" is usually understood as the need of "keeping natural capital stocks intact over time", whereas "weak sustainability would require keeping intact the environmental functions of the natural capital, both human and natural. With weak sustainability, future generations would just need to inherit the same productive functions of a particular exhaustible resource, but not the resource itself" (Vojnovic, 2014, p.534). Compare hereto also Rydin (2008, p.583), who calls attention that within the notion of weak sustainability prevails the idea of "unlimited possibilities for compensating for environmental costs or losses through economic growth. Investment in other forms of physical and indeed human capital can be

more radical approach is considered inevitable for guiding the restructuration of the economic system and bringing it in line with the requirements of a sustainable future.

A crucial difference between the two transformational approaches is that the first one, that we might call dialogic-consensualist, places emphasis on the possibility of qualitative enhancement of political negotiation and decision-making processes by means of participatory and inclusive institutional arrangements. It aims at creating new procedures, which are open, transparent and facilitative, in order to establish an effective democratic process where different visions encounter space of expression, and to provide consensuses and agreements, and thereby respecting the differences and diverse perceptions of their co-citizens and of future generations. Thus, it is understood as transformation pushed forward by the social forces themselves, a process that comes into being internally, that counts on humanity's rational capacity of negotiation, but that doesn't exclude emotion as a rational and fundamental resource in seeking the common good. The approach differs from the approach of democratic-ecological modernization, by considering in its perspective the possible and necessary transformation of the socio-economic systems in view of the recognition of the limits of both capitalism and contemporary democracy. As the presence of nature and of future generations is impossible at the table of negotiations, the institutional arrangements have to ensure de effective presence of their legitimate demands by means of "negative coordination" (Scharpf, 1992, p.2), for instance, by intermediation of environmental movements supposed to assume ecological demands in deliberative processes.

Hence, emphasis is given to the overcoming of conflicts, nourished by the approaches of substantive and community democracy, but above all is part of the movement of the "deliberative turn", which from the 1990s onwards gained strength within democratic theory as a concept that aims "processes of judgment and preference formation and transformation within informed, respectful, and competent dialogue" (Dryzek, 2010, p.3). According to Young, it foresees the incorporation of the dimension of justice or, applied to ecological sustainability, of ecological justice, being thus in line with Dobson's concept of ecological citizenship (Dobson, 2007). The notion of ecological citizenship articulates the dimensions of interests and values. This extended concept of citizenship can be considered a promising mechanism to guide negotiation processes able to supplant habitual processes moved only by particular interests by the institution of new practices for the incorporation of common goods and of the interests of future generations or, within a less homocentric perspective, of the rights of nature itself. In this sense, the deliberative approach nourishes hopes related to the possibilities of our political systems to achieve, by means of dialogical discourse and supported by the principle of reasonability, overcoming our traditional anthropocentric view and substituting our predominant ethic of the presence through an ethic of the future, as conceived by Hans Jonas (1984) in his "principle of responsibility".

The third approach, that I denominated a strategy of conflictive-contesting or disputatious transformation turns out to be quite skeptical concerning the dialogic-consensualist perspective with its beliefs in rational consensuses, dialogically agreed, which at the same time should be able to transform substantially restrictive structural hierarchies. Within this disputatious perspective, the overcoming of socio-ecological conflicts requires necessarily an emotional and competitive confrontation, the building of counter-powers able to promote alternative hegemonic proposals. Though this substitution of the hegemonic model by a counter-hegemonic model must not occur by revolutionary means, but it's perceived as the result of processes of conflictive negotiation, of

---

used to trade off environmental degradation. Thus, development in a rare ecological habitat can be compensated through creating other habitats or nature conservation features elsewhere". Here I adopt these concepts less focusing on its strict ecological meaning, but rather in a strategic perspective distinguishing strategies that aim basically to remediate and mitigate development-conditioned environmental problems (weak sustainability), from those strategies that intend to face and combat the structural contradictions of the political and democratic system, as well as the economic system of contemporary hyper-capitalism (strong sustainability), aiming thus to overcome the current predatory and unsustainable development path.

emotionally conducted confrontation, even though it involves processes of convincing, seeking favorable political conditions for the implantation of a counter-hegemony.

This proposal is definitely more aligned with the agonistic perspective, but finds likewise support in competitive democracy, in the idea of the importance of sub-elites, or counter-elites, or of civil society organizations, whose role should be considered crucial for the advancement of counter-models or of a different hegemony of development, in the same way as the principles of environmental justice and the empowerment of minority groups (outcome democracy) and the valuing of multiple identities and values (community democracy), have major relevance in seeking new democratic hegemonies.

In terms of citizenship, contesting concepts seem to arrive at restrictive dilemmas insofar as citizenship "in its primordial and basic sense, [...] implies in living in a nation state and having a commitment with it, with the rights and obligations considered appropriate in this particular system". It's expected a significant degree of identification and engagement of the citizen in his community: "it's expected that the citizen is taking part in the culture, which generally is supposed to be proper of the community" (Heater, 2007, p.262).

Proposals as Holston's "insurgent citizenship" (Holston, 2009 e 2013) are incompatible with the conception of liberal republican citizenship as it places emphasis in the daily struggle of survival and for a decent life in the peripheries of our huge metropolises. The exercise of such an insurgent citizenship appear in "circumstances of degradation and peripheries" (Holston, 2009, p.247), that is, it's related to a struggle seeking the right for the city, focusing on the locality, but evidencing limits in view of the necessity to think the multiple scales, which have to be considered by contemporary concepts of citizenship (Dobson, 2007; Heater, 2007).

A contesting form of citizenship that comprises the fundaments of ecological citizenship, has to recognize the historical condition of citizenship, which "in its origin, and, without any doubt, during the main part of its history, was basically the hallmark of an elite" (H, 2007, p.260), and therefore should value the growing extra-institutional struggles of local movements as well as the new patterns of mobilization from the part of the social and popular movements, more and more interconnected by new technologies. These act frequently at the margin of traditional civic spaces, or at the interface between the state and society, in different scales, from the local to the global, oscillating, as Scherer-Warren (2006) puts it, between collaboration with state agencies in formulating and implementing public policies, and the exercise of autonomous pressure on state structures.

"Building networks of movement networks and of plural identities, thus, radicalizing democracy from the local levels to the regional, the national, until the transnational in direction of planetary citizenship" (Scherer-Warren, 2006, p.119), seams the most promising strategy for the exercise of a collective and contesting form of citizenship seeking counter-hegemonies of development, or, in accordance to Michael Löwy (2005, p.53), "a new mode of alternative life, a new, eco-socialist civilization, beyond the dominance of money, of the consumption habits artificially induced by publicity, and the infinite production of goods harmful to the environment".

## 4. Final Considerations

Our capacity to adapt to the new political and democratic challenges that are proper to contemporary society, especially those associated to the conditions of risk society and to the requirements of sustainable development, is related, first and foremost, to our capacity to conceive new normative theories – and therefore new practices – about democracy able to provide new guidance for the inevitable institutional and procedural reforms which should allow us to bring forward and to

incorporate the worries about the common good and the survival of future generations, of humanity itself, in our daily practices of political decision-making and territorial planning; and that in all levels and scales, from the global to the local.

The success of such a paradigmatic change depends on the capacity of our societies to mobilize the main agents, the multiple knowledge resources, and diverse reflective and executive competences in order to enhance our capacity to imagine and conceive new sustainable modes of development and to implement them by means of new collaborative practices and against resistance associated to the destructive capitalism which prevails among us.

In this paper we discussed several democratic concepts that share convictions around the limits of the traditional institutions of representative-liberal democracy in attending the demands of a new form of development associated with the basic principles of sustainability, and the perception of the necessity of an ineluctable addition of post-liberal democratic practices of governance to the traditional institutions of representative democracy.

In spite of their different emphasis, these theories denote similarities and convergences and, at the same time, represent different ideological convictions and different expectations concerning the most adequate democratic strategies and the degree of radicalism to be necessary in order to handle efficiently the future challenges related to sustainability. It seems appropriate to assume that the specific empirical context where the different theories have been developed influenced the interpretation that each theory makes regarding (1) the need to go beyond democratic and ecological modernization – which turned out to be a relatively successful strategy at least in the more developed countries –, (2) the expectations to achieve more substantial changes by means of deliberative negotiation processes, or (3) the convictions that such advancement is only possible by adopting strategies of conflictive confrontation.

More contesting or agonistic approaches, where civil society actors become a decisive driving force of change processes, seem particularly essential in developing countries where consensus-oriented planning and governance practices tend to generate manipulative forms of unilateral imposition of consensuses by the main dominant political and economic elites over marginalized and weakly organized and articulated social sectors or civil society groups. The promising Brazilian experiences of participatory budgeting, public policy councils and city forums implemented by several left-wing parties, committed with the concerns of the marginalized social sectors, reveal on the other hand the continuing importance of government action and political planning in order to assimilate popular protest, to create political institutional arenas able to mediate conflicts, to introduce and bring them forward and implement them within traditional formal institutions. Here the role of sub-elites and civil society organizations became more and more essential for exerting political control and, in a Habermasian perspective, to exert pressure on and propel the central political system to incorporate demands and discourses occurring in a civil society driven public sphere. The importance of these intermediating actors – individual and collective – became evident when, due to the passing over of these agents to state agencies, assuming political positions within these left-wing governments, a process of demobilization of civil society took place, presumably responsible for the weakening of these transformative left-wing projects in Brazilian democracy. In addition, contributed to this loss of strength of these political projects, above all in the 2000s, the restricted financial and administrative capacity of local governments to implement effectively the proposals and plans elaborated with citizen participation, that is, its limited capacity to produce corresponding outcomes.

Thus, the Brazilian experience with participatory planning and management reveals the influence and explanatory relevance of the different post-liberal democratic theories and the necessity to adopt an

analytical perspective that takes into account these different theoretical approaches, exploring them concerning their specific contributions to understand concrete empirical planning and governance practices.

Hence, instead of seeking to identify a major theory able to interpret the entirety of the possible empirical fields, the different post-liberal theories form a general framework of reference that allows us to better understand and analyze the complex reality of democratic processes, involving interest, cultural values, conflicts, deliberation and negotiation. The three groups of theoretical concepts regarding democratic-environmental strategies – democratic-ecological modernization, dialogic-consensualist transformation, and conflictive-contesting transformation – could give support to a process of systematization of empirical experiences and permit verifying progress and limits of empirical processes related to their capacity to incorporate concerns related to the common good and the survival of future generations in our daily practices of political decision-making. Here, there is still much empirical research to be done. We hope that our theoretical framework may serve as heuristic reference for future research projects on democracy-environment interdependencies in local environmental governance and planning studies.

# MIXED RENEWAL IN LOW-INCOME COMMUNITIES: A CASE STUDY OF JIANGJIABANG IN SHANGHAI

Xinyue Gan[1], Jianbin Chen[2]

[1]College of Architecture and Urban Planning, Tongji University,ganxinyue@outlook.com
[2]College of Architecture and Urban Planning, Tongji University,chenjianbin1989@hotmail.com

Keywords: Community Renewal, Gradual Renewal, Low-income Community

**ABSTRACT**: *Many low-income communities have been lagged behind in the tide of development in Shanghai. With its huge scales and the complex inhabitants, low-income communities have a flood of impediments in its regeneration. Jiangjiabang is part of them.*

*This article presented a comparative analysis of the advantages and drawbacks between government-led big scope radical renewal and community-led small scope gradual renewal. After the field investigation, the author took comprehensive consideration of the features of the two methods, the physical situation and social demands of residents in Jiangjiabang.*

*The research demonstrated that because of the problems like the oversize scale, the complicated property right and social network, government-led big scope radical renewal was not suitable in Jiangjiabang. Simultaneously, the troubles like the low income of the residents and the weak forces of community organizations made the community-led small scope gradual renewal cannot be adopted either. Hence the gradual renewal which is run by government and operated by community organizations is much fit for Jiangjiabang.*

*The role of the government in the renewal process is the guide, the encourager and master planner, promoting separate renewal of the dweller and keeping the consistency of the regeneration. The role of the community organizations is the operator, participator and adviser, being involved in the renewal process and influencing the decision of government, guaranteeing the diversity of the development.*

*Consequently, creative renewal model should be invited to deal with the particular case when face low-income community renewal problems. In this way the complex problems can be resolved.*

## 1. Introduction

### *1.1. Background*

Urbanization is an inevitable process of human progress. Along with the urbanization process, the modernization goals would be realized. At present, the urbanization process in China has been

accelerated, reached the take-off line of the high-speed urbanization. The outline of 12th Five-year Plan has proposed to improve the layout and form of the city, and strengthen the management of urbanization. However, the faster the developing speed is, the more problems will be exposed. In the current urban development, low-income communities like "city village", "shantytowns" have been in the spotlight. These low-income communities mainly appear in megacities (such as Beijing, Shanghai, Guangzhou, etc.) with high-speed development.

*1.2. Definition of low-income communities*

Low-income community refers to the community where most of its inhabitant have income much lower than the average income level of the city. In other words, most of them are living at the bottom of society. Because of the low income, these citizens cannot afford some basic living environment, they can only chose these low-income communities to live which have terrible environment with some social problems (Mingfeng Wang, Xiaoling Lin and Yuemin Ning, 2012). The typical examples of this kind of low-income communities are ‘city village’ and ‘shantytowns’.

‘City village’: During the process of urbanization, because of all or most of the cultivated land being requisitioned, the residents transformed from peasants still live in the original villages which then turn into residential areas. Therefore, from the narrow sense, "city village" refers to the rural villages, also known as “village within urban area”. From a broad sense, during the high-speed process of urban development, "city village" refers to the residential areas behind the pace of development, free from the modern urban management and with low living standard.

‘Shantytowns’: it refers to the area in the scope of urban built-up area with high density bungalow, long service and poor housing condition, small per capita building area, insufficient supporting infrastructure, big problems in security and fire hazard, inconvenient traffic and poor environmental hygiene. In Shanghai, when we say "shantytowns", it means the region which belongs to the city area originally but now develops slowly with nature of the shantytown areas.

This article will mainly discuss the renewal of the second type of low-income community.

*1.3. The basic renewal model of low-income communities*

The renewal of ‘shantytowns’ is one situation of old city renewal. In China there are two kinds of renewal model for old city: one is government-led big scope radical renewal and another is community-led small scope gradual renewal. Government-led big scope radical renewal refers to the renewal which have large scale, high speed and integrity. Community-led small scope gradual renewal refers to the renewal which mainly done by the user with their own purpose for use. Both of them have their own superiority and deficiency and both of them are adopted in different places. Which model is suitable for the renewal of low-income community is the core content of this article.

### *1.4. Situation in shanghai*

As one of Chinese extremely crowded cities, Shanghai has a large concentration of external population and there are a considerable number of migrant workers come into the city to make a living. Low-income communities with low rent and low living expenses have become the main settlements of these new immigrants. However Shanghai, as the leading of economic developed city of China, has a variety of high-end industries gathered ((Mingfeng Wang, Xiaoling Lin and Yuemin Ning, 2012). While it also has a huge problem in its low-income communities. These problems is the stumbling block hindering the further urbanization of Shanghai. Therefore, solve the problems in low-income communities can help shanghai to promote its urbanization. In other hand, although the renewal of low-income community have been discussed for more than 10 years, and both the government and citizens wished to start renewal as soon as possible, the renewal didn't start even now. The reason for this situation is complex. This article will study Jiangjiabang, a low-income community in shanghai, as a case study to discuss how to solve its renewal problems.

## 2. Methodology

This article mainly adopted two approaches to do the research: comparative study and field research.
The article will firstly do a comparative study with government-led big scope radical renewal and community-led small scope gradual renewal to find the superiority and deficiency of them. Through this comparison, the article will find the special apply condition for each model. Secondly, the article will present the result of field research of Jiangjiabang and sum up the feature of this low-income community. Finally, according contrast between the apply condition of renewal models and the feature of Jiangjiabang, the author will discuss the suitable model for its renewal.

## 3. Two basic model of urban renewal.

There are two basic model of urban renewal in China which are government-led big scope radical renewal and community-led small scope gradual renewal.

### *3.1. Government-led big scope radical renewal*

#### *3.1.1. Definition*

Government-led big scope radical renewal is a kind of renewal launched by government. Government will firstly decide which land need to be renewed. Some experts will participate in this process. And then they will invite some urban planning companies to prepare urban planning project. With this project, they can reuse these land. This model have some features. Firstly, most of lands in this model will be totally demolished to support empty land for rebuilding. After rebuilding, almost all of the construction in this land are completely new. Secondly, government dominate the whole progress. The government led every step of the renewal. Thirdly, government always cooperate with developer who have profit purpose. Government can get money from developers by approve the right to use land for them, and

developers can get money from estate development. Finally, because the goal of the government is clear, they can easily to make decision. Therefore it will just take a short time period for the renewal of a large scale land.

*3.1.2. The superiority and the deficiency of government-led big scope radical renewal*

This model has been widely adopted in China. At the initial stage it achieved great results, but along with the development of cities, an increasing number of problems exposed. Many scholars have also conducted a number of studies on this topic. They got the superiorities and deficiencies of this model. In particular, it mainly includes the following aspects.

*Superiority*

Firstly, it makes urban develop rapidly. As mentioned above, due to the clear purpose of this model, governments can exercise their rights to promote renewal of a particular urban area in a short period of time. By this way it will speed up the metabolism of the city. In this process, the most terrible environment of the city can be improved fast. Therefore the development process of the city can be speeded up. Secondly, it can bring a good economic benefit. Due to the scarcity of urban land, large-scale radical renewal will undoubtedly make the land of old city can be used again. Redevelopment of the land can bring a good economic benefit. Thirdly, the new region constructed by the method will have good integrity. In practice, old city area which needs to be update will be given to one or several teams to design, so that the landscape of the entire region would look without too much chaos. They will have similar styles. This also helps to maintain the integrity of the city and solve some municipal issues on urban scale.

*Deficiency*

Firstly, it break the process of urban development and undermined urban development history. In the process of renewal, the landscape of the cities which have been formed in decades can be completely changed in one or two years. You can find nothing about the traces of the urban development in the new area. This kind of model have created a number of rootless city. Secondly, it takes a lot of start-up capital. The areas which adopt this model often have a large scale with a lot of people living in them. If you want to use the land for large-scale radical renewal, you must relocate all the people living in this land. Therefore it need a large amount of capital to compensate them. This situation will become even worse when face some special land with problems of estate rights. Thirdly, it impacts on the lives of lower level citizens. The objects of the city renewal tend to the place which have poor environment or old facilities. However, these areas are low-cost areas in the city and most low level citizens living in them. After big-scale racial renewal, these area will become expensive areas like wealthy neighborhood. The low level citizens will lost their living environment. Finally, it will separate social networks and damage social vitality. A healthy city is bound to have good interpersonal networking rather than strange feelings and inhospitality. The old city always have some social networks or neighborhood relationships which establish with a long period of time. Nevertheless, the big-scale racial renewal will inevitably lead to large-scale evictions. In this process, these social networks and neighborhood relationships will disappear.

### *3.1.3. The current situation in China and its reason*

The governments of China have partiality for government-led big scope radical renewal. We can see that many cities adopt government-led big scope radical renewal even though it bring some problems. There are four reason to explain this situation.

Firstly, this model have obvious market competitive advantage. On one hand, the capital problem have haunted governments when they face urban renewal problems. The local government will have a lot of financial pressure if they are at their own expense. Hence they need to seek money through the ways like real estate development (Jie Zhang and Jun Pang, 2009). On the other hand, the scarcity of old city land indicate its inherent economic value. However, the developers who pursuit maximizing profit will definitely become the chaser of old city land. They will look for opportunities to acquire land and use their funds for land development for interest returns. According to this, the government who have demand for funds and the developer who pursing profit will cooperate inevitably. There is no doubt this alliance will chose to adopt government-led big scope radical renewal which is much easier and faster to maximize their profit. Secondly, the assessment mechanism of government impelled the government to rely on big scope radical renewal(Jie Zhang and Jun Pang, 2009). In China, government is the absolute power to effect urban renewal. If there are some external negative factors impede the smooth progress of a project, the government will overcome all difficulties to ensure the renewal with its force and authority. This behavior occurs because of the current government assessment mechanism, which often regards revenues, urban landscape as the basis for assessment. Government hopes to change the face of the city dramatically in a short time to get better assessment results. This mechanism led to the government relies on big scope radical renewal to reflect achievements. Thirdly, tax distribution system of China makes government more like big scope radical renewal. Tax distribution system means that lower levels government must hand over their received tax to the higher authorities level by level. That is to say, financial rights go up, while the execution responsibility go down. In other words, the local government must finish their city management with litter revenue(Jie Zhang and Jun Pang, 2009). In this case, governments will rely on big scope radical renewal with which governments can get land revenue by land auction, real estate development. Finally, the lack of public participation contributed to the big scope radical renewal. During the actual renewal process, due to the lack of public participation and its incomplete associated regime, local government were free to command their powers according to their own cost-benefit and maximize its benefits. The authority transferred from the representation of ‘public good’ to "economic man" that make government put profit at first instead of ‘public good’ when they facing the old city renewal problems. That’s why the big scope radical renewal can always be executed.

## *3.2. Community-led small scope gradual renewal*

### *3.2.1. Definition*

Community-led small scope gradual renewal is a kind of renewal which aim is to return to the original development status of a city. That is to say, someone who live in this city want to improve their living environment after they have enough economic strength or their offspring want to enhance their quality

of life after they get better education, they will try to renew their own house.

This model also have some features. Firstly, nobody will force the residents to renew their own house therefor the leading role of this model is the residents who live in communities. Sometimes these residents will establish an organization to integrate different ideas and manage the renewal. Secondly, since the desire of renewal is come from the residents, they must pay for their own. Thirdly, it is impossible that all of the residents in a community have desire to improve their living environment at the same time, thus it will take a long time and it is a gradual process. Finally, it is easily to see the history of the land in this model for the change is not accomplished at one stroke.

*3.2.2. The superiority and the deficiency of community-led small scope gradual renewal*

Due to a series of problems brought by big scope radical renewal over the years, many scholars began to advocate to adopt small scope gradual renewal which make urban development return to its original rule. This small scope gradual renewal also have their advantages and disadvantages.

*Superiority*

Firstly, compared with the big scale radical renewal, it is cheaper and more flexible. The main body of this renewal is the occupants themselves, therefore the scope of update should be very small, without too much effect to other people around. The renewal of a single small unit will significant more economical than big scale renewal. Simultaneously, these changes are small, if they are not as you wish, it is much easier to make corrections. That is why it is more flexible. Secondly, it facilitates public participation. Community-led small scope gradual renewal was principally initiated by community members, and even the Community Management Department also represents the wishes of community members. Due to the small scale, the wishes of the people can be easy to collect and easy to coordinate. In this process, therefore, the degree of public participation is also much higher than big scale renewal. Thirdly, it can be economical to meet the residential requirements. this model change the living environment according to the wish of residents and use the money of themselves, therefore they will make most use of their money to satisfy their own needs instead of waste of them. In this case, some unnecessary functions and spaces will not be produced. Finally, it can protect urban historical environment. This model is a gradual process, thus the shape of the city which formed in a long period of time can be kept for a long period of time, too. When you see the landscape of the city, you can find many traces of history. These superiorities happen to be scarce in big scale radical renewal. However, it also have some special imperfections.

*Deficiency*

Firstly, it is a long term process. As previously stated, since this is a dispersion regeneration pattern, each resident are updated their living environment only when they are in need. Not all of the household are able to have demand at the same time, and the demand categories and cycles of different residents are multifarious. The time for completing the renewal of individual unit is short, while it will take a long time to update the whole region. Secondly, the integrity of this model is not enough which can easily lead to disorder urban landscape. Every resident have their own idea of their idea living environment.

Therefore this model with rely on residents can create a variety of landscape in different units which can easy cause disorder. Meanwhile, since everybody will just care about themselves, many public problem cannot be changed during the renewal process. Thirdly, funds are limited, the transformation may not be ideal. This model mainly depends on the personal or community property. It relieves a big burden of government, while because of the limited financial resources of individuals or communities, many renewal projects cannot be immediately enforced or using cheaper materials which cannot get satisfactory result. These deficiencies are the reasons why the community-led small scope gradual renewal is rarely used by cities.

*3.3. Apply conditions for two models.*

Neither of this two models are perfect, while in some cases the big scale radical renewal is more suitable than small scale gradual renewal, and in other cases the latter is better. There for they both have some apply conditions.

*Conditions for government-led big scope radical renewal*
Firstly, even though this is a big scope model, the scale should not too big. The too big scale need too much star-up cost and it will have more significant subversive to the urban environment. The bigger the scale, more obvious the deficiency of this model will be. Secondly, the environment problem of an area is too serious to wait. When the urban environment of a regional is too bad, the living standard of the residents needed to change as soon as possible, no one wants to wait a long time to gradually repair the urban environment by gradual renewal. At this point, the radical renewal is much suitable to be adopted to change the status quo. Thirdly, some important urban point which have high requirements of integrity need big scale renewal. Some point of the city have important location, but it have no symbol building or landscape in the past that need to create in the process of renewal. At this time it will have high requirements on the integrity of the landscape. This demand cannot be meet by gradual renewal.

*Conditions for community-led small scope gradual renewal*
Firstly, when the government don't have enough capital to do the big scope radical renewal, they can adopt some policies to encourage individuals or communities to use gradual renewal.
Secondly, if community organizations in the region is good, motivated, and the inhabitants have positive view of renewal, using gradual renewal will be better. Thirdly and the most important one, is that if the region has retention value, like it reflects an era of architectural features, it has some other irreplaceable role in the city or its construction quality is good, bulldozing and rebuilding is not only costly, but also not conducive to the sustainable development of the region.

## 4. Case study: Jiangjiabang

Jiangjiabang is an existing typical low-income community in shanghai. It is an old neighborhood which was began to build in 1957. In 1970, majority of these buildings are belonging to factories as dormitories. Then with the pass of time, the slow development of this region makes it lag behind the overall

development of Shanghai. And with living personnel changes, the living condition gradually became terrible. The government said that demolition and resettlement may take place in 1996. However, no demolition operation for big scope radical renewal have been taken until now. This area do have some special features.

### *4.1. Physical environment of Jiangjiabang*

*Location*

Jiangjiabang located near Kunming Road of Shanghai, China. It is about 3 km far from wujiaochang which is a subcenter of Shanghai. It have convenient transportation with two subway station near it.

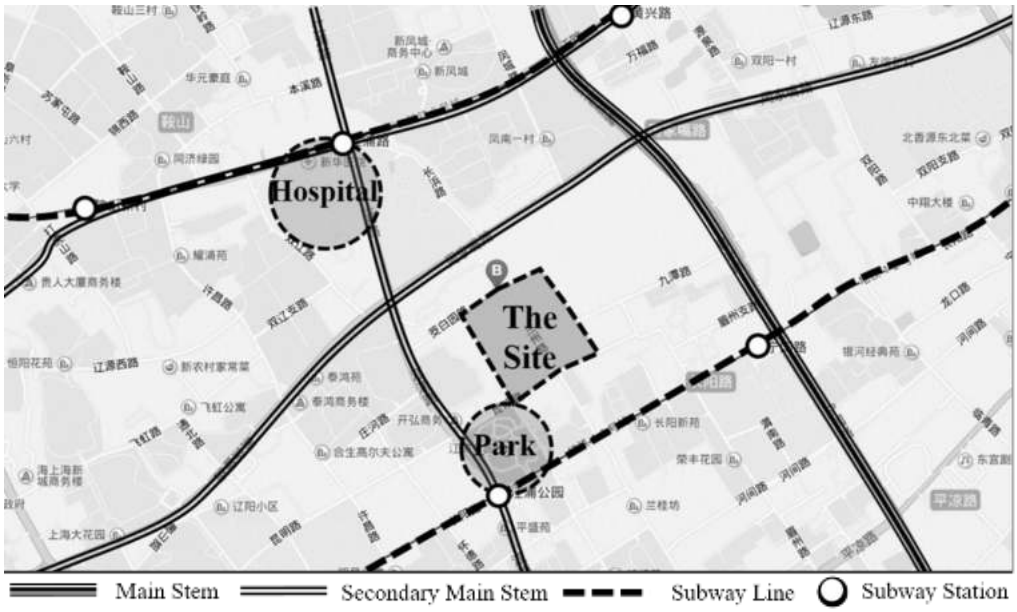

Figure 1. The convenient location of Jiangjiabnag

We can say, Jiangjiabang do have a convenient location. Therefore, living here can effectively save transportation cost. It will also have a large number of customers if doing business around it. Because of the location, it is also easy to buy all kinds of life necessities. As a consequence, this kind of places which have high land value and good location advantages but low living cost are undoubtedly the best choice the migrant workers and other immigrants.

*Scale*

The area of Jiangjiabang is 8.8ha which is equivalent to 13 times the size of standard stadium. It seems not too big in the city scale of shanghai. However, because of the living density of this region is high, it involves a large population. The high density can be seen from map. We can Assume that each House for 3 persons (in fact more), you can imagine how many people are living here.

*Living environment*

*The crowded street environment:* Since Jiangjiabang has been built for a long time, the size of spaces and streets cannot meet the modern way of life. For example, the crowded streets, narrow space, poor accessibility and pavement quality, as well as the filthy surroundings with huddle of wastes, all of this have reflected that Jiangjiabang is short of public space, and its quality need to be improved.

(1) *The uncomfortable housing environment:* The buildings in Jiangjiabang are mostly bungalows with one or two floors. They have characters as small areas with small width and depth, high density, messy and old appearance, disordered illegal structure, safety loophole, the dark and awful inner conditions, shortage of individual privacy with the windows and doors opening toward the streets. Thus, the housing environment is urgent to be improved.

(2) *Municipal facilities:* The incomplete infrastructure: Jiangjiabang has a deficiency of infrastructure due to its history. Since the plan of removal and relocation started in 1996, the infrastructure has always not been maintained. At present, the electricity pipelines and the water system become aging, conducing to a problem of drainage. Still, there is no sewerage, so the inhabitants have to prepare the closestools themselves.

In General, you can use three keywords to describe the physical environment of Jiangjiabang: convenient location, a large number of population and poor living conditions.

### *4.2. Social environment of Jiangjiabang*

*Residents*

Two types of people live in this area: original inhabitants, with Shanghai household register, are at the bottom of the society of Shanghai because of low income; and new migrants, coming from surrounding countryside, and are working in the city. Both of them have low social status with low income, and even suffer from other social class' discrimination because they live in low-income communities. These people are difficult to be adopted by the other social classes, thus dissociate at the edge of the city classes. The isolation of living leads to a serious social segregation, and generates a lot of social problems.

*Living cost*

Jacobs wrote in her book *The Death and Life of Great American Cities*, a city can not only have new and expensive buildings ,but also some cheap and old ones, so that to meet the different needs of different people. Low-income communities like Jiangjiabang, the cheap living cost is the one of its advantages.

The cheap living cost provide migrant workers with great probability of survival opportunity and can also support for their business. Undoubtedly, it will promote this part of population transforms from the rural population to urban population, and boosts the urbanization process. It' existence undertakes the social responsibility for the survival of low-income people , makes up for the lack of the city government behavior, unceremoniously challenges to the legal order of the city and the government's credibility at

the same time.

Table 1. The Rent of the Houses in Jiangjiabnag

| | Living Condition | Rent |
|---|---|---|
| ROOM A | • Just one room<br>• Public toilet<br>• You must be the friend of landlord<br>• 1-2 person | ¥800 |
| ROOM B | • Have a kitchen<br>• Private Bathroom<br>• 2-3 person | ¥1,000 |
| ROOM C | • Better decoration<br>• Bigger room<br>• 2-4 person | ¥1,200 |

Table 2. The Living Cost of Jiangjiabnag and Other Communities in Shanghai

| Income | | ¥2500 + ¥2500 = ¥5000 | |
|---|---|---|---|
| Expense | | Jiangjiabang | Other Places |
| | Rent | ¥-1,000 | ¥-2,000 |
| | Other expenses | ¥-1,200 | ¥-2,200 |
| surplus | | ¥2,800 | ¥800 |

*Community governance problems*

*(1) Informal employment:* We found almost all people living in Jiangjiabang had no formal employment through our interviewing. The main employments of them are small businesses, including fixed stall selling in markets and itinerant vendors without license. The fixed stalls in markets are legal but have high monthly rent, which is difficult to afford by some immigration just coming to the town. Itinerant vendors have inexpensive cost but high risk for paying a fine. These informal employments lead to residents and immigrants' insecure lives in Jiangjiabang.

*(2) Insurance problems:* Because of the informal work, most of the migrants did not participate in the insurance business. As a result, once they have an accident or diseases, they will have to bear all the costs which will give themselves and their families a tremendous burden.

*(3) The children education problems:* In the survey，it was found that many migrants are mostly migrant with their spouse. Whilst their children stay in their hometown, generally becoming left-behind children without the love of parents.

(4) *The crime problems:* Because of the complex personnel, criminal theft are particularly numerous in this region. Because of the lack of the formal registration and the large number of the crime activities, coupled with low-income communities' space and environment problem, it is difficult for police to solve the troubles. This also contributed to the further rampant of theft crime.

*Community vitality*

The face of the community is not just reflected by the appearance characteristics of the physical environment. What make the person shocked is the various activities take place in the space. Rich social activities in the low-income communities naturally form the colorful city life scenes.

*Group- oriented lease:* After investigation, the author founded that the immigrants of Jiangjiabang mainly came from Jiangxi province, and most of the leasehold relations are established by the introduction of the fellow friends. This kind of Group- oriented lease make the community to be an acquaintance community.

(1) *The neighborhood activities:* Jiangjiabang have relatively rich neighborhood activities, including chatting, chess activities, square dancing, etc. These rich community activities close the distance between the new immigrants, as well as the new migrants and local residents.

(2) *Market, social glue:* Through the investigation, the author found that the market is the most vigorous area in Jiangjiabang, Interestingly, through interviews and observation, we found that there are many high-income community residents nearby come here to buy fruits and vegetables and aquatic products etc. These high-income will keep the familiar relationship with some residents. Some of them will become good friends because of the long time.

## 5. Thinking of the suitable renewal model for Jiangjiabang

### *5.1. The evaluation of Jiangjiabang for renewal*

According to the current status of Jiangjiabang, the author summed up some of the regional issues and the According to the current status of Jiangjiabang, summed up some of the regional issues in the update and features in the renewal.

Firstly, the convenient location and the low cost of Jiangjiabang attracted many low-income people to live in (Jianjun Li, 2012). If using a big-scale renewal to address this area and make gentrification to it, that low-income people will be losing their living space (Rongyuan Zhu, Limin Zhang and Xudong Guo, 2006). Secondly, once the big scale radical renewal is started, it needs to compensate for all residents for the demolition. Compensate standards are difficult to set. If based on population, some members of a family have moved to live in other places with the household register still in Jiangjiabang, therefor it is hard to come by. If in terms of area, some buildings damaged and its area reduced with years, and the area of other buildings which built out by their occupants increased. Thus it is difficult to clearly define. Simultaneously, because of the large population, compensation will also be a large government spending.

Thirdly, as said above, Jiangjiabang already have deteriorated living environment which needs to change desperately, so it cannot adopt small scope gradual renewal, because the residents who are suffering the terrible environment couldn't wait any longer (Rongyuan Zhu, Limin Zhang and Xudong Guo, 2006). Fourthly, judging from the results of the investigation, the Community governance problems of Jiangjiabang illustrated that this is a community which has short living and non-fixed residents without public security instability. This point determines community spontaneous renewal will be very difficult in Jiangjiabang. In other words it is difficult to use the community-led small gradual renewal, and must adopt specific government policies to guide. Finally, the remarkable community vitality of Jiangjiabang observed by the author in the investigation, therefore, if we adopt big scope radical renewal to remove this area, it would be huge regret of the city.

### *5.2. Mixed Renewal in Low-income Communities*

Situation of Jiangjiabang decided that it will encounter a lot of obstacles to use either model of renewal. This is the reason why for so many years, it still doesn't start renewal. And this kind of situation represent the most features of low-income communities. As described above, the aim for some scholars to suggest small scope gradual renewal is to compensate for the problems arising in the big scope radical renewal. Analysis the advantage and disadvantage of two models have proved that they are complementary with each other although they are entirely different. Therefore, how about adopt both of them when facing the issues of Jiangjiabnag. That is so called mixed renewal. This can be achieved from two aspects: physical environment renewal and renewal governance reform

*Physical environment renewal*

The first step of physical environment is to evaluate the land. In Jiangjiabang, for example, the number of people involved in is too many to handle, while the government can just manage some important part of the whole area. It needs an evaluation to distinguish which parts should adopt radical renewal while other area need to adopt gradual renewal. This evaluation must be done with holistic view. The area which can be defined as the radical renewal area can be the place where the living environment and the building quality are too bad too live any more. Or these places are suitable for the services facilities while they didn’t have in the past so that the government can adopt radical renewal to demolish these land and building facilities on them. Or these places are the key points of this area which should be rebuilt. After evaluation, the rest things can be done as the government-led radical renewal. The other zones which are not need to renew immediately can adopt gradual renewal with some improvement. Firstly, these areas should be divided into several zones to be managed by different community organizations. The municipal facilities must be maintained and the sanitation and landscape environment must improve. The spontaneously renewal of residents will be encouraged. By this way, there will be no large-scale demolition so that the government will not have that much capital pressure. However, the areas which badly need to rebuild can be renovate and the living environment of the whole area can be improved. In this process, most of the areas in Jiangjiabang can be reserved. The vitality of Jiangjiabang can be kept and the living-cost of Jiangjiabnag will not sharp jump.

*Renewal governance reformation*

Both of government-led radical renewal and community-led gradual renewal are just rely on one actor. The mixed renewal should rely on both of them. The government have four responsibilities. First one is to do overall design for the whole area to keep the right development direction of the whole area. Then, the government should make some rules for the retained areas to avoid the excessive variability which happened when the community guide the renewal process. Next, the government must guide the communities and also organize them to propose some planning for renewal. At last, the government should provide some capital assistance by direct investments or help them to develop some financial platforms or build some financial systems. The communities in fact are established by the cooperation of government and the residents. The community have two responsibilities. First one is that it must be the intermediate between government and residents which in charge of collect the opinions of residents and monitor government actions. Then it should organize residents to do some renew by themselves with some advices and sometimes provide some technical support. This way can give residents more sense of participation and sense of belonging (Zhigang Li, 2011). The role of the government in the renewal process is the guide, the encourager and master planner, promoting separate renewal of the dweller and keeping the consistency of the regeneration. The role of the community organizations is the operator, participator and adviser, being involved in the renewal process and influencing the decision of government, guaranteeing the diversity of the development. Both of them are evitable. By this way, the Jiangjiabang can have renewal with relatively strong integration. And at the same time, the degree of residents' participation is relatively high and it can also ensure that the government will not become institutions which seek nothing but profits.

## 6. Conclusion

Jiangjiabang is a typical low-income neighborhoods in currently China. Due to various reasons such as history and geography, this kind of community will meet different sorts of special issues on the actual application process of renewal. A certain model of urban renewal, in particular, which have been used successfully on many occasions, will also fail when in the face of such complex issues. Therefore, in practical application, the creative renewal model should be adopted according to the actual situation in order to effectively solve the complex practical problems.

# ACCOUNTABILITY AND RELATIONAL GOVERNANCE: THE CASE OF BRAINPORT EINDHOVEN, THE NETHERLANDS

Wei-Ju HUANG (Astor) [1]

[1] Department of Urban Planning, National Cheng-Kung University, Tainan, Taiwan,
wjhuang@mail.ncku.edu.tw

## Abstract:

*It has been argued that the new form of relational governance might lead to a substantial deficit of democratic accountability, but in previous studies less attention has been paid to what accountability is and how to systematically analyse it before announcing there are accountability deficits. In order to advance the knowledge of accountability and relational governance, this paper examines the notion of accountability and adopts a conceptual framework of public accountability established by Mark Bovens to conduct a case study of Eindhoven city-regional governance. Eindhoven city-region has been recognised as a successful story of high-tech development and its success is a result of a new form of relational governance—close collaboration between different levels of government and other parties, including high-tech firms and knowledge institutes. Major focus is put on the establishment and operation of the Brainport organizations, which perfectly represents the new form of relational governance in Eindhoven city-region. By mapping its networks of accountability and assessing its accountability arrangement, this paper finds that the degree of the Brainport organizations' accountability toward the municipal councils differs from municipality to municipality. While the councils of municipal stakeholders of Brainport Development NV may use municipal regular planning and control cycle of annual memorandum, reports, and budget to influence the content and financial frameworks of Brainport organizations' year plan to certain degree, the councils of non-stakeholder municipalities in Eindhoven city-region can hardly ever influence the decision making of the Brainport organizations. From either the democratic or the learning perspective, the institutional arrangement of the Brainport organizations insufficiently satisfy the criteria of accountability. This indicates large space for improvement. Further, the case study results remind us that comparing to the traditional governance mode the nature of relational governance is rather dynamic. It is a learning by doing process and is constantly shaped by the alteration of national policy as well as of the changing agreements between the municipalities. Thus, it deserves continuously monitoring and investigating the change of city-regional institutional setting and its influences on the accountability arrangement of the relational governance.*

Keywords: Brainport Eindhoven, Relational Governance, Democratic Accountability

## 1. Introduction

In the age of network society, a relational approach in spatial governance has emerged for more than a decade (Healey, 2004). The emphasis on competitiveness agenda has positioned city-regions in a European/global economic space (Albrechts et al., 2003). The focus of spatial relations and city-regions has encouraged levels of government to create new institutional arenas to work together and collaborate with private sectors that have access to a wide range of know-how and crucial resources that can help strengthen city-regional competitiveness. Eindhoven city-region in the Netherlands is a good example of such practices. Since 2004, the Dutch government has considered Brainport Eindhoven together with Rotterdam Seaport and Amsterdam Schiphol Airport the top three engines of the Dutch economy (Ministerie van Economische Zaken, 2004). According to Eurostat Regional Yearbook 2011, in Europe the Eindhoven city-region ranks highest in terms of patents per population (more than 2, 000 patents per million inhabitants). The successful story of high-tech development in Eindhoven city-region is a result of close collaboration between different levels of government and other parties, including high-tech firms and knowledge institutes.

However, the creation of new institutional arenas makes possible new alliances and realignments of

power to influence the decision-making of city-regional development. Issues related to accountability and social justice may emerge in the new governance practices (Huang, 2013). Some scholars have argued that the rescaling and reframing of governance space has increased the complex relationships between politicians, citizens, and other stakeholders, and created a post-political situation that may lead to a substantial democratic deficit (Buser, 2014; Swyngedouw, 2005). It is important to examine whether and how people are excluded or included in the processes and how the relationships between them are organized. In other words, the new forms of relational governance has challenged the capacity of traditional institutions of democracy and raised the concern of accountability.

Nevertheless, in previous studies—despite the growing concern of accountability deficit along with the emergence of relational governance—less attention has been paid to what accountability is and how to systematically analyse it before announcing there are accountability deficits. Bovens (2010) reminds that a lack of a consistent framework for the analysis of accountability is undermining accountability practices and preventing much empirical progress in accountability study. Moreover, previous studies often assumed a simple, linear cause-effect relationship of accountability mechanism and ignored 'the problem of many eyes' (Bovens, 2007, p. 455). In fact, there are various types of accountability that exist side by side and form complex networks of accountability (Buser, 2014; Scott, 2000). Some are less formal, less evident and mutually interdependent, such as the informal accountabilities of peer review in a particular community (Scott, 2000). It is inappropriate to jump to conclusions without carefully mapping the webs of accountability and systematically investigating the interrelationships among the webs in the new forms of relational governance.

In the light of these issues, this research first examines the notion of accountability and then adopts a conceptual framework of public accountability established by Mark Bovens to map the networks of accountability and to explore whether and how the new institutional arrangements of Eindhoven city-regional governance challenge the practice of accountability. Major focus is put on the establishment and operation of the *Stichting Brainport* (Brainport Foundation). Brainport Foundation consists of representatives of the regional governance body, local governments, knowledge institutes and high-tech firms. It is a collaborative body determining the development strategies of Brainport Eindhoven NV[1], the economic development organisation for the Eindhoven city-region. The empirical study is from 2008 to 2013, because since December 2012 the regional governance body in Eindhoven city-region, the *Stadsregio Eindhoven* (Eindhoven City Region, SRE), has undergone a process of institutional transforming (SRE Regioraad, 2013). This will influence the role and capacity of the SRE in the Brainport Foundation and the accountability arrangement of the relational governance in the city-region. In the final part of this paper, I summarise the research results to pave a way for more rigorous analysis of the accountability in the relational governance.

## 2. Analysing and Assessing Accountability

The application of accountability is important for democratic governance. It can not only contribute to the legitimacy of public governance, but also prevent and detect the abuse of public powers, and lead to reflection and improvements on the performance of public governance (Bovens, 2010). However, accountability is a very elusive concept. It 'is used as a synonym for many loosely defined political desiderata, such as good governance, transparency, equity, democracy, efficiency, responsiveness, responsibility, and integrity.' (Bovens, 2010, p. 946) Each of the political desiderata is an umbrella concept itself. Accountability in this broad sense more emphasises evaluative rather than analytical dimensions. Moreover, it has to be taken into consideration that the standards of accountable behaviour differ according to particular places, times and institutional settings.

[1] Brainport Eindhoven NV was established in 2008. Its forerunner is NV REDE. Since 1982, NV REDE had been the economic development organization for the Eindhoven region. It aimed to promote business and employment in the region, and its target groups were small and medium-sized enterprises in industry and services.

Specifically, accountability refers to the right to conduct *ex post* oversight and control rather than *ex ante* control and involvement in decision making (Scott, 2000). In order to let the notion of accountability be more operational and analytical, Bovens (2007, p. 450) proposes a more narrow definition of accountability—'a relationship between an actor and a forum, in which the actor has an obligation to explain and to justify his or her conduct, the forum can pose questions and pass judgement, and the actor may face [formal and/or informal] consequences', such as penalty sanctions, minister's resignation, and so on. This definition is centred on four essential questions regarding the institutional arrangements of accountability, including 'who' is accountable to 'whom', 'how', and for 'what'? To clarify the interrelationships between these four elements is a useful starting point for accessing accountability arrangements in particular institutional settings.

*2.1 Typologies of Accountability*

As shown in Table 1, seven types of accountability can be identified according to the nature of the forum and of the obligation. This identification is handy for characterising distinct accountability arrangements.

Table 1. Typologies of Accountability

| | |
|---|---|
| Based on the nature of the forum | - Political accountability<br>- Legal accountability<br>- Administrative accountability<br>- Professional accountability<br>- Social accountability |
| Based on the nature of the obligation | - Vertical accountability<br>- Horizontal accountability |

Source: Based on Bovens, 2007; 2010.

According to Bovens (2007; 2010), *political accountability* is exercised in the opposite direction to that of the delegation chain. Although the composition of the chain may vary in different countries, voters and the executive public servants are the two ends of the chain. In some countries, the media has become major informal forums for political accountability. *Legal accountability* is often based on detailed legal standards, so it is the least ambiguous type of accountability. Its major forums are courts, including civil courts, administrative courts, and so on. *Administrative accountability* refers to a wide range of quasi-legal forums, which vary from ombudsmen and audit offices at different levels of government to independent supervisory authority, inspector generals, anti-fraud offices, etc. This type of arrangement plays an important role to oversee the performance of quangos and executive public agencies.

*Professional accountability* relates to professional peer review on the basis of codes with standards laid down by professional associations. It is especially relevant to the public managers who are professionals, such as architects, urban planners, or civil engineers. *Social accountability* is an emerging concept responding to the urgent demands of contemporary civil society for more direct and explicit accountability relations with public agencies or individual public managers. Under certain circumstances, public agencies or individual public managers are asked to account for their performance to the public, or at least, to civil interest groups, non-governmental organisations, and other stakeholders.

Considering the nature of the obligation, two types of accountability can be categorised, including vertical accountability and horizontal accountability. *Vertical accountability* refers to a situation where the accountability is rendered to a higher authority, who formally hold power over the actor on the basis of a hierarchical relationship, or of laws and regulations (Bovens, 2007). *Horizontal accountability* may be rendered to parallel institutions (such as ombudsmen, audit offices, inspectors, and accountants), or to groups (such as civil interest groups, non-governmental organisations, and other stakeholders). A hierarchical relationship is lacking in this situation.

*2.2 Assessing Accountability from Three Perspectives*

If we see accountability as mechanisms to conduct *ex post* oversight of public governance performance, it must imply a sense of virtue, more specifically, substantive norms for the behaviour of public agencies or individual executives. Although the norms may vary according to different places and institutional settings, they do embed in the judgments, albeit implicitly. In order to allow others to review and to generate meaningful assessments and discussions, it is necessary to establish an analytical framework with explicitly explained criteria.

On the basis of scholarly literature and policy documents, Bovens et al. (2008) recognise that people often assess accountability from three perspectives, including democratic perspective, constitutional perspective and learning perspective. From a democratic perspective, accountability is important to provide a means for citizens and their representatives to monitor, influence and control government conduct. The means involves a responsiveness relationship between the actors in the democratic chain of delegation (Bovens et al., 2008; Bovens, 2007). The central criterion here is to what extent a particular accountability arrangement or regime enables democratically legitimised bodies to monitor and assess the conduct of executive bodies or actors and to induce modification of their behaviours in accordance with the preferences and priorities of the democratically legitimised bodies.

From a constitutional perspective, the main concern of accountability is how to prevent the executive actors from abusing public powers and resources. Its central criterion is to what extent a particular accountability arrangement or regime curtails the abuse. From a learning perspective, the purpose of accountability mechanisms is to encourage openness and reflexivity in administrative systems to enhance government effectiveness and avoid inward-looking conduct. In other words, the executive actors should truly communicate with outside actors, and act in accordance with the external feedback on their executive performance (Bovens et al., 2008; O'Loughlin, 1990). The central criterion is to what extent a particular accountability arrangement or regime can induce the executive actors to constantly take into consideration the wishes and priorities of contemporary civil society. The learning perspective is closely related to the notion of social accountability.

As show in Figure 1, an accountability arrangement consists of three major activities, including informing the conduct, debating and judging, which leads to formal or informal consequences the executive actor has to face. The institutional designs of the three major activities influence the effectiveness of a particular accountability mechanism. In view of this, Bovens et al. (2008) propose an analytical framework consisting of three concrete evaluation questions respectively from the three perspectives (see Table 2). Since this research more focuses on whether the issue of democratic deficit emerging in the relational governance as Swyngedouw (2005) argues, the emphasis of the empirical study is put on the democratic and learning perspectives of accountability assessment.

## 3. Accountability in Eindhoven City-regional Governance

Since 2004 the Dutch Ministry of Economic Affairs has recognised the Eindhoven city-region as the national important Brainport, a centre of innovation and knowledge in the Netherlands (Ministerie van Economische Zaken, 2004). However, the emergence of Brainport Eindhoven is not a spontaneous process but rather a result of close collaboration between the local governments, high-tech industries and knowledge institutes in the past two decades. This close collaboration was triggered by the crisis in the late 1980s and the early 1990s. At that time, the *Stadsregio Eindhoven* (Eindhoven City Region, SRE), local governments, business, and knowledge institutions joined forces to recover from the economic downturn. The SRE is a regional organisation made up of the city of Eindhoven, the city of Helmond, and another 19 surrounding municipalities (see Figure 2), which created a joint fund to strengthen the economic structure of the region and set up the Stimulus programme in 1995 (Brainport Eindhoven, 2011; Brainport Foundation NV, 2009). This collaboration laid the foundation for the Brainport of today.

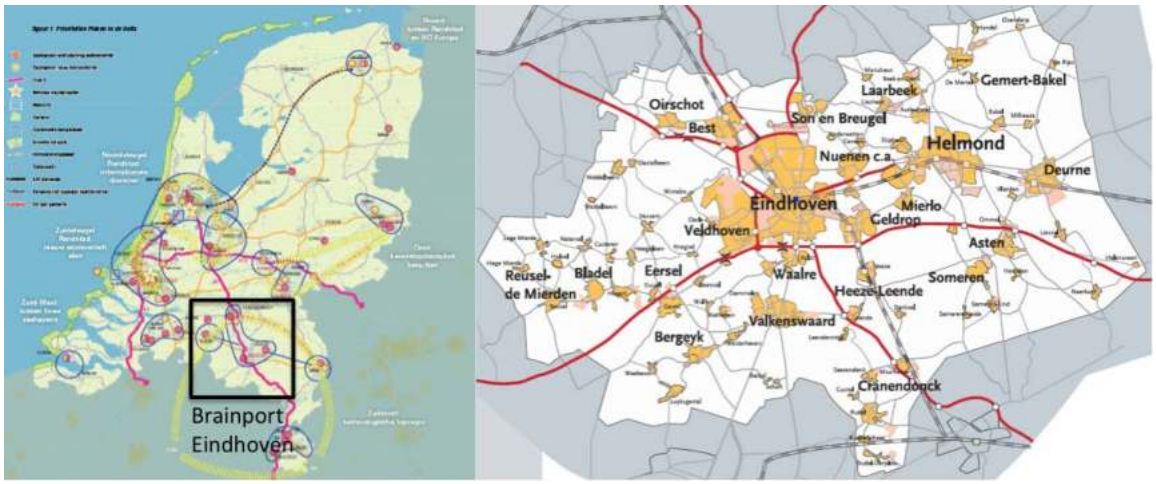

Figure 2. Dutch national strategic planning and Eindhoven city-region
Source: based on Ministry of Economic Affairs 2004, p.10; Brainport Foundation NV 2009, p. 32.

Due to the success of the Stimulus Programme in the late 1990s, people in the city-region have broadly accepted the idea that tight relationships between government, academia, and industry will encourage the creation of an innovative milieu. Since the beginning of the 2000s the SRE and the local governments have decided to adopt a triple helix model focusing on the development of hybrid organisations and tri-lateral networks that overlap and connect these three institutional spheres. The government first invited knowledge institutes and the business community to formulate and commit to a joint action-focused agenda and priorities—the Horizon Programme (van der Meer et al., 2008; Sistermans Commission, 2006; Programme Agency Horizon, 2004). On the basis of its success, in 2005 the government established the *Stichting Brainport* (Brainport Foundation) consisting of representatives of the three sectors, forming a platform as well as a collaborative body to determine the development strategies of Brainport Eindhoven NV and appoint *Raad van Commissarissen* (the advisory committee board) of Brainport Eindhoven NV (Brainport Development, 2012). The advisory committee board consists of representatives of the government, business sector and knowledge institute involved in the development of Brainport Eindhoven. They meet twice a year and act as a think-tank for the Brainport Foundation and Brainport Development NV. The representatives of business sector and knowledge institute are requested to represent the position and expertise they hold rather than a representative of that company or of the institute (Stichting Brainport, 2007).

*3.1 Mapping the accountability of Brainport organizations*

The accountability arrangement is mapped in Figure 3. There are two types of shareholders in Brainport Development NV. One is the triple-helix shareholder, the Brainport Foundation, which determines the development strategies of Brainport Development NV and appoint supervisory committee board. Brainport Foundation consists of twelve representatives from three sectors forming the triple-helix platform. The three sectors include executive committee of SRE, *burgermeesteren* (mayors) of municipal shareholders, presidents of research institutes, and CEOs of high-tech firms and/or chairperson of local business associations, such as East Brabant Chamber of Commerce or employers association. Their major responsibility is to set up strategic development agenda to improve the economic structure and the international competitiveness of the Eindhoven city-region as a whole. Supported by the SRE and the municipalities, the business sector together with knowledge institutes play a leading role in formulating and managing the development agenda (van Leest, 2012a). At the same time, the representatives of the two sectors may need to render accountability to their own boards of organization or councils.

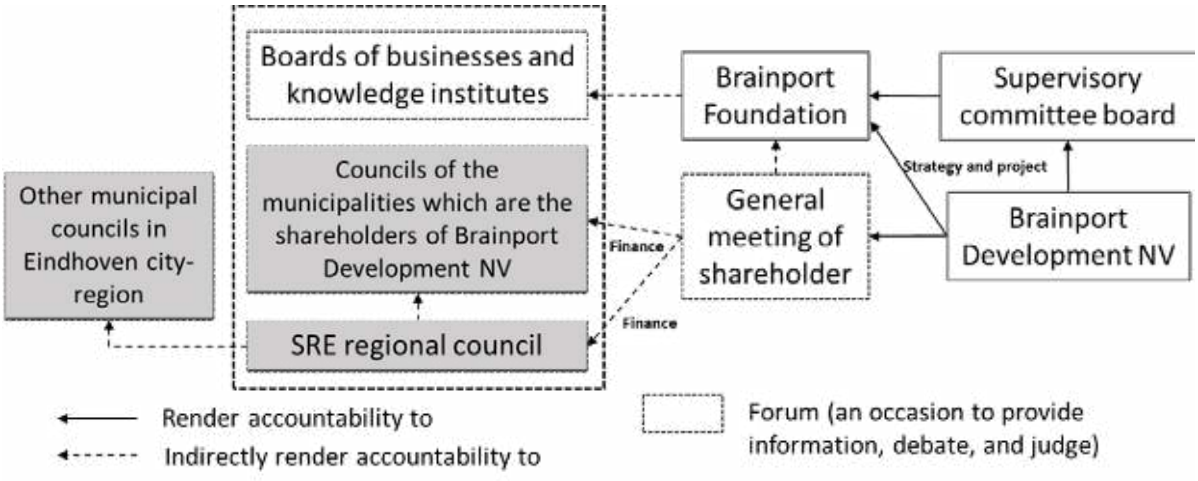

Figure 3. Accountability Arrangement of Brainport organizations

The other type of shareholders is governmental shareholders. From 2010 to 2013, the governmental shareholders included the SRE, Eindhoven municipality, Helmond municipality, and Veldhoven municipality. They were the major financial supporters of Brainport Development NV. Every year they together contributed four million euros as the basic operational funding of the regional development company, although the total amount of revenue depended on its activities of each year. For example, in 2011 the Brainport Development NV had a budget with13 million euros. Except for the basic operational funding, the other nine million euros was from different sources, including the EU, national government, provincial government, municipalities and private sectors. The three municipalities not only contributed through the SRE regional funding, but also provided extra budget to the Brainport Development NV according to their number of inhabitant (van Leest, 2012b). Since 2014, Best municipality has decided to pay extra budget to be one of the governmental shareholders in order to be engaged in the decision making process.

At least twice per year a general meeting of the two types of shareholders is held to check the annual report and annual accounts, and to determine the year plan for the coming year (Gemeente Eindhoven, 2010a). Any strategy, action plan or project that needs financial input from the basic operational funding has to be agreed by the SRE and the municipal shareholders. The councils of the municipal shareholders determine the content and financial frameworks in relation to their jurisdiction via the regular planning and control cycle of *Voorjaarsnota* (memorandum), reports, and annual budget of the municipalities (Gemeente Eindhoven, 2006). Their representatives in the meeting thus play a role of intermediary. In other words, Brainport Development NV has to render financial accountability to the municipal shareholders via their representatives in the general meeting.

*3.2 Assessing the accountability of Brainport organizations*

The assessment of Brainport organizations' accountability is summarized in Table 3. Regarding the information provision, every year Brainport Development NV provides at least three kinds of document to the public, including year plan, annual report and Brainport monitor. The year plan shows the target of their performance and action plans. The annual report is to demonstrate how much they have achieved in previous year according to the target they set in that year's plan. The Brainport monitor comprises 35 macroeconomic indicators (statistics) and an analysis of 70 study reports to provide a coherent picture of the regional economy (Brainport Development NV, 2014).

From the democratic perspective, the accountability arrangement slightly enables the municipal councils in Eindhoven city-region to monitor and assess the conduct of the Brainport organizations and to induce modification of their behaviours in accordance with the preferences and priorities of the municipal councils. Municipal councils can easily get the year plan, annual report and Brainport

monitor from the website of Brainport Development NV, but the information may not be sufficient. In 2009 Eindhoven municipality hired BMC Advies to evaluate the performance of Brainport Eindhoven program from 2007 to 2010 as a reference for municipal council to decide if the municipality should support the following program, Brainport 2020 (Gemeente Eindhoven, 2010a, 2010b). The report concluded that the council of the Eindhoven municipality did not have sufficient opportunity to play a role in the new city-regional governance model according to the BMC report in 2010. Its conclusion was mainly based on three findings. First, it was difficult for the councillors of Eindhoven city to evaluate whether Eindhoven city benefited from each Brainport project, because those projects were implemented for the city-region as a whole. Second, the substantive preferences of the Eindhoven city were not sufficiently visible in the outcome of those Brainport projects. Third, the report also found that coordination between the Economic and Culture sector of Eindhoven city and the Brainport Development NV was poor. It suggested that the Economic and Culture sector should play a leading role to coordinate the collaboration between the municipality and the Brainport organizations (BMC, 2010). The Economic and Culture sector is legitimized by the council and its priorities represent the preferences of the council. The poor coordination indicates a gap between the preferences of the council and the conduct of the Brainport organizations. This implies a danger of democratic deficit in the new governance model.

Table 3. Assessing the accountability of Brainport organizations

| | **Democratic** | **Learning** |
|---|---|---|
| ***Information provision*** | Is democratic chain of delegation informed about the conduct and consequences of executive actors? | Does the accountability arrangement yield executive actors and external stakeholders an accurate, timely and clear diagnosis of important performance dimensions? |
| *Assessing* | Yes, but slight. Twice per year an informative meeting is held for the municipal shareholders, but it is difficult for the councillors to evaluate the information. | Yes, but hardly at all. Every year, year plan, annual report and Brainport monitor are published on the website, but if it is difficult for the councillors to evaluate, then it is difficult for citizens as well. |
| ***Debate*** | Do the debates between accountability forum and executive actors focus on whether the actor's conduct conforms to the democratically legitimized principal's standards and preferences? | Does the accountability arrangement provide a setting and a set of interaction routines which induces ongoing, consequential dialogue among executive actors and external stakeholders about performance feedback? |
| *Assessing* | Yes, but slight and the quality is difficult to evaluate. | Yes, but hardly at all. Occasionally, the company may hold conferences. |
| ***Consequence*** | Does the accountability arrangement provide democratic chain of delegation sufficient tools to influence the executive actor's policies? | Is the external stakeholders sufficiently strong to make accountors anticipate the desirable societal outcomes, yet sufficiently 'safe' culture to minimize defensive routines so that accountors adopt the lessons learned from performance feedback and stakeholder dialogue? |
| *Assessing* | Yes, but slight. Only when the municipalities are the shareholders, their councils may have some chances to influence Brainport policies and programs mainly through financial mechanisms. | Not yet find any evidence. |

Regarding the forum for debate and the mechanism to oversee and control, the only official forum is an informative meeting held twice per year by the director of Brainport Development NV to the councils of the governmental shareholders (Gemeente Eindhoven, 2010a). Although the

representatives of the SRE and the municipal shareholders may convey the councils' opinions to the Brainport organizations during the regular meeting of Brainport Foundation and the general meeting of shareholders, their representatives are the mayors, who are not elected by the citizen and members of the municipal councils. The mayors render account to the Minister of Interior[2] rather than municipal councils. Under this circumstance, the councils of the governmental shareholders have very limited capacity to oversee and control the conduct of the Brainport organizations. The only tool the councils can use is to adjust the financial contribution to the Brainport program via the regular planning and control cycle of annual memorandum, report, and budget of the municipalities. But only the municipalities, which are the shareholders of the Brainport Development NV, can use the mechanism.

As for the non-shareholder municipalities, the SRE—the most important shareholder of the Brainport Development NV[3]—can be seen as their representative in the general meeting of shareholders, because the SRE is a joint administration and representative of the 21 municipalities in Eindhoven city-region rather than a fourth layer of government. However, the regional agenda and programs for regional collaboration of the SRE are determined by the *Regioraad* (Regional Council), which comprises mayors or *wethouders* (aldermen) of each participating municipality. As a result, although after the national government the 21 municipalities together are the second biggest financial contributor to the regular budget of SRE[4], the municipal councils have very limited influence on the decision making of the regional council. In fact, some municipal councillors in the Eindhoven city-region had doubted the democratic accountability of the SRE and criticised its lack of transparency in decision-making, although they identified the achievements of the SRE in promoting regional collaboration, lobbying, and so on.[5] Therefore, comparing to the municipal shareholders of Brainport Development NV, the non-shareholder municipal councils have even less capacity to oversee and control the conduct of the Brainport organizations. That is the reason why Best municipality in 2014 decided to pay extra budget to be one of the governmental shareholders.

From the learning perspective, it is hardly to infer that the accountability arrangement can induce the Brainport organizations to constantly take into consideration the wishes and priorities of the citizens in Eindhoven city-region. Every year the Brainport Development NV publishes year plan, annual report and Brainport monitor on the website, but if it is difficult for the councillors to evaluate, then it is difficult for the citizens as well. Occasionally, the company may hold a regional conference to collect opinions about the development of Brainport as a reference for its year plan, but in which situation the company considers it is necessary to hold the conference, and how they deal with the opinions and feedbacks from external stakeholders are not clear. Except for the two ways, the public may receive information via the public meeting held by the municipalities. But it is an occasion for the executive board of municipality rather than the Brainport organizations to render accountability to the public. It can only be seen as an indirect accountability arrangement.

[2] According to *Gemeenteweg* (Municipality Law) Article 61b, the mayor may at any time be dismissed by national government according to the recommendation of the Minister. If there is a difficult relationship between the mayor and the council, the council may, through the Commissioner of the King, recommend the minister to resign the mayor. But, before the council declares that a difficult relationship between the mayor and the council exists, they need to explain the difficult relationship and consult with the auditor.

[3] In 2011 its shareholders included the Brainport Foundation (50%), the SRE (25.9%), Eindhoven municipality (15.2%), Helmond municipality (5.5%) and Veldhoven municipality (3.4%) (Brainport Eindhoven, 2011).

[4] In 2010, 51 percent of the SRE revenue was from the national government, while 19 percent of the revenue was from the 21 municipalities (SRE, 2011).

[5] In 2010 Daniëlle van Lith, a municipal councilor in the Eindhoven city-region, criticized the direct accountability and a lack of transparency of the SRE in decision-making in the VNG Magazine. VNG is an association of the Dutch municipalities. It works as a platform for the Dutch municipalities. (http://www.vngmagazine.nl/weblog/706/hoera-afschaffing-van-de-wgr ; accessed in November 2012)

## 4. Conclusion

Obvious to all, the new form of relational governance in Eindhoven city-region has built consensus among and drawn resources from the three sectors, and offered the Brainport organizations greater flexibility and efficiency in decision making and action taking. However, after systematically assessing its accountability arrangement, this paper finds that from either the democratic or the learning perspective the institutional arrangement of the Brainport insufficiently satisfy the criteria of accountability. This may be due to three institutional weaknesses.

The first is the malfunction of the mayors and the *college van burgemeester en wethouders* (municipal executives) leading to a weak link between the conduct of Brainport organizations and the preferences of the municipal councils. According to the institutional settings, the mayors—the representatives of the municipality in the regional council and the Brainport organizations—should play a role of intermediary between the councils and the Brainport organisations. The malfunction occurs may be because the mayors are not elected by the citizen and they are supposed to render account to the Minister of Interior rather than municipal councils. Under this institutional setting, even for the Eindhoven municipality, the biggest player in the city-region, its municipal council did not have sufficient opportunity to play a role in the new form of relational governance.

Second, only the municipalities that pay the extra money can be the shareholders of the Brainport Development NV, so the degree of the Brainport organizations' accountability toward the municipal councils differs from municipality to municipality. While the councils of municipal stakeholders of Brainport Development NV may use municipal regular planning and control cycle of annual memorandum, reports, and budget to influence the content and financial frameworks of Brainport organizations' year plan to certain degree, the councils of non-stakeholder municipalities in the city-region can hardly ever oversee and control the conduct of the Brainport organizations. The degree of accountability that differs from municipality to municipality may affect the fairness of decision-making and result in an uneven distribution of resources in the city-region.

Last but not least, for the citizens in Eindhoven city-region there is no regular forum for debate. Only when the Brainport Development NV considers it is necessary, may they hold a regional conference to collect opinions. Besides, the Brainport organizations do not provide sufficient information of their conduct to the citizens. Although the citizens can easily find the three annual documents on the website of Brainport Development NV, it is difficult for the citizens to evaluate the information and find an occasion to express their opinions. This leaves a large space for improvement regarding the openness and reflexivity in the executive system of the regional governance bodies and the Brainport organizations.

Three lessons we can learn from this case study regarding the feasibility and applicability of the analytical framework, and the knowledge of accountability and relational governance. First of all, accountability arrangements can be considered a useful tool to link the conduct of public officials and institutions to the preferences and priorities of the democratically legitimised bodies, to prevent or reveal abuses of public authority, to enhance government effectiveness and to avoid inward-looking conduct. However, this does not mean the more is the better. The design of accountability arrangement has a manner of accumulation. Various types of accountability exist side by side and form complex networks of accountability. The accumulation of accountability arrangement may overload public officials and institutions with bureaucratic and complex procedures. Based on the understanding, the major question is whether the design of accountability arrangements actually work in the intended manner rather than trap public officials and institutions in overly bureaucratic procedures. The analytical framework proposed by Bovens does provide a useful framework to assess systematically whether a particular accountability arrangement is insufficient or not. But it is difficult to measure if the arrangement is sufficient enough, especially when taking into consideration the different perception of accountable behaviour within distinct places and institutional settings. A possible way to improve the analytical framework is to conduct a comparative analysis of similar regional governance settings within the Dutch context.

This links to the second lesson. That is, before making any conclusion, it is necessary to examine carefully the political and administrative systems the new governance mode embedded in and evolves from. This helps understand their influence on the new governance mode and make effective recommendations. Third, the case shows a dynamic nature of the relational governance mode. It is constantly shaped by the alteration of national policy as well as of the changing agreements between the municipalities, so dose its accountability arrangement. For example, since December 2012 the SRE has undergone a process of transforming from a governance body to an administrative platform, Metropolitan Eindhoven, due to the abolishment of *Wgr-Plus* (Joint Agreement Act Plus) in 2013. The Joint Agreement Act Plus had formed the legal base for the SRE to undertake the public tasks since 2006. Up to now, the role of the new regional governance body in the operation of Brainport organizations is unclear. The transformation result will eventually shape the accountability arrangement and affect the degree of accountability. Especially for the non-shareholder municipalities, it is influential, because the SRE could be seen as their representative in the Brainport Foundation and the general meeting of shareholder, but the SRE representative's position in the Brainport Foundation is vacant now[6]. Therefore, it deserves constantly monitoring and investigating the change of city-regional institutional setting and its influence on the accountability arrangement of the relational governance in Eindhoven city-region.

# PARTICIPATION STRUCTURES TO SUPPORT THE INCLUSION OF OLDER PEOPLE ON THE NEIGHBOURHOOD LEVEL

Krön, Annette[1], Rüßler, Harald[1]

[1]Fachhochschule Dortmund, annette.kroen@fh-dortmund.de, harald.ruessler@fh-dortmund.de

Keywords: ageing, participation, neighbourhood development

*For many older people their own precinct or neighbourhood gains in importance with increasing time spent at home and lower mobility (needs). The precinct stands thus for opportunities of communication and participation. Therefore, senior-friendly or age-integrated planning needs to include thinking about structures of communication and participation in order to support and enable older people taking part in the social life of the precinct and generally. This is what the research project "QuartiersNETZ" ("neighbourhood network") aims to develop. While the project includes the development and testing of innovative senior-focused technical interaction and communication media, this paper concentrates on the development of participation structures in the precincts. It describes the approach towards the so-called participation models and presents first steps and insights of the ongoing participation process. The paper also includes a discussion about different understandings of participation, with a focus on the views of planners and community workers, and reviews what the differences in understanding mean for the implementation of participation structures on the ground. This includes the balancing act between broad participation and the capacity to act. Furthermore, first ideas on how the established networks could continue after the termination of the project are discussed.*

## 1 Introduction

Demographic change leads to a number of challenges for planning and urban development in Western countries. It is characterised by different developments, such as population decline, a growth of the proportion of older people – both caused by low fertility rates and low mortality rates – as well as a growing diversity, e.g. ethnical and cultural diversity through immigration, changing and more diverse lifestyles and family and household structures. However, while those demographic changes take place overall, the intensity and occurrence differ between different cities and regions. For instance, some cities grow in population size, while others decrease. At the same time within those cities there is also a concurrence of growth and shrinkage as there are areas that grow and other areas that lose population. The same can be observed for the other characteristics of demographic change. Thus, demographic change is unevenly distributed.

Challenges for planning lie therefore in planning for a more diverse society and older population, in moving away from the growth paradigm towards planning for shrinkage and at the same time planning for different circumstances within the same city. Further current challenges for cities which also influence planning are the increasing competition between cities, the growing social fragmentation and polarisation processes as well as the growing call for (true) participation coming from different parts of the community (Schmidt, 2014; Roth, 2011).

This paper will focus on the challenges (and opportunities) arising from the ageing of society as well as the call for (true) participation. The consequences of the growing proportion of older people are discussed in many areas. The public discussion, for example, is mainly concerned with the effects on economic competitiveness and the future of the social security systems. Other discussions include the impacts on care and medical services and the implications for community work. The planning discussion started with a strong focus on barrier-free urban design and architecture, but has shifted to a more comprehensive view that includes issues such as local supply, mobility opportunities, social life etc. (Bleck et al., 2015).

Both within the planning discussion and the field of community work the debate has gained a focus on the significance of the neighbourhood as a spatial level. With increasing age the neighbourhood gains in importance for people because of lower mobility (needs) and the increase in time spent at home and within the surrounding area (Rüßler, 2007; Knopp & van Rießen, 2014). Low mobility

can be caused by health or financial reasons, while low mobility needs mean that people can fulfil most of their demands and needs within proximity and they are not required to travel elsewhere (e.g. for work). This underlines the significance of well-functioning neighbourhoods and areas where as many necessary services as possible are available. This also means that the neighbourhood stands for opportunities of communication and interaction for (older) people. Therefore, senior-friendly and age-integrated planning needs to include thinking about structures of communication and participation, in order to facilitate the involvement and contribution of older people to the precinct and its social life.

Another reason why the local level has become more prominent in planning is the trend towards (participatory) governance and the communicative turn in planning. The local level is often considered the most suitable for community participation as it is the level which is closest to the community and their lives (Roth, 2011). Also, local institutions and organisations are often less specialised and thus more open to community involvement. Furthermore, devolution means that the local level has gained in importance.

This paper brings together the views of planners and community workers on the neighbourhood, the ageing of society and participation. While community workers come from the "social side" and emphasise the empowerment of people and the need for inclusive neighbourhoods, the planners come from the "planning side" and emphasise the need for a more needs-oriented planning which leads to a better acceptance of projects, better planning and a better environment for the residents. This directs the planners to a "more social view" and the community workers to a "more spatial view".

The paper describes the research project "QuartiersNETZ" ("neighbourhood network") in which researchers and practitioners work together to involve older people into participative neighbourhood development as well as the development and testing of innovative senior-focused technical interaction and communication media. The paper concentrates on the participation processes and the approach towards the so-called participation models. The second section explores views on participation and governance and differences between the planning discussion and the discussion within the community work literature. This includes a discussion about the balancing act between broad participation and the capacity to act. This will offer the background for the discussion of first results of the project. Then the project QuartiersNETZ and its approach towards participation are explained and the four case study areas are described. Subsequently, the first steps and results of the project are presented. The conclusion reflects on the impacts of different understandings of participation and on the possibility of developing enduring structures.

## 2 Participation, empowerment and problem solving

The project QuartiersNETZ has as one objective to develop participation structures (and models) in order to include older people into neighbourhood development and to enable them to develop and express ideas they have about their neighbourhood as well as other parts of their lives. This raises the question how participation is defined within the project and whether all people involved have the same understanding of participation.

Project partners within the project come from different disciplines, such as social sciences, community work, planning and computer sciences. Participation is understood in different ways within those disciplines. This paper will focus on the understandings of social sciences/community workers and planners. Computer sciences are excluded within the discussion of this paper as their work within the project refers to different parts of the project and their participative work is more related to the joint development of concrete technical ideas.

As stated above, it can be said that community workers come from the "social" or "process" side to participation, while planners come from the more results-oriented "planning" or "efficiency" side. In other words, community workers advocate fairness and empowerment while planners advocate effectivity, problem solving and better acceptance planning. The background of these two views will be explained below.

Participation has become an important objective (and buzz word) for planners through the communicative turn in planning (Healey 1997) and the trend towards (participatory) governance, which is partly related to the communicative turn (Grote & Gbikpi, 2002; Walk, 2008; Schmidt

2014). Both trends acknowledge that government in general and planners in particular need to involve further actors and stakeholders, such as the people planned for in order to achieve better results.

Within the strand of governance discussion related to planning it is argued that the state has become an actor among others or that at least its role has shifted to a coordinating and enabling role while it still provides the institutional framework for governance at the national and sub-national level (Jouve, 2005; Benz & Papadopoulos, 2006). Reasons that are cited for the emergence of governance are the 'overload' of government and the 'ungovernability' of modern societies, referring to the growing diversity of society and the increasing load of complex and conflicting demands and expectations placed on the state by the public, organised interests or other actors (Schmitter 2002; Peters & Pierre 2006). Thus, there is a shift from (hierarchical) government to governance.

There are high expectations of the shift towards governance: It is hoped that the application of more participatory governance arrangements or in other words participation processes can lead to more political legitimacy, regained trust into politics, higher responsiveness of politicians and higher satisfaction of citizens with political decisions (Geißel, 2008). Within the context of neighbourhood development there are also expectations that the local cohesion can be strengthened, the self-confidence, responsibility and social capital of residents can be increased and that planning becomes more needs-oriented as residents are asked for their needs, and that this will lead to a better acceptance of planning projects (Schmidt, 2014).

Nevertheless, there are also problems with the shift towards governance. One problem is that often governance structures are not legitimated through democratic elections or similar processes. This can lead to the selective participation of certain groups if there are no clear rules for participation (Haus & Heinelt, 2005; Benz & Papadopoulos, 2006). Another issue is that there can be a tendency towards the involvement of more vocal groups while weaker groups or minorities are disregarded. A further criticism is that governance arrangements are often not capable of acting as they are not legitimised for action, but are only structures for discussion and development of ideas (Jessop, 2002).

It has to be noted that the shift towards governance does not only mean more participation and inclusion of stakeholders in decision-making but that it includes also a more economic approach of planning. This can include a focus on the competitiveness of the city or city region, (public-private) partnerships for previously public tasks or deregulation. The participative and economic trends can go together as improved planning or decision-making can improve or secure a quality of life that enhances the competitiveness, and as deregulation and devolution can mean more responsibility on the local level (Brenner, 2002; McGuirk, 2005). Therefore there is a risk that community participation and engagement replace tasks of the welfare state (Strube et al., 2015; Knopp, 2015).

Many of the governance processes on the local level – and in particular within socially integrative planning – seek to tackle the problems of governance by attempting to specifically include less vocal groups and by emphasising the high importance of participation through residents for the joint problem solution. Sometimes democratic legitimisation is given through the possibility to vote for neighbourhood representatives. However, the crucial question for each governance network is how the objective of broad participation can be brought together with the capacity to act, as mostly the participation processes are concerned with concrete problems or concepts that have to be solved or developed (Schmidt, 2014, p. 115).

In summary, it can be said that participation for planners means to include residents and other actors into the process of planning, in order to achieve better solutions, higher legitimation and also a smoother process of planning (because of less opposition) (Haus & Heinelt, 2005; Schmidt 2014).

For community workers, in contrast, participation is less about solving problems, but more about empowering and enabling people to take part in social life (Straßburger & Rieger 2014; Strube et al., 2015; Rüßler & Stiel, 2015). Participation does not mean to involve people in certain topics as a professional; rather participation is thought as a qualifying activity that enables participants to strengthen social as well as political competences which in turn enables them to articulate their objectives and to take part in decision-making. Through this participation has an integrative effect (Strube et al., 2015).

At the same time, participation is not only the activity of enabling and empowering people, but it is also the act of taking part in social life and decisions. It is an act of the individual; the act of participation makes it possible to influence results and to contribute to social and political processes concerning the own life (Straßburger & Rieger, 2014).
Therefore, for community workers and other social professions participation is about capacity building and processes where participants learn to reflect and to represent their own interests. It stands for social affiliation and inclusion in crucial areas of life (Strube et al., 2015). Participation in this sense does not start with a problem which needs to be resolved and where all stakeholders concerned need to be involved in decision-making, but it starts with the involvement in social and political life and the needs and objectives of the individual. Thus, when looking at neighbourhood development and urban planning, community workers support residents to articulate their ideas and needs. They take an emancipatory approach (FH Nordwestschweiz, 2015).
In summary, it can be said that for community workers participation is integration into social life, while for planners participation refers to joint problem solving and the involvement of the community and other actors into certain topics. The different understandings of planners and community workers explain the problem of the "effectivity trap“ (Munsch, 2005). The effectivity trap means that results-oriented participation processes working towards problem resolution can overburden some participants, particularly those not used to expressing their own opinion, so that they back out of those processes. Therefore participation processes need to be more adapted towards the participants, meet them at their situation, and be less middle-class focused. Thus, the processes need to have further objectives, such as social exchange and integration and not only concentrate on problems and their solution (Munsch, 2005). This refers back to the question how broad participation can be brought together with the capacity to act and is the reason why the project QuartiersNETZ seeks to bring together both sides of participation, the more results-oriented and the more socially and process oriented.

## 3 The project QuartiersNETZ

### *3.1 Older people as co-producers of neighbourhood networks*

The project QuartiersNETZ develops “real” and “digital” networks within neighbourhood precincts and within these networks ideas about how the quality of life and social networks can be improved within the neighbourhood. The development and the testing of ideas is undertaken in a participative manner; that means researchers, practitioners and residents work together. The goal of these networks is to support a self-determined life for (older) residents within the neighbourhood for as long as possible and to facilitate the cooperation and participation of local residents and stakeholders. The term “real” network refers to concrete cooperation and participation structures in the actual neighbourhoods (the four case study areas), while the term “digital” network refers to more technical structures such as a digital platform.
The full title of the project is “Older people as (co-)producers of neighbourhood networks in the Ruhr area”. This title already expresses the importance attached to participation and cooperation within the project. Particularly for the more technical innovations of the project, the concept of older people as co-producers is central and innovative in the sense that it shows the desire to switch from the acceptance paradigm to the participation paradigm (Sorgalla et al., 2015). The leading thought is to not only gather opinions or information, but to let people reach their own ideas and decisions. Similarly, within the real networks the involvement of older people is aimed to make them participants and co-producers rather than only voters and commentators on ideas and events within the neighbourhood.
As the project is funded within the funding priority area “Health and service regions of tomorrow” another important topic is how health services as well as other local services can be improved and interlinked and also how health or quality of life can be improved or maintained. This also includes the idea of shaping the demographic change occurring in the Ruhr area and to support the structural change towards an innovative service region.
The project has a number of sub-projects or sub-topics which include the participative development of: a) a digital platform, b) ideas for adapting technical devices for impairments of older people and

the adaptation of selected devices, c) a training and guidance concept which qualifies citizens to understand and explain technology, d) business models and service provider networks, and e) participation models. As these sub-projects are quite diverse project partners are from a number of different fields and backgrounds, including computer sciences, social sciences, gerontology and geragogy as well as research, care services, municipal government and individual businesses.

As a case study for the Ruhr area the city of Gelsenkirchen has been selected because it is a city that is greatly influenced by ongoing structural change and has experienced developments that are typical for the whole region. Both the Ruhr area and Gelsenkirchen have experienced a strong socio-economic structural change for decades and are particularly influenced by an ongoing decline in jobs as well as changes in the job market from a more industrial to a more service-oriented labour market. This has led to high unemployment and migration loss and thus a shrinking number of inhabitants which has exacerbated other effects of demographic change, such as the growing proportion of older people. It can be said that the Ruhr area is "ahead" of other regions regarding the effects of demographic change and therefore a good case study for developing and testing approaches towards supporting a self-determined life for older people within the own neighbourhood (Fachinger et al., 2015). Moreover, the city of Gelsenkirchen has adopted a master plan for senior citizens in 2005, which established an integrated approach towards senior citizens policy, and has since established corresponding coordination and cooperation structures.

Within the city of Gelsenkirchen four neighbourhood precincts have been selected as case studies. Local actors from the precincts were asked to apply for taking part in the project so that a certain interest in the project is given and there is already some interest in cooperation and working together for the precinct. From the application neighbourhoods were chosen that differ from each other with regard to population structure, building structure and other parameters. This was done to understand the importance of different prerequisites and what this means for participation processes. By working in differing neighbourhoods the need for different approaches in different circumstances can be highlighted, but it is also possible to find out whether some approaches are likely to be universally valid. Furthermore, results are more likely to be relevant for other cities when different types of neighbourhoods are considered.

Table 1 gives an overview of some of the characteristics and differences of the precincts. Already the number of residents differs to a relatively large extent, as the largest precinct has around 19,700 residents, whereas the smallest one has only around 4,200 residents. In the two larger precincts the percentage of people with a migration background is also higher with 37 % and 34 % respectively, in comparison to 11 % and 12 % in the other two precincts. The percentage of people aged 65 and older lies between 18 % and 29 %. The net migration loss between the ten years of 2003 and 2013 loss lies between 3% and 10 %. Differences of existing cooperation structures and relevant topics will be described below in the section on the steps and insights of the project.

Table 1: Selected characteristics of the case studies

| | **Precinct 1** | **Precinct 2** | **Precinct 3** | **Precinct 4** |
|---|---|---|---|---|
| Population | 19,700 | 13,600 | 8,900 | 4,200 |
| Population density (people/km²) | 6,486 | 4,233 | 1,671 | 1,843 |
| Percentage of people aged 65 and older | 18 % | 22 % | 29 % | 26 % |
| Migration net loss between 2003 and 2013 | -3 % | -10 % | -3 % | -4 % |
| Percentage of people with migration background | 37 % | 34 % | 11 % | 12 % |
| Percentage of unemployed | 15 % | 13 % | 4 % | 5 % |

| | | | | |
|---|---|---|---|---|
| Percentage of people receiving transfer payments | 27 % | 23 % | 6 % | 7 % |
| Percentage of people living less than 500m away from open space that is at least 0.5 ha | 37 % | 74 % | 86 % | 91 % |
| Dwelling vacancy rates | 11 % | 10 % | 4 % | 5 % |

*3.2Participation models*

This paper focuses on the participation process and the participation models which will be one result of the QuartiersNETZ project. The participation models are thought to facilitate the development of participation processes within neighbourhoods and precincts, similar to a field manual. They will include insights from the project regarding the incorporation of resources, potentials and knowledge of older people (and other actors), the initiation of self-organisation as well as the development of democratic processes within the precincts. This includes the establishment of networks, direct democratic structures as well as a connection between the residents and political and administrative structures. The models will present ideas and approaches according to the different conditions and requirements within the different types of neighbourhoods. Naturally, it will be difficult to generalise from the four case studies, but it is hoped that some useful rules of action can be highlighted from the work in the case studies, particularly in comparison to the experiences of similar projects.

To identify the basic principles for the participation models, participation structures are implemented within the case study neighbourhoods and participative processes initiated. The establishment of these processes will be described in the section below. Mainly, the content of the participation process will concentrate on neighbourhood development and structures that enable people of different age groups to live well in a neighbourhood precinct and to stay there as they grow older. Further topics may be included at a later point in time as will be the development of the democratic structures.

For the project QuartiersNETZ, discussions about problems with ageing and how technology could help and what kinds of services are needed would be particularly interesting. These topics may be introduced through the city-wide working groups described below or may need to be introduced into the precincts by project members over the course of the project. Possibilities include working groups at the neighbourhood conferences as well as focus groups or individual discussions with self-selected participants. How this will be handled will be decided over the course of the coming months and approaches are likely to differ for the different sub-projects.

The neighbourhood level offers the opportunity to ask the residents for their day-to-day expertise of living in their neighbourhood as well as their opinion and to acknowledge that they are experts of their precinct. The older residents are encouraged to develop ideas, start activities and think about what they need within their neighbourhoods and particularly what services they need to maintain their health and well-being, and how these services and their providers could be integrated into the neighbourhood and possibly also linked with each other.

The support of the neighbourhood networks and participation processes through technology, such as the digital platform or the improved handling of devices, is thought to support participation in social life and to prevent tendencies of (self) exclusion. Therefore their role usage will also be included into the participation models.

A crucial element of the participation models will be to bring together the two sides of participation in the sense of participation for integration and empowerment and participation for neighbourhood development (projects), as discussed above. While the latter is more results-oriented and concerned with (planned) projects, the former is more concerned with facilitating social integration and supporting self-organisation. Both forms of participation are necessary and have their merit but are often unconnected and particularly the participation for integration and empowerment does not exist very often within precincts. The challenge will be to bring actors of both forms of

participation, such as residents, community workers, service providers, municipal staff and politicians together.

## 4 First steps and insights of QuartiersNETZ

### *4.1Establishment of participation structures*

As described previously, participation structures have been established in the four case study areas in order to start participation and empowering processes and to find out desires and demands of older residents regarding their neighbourhood. The concept of older people as co-producers is also present within those processes. The processes taking place in the precincts over the project duration will provide the basis for the participation models.

As a first step "neighbourhood conferences" have been established in the four precincts. These conferences take place every three months and participants discuss self-selected topics and develop actions and activities. For the opening neighbourhood conference an official invitation from the mayor has been sent to all residents aged 50 and older. To motivate people to come to the event there have been additional efforts of approaching people within their networks and through multipliers for example within the migrant communities.

The precincts are at different stages with the conferences. While in precinct 1 the conferences have already been established three years ago in the context of another project, the other precincts have started in September 2014, March 2015 and May 2015 respectively. Reasons for this are the differences in already existing cooperation and participation structures and the related work to start those structures and to get local actors on board for the conferences. The conferences in precinct 1 have also been re-established and reorganised with a conference which doubled as a new start and an interim conclusion of the results that had already been achieved.

The neighbourhood conferences are about developing ideas and activities for the respective precinct. At the opening event ideas for and issues within the neighbourhood are gathered from the participants and in the following events working groups are established out of the collected topics which take care of the ideas and identified problems. It needs to be emphasised that there is no funding available from the project for activities so that the participants are required to think about what they can do, how they may get others to take needed actions and how they could get access to funding sources. They are supported by professionals within their working groups but they decide about the topics and activities that are undertaken.

In most of the conferences topics centre around issues like security, cleanliness, traffic, green spaces and housing. Topics that are not related to the urban and social situation of the precinct have not come up yet, but may be addressed with time.

The neighbourhood conferences are organised and undertaken by one of the project partners "Generationennetz" (generation network) which is a network of several city-wide organisations, including the city of Gelsenkirchen itself. The advantage of this is that the Generationennetz is already organised locally and knows many of the relevant local actors and, what is even more important, the actors also know the Generationennetz and know that they will stay and be available even when the project will be completed. This enhances trust into the project and improves the probability of enduring structures and processes. However, with the termination of the project funding for these local structures of the Generationennetz will decrease so that it is crucial to develop self-supporting structures which reinforce the developed activities and structures.

One crucial point is that the community involvement remains voluntary and that no one should feel obliged to take part. However, another central element is to avoid the effectivity trap and the reproduction of social disparities and to enable and encourage groups and people who may not be used to participate and express their opinion to take part in decision-making. This means to persist in inviting people to the processes and to develop and implement suitable enabling structures and low-threshold participation methods.

To reach out to certain groups that often do not take part in participation processes because of different barriers (Strube et al. 2015), a broad range of participation methods as well as specific invitation formats will be used. Apart from the neighbourhood conferences it is thus planned to develop further events and formats within the precincts in order to reach people who do not feel

comfortable with larger groups or "talking events". These formats will include events where being there or doing activities is the main requirement so that connections between people can form and no pressure for further participation exists. Those events are thought to enable people who would normally not come to participation events to make first experiences with these events and to integrate them into the process. What those formats and events will look like will be developed together with already participating residents and multipliers.
For further events and workshops of the project invitations will also be disseminated via medical practices, pharmacies, care services, self-help groups and other local organisations. To reach people with low or no knowledge of German, invitation letters will be translated into the most common foreign languages and where possible translators will be at some of the events. Additionally migrant groups and organisations will be approached and asked to be part of the process.
To enable households with low income to take part, the events will be held at central locations within the precinct so that no travel expenses occur and the locations are easy to reach. To reach less mobile people it is considered to offer transportation services. Outreach work and events that are held at already existing venues and groups are also considered. The experiences with the participation methods and enabling structures will also be part of the participation models.
Another strand of participation are the already mentioned four city-wide working groups which refer to four of the sub-projects. The groups discuss ideas for the digital platform, interaction and communication media, the training concept and the business and participation models. Officially, these groups meet only every six months, although some of them self-organise interim meetings. The groups are a form of advisory and idea-developing groups with participants including citizens, service providers, municipal staff and further relevant actors, such as relevant associations and organisations. As an example the working group on the participation models – which is partly combined with the group on business models for service providers – has so far discussed how more people can be reached in the precincts, what participation methods and activities would be useful for reaching "difficult-to-reach" groups and how networking between the different service providers can be initiated and organised. The developed ideas will be implemented and tested within the neighbourhoods. The dissemination of the ideas will be initiated through group or neighbourhood "ambassadors". The exact workings of this will be developed over the next meetings of the groups and the neighbourhood conferences.
When dealing with participation structures it is also important to understand that some people may use these structures for their own goals and objectives. This is not necessarily a bad thing as their goals may help the precinct as well, but it is necessary that there are some neutral actors without self-interest in the precinct which can coordinate the process and pay attention that every actor in the precinct has the same right to be heard and the same opportunity to express their opinion. One example of an actor with self-interest is for instance a housing association, but also a municipal planner who has planned something within the precinct and wants to get acceptance for his or her ideas. Here, the involvement of those actors in participation processes and the execution of how they present their ideas and how others are allowed to comment on this is crucial. Someone needs to watch that the processes and structures are not misused and that especially actors or residents who are not used to play a part within those processes and to express their opinion are empowered and enabled to do exactly this. This is one of the tasks of the Generationennetz, but also of the people that already participate in the project and processes. How this is and can be handled will be one of the topics of the participation models.

*4.2Networks and participation structures within the case studies*

As described above, the precincts were selected because of their differences in order to understand the importance of different prerequisites and what this means for participation processes. It can already be seen that different topics are important in the different neighbourhoods and that diverse actors are involved in the local social life, participation, local supply, community work etc. Naturally, it is not possible to generalise from one neighbourhood or even four neighbourhoods how local actors will deal with certain problems and participation and empowerment. However, the

differences between the case studies may be able to show some specifics of the individual case and similarities may show problems and reactions that are similar in most neighbourhoods.
The precincts do have different issues and topics, even though they are all occupied with the challenges of the ageing process as well as service provision. In one precinct the main issue is that no venue exists where residents can meet or organise groups, so one of the first steps is to organise such a venue. In another precinct a strong network of citizens exists who have come together to improve the quality of life within their precinct, collect ideas of other residents and to organise neighbourhood activities so that this network builds an important base for the project. For a third precinct, integration is an important topic because a large part of the residents have a migration background and not all of them know German.
Differences exist also regarding the actors that are already active within the precinct. In one of the smaller precincts there is a large network of citizens already organised in different institutions, such as the local group of the social democratic party, the local union, the local group of the Workers Welfare Organisation and the sports club. These are mostly the same people and they form a group that is interested in the improvement of the neighbourhood and willing to take actions and personal responsibility. While this is a valuable virtue for the neighbourhood and helps to get things moving it is also important to keep in mind to include further residents into the process who are not organised within the already existing networks and who may not be as strong in debate.
One of the larger precincts has already a history of participation processes, on the one hand through a preceding research project trying to establish participation processes on the quality of life for older residents within the precinct (Rüßler et al., 2015), on the other hand through the federal support program "Soziale Stadt", as a socially integrative planning program. Therefore, a number of activities exist already and there is some funding for construction projects which have already been started or are planned. There is also a neighbourhood development office within the precinct which organises projects and participation processes for the support program. However, even though there is a history of participation processes, it seems that only a certain group of the local residents have been activated and that it is necessary to introduce further formats and events to reach and include further groups. Also, it will be necessary to re-motivate some of the residents or local business people who have backed out of the participation process at some point. A process which is more self-organised and bottom-up may be helpful to develop more enduring structures and to include more groups and residents.
Different objectives and time frames for participation also exist between the groups relevant to the neighbourhood. Residents tend to be less focused on time and fast results and more on developing ideas for the precinct as well as enduring structures. Business and service providers, in contrast, are more likely to watch the time spent on participation processes and to aim for (quick) results as they do not want and cannot afford too much "non-productive" time. Of course there are also exceptions to the rule, but during the first working groups and neighbourhood conferences these differences have come up relatively clearly with some of the professionals stating that the meetings were not enough results-oriented for them or that they would not be able to come to "too" frequent meetings.
The project QuartiersNETZ has therefore started to develop different formats for the different groups in order to do justice to their different needs and to ensure that they do not leave the process. Specific meetings for service providers have been set up in which the topic of networking between them is discussed and which are more results-oriented. These meetings are also incorporated into the sub-project concerned with the development of business models. At the same time the neighbourhood conferences and other participation formats with their focus on inclusion remain a crucial element to support the empowerment of residents and their ability to influence the future of their neighbourhood. The results of the "business meetings" and their participants will be brought back to the neighbourhood conferences at some point, to avoid the development of two or more separate structures and to develop joint ideas for the precinct.
Overall, the participation processes within the neighbourhoods had a good start with many people interested in participating and a good turn-out for the first conferences. The coming months will show whether participants will stay, what activities will be developed, whether "difficult-to-reach" groups can be reached, what formats need to be developed, and how those processes can be integrated into municipal structures.

## 5 Conclusions

The literature review has shown that different understandings of participation exist within different fields. This can also be experienced on the local level, where some local actors are focused on the inclusion of residents and the corresponding process, while other actors are more focused on the efficiency and results of participation processes. Each of those actors has their reasons for their focus. For example sometimes results are necessitated within a certain time frame so that inclusion efforts may take too long for the process in question. However, this does not mean that inclusion efforts can be dropped. Rather this means that inclusion efforts are a crucial basis for participation work and need to be implemented in all precincts of a city. If participation processes for inclusion already exist, participation processes that are seeking results will be able to include more residents and avoid that only the well-organised groups and "usual suspects" will be able to participate. This means time and effort need to be put in for the "inclusion and empowerment" process so that when results-oriented processes arise the residents are already "prepared" for the corresponding participation process. However, this also means that people will be ready to express their opinions and develop their own ideas and participation will occur bottom-up, something that planners may not be used to, but that is crucial for the democratic process of urban development. In any case, both sides of participation are necessary and need to be organised within a precinct.

It will be one of the challenges for QuartiersNETZ to develop processes for both kinds of participation and to interconnect them with each other. It will be necessary to include a number of different groups into the project (and the precinct) to achieve this. For example the municipal administration will need to be brought into the project more strongly, as the ideas and activities developed within the neighbourhood conferences will need to be coordinated with municipal projects and vice versa. This will also necessitate bringing together the more results-oriented thinking of the administration with the more inclusion-oriented thinking of the participation processes, or in other words bringing community workers together with planners.

This challenge will also be one important element of the participation models. The models will aim to make statements as to how the two sides of participation in the sense of participation for integration and empowerment and participation for neighbourhood development (projects) can be brought together. The integration of the neighbourhood participation processes into the local democratic structures will also need to take into account the different understandings of participation.

The project QuartiersNETZ has started to develop different formats for different groups as well as for different topics, in order to do justice to the different needs. For instance, more results-oriented events are offered for service providers. By having groups with a focus on efficiency and results and groups with the focus on inclusion it may be possible to do justice to both sides of the participation conundrum. However, it remains to be seen how well the consolidation of the groups and topics at a later point in time works.

The participation conundrum also shows how important the development of sustainable structures is that continue when the project and its funding is terminated. Without the coordination through the project there may be no actors that maintain the focus on the inclusion side of participation and the results-oriented participation may predominate again. However, exactly this focus on inclusion may be the key to the sustainability of structures because once residents are empowered and involved, they are more likely to self-organise and demand their inclusion. Similarly, when the networking and joint business models are useful for service providers they will self-organise and maintain the network.

Yet, this leaves two questions: 1) how can neighbourhood networks be organised, established and maintained without project funding (within the budget of a municipality)? and 2) is it possible to completely leave the precinct on its own or is it necessary to maintain some professional support? Currently, we would argue that it is necessary to maintain some professional support which can organise the relevant contacts to government and other actors and which can ensure that the inclusion of all population groups is still a relevant goal within the precinct and which can act as a "neutral" actor and a network node and multiplier. Similarly, the establishment and organisation of neighbourhood networks is possible without targeted project funding – as the city of Gelsenkirchen has shown with their already existing structures – but needs the commitment of the municipality

(or other actors) to put in at least *some* effort and staff in order to initiate and support such processes. How exactly this can be organised will be another element of the participation models at the end of the project.

Acknowledgements: We would like to thank the German Federal Ministry of Education and Research for funding the QuartiersNETZ research and development project.

# EMERGING GOVERNANCE MODELS IN THE INNOVATION OF URBAN SERVICES: RISKS AND OPPORTUNITIES

Emma Puerari

Department of Architecture and Urban Studies | Politecnico di Milano | emma.puerari@polimi.it

Keywords (maximum 3): private-public partnership, urban governance models, public-place-keeping services innovation

*The proposed paper considers that cities are facing challenges to maintain urban infrastructure and establish efficient, open and participative innovation processes to jointly create the applications and services able to respond to citizens' needs and to develop more inclusive and democratic urban processes. It accounts urban services as crucial factors for the innovation of urban governance. In particular, it focuses on public-place keeping services as paradigmatic examples of an active participation of citizens and different kind of institutions to the maintenance, creation and re-activation of public space within an innovation perspective. These public-place keeping services are potentials activators of the so-called 4P model (Private, Public, People Partnerships). In fact during the last decades it was suggested that it is possible to establish public-private partnerships (PPPs) for services supply so integrating the potentials of both the sides public and private* (Osborne and Brown, 2011a). *Nevertheless, many criticisms have been raised against PPPs that are charged to not be a real occasion of cooperation* (Jessop, 2002; Miraftab, 2004). *Some scholars begin to consider the potentials of new possible models for the management of public services. This paper, analysing two case studies from two different European cities (Athens and Rotterdam), will focus on which can be the role of the public sector in defining/envisioning possible futures in a 4Ps perspective.*

## 1. Public services innovation

The nature of public services, and of public service organizations, has changed over the past thirty years and is still changing. This phenomenon is caused by the mutation of political and socio-ecological contexts in which they develop. These changes can be required by a sudden unforeseen crises, which can be environmental (i.e. earthquakes, hurricanes, etc.) health related (as the Ebola cases in Africa in 2014) or a man-made crises (i.e. arsons) (Osborne and Brown, 2005). They can also derive from the change of the local and national political system and of the actors involved in public services provision, and from the growing scarcity of natural and economic resources and also from the changing in the relationship between the different actors involved and between all these factors (Ostrom and Cox, 2010), as for example the changing of global economic factors, government funding and economic structures (Harding, 1994) innovation funnel.

These changes are forcing and challenging cities to maintain and upgrade urban infrastructures and establish efficient, effective, open and participative innovation processes to jointly create the innovative applications and services able to respond to citizens' needs. In particular in this time of growing complexity, due to the crisis of representative democracy, the globalization of culture and economy, the rising cost of energy, the financial crisis and the subsequent economic crisis, the problem of fragmentation (diversity), the ageing of the population, the increasing interest (at all scales from local to global) in environmental issues (Albrechts, 2013).

During the last thirty years the partnership approach received a widespread support from across the political agenda across the local and the supra-national level (McQuaid, 2000), aiming to answer to the new need of people caused from the changes of the different context and environment. Public-Private Partnerships (PPPs) have been proposed as a key tool of policy across the world (Osborne and Brown,

2011b; Osborne and Murray, 2000; United Nations Economic Commission for Europe, 2008). Nevertheless, many criticisms have been raised against PPPs that are charged to not be a real occasion of cooperation (Jessop, 2002; Miraftab, 2004). Some scholars begin to consider the potentials of new possible models for the management of public services. The literature is trying to show how it is possible to develop a new partnership involving the public and the private sector and people (Public, Private, People partnerships, the 4P model) (Kuronen et al., 2010; Majamaa, 2008).

Starting from the evidence that public-place-keeping services are showing up as real occasion for the innovation of urban services and the related governance structure (Hou, 2010), this paper will analyse (in section 2) the Public-Private Partnership model (3Ps) versus the Public-Private-People partnerships (4Ps), which will be better present in this section; then (in section 3) it will describe the concept of public-place-keeping services and (in section 4) analyse two European cases as examples of the dynamic arising in public-place-keeping services, analysing them on three characteristics of the partnerships model. Finally, (in section 5) it will discuss some specific governance aspects of 4Ps arising from the examples shown, and (in section 6) it will present some conclusions and implications.

## 2. Emerging governance models

### *2.1. The partnership paradigm 3Ps versus 4Ps model*

The supply of public services is associated with two types of agents: public or private. As highlighted before, during the last thirty years the partnership approach were believed to embody many advantages which are coincident with the presently acknowledged main criteria for sustainability – it requires consideration of multiple stakeholders' interests, it implies a long term perspective based on common goals, and can accommodate a wide range of conflicting perspectives (Leach et al., 1994). The partnership approach stimulated also new reflections about innovation and causes a new wave of state reforms, starting from economic liberalization, then more focused on administrative reforms and now searching for new more collaborative models.

Going beyond the PPPs model, which started to be questioned, for example Hood (Hood, 1991) states that the advent they has changed little and all the old problem and weakness remained, some scholars begin to consider the potentials of new possible models for the management of public services. What is considered actually is a third tier, the people, regarding the fact that citizens can contribute significantly to service delivery (Ahmed and Ali, 2006). A new vision of governance is emerging that includes the three main sectors (government, the private sector and civil society), a user-centered model that emphasizes process between many actors with different and sometimes conflicting priorities, looking at the way in which the empowerment of people can be achieved in emerging governance system. Far from the urban literature, this model arose with the Toyota 4P model (Dahlgaard-Park and Dahlgaard, 2007; Dahlgaard-Park, S. M. Dahlgaard, 1999; Nonaka et al., 2008). After that, Majamaa et al. (Majamaa et al., 2008) have proposed the model of *Public-Private-People Partnership* (4Ps) for public service provision involving real estate development. In this perspective, the 4Ps model would support active end-user participation in the production of public services, approaching the idea of *co-production* (Leadbeater, 2004).

Against the concept of 3Ps, which represented a formal and well established agreement between the parties, the 4Ps model represents a more informal way to cooperate between the stakeholders (Concilio and Molinari, 2014). In this model of delivery the emphasis is on horizontal relationships between partners, rather than hieratical structures of planning and delivery that are found in state-centred or market-centred delivery. Usually, the stakeholders involved have a direct interest in the quality of the spaces and related services (Carmona et al., 2008).

In a 4P setting there is a fluid networking between partners, which are not expressing the same role over time, their role may change also in relation to their knowledge and capacity in relation to the different challenges that they should face up. People would have, besides the formal channels of local democracy towards the public body, also informal channels to influence the public and the private provider, which, in turn, would be encouraged to develop its service provision further - and even to create additional third-party services, in response to the end-users' further needs on real estate and facility development, exceeding the actual legal requirements on the public service in question. Indeed, citizens are becoming more and more important as *city makers*: they, act at the micro-scale, do things to achieve urban changes and transformation and, at the same time, they are acquiring a more important role.

## 3. Public Place Keeping Services

### *3.1. The concept of Public-Place-Keeping Services*

The concept of *Place-Keeping* was coined by Wild (Wild et al., 2008) and it is related to what happens just after high quality places have been created. This means maintaining and enhancing the qualities and benefits of places through long-term management (Dempsey and Burton, 2012). In this perspective, many aspects of places influence the maintenance of them. It is not only related to physical or ecological aspects, but also to social and economic issues (Ostrom and Cox, 2010). Hence, *Place-Keeping* it is described as 'long-term and responsive management, which retains and enhances the social-environmental and economic quality and benefits which a place brings now and in the future' (Dempsey et al., 2014, p. 14).

*Place-Keeping* it is obviously affected by the different contexts within which it occurs. These dissimilarities implies that not only the physical structure or subject can change, but also that places are affected by a variety of uses and users that will ask for different requirements. This paper considers *Place-keeping* as a process characterized by maintenance, recovery and restoration of the existing environment, but also by a regularly day-to-day capacity of use of the place (i.e. daily use, social, cultural and special events, etc.). This means that also the frequency and quality of the use of that place are significant.

Different kind of *public-place keeping* exists. This paper refers to processes taking place at a micro-scale like a pocket parks, small shared gardens, small abandoned plot. Considering that many experiences of experimenting new models for the implementation and management of the urban public services are related with the management of urban green or abandoned areas and public space, due to the fact that in many cities open space and green areas maintenance is challenged by the economic crises so asking for innovation not only in the way maintenance is carried out but also in the service conceptual framework[1].

On one hand green areas represent a very traditional urban public service that a municipality is asked to supply and maintain to assure a high quality of life in the city, health, security, a good quality of the urban environment, sports, and *loisir,* but also good urban ecosystem to address some of the most important challenges such as climate change, water and food security. On the other, abandoned areas are spreading around many cities due to the contextual changes related to the political, environmental, social and economical issues.

They are one of the most evident examples of the people's reaction against the ineffectiveness of the

public service management[2]; they are considered catalysts of growing civic activism. There, new forms of dialogue between citizens and institutions are developed and experimented, while also shaping new governance frameworks (Concilio and Molinari, 2014). These *public-place keeping* services can represent a long-term management way to focus on public open space maintenance. Restoring abandoned or not well-maintained green areas, where *place keeping* doesn't occur, can represent a considerable economic and social cost.

These kinds of place-keeping actions are carrying innovation dynamics, which are leading to the creation of something new, which is not necessarily a new product, but they produce a process that becomes accepted in an organization or in the society (National Audit Office, 2006).

### *3.2. Four lenses on Public-Place Keeping Services*

The innovation of urban services that take place within socio-ecological system, such as cities, is the results of complex dynamics, actions, socio-spatial system of resources, actors, and context issues. These different dynamics are affected, fostered or impeded by the related governance system. In this paper we want to look at some initiatives, proposed as example of innovation of urban services, which are affecting through three specific lenses, chosen within a wide range of possibilities (Ostrom and Cox, 2010):

1. The promoter: These are the actors that activate the emergence of Public-Place-keeping initiative at the beginning (citizens, which can be part of the local community or external promoters, civil servants, department of the public administration, a private foundation, a public body, etc.)
2. The participants: They represent the different stakeholders taking part in such experiences (local community members, citizens groups, sponsors, civil servants, etc.)
3. The level of formality of the agreement (formal, informal, etc.)

These lenses could be useful in understanding and interpreting the intrinsic dynamic of service innovation and the related governance structure.

## 4. Two examples of Public-Place keeping services

### *4.1. Pocket park in Victoria, Athens*

The creation of a pocket park in the Victoria area of Athens in Victoria wants to answer to the lack of green areas and playground around the city of Athens, matching with that the problem of vacant and abandoned spaces. It was proposed and realized by the local community guided and engaged by *Atenistas*[3], an open and active community of citizens of Athens. They are a group, not a legal body or

---

[2] See for example:

- Salem Public Spaces / Salem-MA (USA)
- Isola Pepe Verde / Milan (IT)
- BOST / Bankside-London (UK) (8)

[3] Their beliefs are concentrated in areas of interest such as (i) Free access to pedestrian streets, pavements and squares, (ii) Cleanliness of the city, (iii) Due process of law, as many of problems in Athens come from the non-law enforcement, (iv) Promotion of tourism (since tourism is one of the biggest industries of Athens) since they have the ambition to make the city of Athens friendlier, with more services to tourists, (v) Promotion of public transportation and bicycles and the creation of bicycle lanes and pedestrians streets, and (vi) Raising money for good causes through the sponsoring of the city by private companies and the citizens (http://atenistas.org).

a political party, who wants to stimulate the creative participation of people to the issues that are afflicting Athens. The group was born in 2010, triggered by the action of one professional. Although many emergent initiatives that are arising around the city in the last years (since 2008), *Atenistas* are the best known, they are seen as a blue print for social movements in Greece (Malkoutzis, 2013). Several activists participate to their actions, but the core group remained the original one; they are the supervisors, guided by one leader, who has the ultimate control over all actions of the group. The small active group had since the beginning a distinct graphic identity and mainly use Facebook and Twitter to advertise their actions, events and gatherings. This kind of participation is free and informal anyone can participate without giving personal data despite an email in order to be part of the newsletter list and to participate to their action.

Figure 1. An image of the Pocket Park in Victoria

In 2011 two *Atenistas' activists* discovered a big, fenced-in corner plot filled with garbage, embodying the ruins of a torn-down building. They started a research about the area and discovered that half of the plot belongs to the Social Insurance Institution (IKA), and the other half is private. After almost a year of consultations with the City Council, the IKA and the private owner, the demolition permission for the building was granted in April 2012, and in May the wreck was torn-down[4], with the permission of Athens municipality that lighted the area and cleaned the plot. On Saturday June 23rd 2012 and during the following week, *Atenistas* proceeded with the final stage of the makeover (tree planting, installation of benches made of discarded pallets, path formation, litter bins positioning, etc.). After this action, the local residents had embraced the new open space had made it their own. They had adopted the trees and plants and watered them throughout the all year, and the owner of the mini market has undertaken the management of the space. One big issue remained to be solved at the end of this action: the necessity of water supply, which was still under discussion with the Athens Water Supply and Sewage Company. In May 2013, Atenistas's Green Team decided to revisit the pocket park. The spot needed a second, better-designed intervention, with more plants and trees and playground gear. The new design plan enriched the space with new elements: colourful murals on the surrounding walls, new playground toys, more plants and trees, etc. Residents and kids collaborated

[4] http://atenistas.org/2012/06/25/feron/

with *Atenistas* in the construction of the pocket park, painted the walls (with the help of the *Atenistas-Creativa* group) and learned how to plant flowers and herbs[5]. After this second intervention also the local primary school started to use the spot in doing their classes.

*4.2. Tuin aan de Maas, Rotterdam*

The Mullerpier area, in Delfshaven-Rotterdam, was the scene of a big intervention of urban development. The first block of houses was completed in 2002, but only one unity was ready. The rest of the area was left as a large plot of sand and weeds. The Public Administration publicly declared that that area would not be build immediately, as promised before, but just after some years. Hence the residents of the area decided to act in order to improve the quality of the public space around their homes and to have a place where share time and chats between neighbours.

In 2004, a group of four or five people decided to organise a restoring action in the area, taking advantage from the public initiative 'Groene Duimen', which gave a small amount of funds to the citizens who wanted to activate a new agricultural initiative in the city. To obtain this funds in an easier way, the group decided to become an official foundation. They started to restore a small part of the land around their houses and grow small plants and vegetables. The initiatives obtained a great success and started to involve more people from the neighbourhood. After some time, the first initiative was destroyed by construction machinery that had to restart the official works of urban development. After this episode, the works stopped again. The reaction of the residents was immediate, they didn't like that their work was destroyed without having nothing in charge. For this reason, during 2008, the initial group decided to make a new garden in the same area, the "Pilot garden" to see if there was the possibility to make it better than the first one. From this test, the experience was completely successful and by 2010 the *Tuin aan de Maas* was completely shaped as a residents' initiative and in 2012 they decided to double the area dedicated to the garden creating a trees and flower garden.

Figure 2. An image of the Tuin aan de Maas

[5] http://atenistas.org/2013/05/28/feronfylis/

After the first experience of destruction of the area, since the agreement between the residents' group and the city council was informal (the group just asked and obtained the permission to take the area sending an e-mail), the Foundation of Tuin aan de Maas decided to ask for a more clear agreement between the parts. The residents were aware of the temporary conditions of the pocket park; they didn't want a formal contract with the City Council, but they wanted to be informed before on the decisions about the area. They didn't ask to have the responsibility of the area, but they wanted to have the time to move the plants, the vegetables and their things from the garden and, just in case, to replace them somewhere else.

The core of the active residents' group still consist of four or five people, who are part of the foundation, but they have involved forty or fifty people who are working at the garden and use to enjoy it. They did a good publicity to their initiative, using Internet and social media and they obtained funding for their activity also from private funds, obtaining prices as social initiative. They were able also to attract people from the other neighbourhood of Rotterdam.

*4.3. Two experiences: similarities and differences*

These two experiences cannot describe the whole complexity of what is happening around the two European cities, chosen as case study. But they still stimulate some reflection about the peculiarities of the characteristic of these *Public-Place-Keeping Services*.

Table 1. Analysis of the Public-Place-Keeping Services initiatives

| **Initiative** | **Promoter** | **Participants** | **Agreement** |
|---|---|---|---|
| *Pocket Park in Victoria* | • External body | • 15/20 members of the promoter group<br>• 30/40 members of the situated community<br>• Private companies | • Informal |
| *Tuin aan de Maas* | • Member of the local community | • 4/5 core members<br>• 40/50 residents<br>• Private foundations | • Informal |

Analysing these two cases on these components helps in develop some considerations about them and capture some differences and similarities. These Public-Place-Keeping initiatives are related to small abandoned plot of the city. The first (*Victoria*) is situated in a central area of the city of Athens, the second one (*Tuin aan de Maas*) is next to a neighbourhood of new and not completed development in Rotterdam.

The promoter of the initiatives in the Rotterdam case was part of the situated community, who wanted to improve the quality of the space around the area and to better know the neighbours. In this case, being part of the community was a point of strength from which start to make the area liveable for all. In the Athens case the project came from an outsider promoter, a group, who experienced the same problem of abandonment and scarcity of quality of the public space around the whole city. The residents accepted the project easily. They found it as good opportunity to restore the area and to re-appropriate of the area in order to have a spot to use and to share moments and chats between neighbours.

The ownership of the land can represent a big issue for public-place-keeping services. In the examples presented above we can notice that in the first case the process of activation of the initiative was stuck

at the beginning waiting for the permission of each stakeholders involved. In the second case just an e-mail was necessary to start the process. Since, the property was unitary.

The participants in Athens were just "outsider" at the beginning but this issue was not an obstacle; it helped the local community to become aware of the problem. In this case, it turned in an opportunity, it was the occasion for activating the citizens' reaction in maintain the area. An issue arise when the time to restore and renovate the design of the area occurs. The local community didn't have the knowledge to do it by itself and for that reason involved again the promoter group in order to restore it. These shared-working days worked as practical and learning workshop. In *Tuin aan de Maas* the commitment of the local community was high since the beginning, but it spread around in a different way. The foundation was able to involve many people from the area and from other neighbourhoods around, but the real commitment for the place keeping was still in the hand of the core group (only4-5 people). They tried to involve other participants in the foundation but most of the people like to enjoy the place without having stable duties on it. In this case the design and maintenance of the pocket-park was totally realised with the internal shared knowledge of the group.

The level of formality of the agreement it is different in the two cases. It is possible to classify the *Victoria* case as semi-informal. Since the permissions were asked at the beginning of the process, but they were given by e-mail without the necessity to sign contracts between the stakeholders involved. In Rotterdam the agreement was more or less the same at the beginning of the story; then, after the "destruction event" occurred, a contract was necessary to ensure the needs of the foundation. It was not a necessity for the City Council to have a contract and fix the responsibility on the area, but it was a strong need expressed by the community, since the situation of instability that they were compelled to live.

## 5. Governance models arising in public-place keeping services

The two case studies presented above are an example of innovation of public-place-keeping services. They represent an innovative way for long-term management of these small plots, transforming them in pocket-parks aiming to enhance the quality of life of local communities. Analysing the promoters, the ownerships, the actors and the level of formality of each agreement helps in understanding the specific governance structure that allows such organisation.

In fact, these kind of public-place-keeping services are calling for innovative governance structure. As highlighted before, more than one solution for the management of the public space exists. Between public, private and public-private partnerships these services are calling for more fluid, dynamic networking and alliances, such as Public-Private-People Partnerships (4Ps) (Concilio and Molinari, 2014), where trust and collaborative values assume a contractual power among participants (Blomqvist, 2002). The different kind of agreements informal or temporary allows a fluid exchange of flows, dynamics and knowledge between participants and stakeholders.

These informal agreements between the different actors involved foster a continuous testing and learning of innovative solutions. The role of each actor is not defined before through a contract, but is dynamic, temporary and –probably- the best for that solution in that specific moment, but it can not always be the best solution ever. Such changes in the roles allow and force the stakeholder to a continuous dialogue to find solutions to different issues through a top-down and bottom-up interaction as an external and internal exchange of values. For example in the *Victoria* case the involvement of the City Council helped the initiative starting with a top-down decision to allow these actors to act in that place, but

These continuous exchanges of ideas and knowledge trigger the building of trust and confidence, within the community and between the community and institutions. Indeed, it is also evident that sometime the use of formal agreement (see the *Tuin aan de Maas* case), acting as forms of reciprocal commitments, help in building trusts between the parts and in clarifying the intents.

The governance structure, which is emerging is open, involves public, private and people stakeholders. The people involved in such initiatives may change over time, although some heroes and leader can be identified in each story. Groups are not pre-defined as stable, they are open in growing in numbers and in changing as people. In the same way public and private actors can assume different forms and responsibility each time.

## 5. Conclusions

The analysis conducted in this paper contributes to the theoretical discussion on the governance models of Public-Place Keeping Services. It is possible no one-fit-all solution elitists. Along the Public-Place Keeping innovation process more than one model is necessary to answer to each innovation challenge posed by citizens' needs. It could be a combination of bottom-up or top-down initiatives and a combination of 3Ps or 4Ps partnership. Indeed it is not yet clear which governance approach will be more successful, but their applicability depends on the specific properties of the long-term problems they are intended to solve (Siebnhuner et al., 2013). In the innovation process more than one governance models can be practicable and/or necessary and they evolve from one to another not necessarily in a continuous way and related organizations can be simple or complex but are rarely stable; more often are temporary or ephemeral.

The replication or adoption of the changes related to public-place keeping it is not always a planned or intentional activity, but it is often something that can be understood better as an emergent process and practice. This does not mean that it is necessarily a bottom-up process, coming from situated people. External factors and actors can also activate a place-keeping process; it is something that happens in relation or consequently to specific circumstances.

Moreover, the increasing of the number of partners does not necessarily equate to more successful partnerships. More partners can bring added challenges for communication and coordination, and building trust between partners who are not used to working together; reconciling profit-driven motivations with users-focused ones can be an issue.

In such context, the coordination of these kinds of processes is not linear; it shifts from one stakeholder to another. These kind of environments shows up the opportunity for urban administrations and institutions to play the role of 'growers' (i.e. "capturers, ", drivers and facilitators) of scaling-up processes, of urban forces showing innovation potentials and self-organizing ability in facing socio-urban problems has been analysed through the consideration that they can capture the innovation potential intrinsic in every urban complex system to foster innovation of public services (Puerari et al., 2013). Hence, it is possible to assume that public institutions can be the crucial capturers of *innovation epiphanies* and crucial aligners of innovation forces towards creating a new perspective for the re-organisation and implementation, hopefully innovation, of public services.

Public administration should not just shift the responsibility of the provision of urban services within a urban innovation environments, but they should be able to foster the innovation epiphanies in order to capture the opportunities within them without loosing the capability of doing things, but being there to help in sustain them.

# PROVISIONAL AND PRECAUTIONARY POLITICS AS FOUNDATION FOR PLURALITY PARTICIPATION IN URBAN DEVELOPMENT – A POLITICAL CULTURE THAT INCORPORATES THE "WISDOM OF THE CROWDS" WITHIN A SOLIDLY UNITED PLANNING AND PARTICIPATION PROCESS.

Hannes Rockenbauch [1], Walter L. Schönwandt [2]

[1]Institute for the foundations of planning, university of Stuttgart, rockenbauch@igp.uni-stuttgart.de
[2]Institute for the foundations of planning, university of Stuttgart,schoenwandt@igp.uni-stuttgart.de

Keywords: planning, politics, participation

*Cooperation and participation have today become regular components of planning processes. Processes that take the ideas and concerns of citizens into account are recognised as more suitable and are therefore more easily accepted. The protests against the infrastructure project "Stuttgart 21", however, have demonstrated that the so-called "communicative turn" in planning theory has failed to install a planning and policy-making process on a level playing field with the citizens.*
*What is missing is an approach which brings the actors jointly to the table. In real life practice, politics, public administrations, and citizens are often parallel worlds with their own general rules and rituals, and with little mutual understanding. The concept of Provisional and Precautionary Politics can provide the stimulus to change the culture of local planning and policy-making processes. This kind of politics means a radical break with the rational planning model, which assumes that everything can be planned. By contrast, it aims at a common and mandatory process of open-ended knowledge generation, in terms of a body of experience and feedback. Provisional and Precautionary Politics is based on the assumption that in a changing world and due to human fallibility, knowledge and actions can only be preliminary. Therefore, it is important to preserve maximum scope for future action. According to this proposition, the "wisdom of the crowds" helps in solving complex social problems, while, in turn, planning and politics can help the "wisdom of the crowds" to achieve common action*.

## 1. Introduction

Already in the seventies and eighties, the academic discourse on planning had departed from a planning culture that still perceived the planner as having a "God the Father" type role and saw the world as being predictable by planning. The fantasies of omnipotence of a rational understanding of planning were set against the so-called "wicked problems" (cf. H. Rittel, 1973, p. 20). Owing to their quality of being socio-culturally constructed, these "wicked problems" led to the derivation of the demand for greater citizen communication, culminating in the so-called "Communicative Turn". Suddenly, the citizens became the focus and efforts were undertaken to ensure their participation in planning, which had until then mostly remained a sovereign affair. In the meanwhile, a broadly differentiated collection of formats for participation has developed. However, in political and administrative practice, the classic representative division of labour all too often still holds sway, following the motto: "Politics and planning decide, and the citizen must live with it." The fact that this outdated conception of planning is still deeply ingrained in Germany was last demonstrated by the controversies over the infrastructure and real estate project *Stuttgart 21*. By the autumn of 2010 at the latest, when the images of the police operation in Stuttgart's palace garden flashed around the world, the calls for better citizen participation in politics and planning in Germany became so loud that the search for new forms of participation and cooperation gathered renewed momentum everywhere. The Green Party-Social Democratic state government, in the meanwhile, even has a state councillor for civil society and since 2013, the University of Stuttgart has been offering a new master's course, "Planning and Participation", for studying citizen participation, while municipalities and administration departments are increasingly experimenting with various formats of participation. (cf. Selle, 2013, p. 337). However, parallel to these efforts, an old debate resurfaced between those who wholeheartedly proclaimed a new "culture of being heard" (cf. coalition agreement of the Green Party-

Social Democratic state government of Baden-Wuerttemberg, p. 1) and those who tirelessly warn against ungovernability and the decline of Germany as a business location on account of the attacks on representative democracy by enraged citizens (cf. Kurbjuweit, 2010, p. 26). In the light of such statements, the question arises whether things have really changed since the events of Stuttgart 21. Is it not true that soap-box oratories pay lip service to the "culture of being heard", but that in everyday life, the effects of participatory projects on the actual practice on the ground turn out to be rather modest? If this is true, why then is it so difficult to actually progress with "plurality participation in urban development"?

It should be noted that in the current debates over concepts of participation, a central aspect is often missed out, namely that the success of participation significantly depends on the decision-making processes in which it is embedded. This means that for participation to work, one has to particularly take a fresh look at processes in politics and planning. The search for ever new participation procedures seems to remain less expedient as long as the actual causes lie in the democratic deficit within the routines and processes of planning and politics themselves. The basic proposition of this paper is as follows: **Without fundamental changes in the decision-making processes in politics and planning, participation will, at best, remain little more than a well-meaning spectacle of participation, while the opportunity to fundamentally improve planning and political decisions in urban development by means of plurality participation is lost.** As long as politics and planning on the one hand, and plurality participation on the other, stand against each other in parallel worlds of sorts, as is the case today, many efforts go in vain in spite of planned communication. This is not only because the interfaces and time schedules of participatory processes don't fit to the processes in politics and administration, but also because according to the classical understanding of representative democracy, the field of politics and administration is not prepared to hand over decision-making authority. Frustration and conflicts then seem inevitable for both sides. Indeed, the problem faced during Stuttgart 21 was not a lack of participation but that the existing participation remained ineffective because citizen demands failed to flow into the planning. Already in 1997, open citizen participation was invited for the future city quarter. After three months of intensive work by the citizens, the city council adopted the framework prepared by the administration without any major changes – hardly surprising since the city council had decided on the main planning parameters in a basic agreement already in 1995 (cf. Süddeutsche-Online, 2011). In 2012, the Deutsche Bahn AG and the state of Baden-Wuerttemberg held the so-called "Filder dialogue" on a section of Stuttgart 21. However, the dialogue did not result in adhering to the route variant preferred by the citizens, but to that from which the Deutsche Bahn AG would have profited the most (cf. STZ-Online, 2012). It is not for nothing that, in numerous debates, Stuttgart 21 is cited as a dissuasive example for how politics and planning should not be conducted.

If one follows the above-mentioned proposition, the usual viewing framework shifts away from the search for new participation procedures and towards the specific practice of politics, administration, and planning. Hence, when we ask ourselves how participation, politics, and planning can come together in future, the answer can only lie in a mutual process of change. On the one hand, participation procedures should be better integrated into political and planning processes, and on the other, the organisational and methodical foundations within future political and planning processes to make plurality participation work must first be created. This includes that the specific changes in the decision-making of politics and planning don't function without a transformation in the culture of politics and planning. What is being seen as constituting this culture, is the proposition that the search for answers to the question of "how we want to live and produce in future" can only be a joint search by politics, planning, and citizens. On this basis and under the term of "provisional politics and planning", this text intends to develop preliminary approaches for the construction of a new understanding of politics and planning as processes of joint learning with the citizens.
At the start of this paper, the most important terms used and the intellectual approach are clarified. In the second stage, an own approach for "provisional politics and planning" is developed, taking Christoph Hubig's deliberations on provisional ethics as a starting point. In the third stage, the consequences of the basic proposition that it is the field of politics and planning processes in particular

which must change are taken up. In the conclusion, the most important insights are summarized and the further research needs stated.

It is to be pointed out that whenever there is general talk of politics and planning, it always refers to the sphere of municipal politics and planning in Baden-Wuerttemberg.

## 2. Provisional politics and planning as cooperative knowledge-generating process

For a better comprehension of this paper, it seems useful to briefly address the author's understanding of politics and planning.

### *2.1. What is understood by politics and planning*

The understanding of politics and planning which is taken as a basis here is oriented towards Benjamin Barber's definition.
"the need for politics arises when some *action* of *public* consequence becomes *necessary* and when men must thus make a *public choice* that is *reasonable* in the face of *conflict* despite the *absence of an independent ground* of judgment." (Barber, 1984, p. 122).
According to Benjamin Barber, politics always has to do with taking action or not taking action, whereby politics, in his view, "only" refers to the publicly relevant realm of taking action for which people are obliged to come to public decisions without having any "independent ground" to refer to as basis for decision-making. Barber describes politics as a negotiation process which is supposed to produce reasonable decisions in spite of differing views and disagreements. (cf. Barber, 1994, p. 106ff). This view of politics as being a negotiation process which, despite a recognised pluralism of values and a given uncertainty regarding the future, is condemned to come to "reasonable" decisions, connects with Christoph Hubig's theoretical deliberations on smartness which are discussed later. Since the discussion on different perceptions of democracy is not the main subject of this work, it may just briefly be mentioned here that Barber's conception of "strong democracy" most closely matches an understanding of democracy as "provisional politics and planning". In both approaches, citizen participation and participation in planning and politics serve as a kind of political epistemology which makes possible – albeit not in all cases but where it matters – citizen self-government. (cf. Barber, 1994, p. 146)

If one agrees with Horst Rittel's proposition that planning is an integral part of politics (cf. Rittel, 1992, p. 35), Barber's definition can be transferred almost one-to-one to the planning process in urban development. Especially when it comes to questions of urban development, it is considered necessary to arrive at reasonable decisions despite different views on one and the same problem. For example, to a traffic planner, a car parking space represents an entity that can be compulsorily determined from the legal framework according to precisely defined regulations. For a retailer, a car parking space may, proverbially speaking, be a locational advantage. For a pedestrian who is obliged to squeeze himself between parking cars, it is a traffic hindrance, and for a child it represents an area which could have been better used for a playground or for a tree to climb. To be able to come to a publicly useful and balanced decision under precisely these kinds of differing viewpoints and interests, is the planning-related challenge and - in keeping with the approach chosen here - simultaneously politics-related challenge of planning. Barber's definition, however, also allows another analogy. In planning, just as in politics, absolute truths don't lend themselves for use as independent justification. This perspective on planning and politics breaks with the view that there allegedly exist absolute truths that form the basis for decisions that permit no alternative and a "take-it-or-leave-it" manner of politics of any kind. However, it also breaks with the planners' understanding of themselves as experts with a "God the Father" type of role in developing cities.

Based on an understanding that views politics and planning as a negotiation process which despite differing perceptions and disagreements is supposed to lead to reasonable decisions, the proposition is

made here that there can be no sound decision-making foundation for complex urban development processes without "plurality participation". Why is this so?

### *2.2. Dealing with uncertainty and insecurity*

In contrast to routine tasks such as the issuing of a building permit, the problems of urban development are usually complex. This means, for example, that these questions depend upon a variety of factors which are probably not all known, but are often dependent on each other and have their own unforeseeable dynamics (cf. Schönwandt, 2013, p. 22).
This situation is aggravated by the circumstance that the penetration depth of human decision-making vis-à-vis global ecosystems, for instance, has increased owing to the advancing dynamics of "techno-economic superstructures" (cf. Hubig, 2007, p. 134). This, however, also leads to growing uncertainty regarding the effects of such human interventions. Politicians and planners whose plans and decisions are oriented towards future action are thus confronted with considerable challenges. In a constantly changing world, one may ask what is at all certain except the certainty that nothing is certain?
To avoid ending up in fatalism, planners and politicians depend on enlarging the knowledge base of their decisions for which they require the knowledge of the citizens. Klaus Selle (2013, p. 353) justifies plurality participation vis-à-vis the experts with the observation that there isn't just "knowledge" but that planning and politics requires various forms of knowledge. As such, planners are especially needed where "explanatory knowledge" or "instrumental knowledge" is needed, i.e. knowledge of how things are related to each other in the world, and of how to act. The citizens, in turn, are to be called upon when it's about the knowledge of "what is" and of "what ought to be". According to Klaus Selle, planners and citizens are simply experts in different fields, as the case may be, though all their knowledge and views are indispensable for successful planning.
To jointly learn from this communication, it is necessary to place political and planning decisions under the condition of human fallibility, since knowledge and the world are constantly changing and only a small part of the world and of knowledge is open to individual human beings (cf. Hubig, 2007, p. 129). Instead of making the individual knowledge-bearer the starting point of decisions, plurality participation in political decision-making is required, as Aristotle had already demanded. "[...] Since there exists a plurality of persons, each one of them may possess a part of the virtue and wisdom, and the entirety, in coming together, may become like a single person with many feet, hands, and senses." (Free translation from German, Aristoteles, Politik 1281b 5-10).

If the goal is to base political and planning decisions on the knowledge of real societal and social relationships, then plurality participation is indispensable. It represents the only possibility to integrate the day-to-day world and thoughts of the concerned and participating persons into the decisions. Moreover, politicians and planners usually don't have to (and in purely physical terms, can't) live with the planning effects which they have caused. More often than not, this leads to a lack of experience on their part, though an "experience-rich capacity for judgement" is necessary for assessing their own decisions. In order to improve political and planning decisions, politicians and planners thus depend on the experiences and the local knowledge of multitudes or pluralities on a feedback level (cf. Hubig, 2007, p. 129).

The „wisdom of pluralities" can thus serve as a pool of experience and a feedback level of politics and planning with a view to solving complex problems.

### *2.3. The wisdom-related ethical consequence of value pluralism*

The understanding of societal and social relationships such as the question "how do we want to live in future?" is an exceedingly normative process. This means that such an understanding is a negotiation process about what should at all be perceived as a relevant problem or a desirable goal. Assuming that every value requires higher-level recognition by the decision-making subject, value pluralism and hence value conflict are bound to emerge in an increasingly pluralistic world (cf. Hubig, 2007, p. 137). Final justifiability for public decisions is lacking. As mentioned above, Horst Rittel calls these socially constructed problems "wicked problems" because there supposedly is no scientific solution-finding

routine for them as there is for the "benign problems" of, say, the engineering and natural sciences. At first, there usually is disagreement over what is and what ought to be, urgently requiring any form of decision-making on how to act in future.

However, in the light of these conflicts and uncertainty, how can balanced planning and decision-making processes be possible? Ever since the philosophers of the world have attempted to find justification instances for human actions, there have, in turn, been disputes over precisely these instances. In principle, even the most diverse approaches are all based on the attempt to derive from higher-level rules justifications for dealing with value conflicts. Broadly speaking, one can distinguish here between utilitarian, discourse-ethical and smartness-related ethical approaches (cf. Hubig, 2007, p. 119). In most cases, deliberative democracy theories which can be included in the group of discourse-ethical approaches, and following Jürgen Habermas, for example, are cited for justifying "plurality participation". The approach attempted here to describe principles for a culture of provisional politics and planning also draws on particular smartness-related philosophical deliberations which Christoph Hubig has developed as "provisional morals", based on Aristotle and René Descartes. These theoretical deliberations represent a pragmatic approach for processes in planning and politics. In contrast to discourse-ethical approaches, real negotiation processes are less burdened by strong entry preconditions such as the demand for a domination-free discourse or the demand for consent of all concerned persons as justification instance.

At this point, it should be noted that Christoph Hubig (2007) developed his provisional morals as an ethics of technology and not as an aid for politics and planning. Nonetheless, his basic ideas which are meant to help come to reasonable decisions in the face of "dynamic situations of uncertainty" and existing value conflicts, are very interesting for the similarly complex decision-making situations in planning and politics.
From Hubig's deliberations (2007, p. 119ff.) and going beyond "plurality participation", the following requirements of provisional politics and planning can be derived:

1. Provisional politics and planning is problem-oriented and situation-specific.
2. Provisional politics and planning makes sure that individual decisions and actions are conducive to the strategic goal of a good life for the community (cf. Hubig, 2007, p. 128).
3. Provisional politics and planning includes human fallibility, especially under dynamically changing conditions, in its plans (cf. Hubig, 2007, p. 130).
4. Provisional politics and planning orients all decisions towards the goal of preserving the conditions for action.
5. Provisional politics and planning takes provisional decisions.

### *2.4. What does provisional mean?*

The term "provisional politics and planning" has been deliberately chosen to be provocative to make clear the break with the terms relating to politics and planning prevalent in Germany today. In this context, "provisional" should by no means be confused with "arbitrary" or "weak". Here, "provisional" signifies an approach that allows to react flexibly to changing circumstances and to learn from human errors. "Provisional" should, as such, be understood in its threefold meaning of being foresighted, protective, and reversible. This makes provisional politics and planning an approach that delivers error-friendly and, hence, robust decisions.

In his deliberations, Christoph Hubig refers to the image of "tent morality", which René Descartes had developed already in the seventeenth century. For Descartes, in the time of change in which he lived, there was no moral foundation anymore. He spoke of there being no fixed house of morals anymore (cf. Hubig, 2007, p. 133). As a reaction to the loss of a secure assessment instance, Descartes developed his thoughts on provisional tent morality as transit morality. In this image, the tent becomes the symbol for at least providing a minimum measure of protection and comfort for the journey to a new, yet-to-be-found solid house of morals. Christoph Hubig takes up this tent notion and transfers it to our present time to derive a canon of features from it with which particular options for action can be

marked as preferable. In doing so, Hubig concretises Descartes' approach for a tent morality by developing assessment criteria from the image of the flexible and easily transportable tent. Flexibility, adaptability, reparability, error-friendliness, and optimisation ability, but also the possibility for easy revision, represent some of these criteria. A tent should, however, should also have the ability to be carried on many shoulders, which brings Hubig to the issue of diversity and participation. It is striking that these criteria also include the main criteria for sustainability (cf. Hubig, 2007, p. 136).

The limits which provisional politics and planning defines for future decisions and actions assume special significance here. These limits result from the basic smartness-related ethical demand for preserving the conditions for action. To retain the possibility to learn from errors and to be able to deal with changing circumstances, provisional politics and planning takes into account, in every decision, the goal of preserving the ability for action and the possibilities for action, for future action. As such, all actions which question the subject of action (or its ability for action as self-determined being) should be avoided, just like actions that endanger future scopes of action (possibilities for action). Hubig distinguishes between the option values and the bequest values. The option values, like the sustainability criteria of renewability and diversity, for example, aim to keep open future scopes of action. Bequest values aim to preserve social structures such as education and upbringing, etc., as well as corresponding organisations and institutions. According to this, bequest values are basic conditions which are necessary for the formation of autonomous subjects and their value competence (cf. Hubig, 2007, p. 142).

This self-limitation not just allows joint learning processes but also allows the sphere of politics and planning to admit that it doesn't always know the one solution that's right for all. On the contrary, provisional politics and planning aims to make planning and politics permanently negotiable anew by preserving the scopes and conditions for future decisions. Once planning and politics are permanently negotiable anew on account of plurality participation, it can be ensured that the wisdom of the plurality not only represents an additional feedback level, but in fact turns into a strategic control level in an iterative optimisation process. Moreover, once politicians and planners accept this understanding of provisional politics and planning, a new dynamics in politics and planning can emerge. As such, political confrontations over what constitutes "the only correct decision" would relax, since the retention of smartness-related ethical limits will permit to tentatively commit oneself to a particular course of action (and perhaps also risk an experiment) and then, if necessary and under plurality participation, to continually readjust or, if need be, even revise the decision in favour of another variant. Under the conditions of provisional politics and planning, disagreements revolving around the question of "how we want to live in future?" are not decided once and for all, but form important resources to optimise and correct provisionally taken decisions. By means of the concept of provisional politics and planning an understanding of planning and politics becomes possible that practices plurality participation as a joint learning and knowledge-generation process.

## 3. Plurality participation in urban development

Following the rather theoretical deliberations on an approach for a new understanding of politics and planning, as described above, the next chapter is about the practical difficulties of plurality participation in urban development. At the beginning of this chapter, the main terms such as "plurality participation" and "urban development and urban planning" are briefly determined in more detail.

### *3.1. Urban development and urban planning*

In this context, urban development, following Klaus Selle, is viewed as a joint effort by entirely different actors (cf. Selle, 2013, p. 13). The actors can roughly be divided into three supersets: market actors, state or municipal actors, and a group of citizens who belong to civil society in all their diversity. Cities develop in an interplay of these three sets of actors. Urban development, in turn, can be described in more detail by means of an arbitrarily differentiable range of characteristics. The different actors all contribute in their own way to the constructional-spatial, social, ecological,

economic, and cultural development of cities (cf. Selle, 2013, p. 77). As such, urban planning is viewed as the attempt to steer the diverse urban development processes which are taking place anyway in the direction of strategic goals for the public good. In doing so, urban planning is not restricted to constructional-spatial uses only (comprising areas and facilities), but endeavours to influence the social make-up and institutions by creating organisations and guiding attitudes (cf. Jung, 2008, p. 28ff)

### *3.2. Participation*

Numerous actors are involved in all these diverse processes. This text specifically focuses on the participation of inhabitants as actors of civil society in the field of urban development. Inhabitants participate in urban development in diverse ways. Citizens can, by their own actions, participate directly in urban development, for example for the cause of neighbourhood gardens, building owners' associations, and much more. They can also, however, participate with others in the form of collaborations and co-operations such as housing or energy associations (this type of participation is only briefly outlined here; in any case, it represents the area where civil society actors become new market actors). Finally, they can participate in opinion-making by means of protests and campaigns, and in decision-making of local democracy by means of elections and referendums (cf. Selle, 2013, p. 60).
Participation, in this context, is understood as a broader concept, similar to the participation of citizens in decision-making processes initiated by politics and planning. From this understanding of participation, it becomes clear that what is needed is more than a mere "culture of being heard", but rather a culture of "joint effort".

### *3.3. Practical prerequisites for plurality participation in urban development*

In his polemic interjection, *Stop participating*, Klaus Selle (Selle, 2013, p. 337ff) concludes that "never before has there been so much participation". However, true cooperation on an equal footing with the citizens is hardly evident in everyday administrative and political practice. Traditional understandings of roles, as well as a deep-seated distrust of the citizen as troublemaker and the alleged necessity to stay "among themselves" and "not go public" means that participation is often futile. A lack of support for participation within politics and administration certainly also is an important aspect. Just as decisive, however, is the situation that participation and politics today are still separate worlds. As a rule, the classical representative division of labour holds sway here too: The planner plans, the moderator/mediator facilitates participation, and the politician decides. Thanks to this division of labour, even well-constituted, methodically mature, and comprehensive participation processes are doomed to failure, as they are usually poorly or not at all integrated into the "parallel universes" of municipal politics and planning (cf. Klaus Selle, 2013, p. 372), or encounter deficits of democracy there (see below).

Conceiving of politics, planning, and participation as belonging together, not only right from the start, but in actual practice too, is a conception that faces considerable unsolved challenges today due to the constitution of planning and political processes in Baden-Wuerttemberg, which is unfriendly to the citizen. In the following section, some of these challenges are briefly discussed.

#### *3.3.1. Inadequate transparency and impossible control*

In the political practice of municipal politics in Germany, citizens today still stand in front of closed doors. The legal possibilities for citizens to demand transparency and information on political decisions usually fail due to an inadequate legal basis, including a lack of municipal statutes on freedom of information. In addition, in municipal practice, basically almost every issue undergoes preliminary discussion in non-public committees. The tendency towards confidentiality increases to the extent that municipalities privatise their organisational units of city administration and their public services, or at the very least, organise them on a market basis. Conversely, market players often gain direct access to decision-makers' backrooms (cf. Lobbycontrol, 2013, p. 9). In this way, secrets of

trade and competition lead to non-transparent procedures. Frequently, however, transparency fails simply because of the required human and technical resources in the municipalities. As such, documents of meetings, for example, often only reach committees at the expiry of the minimum period, while protocols usually take longer than prescribed.
**Need for change:** The creation of the legal prerequisites for ensuring transparency of municipal freedom of information statutes, as well as the personnel-related and financial means for transparency must be ensured by the municipalities. Existing information gaps otherwise make it impossible for the citizen to trace or control political decisions, let alone to intervene in advance and at an early stage, or even to contribute new arguments for decision-making. Moreover, a self-conscious use of direct democracy rights such as a referendum is significantly hampered.

### *3.3.2. Inadequate formal procedures*

In municipal practice in particular, where planning projects directly concern citizens, the formal participation procedures are inadequate. Municipal codes, such as in Baden-Wuerttemberg, exclude direct-democratic decisions on the budget statutes of municipalities as well as on urban land-use planning. An amendment of the municipal code of Baden-Wuerttemberg, planned for this year (2015), is envisaged to at least make the decision on development plans referendum-capable. Whether this will give an actual impetus to participation remains to be seen. Experience has shown that formal "participation at an early stage", provided for by the building code with regard to the preparation of urban land-use plans, often proves futile. This has a very simple cause: At the time of "participation at an early stage", the consequences of plan change, and with it, the citizens' own concern, are inestimable for the citizen. From the point onwards when it becomes clear "what actually it is that's coming", which results in growing citizen concern, most of the fundamental decisions have already been taken. The leeway of citizens then usually approaches insignificance. Citizens are left with the means to "object and suggest" and the thankless role of being commentators of an evaluation process which, according to municipal code of Baden-Wuerttemberg, can only be decided upon by the municipal council. The planned amendment of the municipal code will not change this procedure in any fundamental way. Participation prior to or during decision-making assumes the presence of an activated citizenry which, at such an early stage, only appears likely in exceptional situations.
**Need for change:** Though correct, it is insufficient that drawing up of development plans should now become referendum-capable. Citizen participation should also become possible when goals are turned into concrete resolutions.

The formal procedures are inadequate not only in terms of the specification of the type and extent of future development by means of a development plan. As we have seen, many suggestions by citizens go far beyond the steering possibilities of classic urban development instruments. For example, the demand for lower prices in local transport lies outside the sphere of statements and regulatory possibilities which can be decided by a plan (cf. Selle, 2014, p. 29). However, even taking a municipal transport company as an example, citizens in Baden-Wuerttemberg lack an obligatory option to oblige the municipality - by means of a referendum - to lower fares and, in a countermove, to increase a tax to finance it, for example. Just as in the case of statute resolutions of land-use and development plans, direct citizen participation is not permitted by municipal code in Baden-Wuerttemberg for the preparation of a municipal budget. Due to this, there is a lack of formal instruments to decide on obligatory financing through participation processes. Hence, no matter how well participation procedures are constituted, the ideas of citizens, in most cases, finally depend on implementation by the municipal council. When other priorities are pursued in a cash-strapped financial situation, or a municipal council is simply voted out, there may well be a lack of funds for measures which are, per se, welcomed by all.
**Need for change:** The formal instruments of participation in decision-making should be expanded in the municipal codes of the federal states. In particular, it is a matter of formally guaranteeing participation in statute resolutions of land-use and development plans, as well as in city budget preparation. Only in such a manner can emancipatory budgets such as in Porto Alegre also become possible in Germany or in Baden-Wuerttemberg.

The expansion of formal instruments places higher demands at the implementation level of municipal administration, which not only pertains to the above-mentioned demand for greater transparency.

### *3.3.3. Administrative organisation doesn't fit to the aspirations of participation.*

In many cases, it is simply the internal routines and rites of administration which make it so difficult for participation to connect. Participation processes mean additional administrative burden for which there usually isn't any staff, money, and time in the departments. If, in addition, the participation processes are looked after by external professionals, it can easily happen that subsequently simply no one in the administrative departments (which are usually organized in sectors) feels responsible for the implementation of the "unsolicited" outcomes. The result is a kind of diffusion of responsibility. The numerous ideas of citizens disappear in the „depths of municipal administration" (Selle, 2014, p. 29). Should there, indeed, be somebody to take responsibility, specific agreements often remain valid only until the next change of head officials or department heads.

However, even before outcomes and agreements begin to be implemented, it quickly becomes apparent that administration departments, which today are mostly organized according to hierarchies and sectors, reach their limits when confronted by citizen participation. Even where citizen participation and a given municipality happen to be dealing with the same problem, their way of working mostly differs fundamentally. In participation processes - as would seem natural - discussions take place based on a problem definition. The ideas and preferences of citizens thus emerge in a thematic and spatial context and are derived from the given problem definition. While all discussants in participation processes (excepting certain work phases) take part in a discussion, municipalities work in a much more specialized manner and in specific departments on account of their organisational form. In cities, such as in the state capital Stuttgart, municipalities usually are complex administrative units with several political departments, which are divided into administrative offices, which, in turn, are structured into divisions. Except for necessary project meetings, divisions working on the same problem do so in parallel, however, each with a specific professional orientation. These sector-wise competencies thus, for example, lead to a laborious coordination routine, so that every responsible person touched by a specific problem is actually involved, and legally watertight procedures finally ensue. Freely adapting from Garry D. Brewer, one could, as such, conclude that "participation knows of problems, while municipalities know of departments".

Apart from the different professional departments, the different hierarchy levels of administration departments must also, however, be involved, and the different political committees heard, until a political decision can be reached. This usually laborious coordination procedure not only takes time, but also leads to successive changes and coordination processes during its passage through the various offices, and thereby leads to constantly changing drafts of one and the same resolution proposal. As such, it is difficult to ensure that citizens' patience doesn't wear thin, since being active on a voluntary basis means that the citizens lack the time to check and comprehend constant changes.
Furthermore, the different competencies and authorities in administration can also be used to always delegate responsibility to precisely that department or person which/who happens to be absent. Justified citizen concerns often prove futile when the key responsible person is absent.
**Need for change:** The planning and decision-making processes in administration must be newly organised according to the principle of "gathering everyone around the table". The appropriate demand to follow this maxim in participation processes not only applies to concerned citizens, but also - and particularly so - to the authorities and responsible persons in administration. For these processes, the necessary staff-related, financial and temporal resources should be made available.

### *3.3.4. The numerous informal procedures don't fit to the structures of the established routine of politics and therefore often remain non-binding advisory procedures.*

Following a brief problem outline, many participation processes begin with a brainstorming on or other creative methods applicable to the ideas and aspirations of citizens. In most cases, however,

there is no time to direct a structured negotiation process on the usually divergent aspirations and wishes. As such, participation only serves to collect ideas and, if necessary, criticism. The actual negotiation process on what should bindingly be implemented in the light of usually scarce resources is left to the municipality and the politicians. This division of labour corresponds to the common perception of parliamentary democracy where parliamentary processes are merely supplemented by citizen participation. This is the principle according to which most of the municipal participatory budgets currently function, including the participatory budget in Stuttgart. The decision-makers in administration and politics are, in such cases, left with almost nothing else but to simply pick out from this "motley bunch of flowers" what would anyway have fitted to their concept. In Stuttgart, the municipal council is presented with a citizen wish list containing over 100 suggestions on the budget discussions. Such procedures have little in common with participation processes.

Since informal procedures, for a start, take up discussions from the perspective of the issue at hand or the problem faced by (and wishes of) the citizens, it is difficult to ensure at the beginning whether ideas can at all be realised via the municipal-politics level. The different political competencies in a federal Germany, and the different regulation possibilities derived from them as restrictions of municipal politics and planning, at first understandably play no role in the participation process. However, if such a reflection is missed until the end of the participation procedure, "inappropriate" results of participation may correspondingly often be present.

Besides the fact that many citizen demands can, indeed, not be decided upon at the municipal level alone, suggestions of participants often depend on the initiative of private actors for their implementation. This presents a difficulty for many politicians, as often the political will to intervene by steering the organisation or the behaviour of private actors is lacking. It becomes particularly complicated when powerful market players such as large investors or employers in the city are negatively impacted by the implementation of participation. Thus, till now and in spite of a delinquency procedure of the EU, no traffic-restricting measures are being taken to reduce air pollution in Stuttgart. The argument usually goes that the city is an important automobile industry location and must therefore also consider its interests. According to the Stuttgart action plan, *Nachhaltig Mobil* ("Sustainably Mobile"), "it's not about the question as to whether one is for or against cars, but about how well-networked mobility can be set up and organised in our city. This is also and precisely in the interest of our automobile industry." (cf. Aktionsplan, 2014).
**Need for change:** Even if this democracy deficit on a municipal level cannot be cured by a procedure or by local politics, it is at least the task of the participation procedure to carry out mutual qualification as well as joint consideration and prioritisation. For these comprehensive processes, the necessary time and money must be planned right from the start. If this is not the case, the ideas of the citizens often don't really fit well into the political arena. They are not or only partially taken up, which, in turn, leads to frustration on the part of the citizens since all efforts have been futile.

## 4. Conclusion

Understanding politics and planning as provisional precautionary, plurality participation becomes a necessity for arriving at wise and balanced decisions. While retaining smartness-related ethical limits which aim at maintaining future possibilities and abilities of action, politics and planning as a joint learning process comprising politics, planning, and citizens becomes possible. Provisional politics and planning allows to flexibly react to dynamically changing local and global conditions by taking into consideration the changeability of every decision.

The shift of the prevailing examination framework, away from the search for new participation procedures and towards current processes in politics and planning, delivers concrete insights on the changes required to make plurality participation successful. These changes range from obligatory rights such as municipal freedom of information statutes and

more resources for transparency to the expansion of direct democracy rights, so that urban land-use planning and municipal budget statutes become referendum-capable to the point where concrete organisational and methodical changes are made which permit plurality participation in political and planning processes.

It must be the goal of further deliberations to concretise the thoughts outlined here, in order to develop a more concrete understanding for a provisional politics and planning, as well as more concrete suggestions for plurality participation, following the maxim of bringing "everyone to the table". In practice it will surely be impossible to have everyone always negotiate everything around one table, as it were. More likely, it will be a question of scheduling the phases of task distributions by targeted links ("everyone to the table") and improved interfaces (transparency) in such a way that joint cooperative problem resolution between politics, planning, and citizens becomes possible.

In conclusion, it remains to be mentioned that provisional politics and planning can only function if the possibilities and abilities for participation are available to the plurality. Without the associated guaranteed participation in education and social prosperity, and without sufficient time, plurality participation in urban development remains an empty promise, or rapidly assumes a skewed social and exclusive position.

# Crafting Tools of Planning Practice and Pseudo-Participation: Hegemonic Power Relations in Decision Making Process of Urban Development in Turkey

Tugce Sanli, Tim Townshend, Ian Thompson
*Newcastle University, School of Architecture Planning and Landscape, NE17RU, United Kingdom*
t.sanli@ncl.ac.uk, tim.townshend@ncl.ac.uk, i.h.thompson@ncl.ac.uk

***Abstract***
*The development of urban areas has a strong relation with the cultural structuring and traditional praxis of a community. In planning practice, the cultural context not only affects urban spatial configurations and societal considerations embraced within, but also legislative and administrative systems and their operations dictates the process and production of those spaces. The debates that concentrated on the disappointing side of the reality of planning attempted to unfold the hegemonic relations of power in decision making process (Hiller 2002; Flyvbjerg 1998). This paper focuses on the emerging traditions of planning practice in Turkey whereby quick solutions to end daily conflicts and power relations in planning have altered planning practice. Within this context, this paper is concerned with the ever widening gap between the idealised steps of planning practice and reality, which challenge ethical planning practice and limit democratic participation, in which the lack of the former also distorts the nature of the latter. This paper argues that, the decision making process of planning in Turkey is embedded in implicit structures and relations. It also highlights that participatory and democratic ethos of planning are merely enacted in a superficial and often conditional manner. Therefore, the real practice presents vanishing of that participation and loosening of the professional ethics. The lack of professional and institutional ethics in the planning process is further revealed when it is considered how legislative structures are being crafted in favour of particular interests of powerful actors, thereby diminishing the chance of rightful participation.*

**Keywords:** Planning Practice, Power Relations, Ethics in Planning, Participation

## 1. Introduction

The relations of power has become the cog-wheel that constantly applies its own rules in the reality of practice and has been in tandem with distortions contrary to the ethos of planning via decision making processes. This situation on one hand challenge ethical planning practice and on the other hand limit democratic participation, in which the lack of the former also distorts the nature of the latter. Therefore, this paper aims to unfold the planning practice in Turkey, where the context dependant conditions and quick daily solutions have become a tradition. In addition,, while the planning ethics quest for inevitable human values and higher priorities for the all members of society (Wachs 1995); the matters of process decision making, planning practice and ethics, and public interest emerges as delicate issues. It is because each brings its own ambiguities and questions that further can be answered differently in different contexts, cultures or circumstances. Who is the real decision maker? Who governs (Dahl 1961). Who makes the city? Who obtains (or should obtain) planning ethics?

Although above mentioned matters and questions can be increased in number, owing to the scope of this paper the focus will be on the 'dark side' of planning (Flybjerg 1998) that leads to distortions in practice and in ethics via non-participatory processes, dominating decision making processes that is embedded in implicit structures and relations. As planners are not the only agency of the planning practice, even in some cases they are the least authorised ones, it is important to realise the responsibility of ethics can not merely be handed on planners. There, the allied relationship between decision makers and developers; pseudo-participation of the some and non-participation of the rest of

the actors; crafting statutory tools reveal how power operates in reality and how the hypocrisy within planning practices condoned by benefit holders are uncovered.

The present research unfolds the relations of power in reality via analysing the production[1] process of two shopping malls: Armada and Kentpark in the capital of Turkey, Ankara. The main data for this research gathered via archive researches of the regarding municipalities, and from the interviews conducted with the key informants of the process. However, during the investigation new faces of practice and new actors emerged who further unfolded the above mentioned production processes and uncovered the driving forces of deformation in planning and planning ethics. Therefore, a detailed investigation for revealing all the actors and their relations within the process become prominent. Therefore, this research investigates these hegemonic relations and conditions that drives these relations, and the way that these forces operate are explored in order reveal linkages ethics in the whole process that is beyond the ethics of the merely planner. With this regard, the interviews were carried out with political, managerial, professional representatives from both the public and the private sector, some of whom can be considered to be urban elites. There, 16 interviews were conducted and all relevant municipal documents of the selected cases (plan proposals-approvals, opposing petitions, commission reports, and council decisions) and court documents, some of which are gathered from lawyers of the processes, were investigated.

In this study, the word planner is used to represent the planners with reference to the municipality in which they work in their direct quotations, and their names have not been revealed at their request. Therefore, for example they are named as Planner_MM for the planner from Metropolitan Municipality. Moreover, although a planner and the head of directorate of construction affairs of each municipality (Head_MM for Metropolitan Municipality) and Deputy Mayor of Cankaya district municipality were interviewd, due to the limitations of this short paper only some of the direct quotations were presented. However, although the head of the Chamber of Urban Planners as the other actors named above has a planning background and runs his company as a planner, he was interviewed because of his position in CUP; therefore he is referred to as Head_CUP. Finally, the expert assigned by the courts of the selected cases (is also a planner and an academic) and the lawyers of the processes (the lawyer of CUP and CCCAA – NGO named the Contemporary Capital City Ankara Association) were also interviewed.

## 2. Power to plan or power over planning

The urban spatial problem arose around the relations between political economy and urbanisation. However, while urban planning is being criticised for serving for the interests of the dominant classes through space production of capital accumulation and consumption (each dialectically requiring the other to survive), a constant and inevitable need emerges that keeps the operation of the process alive by producing more space by using the tools of state and local governments to attract more capital to be fixed in urban space (Harvey, 1981; Molotch and Logan, 1987; Logan and Molotch, 2010). There, the spatial fix in the local economy refers to land and property markets, investments and ownership relations reshaping the built environment and serving as a development strategy, especially after the 1980s (Healey, 2006), which ignore long-term consequences and have actually been neither a ‘placebo’ nor a ‘panacea’ in the regeneration of local economies, as they lead to land speculation and short-term growth benefits (Turok, 1992). Therefore, local governments’ structure in the decision-making processes and the approaches concentrating on space production and the role of power became an important tool, not only for revealing administrative processes but also for investigating the direct

[1] The word production is selected intentionally as will be seen in the empirical examples the process is not limited to planning nor to decision making but to a whole process starting from plan proposal (actually even before) to actual construction and operation of the structure.

and indirect roles of power, as this power became suitable to craft legitimate tools to favour the *capital*[2] holders.

On the other hand, planning and planner ideally appears to be as the problem solver. Therefore, urban planning is considered to be a political and a professional practice (Low, 1991), and a powerful instrument that produces and reproduces urban space, *ideally* aiming for democratic social change (Forester, 1989) and a moral praxis as well as a technical and an utopian discourse (Friedman, 1989) however that recently has become more entrepreneurial (Friedman, 1998). However, within the praxis the planners face with various challenges and dilemmas, which cannot be limited to subjective individual values nor mere preferences (Hendler 1995) and can be partially beyond the planning profession, where the participation of the planners themselves is superficially provided and instead the only effective practice is operated via various hegemonic power relations. In addition, planning as 'the expert's realm of true essence or idea, striving to partake of the ideal good within the physical world' (Gunder, 2003, p.238), has a reality that 'often disappoints' (Hillier, 2002, p.3). This is because the practice of planning ends up serving the political economy for urban development, due to its deployment in power relations and planners 'on the side of those with power, specifically powers of the state' (Friedman, 1989, p.129), especially in some contexts and cultures more than others where the ethical considerations are also challenged via time honoured daily solutions to potential conflicts.

Furthermore, as the research deals with the dark side of planning that dominates the reality of the urban development, it is a prerequisite to understand the current theories of planning that directly or indirectly relates with power relations in the planning literature. There two main streams emerge. The first group briefly addresses the matter of power and attempts to review planning and planner's role with regard to Habermasian communicative approach (Forester, 1989; Hillier, 2002; Albrechts, 2003; Healey, 2006). The other group, on the other hand, following Foucauldian approach provides a critique of planning practice (Flyvbjerg, 1998; Flyjbverg and Richardson, 2002), even some extend their criticisms to the very nature of planning, as the agency of social control and oppression (Yiftachel, 1998; Huxley and Yiftachel, 2000).

**Communication centred approaches**

The first group, although acknowledging the existence of complex power relations, focuses on what should be done and what planners could do by offering the Habermasian communicative approach (1984), where common principles should be accepted to generate communicative exchange, and suggests communicative and collaborative approaches (Innes, 1995; Healey, 1996, 1998, 2003; Forester, 1989; Hillier, 2002; Albrechts, 2003; Booher and Innes, 2002). In addition, there are also researchers who focus on individualistic conditions and the position of the planner while supporting the communicative approach in planning (Tewdwr-Jones 2002; Tewdwr-Jones and Allmendinger 1998). Within this thought, the centre of attention is the moral obligation of the planner, whether s/he is a public- or private-sector planner; and the planner's 'thought' (consisting of the interaction of values–behaviours and ideals) as an expert privilege prior to action (Tewdwr-Jones 2002). Similarly, while Marcuse (1976) put the emphasis on the planner as the as the median of ethics in practice; Hillier (2002) emphasised the importance of the role of planners within planning systems and practices, where the planner and the government has a primary and a fundamental power to define (redefine), to organise (reorganise) urban space in order to generate a place of their choosing. However, the communicative and collaborative approaches still give little attention to the already existing distortions generated via the traditional, cultural and contextual ways of dealing with things

[2] However, it is important to highlight here that the 'capital' refers not only to economic capital, but also various other types of capital, each of which is intertwined with the others. As Bourdieu (1986) and Coleman (1990) also suggest, networks of relationships generate and develop various types of capital (economic, political and social), each of which would have its own unique position in the power struggle of the urban context.

which become normalised through time and are even converted into planning tradition. This approach also underestimates the subtle empowerment of other actors and power plays among them which are beyond any planner and cannot simply be referred to as a non-decision process (Bachrach and Baratz 1962) (or simply as another face of power) or cannot either be defined as mere corruption. This is because this power generates itself through different types of capital and acts through the complexity of urban reality. Therefore, this research provides a realisation of context specific and authentic conditions instead of accepting what has been suggested as idealised – in a way utopian – types of solutions.

**Power relations centred approaches**

The communicative centred approaches are usually lacking in addressing the more veiled and informal conditions of power, as they mostly set more idealistic conditions and contexts. Therefore, they become weak in revealing the conditions where the state or its institutions themselves become the underlying apparatus for mutual interest (with capital holders) for the production of urban space (Yiftachel, 1998). Therefore, although 'power may become the acid-test of planning theory' as Flyvbjerg and Richardson emphasised (2002, p.44), specific factors and traditional praxis requires a better acknowledgement within the current planning practice. This is because, as this research also presents in the empirical sections, so-called public-interest representatives (some planners, some institutions and use of state tools) have themselves become the agent of the hidden exercising of power and the protection of special interests by revealing how legitimate tools and frameworks of planning 'are crafted' 'in favour of particular interests' (ibid.; Flyvbjerg 1998). This approach, using phronesis (Flybvjerg 2012), criticises the Habermasian communicative approach for ignoring the nature of the capitalist condition and the strong structural position of the state and its institutions, and instead states that focusing only on the communicative processes would blind the approach to the non-communicative (or implicit communicative) processes in which most of the decision-making processes take place. However, in the power concerned approach analysis of real rationalities is seen as the main pillar of any power investigation as it helps to reveal the asymmetrical relations between power and rationality. There the latter is dominated by the former within the complexity of the dynamic reality, while at the same time producing that reality (Flyvbjerg, 1998–2002), in which the domination and production concurrently weakens modern democracy and planning by generating distortions; therefore, planning practice and democracy within that praxis have gone 'astray' (Flyvbjerg, 2002, p.357). In addition, Huxley and Yiftachel (2000) remind us of the dependence of planning on state regulations; thus, regardless of the inclusiveness of the communicative and collaborative approaches on the surface and the good intentions of the planners (Yiftachel, 1998), in the background the state and its tools will be driving the process through its interests. Thus, planning becomes the tool of the process. Hence, urban planning practice, being responsible for the production–reproduction and organisation of urban space and inherently a state apparatus, becomes vulnerable to power relations and ethical distortions while at the same time being their active partner.

Furthermore, the communicative approach is criticised by the latter group for being 'too idealistic and often unrealistic' (Yiftachel, 1998, p.297); while the Foucauldian approach is also criticised for not suggesting any solution but providing mere narratives (Forester, 2001). There are also others who suggest a different perspective and advocate the importance of *trust* in the planning profession and criticise the privileged use of the word 'power' in the planning vocabulary (Stein and Harper, 2003). They state that power-centred research undermines positive productivity and blinds us to the distinction between what should be done and what is actually being done (ibid). however, while it is important to realise that 'obsession with power is dangerous' (ibid:125) it is also critically relevant to not to ignore the intertwined and dynamic nature of power which is able to generate its own actors and its own strategies to by-pass potential obstacles that are initially suggested by the idealised planning approaches.

Nevertheless, it is also important to keep in mind that the gap that emerges via subtle power relations is not only between theory and the reality but also in the structures and levels of the implementation process. Therefore, in order to provide a better understanding of these constraints and driving forces of power relations, the historical and traditional ties need to be shown in relation to theory and practices (Marcuse, 1976; Fischler, 1995). Therefore, instead of adopting one of the abovementioned approaches to the existing Turkish context throughout this research, the investigation will concentrate on revealing the dimensions and the possible reasons for this theory-practice gap, to be bridged later by policy practice, providing historical and current perspectives.

**3. Contextual inputs: power to plan or power over planning?**

Urban development which evolves through relentless investment in the built environment and maximisation of urban land value, especially for developing countries like Turkey, is usually recognised as the main pillar of success of local and national governments; therefore, it usually has a central position in local and national agendas. However, the experience of disruption in urban development in Turkey cannot be simplified just through pointing out the maximisation of the urban land value, and thus the commodification of urban space. A distorted legislative system and administrative praxis, the power of *capital*, networking and the tacit relations between the various layers of authority and actors should also be identified. There, although urban planning, as a state apparatus, has the aim of managing land use within the city, in reality the redundant flexibility of the land use terms and lack of limitation in using them has become the mode of city management, which is left in the hands of the few.

In Turkey, urban power relations among various explicit and implicit actors have usually been the basis for the decision-making processes and production of urban space. Urban populism, through urban planning and urban development, has been perceived as a good new business with short-term profit inquiries (Ersoy, 2001; Tekeli, 2001). Moreover, electoral appeal and network relations of power have led to clientelistic relations and distortion of the system where the decisions and/or the processes of urban planning are perceived as a structure that can be 'relaxed, modified … in response to particularistic and individualistic demands' (Oncu, 1988, pp.44–45). In addition, the political/economic milestones of the country (post-1980s and post-2000s as the latest two periods) altered the urban management structure, therefore the condition of planning, (from centralisation to decentralisation and later recentralisation) by using (and in some cases reshaping and crafting) the legislative tools that further manipulated public perception.

The aim of the government of the above mentioned periods has been to manage the needs of international capital and internal struggles and conflicts within the party, and to maintain public attention over forthcoming elections as well as election promises on built environment development. This led to a significant focus on metropolitan centres as the representatives of internationalism 'and as the most likely bases of its clientelistic networks and electoral appeal' (Keyder and Oncu, 1994, p.400). Especially after 1980s the urbanisation of capital has become more apparent. The cities became an investment arena; the 'non-material resources which do not have immediate monetary costs' and 'selective implementation of regulatory powers of local government' instilled a sense that the regulatory systems regarding the built environment might 'be relaxed, modified … in response to particularistic and individualistic demands' (Oncu, 1988, pp.44–45). In this period the local administration system was revisited and the two-tier municipal system was introduced (as metropolitan and district municipality). Nevertheless, this change in the local administrative hierarchy and creation of an 'all-powerful metropolitan mayoralty' (Keyder and Oncu, 1994, p.405), decentralised powers over the built environment brought about additional conflicts of interest at the

local level due to different representation of interests. Moreover, the urban entrepreneurships that focus on gain through investing in the built environment due to their economic capacity also generated global networks and concurrently developed a capacity to manipulate elected officials (ibid p.415). In addition, privatisation projects through government tenders and additional financial incentives emerged; thus, real practice of the decision-making process reconfigured: '[those] who have been on good terms with cabinet ministers have benefited from speculative deals in real estate, fictitious exports and development of tourist resorts' (Helvacioglu, 2000). As a result, from the mid-1980s, the built environment became particularly crucial for various interests and urban planning has started to be treated as municipalism instead of developing a better understanding of city-making. As also Oc and Tiesdell (1994) stated "in Turkey, planning decisions are often transparently distorted or biased in favour of powerful individuals and businesses or are expedient populist measures to engineer political support. This short-termism and partisan nature of planning decisions is actually counterproductive" (pp.108–109) and this also disturbed the 'jewels of planning' embracing reason, democratic process, community and nature (Blanco 1995) and therefore the notion of ethics within planning practice. Therefore, in practice, urban planning regenerated its meaning from the non-professionals' perspective that is dependant to quick solutions to daily conflicts and thus made the condition of urban site more vulnerable to exploitation.

Moreover, following that period the 2000s witnessed further aggressive development of built environment, where the construction sector was seen as the main pillar of the economic growth of the country more than ever. There, further changes enacted in relation to 80s decentralisation approach that was initially towards a more powerful metropolitan municipality and mayor as the city-boss. Owing to this change metropolitan municipalities were empowered to be able to overrule or to exclude the district municipalities in the planning processes if needed (mostly when the interests of these two conflict). This also promoted mayor centred approaches and fortified alliance of the private sector with public sector, as now the developers do not necessarily get approvals from both levels of municipalities and instead having a good relations with metropolitan municipality (in other words with the mayor) would be enough the get the approval. Nonetheless, in the cases of Turkey this condition may get further aggressive when the metropolitan municipality is ruled by the same party with the central government as then their demands are welcomed in terms of enacting context specific legislations via crafting the existing ones. Therefore, such metropolitan municipalities have used their ability and powers under the regulations to provide required modifications and cooperation to favour private partners, and the project returns are then shared with that authority, thus both sides benefit and achieve their goals (Uzun 2007). There on one hand the private developer would get the project done and on the other hand the municipality would promote itself based on that investment. However, recently, by 2011, the decentralisation approach reversed and the central government re-centralised the administrative hierarchy for planning, where the central government via ministries empowered with authorisation of overruling any local government (both metropolitan or district) further causing conflicts in planning practices. For instance, now two different plan proposal for the same area may be approved by both metropolitan municipality and ministry yet without being clear which one would be applied.

### 3.1 Planning practice given terms, idealised steps and ethical considerations

Not only enacting laws, but also using open-ended and flexible terminology, paved the way for the investors to work around the system in pursuit of their interests. For instance, the terms Urban Services Areas (SA); Urban Working Areas (WA); Central Business Districts (CBD) and Urban Regeneration areas (RA) have been given the rights to be used for the same or similar land uses and owing to their vague configuration become time honoured tradition of planning and treated as synonyms. In addition, although there are various tiers of planning with various scales in Turkey it is

usually the *plan modifications* that lead the planning practice and urban development. There, the term has become the widely used tool for urban development in most cases to change existing plan decisions and/or to generate more flexibility concerning urban land (Ersoy, 2001; Tekeli, 2001; Kilinc et al, 2009). Thus, plan modifications maintain a very important role in Turkish planning as they have become the main praxis of planning, and through them any existing plan decisions can be changed.

Nonetheless, another problem is the incompatible condition of idealised steps of planning practice with planning in real practice. Below figure[3] presents the idealised steps of planning procedure provided by the Ministry. Here, the ministry presents the idealised procedural processes in accordance with the given legislative system. Here, after a plan gets approval, there is a 30-day consultation process which is usually carried out via the announcement boards within the municipality and more recently through the websites of some of the municipalities. Any objection to the approval must be presented within these 30 days. The objections are assessed by the relevant local government within 15 days and the plan decision is then finalised. In addition, after the final decision, there is a 60-day secondary consultation process, in which period opposition may be expressed through filing a lawsuit.

*Figure1. The approval procedure of master and implementation plans*

### 3.2. Ethics in Turkish planning

Especially in large cities of developing countries, there has been a relentless commodification and privatisation of urban land, which on the one hand has reshaped the spatial condition of urban space and on the other hand has reformulated the urban power relations operating at each level of urban development. In this regard, the nature and relationship between the public and private sectors in the socio-spatial production and management of built environment has been altered. Consequently, the inexorable changes in urban space, driven by the ephemeral urban politics focusing on possible economic benefits have also led loosening of professional and institutional ethics. However, the researches on ethical matters are very limited. There, the research in consideration to Turkish planning system was conducted by Kilinc et al in 2009 via EU research project. According to that research urban land rents, the weakness of legal sanctions, rapid urbanisation, the mechanism of expertise (the moral character and philosophy of the ethics of regarding occupation, education, experience, place of work); moral duality; working conditions of urban planners; the lack of planned land; and the structure and profiles of the city and council members are revealed as possible sources of ethical problems in planning in local government level. In planning processes at the local level, the councils have the sole authority to give approval or to make any change, which gives them a significant ability to exercise

[3] Due to the scope of this paper only the approval process is shown as the process after approval is usually prone to conflicts

power. This becomes important; especially when one considers that the council members do not necessarily have much proficiency regarding urban planning. The above mentioned research also demonstrates that the proficiencies of the council members lead the way regarding urban development, i.e. the council members may be builders, tradesmen, managers and civil engineers, and as the majority of their proficiencies are related to construction, those members 'have a tendency to approve all the plans which accelerate the construction sector without any limitation or evaluation about whether the plan is good or bad' (ibid, p.73). In addition, planners can also be added to the list with unethical behaviour, some of whom become active participants in power relations as some of who have tendency to accept any job for its monetary and networking benefits. Moreover, the normalisation of corruption among professional actors, as well as public perception, is also presented as the final word on the subject: here, the new motto of 'they steal but they serve' (ibid, p.75) for urban political figures has become the traditional perception of the public.

## 4. Empirical research: two different cases with similar practices

The two cases Armada and Kentpark and their planning processes have revealed the challenges and the real practices of planning for private developments in Turkish cities. For the urban development of selected cases, the common tendency is to start with a plan modification that comes from either a single investor or from a private company as the developer. Then, the process continues with the assessment of the proposal by the directorate of construction affairs of the relevant municipality, which later obtains final approval from the council by voting in their meetings and if there is any problem the proposals are then passed to the planning commission for further consultation. During this period the planning commission delivers an assessment report, although the council may decide whether to issue a final decision in parallel with the commission or not. After the approval of the plan by the council, there is a period of one month in which any objections should be raised in the format of a formal petition. However, according to the district municipal interviewees, such applications do not have any significance, as they can easily be rejected by the municipality. Therefore, the main conflicts and disputes start within the secondary objection process (a period of 60 days after the initial 30 days) where a lawsuit is entered against the approval, in order to suspend (or cancel) the project (by law NGOs or even a citizen may enter a lawsuit and therefore can become a stakeholder in the process claiming public interest). In the case of Ankara, it is usually the district municipalities, the Chamber of Urban Planners (CUP) or NGOs (e.g. Contemporary Capital City Ankara Association – CCCAA in this study) who raise objections and enter lawsuits; according to them they are the only organisations to reclaim the rights and represent the views of public and of the public interest in the city. As, in the planning process there is no direct participation by the public themselves; the power relations and planning process inherently omits them and instead continues between decision makers, developers and opposing actors. This process is also the phase in which complex power relations surface, as otherwise (without any opposition) there would not be any attention given to specific matters and the practice of the relations of power would be completed unnoticed.

### Armada Shopping Mall

The Armada commenced construction in 1999 and was completed and opened to its users in 2002; and as a result of the high competitiveness of the market, a second phase of development (Armada II), was completed by October 2012. The west axis of Ankara has been significantly developed through the 1990 Ankara Master Plan and through other scales of plans where Armada and some other recent malls were located and had the land use of *SA*. The initial planning proposal for the plot of Armada in 1998 suggesting higher building rights owing to a modification plan approved by the district municipality. There was no further change in the process until 2008, when a new plan modification was suggested including the nearby plots. This was all declared to be one big urban regeneration area (*RA*) yet was not approved by the Metropolitan Municipality due to the overlapping and conflicting planning notes of the

declaration. Following that, in late 2011, the same architectural company proposed another modification plan, referring to the Armada and the adjacent plot for Armada II. There, although the same planning notes of the declined proposal were used for the new proposal the proposal was conditionally[4] approved by the council of the metropolitan municipality in 2012 regardless of the adverse report of the planning department. However, in the meantime, the Chamber of the Urban Planners (CUP) entered a lawsuit against the approval objecting to some of the planning notes by claiming those were seeking *'tailor made'* adjustments. Yet, while the lawsuit was still pending the implementation plan was quickly approved by the Metropolitan Municipality council to enable the construction. In addition, the district municipality Yenimahalle, was excluded from the recent decision making process and all the proposal-approval and negotiations were done between developer and the Metropolitan Municipality; and therefore by using strategies (either via declaration of RA or completing the approval process via 1/5000 scale plans) the participation right of the district municipality has transformed to non-participation. However, the project was completed by October 2012 and running since then regardless of the conflicts emerged.

**Kentpark Shopping Mall**

Kentpark started the construction in 2006 and completed in 2009 on and opened in 2010. The area had been used as the land of Agricultural Machinery and Equipment with 0.2 precedent building via parcelling plan approved in 1976; later it had been used as a showroom of Fiat – Tofas automobiles. However, the area was planned as *SA* like the most of the parcels on the highway and therefore got higher building rights from 0.2 to 2.00 after 1990s. Compared to Armada the conflicts and complexities were higher in the planning process of Kentpark. The planning process for the Kentpark shopping centre started in 2005 and since then until 2011 the approvals of plans for the mall subjected to 10 different lawsuits in total. Each approval for the site was faced with a lawsuit either entered by CUP or CCCAA or by the Cankaya District Municipality.

The mall proposal came first came in 2005 via two different plans both approved by the metropolitan municipality on the same day. There one proposed a gigantic statue which can also be used as commercial-cultural centre run by municipality and seek for an increased building rights and an additional residential area in the project. The second proposal on the other hand was to support the first by proposing a RA declaration in order claim the Metropolitan Municipality as the only authority. After their approval both proposals faced with different lawsuits entered by CUP, CCCAA and district municipality in the same year. However, as it becomes a usual custom while the lawsuits were in process, an implementation plan was prepared and quickly approved by the metropolitan municipality in order to start the construction in 2006. From this point on new proposals[5] as a tactical action quickly approved, yet all faced with further lawsuits entred by the above mentioned. The process that started in 2005 with RA declaration and approving a gigantic statue allowing cultural-commercial centre in followed up with a declaration of CBD while the lawsuit on the previous approval was due. After the CBD declaration has also faced with lawsuit the site was declared as RA once more which again has been subjected to further lawsuits.

The court for each lawsuit consulting to assigned urban planning experts, first gave a decision of suspension of execution and that is usually followed by a full rejection of the approval. However in the meantime the construction continued with full flow based on the implementation plans; construction and building permits, and the mall construction was completed by late 2009 and started to run by 2010. As nearly all approvals faced with court conflicts ended with rejection or suspension, one last strategy was

[4] Here the condition for the company was to build a school in one of the regeneration projects of Metropolitan Municipality in a different district with turn-key basis; and the turn-key basis means: until the company would complete and hand in the key as they agreed with the municipality, in this case the school of the other *TA* project, they will not be able to get any occupation permit for the mall.

[5] However, each new plan proposals most of the time have either the same the planning notes or similar ones with minor changes, even though these were the main reason of objections in the lawsuits.

proposed by the developer and approved by metropolitan municipality in 2011. This time, as the construction was already finished and the mall had started to operate, therefore the main purpose of that new plan was entirely focussed on legalising the current structures on the site. This also got its ground from another ambiguous term, which has become almost a tradition in the history of Turkish planning stating: "current status of the site is the planning status of the site", meaning: whatever structure is on the plot would be treated as the legalised planning status through a provided plan. Then, another lawsuit was entered by the CUP against that final attempt, and although once more the experts and the court were against the latest planning proposal, no sanction was issued for the completed mall and it is still continuing to serve. The situation implicitly points out many "dark sides" and "shadows" generated by some power that even become higher than the courts. Therefore, the case of Kentpark proves that, in Turkey, urban planning practice, especially for large projects that provide quick returns, lacks consistent and just authorisation, and the correct use of legislative tools; participation and monitoring have become mere rhetoric. In addition, the planning practice in reality on the land has become an apparatus that is theoretically attached to the state but is operated by the hands of a few who favour holders of capital for mutual benefit.

### 4.1. Echoing actors: the relations among and the pseudo or excluded participation

In Turkish legislation, it is not mandatory for municipal authorities or private developers to include an additional consultancy or seek the participation of professional representatives, NGOs or citizens. Thus, the voices of these civil actors can only be heard in the event of objections. The process in actual practice displays the pseudo-participation of external[6] actors. It is 'pseudo' because it occurs only if the process includes a legal challenge, as the ordinary process does not provide any option for participation. Thus, it is vitally necessary to understand ongoing power relations because only then can the routine of the distortion of planning practice be broken (Forester, 1989). Moreover, the pseudo-participation, emerging only in the case of opposition, also makes mutual trust building and reliability of the process vulnerable, which is suggested to be central to planning (Stein and Harper, 2003). This is because the representation takes place only in the condition of opposition and thereby the purpose is synonymised with 'to oppose' and thus creates discontent. This also redefines the decision-makers' perception of the representation of civil action, claiming that it is biased and is done for the sake of opposing; therefore, NGOs and particularly CUP have been criticised for that and for being 'stubborn and raising opposition only to be obstinate':

> *The CUP and other organisations should participate of course but only if they are going to give positive critiques not negative, if you are going to give a negative critique why would I invite you? The chambers are not giving up just to be obstinate* (Councillor_MM).

Therefore, the process suggests the representation of the non-governmental actors is limited to two aspects: the first one is non-functional and ineffective even if realised; and the second is redundant because there is a bias held by the authorised governmental actors who also question practice-related proficiency and disregard the planning profession. Turkish planning practice assigns greater authorisation to council members and their will; even if they do not necessarily have professional expertise in urban planning, their opinions have higher status than planners'. Therefore, urban development, based on the councillors' will, has been left to daily experiences rather than professional expertise. Supporting that the interviewed councillor expressed his content on his position and his colleagues and he rather criticised the role of planners especially the experts that are assigned by the courts and who are usually academics in well-known universities. Similarly the head of metropolitan municipality planning department also raised his criticism by putting all blame to planning academics:

[6] Here 'external' refers to actors like CUP and CCCAA which are only able to participate externally through raising an objection.

> *You academics! You put obstacles in the way of everything, in the way of every investment* (Head_MM).

> *Who are experts? They are academics, they are also preconditioned. Think: the municipality has 500 employees and they gave a decision, then 3 professors are appointed by the courts to challenge that decision. How many plans have these professors done in real life? What have they done throughout their life apart from being an academic? They say urbanism principles, which principles? There is no such thing. You can't think everything is for the public interest … The experts should also investigate the daily conditions of how much money was spent for that investment, how many people will be suffering from their decision* (Councillor_MM).

Since 2004 (the enactment of Law for Metropolitan Municipalities), the metropolitan municipalities have been the higher authority and have been able to overrule the district municipalities, and have right to enact new regulations or to propose new legislation as mentioned the declaration of RAs has been one of the examples, There the new situation not only widens the scope of authorisation of the metropolitan municipalities, but also eliminates possible opposition that might come from the districts. In other words, in some cases the opportunity for the district municipalities to participate democratically in the projects within their borders is further restricted and has allowed metropolitan municipalities to disregard the democratic participation of district municipalities:

> *I wish they wouldn't be obstinate on these things, because at the end of the day they are just a district municipalities* (Councillor_MM).

Nevertheless, on the opposing side, the representatives of CUP, CCCAA and *ordinary planners*[7] working in municipalities further uncovered the 'dark sides' within the current planning practice in Turkey. As was clear in the above explored cases, the process continued with an alliance between the approving institution and private developer (the proposing side) engaging in various tactical and strategic actions to end the conflict. Thus, the existing structures and distortions bred from the realities experienced have leveraged the already powerful in the system, while causing the powerless to lose yet more.

> *Even since the beginning of the first planning experience, the rulings of plans were undermined. This might happen even more nowadays … At the implementation of a plan, a request comes from an individual or friendship or old-boy network, such that you are not able to refuse the request. This is what usually happens* (Planner_MM) *There have been many interesting incidents that we had faced on these issues, well things that you cannot even take a note of them let alone recording, mafia style with brute force, let me only tell this much* (Lawyer_CCCAA).

Furthermore, ethical considerations were also frequently brought up by the interviewees. Added to the results of Kilinc et al (2009), this present study puts forward that the lack of professional ethical considerations and aggressive yet hidden distortions are also fed by the existing relations of urban power. The legislative grounds, jurisdiction, individualistic perceptions of planning principles, actors and interactions have been changing in an interconnected mechanism while having a significant impact on the performance of the planning profession; and thus, on the ethics of the profession and values in planning. Following a similar pattern the relaxation that has happened within legislative structures and the ethos of planning has also become relaxed by the actions of some of the planners, and ethical considerations and professional morals have been reduced to a way of thinking: 'if I don't

[7] With no decision making status therefore less authorised yet have a relaxed position in criticising the institutions even if its where they work.

do this for that company someone will do it anyway, so why would I miss that job', as stated by some of the interviewees, revealing the 'allegiance' condition in professional ethics (Marcuse, 1976) yet lack of fulfilling other principles of planning ethics.

> *Obviously these kinds of plans are prepared by certain names. However, it is not because of the powerful economic capital relations. It is a kind of closeness to the authority. 'Whose plans are able to get approval from this municipality without a problem?' This question is a frequent advertisement tool for those names* (Head_CUP).

**5. Conclusion and discussion**

This study provided further realisation of vernacular politics within the process of urban development and planning practice of shopping mall development in Ankara. There while the kinship embedded in the process with social ties built close circuit consensus between decision makers and private developer, any attempt to intervene that consensus or its decisions were defeated by the consensus itself having its power from the above mentioned driving forces. Through the analysis of the cases it become clear that the already powerful public institutions, generating their power from gaps in the legislations and the status given by that legislations, form an alliance with the capital holder while the rest of the less powerful governmental institutions or non-governmental organisations are deliberately excluded from and externalised in the process. The cases proven that the complex hegemonic power relations that are sequential are also definitive for the whole process of urban development. These hegemonic relations can be represented in two ways in the process: the institutional (internal) that is built up through the hierarchies in the authorisation added to the traditional structures; and individualistic unorganised that is built up through the interrelations of networks of external actors with internal actors. Here what is meant by institutional in practice is the governmental structures that has its own hierarchical structures (mayor, council members, departments and hierarchies within the department), whereas the unorganised refers to private companies; developers and their non-legislative relations with the authority. Therefore, using the legislative tools in favour of private investments and easing the path for the investors by the local authorities via relaxing and crafting the tools in responding individualistic demands (Oncu 1988; Flybjerg and Rirchardson 2002) can also be considered as distortion in planning and of institutional ethics that requiring mutual negotiations to benefit both sides in the end.

The cases revealed that idealised steps provided by the ministry which are confirmed by the municipalities and have been taught in the planning schools, are in reality unpractised. These steps as proven through the cases are providing an idealised structure but become invalid within the struggle of the power relations and planning praxis. In reality the planning practice continues mostly through proposal of plan modifications and through the use of recent planning trend 'urban regeneration area declarations'. In addition, the focus of the all planning practice has become the approval process and generation of strategies to provide the approval without much of a challenge, instead of focusing and elaborating on the production of the plan, which should have been the process of participation and any possible negotiation towards a consensus building among actors. The investigation of municipal archives and interviews with key informants has revealed that the reality of planning, as Hillier (2002) emphasised is disappointing, as the idealised steps of planning. Through this investigation a new insight to define and redefine the actors came to surface, some of who were hidden within the idealised formal processes defined by legislation (see Figure 1). The additional processes and actors of planning practice for the selected cases surfaced via plan modification proposals, approvals and formal objections; each step bred antagonism among the actors engaged in various tactics. Thus, the usual flow chart of the planning process needed to be revisited with regard to the selected cases (Figure 2).

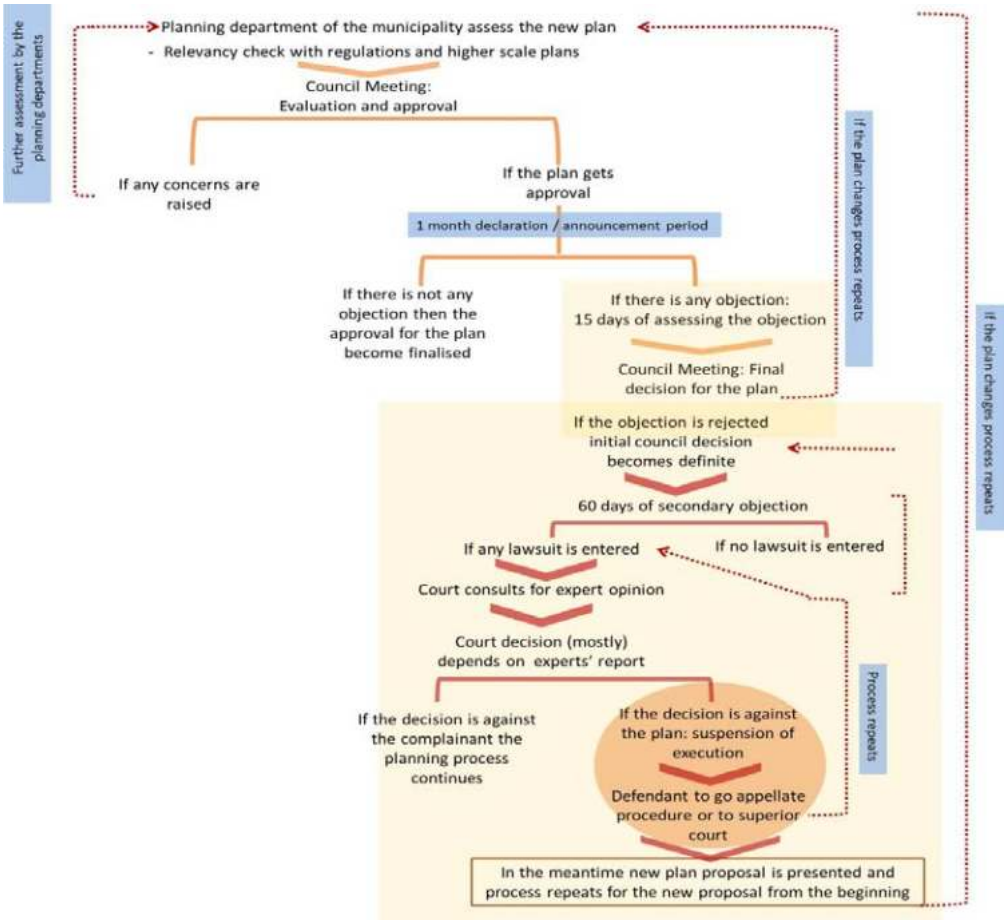

*Figure 3. Redesigned flow chart of the formal processes with regard to real practices*

In addition, what is noticeable here is that the metropolitan municipality is mostly subjected to lawsuits as the defendant, as they are the ultimate decision-makers on urban development by virtue of new legislation. The developers have been aiming to develop good relations with that authority and inevitably participate on its side in the courts. Thus, in those cases they act collectively, operating through various strategies with mutual interests. As seen in the cases, if the lawsuit continues by a decision to suspend proceedings by the court, then in the meantime (during the time between the suspension decision and the application of the appeal procedure) another plan proposal is prepared by the private representative and approved by the council in order to be able to continue construction and gain time. However, this new proposal can also be (and mostly is) subjected to further objections, continuing with lawsuits, and the process then repeats as happened in Kentpark. However, attending to these strategies requires an intense and a careful follow-up by the institution opposing the development, due to the lack of transparency in planning practice. Echoing that, during the interviews both the district municipalities and CUP members stated that they assign one of their members only to follow up with the new proposals approved by the metropolitan municipality, in order not to miss the objection period as defined by law.

Moreover, the perceptions of the actors for each other also contribute to the powerfulness or the powerlessness of the actors. The incisive and prejudiced thoughts of the actors for each other, as presented in the statements of the decision makers against oppositional actors, expose a clear antagonism shaped by bias; mistrust and disregard for the profession. This situation on the one hand proves the mistrust and lack of quality of dialogue leading to an emergent of antagonism; on the other hand underpins the powerless condition of the opposition.

Finally, adopting the ways which the planning is practiced in accordance with the beneficiaries' demands (i.e. using certain terminologies in the legislations which already encapsulate an indefiniteness and flexibility); the clash of the authorities and; lack of transparency are paving the way through a distortion in planning and ethics where also not having effective sanctions makes the supremacy of the legislative system to be treated nothing more than rhetoric in the practice. Overall, resultantly, the struggle in the power games of the urban space while being reshaped via interrelations of the powerful actors and their tactical actions, is also incapacitating powerless opponents consistently which also get weakened further by the degradation over the perceptions of planning principles and ethics. Thus, the representation of public interest and the essence of planning principles are silenced through manipulative and hegemonic power relations.

# LOCALISM IN ACTION: POST-POLITICAL NEIGHBOURHOOD PLANNING

William Sparling[1]

[1]Leeds Beckett University, w.sparling6996@student.leedsbeckett.ac.uk

Keywords: neighbourhood, post-politics, localism

*The paper presents emerging primary research, in the form of two 'inner-urban' case studies, which investigates what Localism in the United Kingdom - specifically Neighbourhood Planning - means for processes of planning within an English northern city. That is to say, it discusses Localism's impact(s) upon the process and content of plan making within a post-political perspective. In England, Neighbourhood Planning is grounded in the localist narrative of the United Kingdom Coalition Government to 'devolve power to communities'. Neighbourhood Plans represent a way in which people may be included in the planning system and participate in decision-making by allowing the creation of a statutory document of the local plan. However, it has been argued that planning has been underpinned by a form of post-politics, with outcomes that are often constructed on vague governance objectives, normatively 'sustainability' and 'growth'. This has been most notable in the 'spatial planning' approach of New Labour, which attempted to speed-up the planning system through achieving a meaningful consensus in development decision-making. In seeking to achieve this consensus, it has been argued that conflict and dissent have been marginalised and carefully managed within a variety of styles and scales of planning. The crux of the argument is as follows. Whilst on the face of it, 'spatial planning' within political narrative appears to have vanished, to be replaced by processes of Localism, spatial planning doctrine as mind-set and professional practice still remains.*

## 1. Introduction

The concept of the neighbourhood within city planning is viewed with some suspicion by Jane Jacobs. Neighbourhoods are sentimental constructs that are akin to a valentine, attempting to merge and distort two very distinct paradigms of the city and suburban life. Neighbourhood plays on emotions of sentimentality, rather than rational, or good sense. Cities on the other hand are different. Cities, if they are created by everybody, can provide for everybody (Jacobs, 1992). If the neighbourhood is something everyone can relate to – sentimentally at least - it is something that they can control, can create. Perhaps neighbourhoods are to be seen as building blocks of cities created by everybody.

Engaging with theories of post-politics, the working paper discusses state primed localism, followed by the emerging empirical study. The aim of the paper is to demonstrate how 'Localism' in England may be an attempt at the continuation of a post-political spatial planning and in doing so outlines emerging findings of two inner-urban Neighbourhood Planning case studies. The paper charts emerging findings based on the attempts of Government to deploy Localism, the issues encountered by those involved in making Plans, and the responses of local government and planning profession. Discussion takes place of an era of political, regulatory and policy flux, post-2010, characterised by a British coalition government consisting of the Conservative Party and Liberal Democratic Party. To be clear, Localism and Neighbourhood Planning in this paper refers to that developed by the Coalition Government. Along with the National Planning Policy Framework these are applicable to England only, due to the devolved nature of planning in the United Kingdom.

Localism is enacted by the Coalition as part of an on-going political localist narrative that appears to prioritise scales beneath the 'national' in decision making. Neighbourhood Planning is a key component of Localism, a tool, or more accurately is a set of 'rights', that is "promoted vigorously"

during the initial stages of the new legislation (Parker, 2012, p4). The Neighbourhood Development Plan sits within the wider package of Neighbourhood Planning 'rights' that is created, of which there are three; a Neighbourhood [Development] Plan; a Neighbourhood Development Order; and the Community Right to Build. Neighbourhood Planning is also promoted alongside a plethora of other 'rights' that purportedly allow greater control over subjects of economic development, buildings, and public service delivery (Locality, n.d.).

Planning in England is inherently political in its nature, due to the nationalised structure of development rights and land use regulation against which decisions are made in the United Kingdom (Booth, 2002). As a result, competition between many actors is intrinsically part of the planning system when decisions are made, with the state making decisions on behalf of the people, with a range of solutions and theories which attempt to reconcile differences and achieve consensus (Healey, 1997). Decisions are made within a system characterised by a plan-led structure, created in the early 1990s. Being plan-led, the system is such that at the local level, local planning authorities create forward looking development plans for their area, on which the public has a legal right to be consulted, before becoming legally binding documents. Planning decisions are then made by the local planning authority based on legislation, case law and local and national policy. This is the primary way in which Neighbourhood Development Plans appear to have influence and the principal way in which they are intended by Government to be used (UK Parliament, 2011; 2012). It is the process of creating such a policy that is the focus of the paper.

Neighbourhood Planning is pronounced politically as an opportunity to influence decision making, to create neighbourhood. Neighbourhood Development Plans are intended to "...give [people] the opportunity to make their own choices..." (Clark, 2011, no page). Emerging criticism of Neighbourhood Planning perceives the policy as a method for removing politics from decision making, by foreclosing debate around carefully selected parameters (Allmendinger and Haughton, 2012). Political ideology is removed from decision making, reducing decisions to "technocratic deliberation" (Deas, 2013, p.75). To do so, a variety of mechanisms can be deployed, including the use of vague nomenclature and 'governance' arrangements without a specifically clear overall objective. There are well-choreographed processes within which conflict, or the potential for it, is displaced or residualised (Allmendinger and Haughton, 2012).

Conversely, in areas that have taken up Neighbourhood Planning, there may be an "antagonism developing" at the neighbourhood scale that is contrary to this post-political analysis (Bradley, forthcoming, p.4). It is argued that in creating a nationally deployed framework of post-politics as Localism, Neighbourhood Planning has given people a collective identity. Rather than politics being residualised and reduced to a technocratic procedure between competing interests, antagonism develops to question political structures and ideals (Bradley, forthcoming). However, these can't be seen as being on a linear axis of 'post-political vs non-post-political'. A post-political analysis of cities goes much wider than this and as antagonism develops in one area, post-political responses may emerge. There are various trends which may highlight a post-political condition within planning, from a variety of sources. If Neighbourhood Planning is to be understood from a post-political perspective, and as such the concept of 'neighbourhood' within cities, it must be noted that the concept does not exist in silo.

Empirically the paper engages with two 'inner-urban' Neighbourhood Planning case studies within Leeds, England. The case studies are constructed of semi-structured interviews with members of the neighbourhood forum creating the neighbourhood development plan for two areas, in addition to local authority planning officers, elected councillors, developers, planning consultants and national civil servants. Observation data in the form of notes is also used to support the discussion, made during

forum meetings and discussions with individuals outside of the semi-structured interviews. A review of material produced by the neighbourhood forum within each area, including forum and boundary designation applications, leaflets and consultation information, minutes of meetings and discussion papers, also supports the case studies where necessary. It is recognised, that whilst these case studies tell only a fraction of the unfolding localist experiment of contemporary planning, they make a contribution to the development of post-political analysis of a recent, specific concept of localism that it appears will remain.

## 2. The post-political condition

### 2.1 Spatial planning

Spatial planning is deeply embedded within English planning, so it is worth briefly highlighting, in order to understand the impetus for Coalition changes. Despite the significant reforms to the planning system, and absence of 'spatial planning' from political rhetoric, it is likely there will be a residue left behind. Certainly, the potential for such entrenched thinking remaining in the planning system is predicted:

> "...while the reforms are radical and represent a potential critical juncture in the evolution of local governance, problems of implementation are likely to dilute to dilute radicalism in favour of more incremental change. In particular, we argue that New Labour's approach to local governance – with its emphasis on performance, partnership and participation – has become so deeply entrenched at the local level that the Coalition's reforms will inevitably be interpreted and refracted through this lens" (Lowndes and Pratchett, 2012, p.22).

Spatial planning emerges within contemporary planning as an assemblage of approaches appearing globally and "appealing to many diverse constituencies" (Allmendinger and Haughton, 2012, p.4) by offering a progressive way forward, whilst delivering economic growth. Spatial planning as a turn of phrase is used in the United Kingdom by the State, professional groups, academics and politicians and others to describe diverse processes of planning reform, policy integration and strategic governance (Tewdwr-Jones *et al*, 2008). Likely emerging out of re-territorialization, europeanization and integration debates (table 1.0), as a concept, it is difficult to pin-down and a variety of components of spatial planning may exist, all present within academia, policy making, professional doctrine, politics, and as a way of thinking about concepts that intersect with planning.

| Debate | Summary |
|---|---|
| Re-territorialzation | The re-territorialization and rescaling of policy-making |
| Europeanization | The European origin and development of spatial development |
| Integration | The push towards sub-national agency and institutional integration |

Table 1.0 - three theoretical and political origins of UK spatial planning (Tewdwr-Jones *et al*, 2008)

### 2.2 Post-political spatial planning

Post-politics arguments are underpinned by changes to the global political system, economic globalisation and increasing acceptance of diverse lifestyles (Allmendinger and Haughton ,2012). People live their lives within fluctuating identities, with an acceptance of individualism. As a result, 'Partisan conflicts are a thing of the past and consensus can be achieved through dialogue" (Mouffe 2005, p.1). Fundamental to these arguments are changing theories and models of democracy, which

sees a shift from aggregative democracy, towards deliberative democracy and finally a shift towards governance processes (Allmendinger and Haughton, 2012). Temporally it appears inevitable as a result, that an unspecified era is to become synonymous with a "policy imperative for planning practice to become more oriented towards consensus building" (Allmendinger and Haughton 2012, p2). The political climate at the start of the New Labour era, however, appears to have created perfect conditions for a substantive shift towards this.

With these larger, fundamental changes to the global political system taking place and planning as a profession so deeply hinged on conflict, the New Labour era may also simply represent another stage in the shift to ever increasing levels of conflict choreography. New institutions of Government are created by New Labour, based on the consensus building 'Third-Way' approach (Allmendinger and Haughton, 2012, p.3). In that perspective, spatial planning departs from land use planning in that it focuses on "consensus brokering, allied to approaches designed to speed up planning decisions in order to facilitate economic growth" (Allmendinger and Haughton, 2012, p.12). Conflict is carefully managed and subsequent debate is foreclosed around issues based normatively on 'growth' or 'sustainability' for example, key features of the dominant contemporary planning agenda (Owens and Cowell, 2010). A 'spatial planning' system is created that operates with indiscernible strictures - portrayed as an arena for debating hefty issues, a way forward for society.

Whilst a post-political condition is most evident within spatial planning, these approaches may be one step further, rather than the end in itself. Primary to the argument of this paper is this formation of a 'de-politicized' consensus, or "crisis of consensus" when attributed to spatial planning (Allmendinger and Haughton, 2012). The impact of that trend is neatly summarised on the planning system:

> "This system gives the superficial appearance of engagement and legitimacy, whilst focusing on delivering growth expedited through some carefully choreographed processes for participation which minimise the potential for those with conflicting views to be given a meaningful hearing" (Allmendinger and Haughton, 2012, p2).

Post-political criticism emerges, which sees spatial planning as not progressive, that rather it's a cleverly managed process within deliberately designed constraints. From this perspective, contemporary spatial planning loses its meaning. What is it for? Spatial planning's use of abstract nouns and vague nomenclature allows objections to coalesce and significant opposition creates fractures, allowing challenges to spatial planning and its consensual underpinnings and leading eventually to planning reforms from the Coalition government.

## 2.3 Emerging post-political trends

To be clear, whilst the primary focus of the paper is consensus, there exists a variety of trends that may be identified as post-political. Research and discussion of post-politics takes place at the 'macro' scale, including discussion of entire planning systems, metropolitan regions,and cities, whilst at the neighbourhood scale, a post-political literature is also developing (Davoudi and Madanipour, 2015). To this end, post-politics analysis anticipates neoliberal and localist strategies to be embedded in planning processes at a variety of scales (Allmendinger and Haughton, 2012) and as a result a post-political landscape is emerging across scales of planning. The main thrust of the paper is to investigate the extent to which a post-political consensus remains. However, within that there are six key post-political trends that are identified (Figure 1.0) (Clarke, 2015).

1. *Prior condition: national austerity policies and cuts in local funding.*
   These measures "bring shifts in the 'strategic priorities of city government and coalitions" (Macleod and Jones, 2011, 2444).
2. *Widespread agreement over conditions that exist and what needs to be done.*
   Despite conflicts of interest and opinion, there is widespread agreement over conditions that exist and what needs to be done (Ranciere, 2003).
3. *Growth in managerial approaches to Government.*
   Government is reconceived as a managerial function, deprived of its proper political dimension (Zizek in Swyngedouw, 2011).
4. *Expert opinions called on to legitimise decisions.*
   Options presented as complex and in need of expert opinions to legitimise decisions (Sloterdijk, 2005).
5. *Politics as a distribution of spaces.*
   Importance of activities that create order by distributing places, names, functions (Ranciere in Swynedouw, 2011).
6. *Gradual 'de-politicization' and 'de-democratization' of significant institutional forms.*
   Urban institutions streamlined to foreclose debate and respond to market; now less accountable to the public (Macleod, 2011).

Figure 1.0 – six key trends of post-political cities – (Clarke, 2015, pp. 57-58)

Also identified as post-political, is the "distinguishing 'turning points' in which post political elements are emerging...the temporal and spatial nature of post-political forces" (Clarke, 2015, p.58). Furthermore, an 'ultra-politics' of consensus, to control that which might disrupt a consumerist city (protest and homelessness for example) is also highlighted (Clarke, 2015). It is conceivable that as one post-political trend appears, it is responded to by another post-political trend. These actions and responses may also occur within and across a variety of scales.

## 3. Coalition Government Localism

Coalition criticism of spatial planning emerges as a narrative of a democratic deficit. Consensus building approaches of spatial planning by New Labour had failed, the system was broken (Allmendinger and Haughton, 2012; Conservative Party, 2010). Much of the criticism levelled at spatial planning from all angles may remain as residue within the current system and are critical to a post-political analysis in the eyes of Allemendinger and Haughton (2012), so it is worth highlighting them here. Firstly, a rescaling of functions and processes takes place, especially through devolution, and there is emphasis on collaborative working. Despite this spatial planning is too driven by central priorities. Secondly, spatial planning is accompanied by "the emergence of multiple soft spaces and associated governance processes" (Allemendinger and Haughton, 2012, p49) which circumvent the statutory planning process.

### 3.1 The Open Source Planning idea

*Open Source Planning* (Conservative Party, 2010) is an example of the wider context out of and within which the Coalition Government develops; a rejection of the large and over powering state and to develop a capacity within 'civil society'. *Open Source Planning* promotes open source software development as being "...highly flexible and adaptable..." and that it "...values transparency and free access..." (Conservative Party, 2010, p.1). Applied to planning, it is necessary to reject the "[New Labour] Government's centralising, corporatist attitude..." (Conservative Party, 2010, p.1), rather planning is a conflict-free 'community', without regulation which just gets things done. Whilst open source software development may contain these values, it is embedded within a larger 'movement' of

community software development which requires managing and organising. It is an organic process, which may be flexible and adaptable. But this is not a process without its limitations and divisions.

## 3.2 Big Society

Localism, as enacted by the Coalition Government, followed on in much the same vein as *Open Source Planning*, emerging from the political rhetoric of the 'Big Society'. The 'Big Society' agenda, pursued by Ministers in the early years of the Coalition Government, challenges a state that is perceived as interfering, monolithic, slow and unifying, a state that has colonised people's lives. An economic recovery is needed, but so too is a social recovery (Cameron, 2010, no page). The agenda therefore advocates the rollback of the state, but acknowledges that the state must encourage concepts to replace it including 'social action' and 'public service reform'. Thirdly 'community empowerment' will create "communities with oomph – neighbourhoods who are in charge of their own destiny…" (Cameron, 2010, no page). Neighbourhoods are the polar opposite to the state. Neighbourhoods are exciting and energised.

The 'Big Society' and Localism promises to radically change the way in which governance, public services and policy are delivered. Neo-liberal ideas of economic growth are sutured to a desire to increase the number of actors in the system at the lowest possible level. Firstly, the state will "drive [power] down even further to communities, to neighbourhoods and individuals" as 'decentralisation' (Cameron, 2010, no page). Secondly the state will release data, under the banner of 'transparency', and thirdly it will provide limited finance directly to neighbourhoods. Purposes for the decentralisation of power within the 'Big Society' is clear within a series of Government financed and promoted 'vanguards'. The intention is to give these 'vanguards' the power to run parks and libraries but also to "plan the look, size, shape and feel of housing developments" (Cameron, 2010, no page). Neighbourhoods are expected to want to plan *for* development. The State is the enabler.

Austerity measures appear to create opportunities for voluntaristic experimentation in public service delivery. Major concerns about the UKs budget deficit gives impetus for the Spending Review, setting out areas for public spending reductions. Local government at the central level faced "a disproportionately high share of the cuts" (Lowndes and Pratchett, 2012). The Department for Communities and Local Government had its 'local government' budget cut by 27 percent and its 'communities' budget cut by 57 percent over four years (Lowndes and Pratchett, 2012). Austerity measures are the driving force behind the Spending Review. However, new freedoms for local government are also identified as a way to mitigate against long term effects of financial reductions. Specifically, the spending review identifies:

> "...removing barriers to greater independent provision, and supporting communities, citizens and volunteers to play a bigger role in shaping and providing services; and improving the transparency, efficiency and accountability of public services" (HM Treasury, 2010, p8).

Financial cuts that drive the Spending Review conversely appear be driven by an ideological attempt to allow rollback the state and thus allow greater innovation within public services, with local government seemingly given greater power over how to prioritise spending on public services. The point is, even in the face of massive cuts to local government, the State sees itself as the innovative enabler.

## 3.3 Localism

The structure of the Localism Act is such that it is an accurate indicator of the dominant belief at the time, that localist policy in planning is a way to deliver economic growth. Despite the attempts of Government to promote Localism as a tool for empowering 'communities', the structure of the Act appears to be clear on the role of planning. Neighbourhood Planning is situated within Part 6 of the Localism Act, within 'Planning' rather than Part 5 which is entitled 'Community Empowerment' (UK Parliament, 2011). As such, this accords with the movement of responsibility for Neighbourhood Planning between the directorates of the Department for Communities and Local Government in approximately the first year of its implementation. The responsibility shifted between the Planning Directorate to the Decentralisation and Communities team. The Planning Directorate has a clear remit of economic growth, demonstrated by the economic focus of the impact assessment for Neighbourhood Planning (DCLG, 2011), whilst the Decentralisation Communities team have responsibility for community empowerment aspects of Localism.

## 3.4 National Planning Policy Framework

Coinciding with the legislative changes was a period of policy flux, demonstrated by the removal of hundreds of pages of previous planning policy, replaced primarily by the 49 pages of policy in the *National Planning Policy Framework* [*NPPF*] (DCLG, 2012). This was justified at the time as being about 'reforming' a top-down and slow planning system (Clark, 2012) popularly reported and discussed in the profession as 'cutting red tape' (National Trust, 2015; Acres, 2012; Groves, 2014). Additionally, other key changes are the removal of regionally set housing targets and the entire regional layer of planning, previously existing in the form of Regional Spatial Strategies and created by Regional Assemblies (UK Parliament, 2009). A power shift away from the regional towards the neighbourhood scale is legislated for. Introducing optional 'rights' to be taken up, the plan-led system at the local level is retained, with responsibility for formal plan making remaining with Leeds City Council.

The policy within the *NPPF* is divided into key themes, which place emphasis on delivering economic growth and a rhetorical shift away from excluding and unaccountable decision making towards a devolved and inclusive planning system. Removing the regional tier of planning, reduced policy guidance and the rhetorical removal of targets may "free-up local authorities and neighbourhoods to plan in the way that they wish, as long as it is 'sustainable'" (Parker, 2012, p4). Planning's purpose is "helping to achieve sustainable development…[and]…this should be a collective enterprise" (DCLG, 2012, pi). A target culture and remote decision making are identified as a barrier and "Dismantling the unaccountable regional apparatus and introducing neighbourhood planning addresses this" (*ibid*). Localism is to help to deliver "sustainable development" (*ibid*) and the mechanism for doing so is via a Neighbourhood Plan. Neighbourhood planners are to plan in the way that they wish, supported by local authorities, as long as they plan *for* 'sustainable development'.

## 3.5 Neighbourhood Development Plan

How does state deployed Localism work? Neighbourhood Development Plans are legislated for by the *Neighbourhood Planning Regulations 2012* and as such there are five necessary steps in their creation. Neighbourhood Plans must first establish a geographically bounded Neighbourhood Area and determine the qualifying body. Secondly the plan must be prepared according to the 'basic conditions' and undergo an independent examination. The basic conditions stipulate that a plan must; have regard to national policy; contribute to the achievement of 'sustainable development'; be in 'general conformity' with the strategic policy in the local plan and; be compatible with EU regulations and

directives. If the plan is successful, independent examination is followed by a yes/no (accept/reject) referendum of the residents within the area and finally, a Neighbourhood Plan is formally 'made' by the local authority. At each stage a decision is required before moving to the next, with the exception of the area and forum designation which can be submitted for consideration concurrently.

A qualifying body is the legal entity which writes the plan. In areas that have a Parish or Town Council, they are automatically the only qualifying body within that town or parish boundary. The neighbourhood area boundary is established as the parish or town council boundary (or an area within it). Areas without a Parish or Town Council, mostly urban areas, must establish a qualifying body and neighbourhood area by making a planning application to the local planning authority. The qualifying body takes the form of a Neighbourhood Forum, consisting of a minimum of 21 people that "live, work or carry on business" in the defined area (UK Parliament, 2012, p. 3ff). A statement of rationale for why each should be designated must be submitted as part of this application.

**4. Case study: towards post-political Localism in Leeds**

This section begins to chart the impact of Neighbourhood Planning in Leeds. It outlines emerging findings of two case studies consisting of semi-structured interview data of people involved in the production of two Neighbourhood Plans. Most recently, supplementary planning documents have been produced for villages in the form of Village Design Statements, with this technique then applied to urban areas in the form of Neighbourhood Design Statements.

## 4.1 Emphasis on technical-managerial apparatus

Localism attempts to reinvigorate and energise the neighbourhood as a 'community'. However, during a period of austerity and funding reductions to local government, neighbourhoods are politically seen as a site to deliver wider political strategies of the local authority. Plans represent an opportunity for a "locally strategic" base, in the absence of resources for wider strategic service delivery. Despite the use of vague terms such as 'community' and what this might consist of, it is possible to differentiate between 'community' and the local authority. During an interview with a leading member of the community in Case Study A's Neighbourhood Forum, it is explained: "The local authority Councillors are involved, although when the Neighbourhood Plan was set-up they were told, I'm not sure by who, to take a back seat" (interview, 2015), with another ward councillor saying: "I heard about it through the grapevine...I didn't even know about it. We were then told to take a back seat...although maybe not in quite so few words, but I'm paraphrasing what was said" (interview, 2015). The chairman of the forum felt that this was a deliberate decision, due to the perception of the local authority: "To not be seen to be leading because it is seen to have become a council thing again" (interview, 2015). In areas where the local authority it appears has a bad reputation at an institutional level or there is a perception of previous failure, Neighbourhood Planning may represent a clean break from the past. As a result, officers approached resident's groups within the now defined Neighbourhood Area to create the plan. However, it is a political decision from within the local authority to encourage and develop a Neighbourhood Plan for an inner-urban area, the first one of its type within the local authority boundary. Local councillors, once they found out about the plan, then gave their support where they felt they could, acting as facilitators where major issues arise, but they didn't drive the plan in the early stages.

Spatial planning focussed on delivery, in an era of deregulation of the planning system. It attempted to bring together disparate fragments and deliver on the growth agenda of New Labour (Tewdwr-Jones *et al*, 2008). Spatial planning presented an opportunity to deliver "the social, economic and environmental infrastructure needed for our communities and it is the mechanism for managing this

delivery process" (RTPI, 2007, p.5). Such an approach echoes the current era of deregulatory policy flux, the residue of which clearly remains, albeit now an approach reoriented towards a specific Coalition definition of "sustainable development" with a strong 'growth' agenda behind it. A planning consultant working on Case Study A explained how this had worked in practice:

> "I feel that they feel that finally after many years of sort of...promises and failed strategies and initiatives and projects within [Case Study A] that the Neighbourhood Plan might actually be able to pull things together and provide some kind of reasonable framework for retaining the best of what [Case Study A] has got and improving it on a number of fronts for current and future residents" (interview, 2015).

Neighbourhood Planning in an urban area intersects with the local authority in more than one way, not just creating planning policy. There is a clear site of competition between a number of actors, that may develop into antagonism and conflict, primarily between services and Case Study A's intentions. Neighbourhood becomes a site of both a competition for resources, with a focus on delivery and efficiency and potential for conflict between competing priorities.

As a result, it is necessary to distinguish between 'neighbourhood' as stakeholder and 'neighbourhood' as process. Local authority stakeholders are brought together at the neighbourhood scale, to discuss a way forward with neighbourhood as a stakeholder, to plan for the future, based on vague nomenclature of growth for example. Neighbourhood as stakeholder requires 'managing' and working with, whereas neighbourhood may also be the process for galvanising service delivery and responding to fragmented governance around a collective way forward. The stakeholder as 'neighbourhood' in Neighbourhood Planning, is managed both internally within the local authority and as an external stakeholder, depending on the department. It is in the best interest for the local authority that the Neighbourhood Plan is successful, because Neighbourhood Forums will create a plan that becomes the responsibility of the local authority. The Neighbourhood Forum as an entity creates an arena for debate and discussion, which would otherwise not take place. Bringing together these various actors within the system brings with it antagonisms, but also new understandings between the neighbourhood and local government. The effect of this, however, is that rather than an arena for debate and disagreement, politics in Neighbourhood Planning is replaced by normative principles. These manifest themselves as instruments, processes or narratives within which 'things happen' to achieve a consensus.

Reaching a consensual way forward is also not constrained to the land-use planning policy that Neighbourhood Planning legislated for, as they are being used as a tool for reconciliation across boundaries and sectors. In urban areas, land-use and development appear to intersect with a wide range of other policy sectors and spatial planning previously attempted to integrate these. Localism appears to allow the same, focusing on the management and control of apparent complex and multi-scalar issues, albeit at the neighbourhood scale. Local government appears to be oriented more towards a mediation role, managing both internal departments and also external stakeholders in the neighbourhood.

## 4.2 Emphasis on narratives

The narrative of community within Open Source Planning translates into Neighbourhood Planning, within which it is established that the site of community is neighbourhood. Neighbourhood Plans must produce an acceptable 'good' outcome, based on discussion and deliberation between all interested parties. Two planning professionals from central government interviewed for the research, said Neighbourhood Planning is an arena for "...grown-up discussion to achieve a good outcome for everybody" (interview, 2015). This 'grown-up' conversation sentiment is echoed by two local

authority officers during the semi-structured interviews. Those creating a Neighbourhood Plan (whoever 'they' might be) must act in a rational, or sensible, way to achieve a 'good' outcome. In the eyes of the local authority officers, the grown-up conversation must come from all of those involved, including them. However, what is less clear to the officers is what a 'good' outcome must be. Given the legal context of Neighbourhood Planning and the need to climb through regulatory hoops, it becomes clear. Neighbourhood Plans must deliver a 'good' outcome, based on the poorly-defined governing normative principles of growth and sustainable development.

The post-political condition describes how new forms of governance have appeared in contemporary planning, attempting to reconcile conflict and competing agendas through negotiation, to reach "mutually beneficial agreement" (Allmendinger and Haughton, 2012 p.4) within a positive-sum game. This amounts to a post-political 'mode' of governing by technical-managerial governance, resulting in the taking over of "the space of the political by forms of consensual depoliticised governance" (Oosterlynck and Swyngedouw, 2010, p.1577). It appears that Neighbourhood Planning as an instrument or process relies on the narrative of 'grown-up' conversation, constraining the debate to deliver a good outcome – growth.

## 4.3 Emphasis on instruments

Neighbourhood Planning as an instrument - that is a combination of legislation and policy - attempts to ensure that an acceptable outcome is delivered based on the narrative of growth. The issue here is; in order to make the next stage, the Neighbourhood Forum must overcome the 5 legal hurdles in the regulations in a satisfactory manner. Neighbourhood Planning Regulations stipulate those hurdles, whilst aiming to deliver 'growth' through 'sustainable development'. At the 'macro' level, Government intentions are clear; Neighbourhood Planning policy is about "testing" (interview, 2015), whether Localism can make 'communities' more accepting of development (figure 2.0).

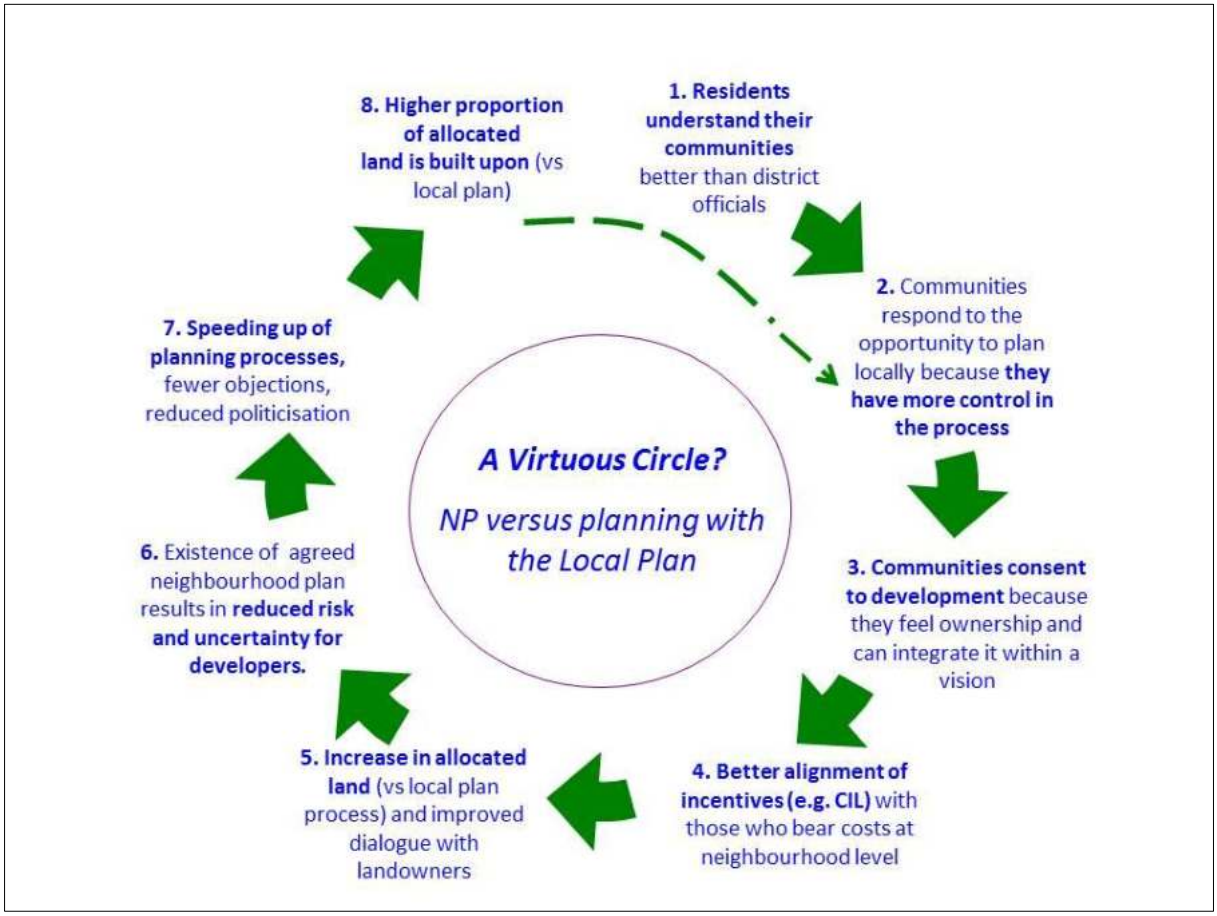

Figure 2.0 – testing Neighbourhood Planning – (DCLG, 2015)

The structure is such that despite the potential for conflict, Neighbourhood Planning is appears to be a "managerial-technological apparatus" (Allmendinger and Haughton, 2012, p.4), the aim of which is to produce a "good outcome" (interview, 2015). An instrument that is regulated by 'the police' (Ranciere, 2005), which are the "activities that create order...with agreed defined roles, processes and acceptable outcomes" (Ranciere, 2005 in Allmendinger and Haughton, 2012 p.4). Such an apparatus, it is argued has resulted in 'depoliticization' with 'politics' being replaced by "processes, instruments and narratives" (Allemendinger and Haughton, 2012, p.4). Neighbourhood Plans are structured so that the only way forward is to be accepting of development. Such a macro view, however, largely ignores the work required to overcome the legal hurdles put in place. Although this may represent an attempt at incremental decrease in the *potential* for conflict, each hurdle may be a site for conflict and contestation.

## 4.4 Emphasis on antagonism

Neighbourhood Planning may produce conditions for conflict and where there are deep rooted tensions, it is possible that an outcome which is acceptable may not be reached. Such conflict may be based on identities, not least at the boundary designation hurdle for example, (Bradley, forthcoming) which even at neighbourhood level take effort to overcome. There is potential for the boundary designation to generate "frontier effects by expanding the confrontation beyond the initial point of antagonism" (Bradley, forthcoming, p.10). In creating a legally marked neighbourhood, there is

potential for this to not only mark the edge of the Neighbourhood Plan, but also to create a political barrier between entities that has a practical and symbolic importance (Bradley, forthcoming). Boundary designation may therefore have deeper and longer-lasting effects.

The primary research for the paper found that boundary designation is a tricky legal obstacle to overcome, which can lead to antagonism that goes unresolved, yet delivers a boundary designation. This resulted in an underlying potential for conflict between the two Neighbourhood Forums that remains. The boundary designation for Case Study B was difficult due to the close proximity of discussions taking place for another Neighbourhood Plan, and their perception of place. Whilst it is acknowledged that competition can develop between stakeholders, a line of antagonism developed between two 'factions', who were intending to become a Neighbourhood Area and Neighbourhood Forum, which took 9 months to "resolve", according to members of the forum and officers interviewed (interview, 2015). The area in question is a small collection of shops, defined as a "local centre" within the settlement hierarchy of the local authority plan. Both groups lay claim to the area, with neither backing down. It became about ownership of the place and essentially which Plan would have control. Despite attempts at amicable resolution though deliberation and sensible debate, conflict remained, and it was the responsibility of the local authority to decide the boundary designation. During an interview a senior council officer stated how this happened:

> "The two groups couldn't decide on the boundary designation and at times the debate became quite heated.. so my suggestion to both groups was to go ahead and submit [the area application] and take it from there..." (Interview, 2014).

After the decision had been reached (although it took 9 months), a practical solution was delivered in that the smaller area, without another recognised 'local centre' in the settlement hierarchy was "given", in the words of a council officer (interview, 2015) the area. However, whilst the practical solution has appeared to resolve the issue, antagonism and bitterness between individuals still remains and this spills into the decisions made within the Neighbourhood Forum structure. The implications of this are at an early stage, but may lead to difficulties in encouraging "grown-up" discussion between the two Neighbourhood Plans, where they might be more suited to work together on 'locally strategic' issues. Again, whilst Neighbourhood Planning appears to give room for a meaningful debate, there is a regulated and mediated process to climb through, facilitated by the local authority, in what appears to be a logical order for only acceptable outcomes to be achieved.

## 5.0 Conclusion: post-political outcomes

The attempt of Government post 2010 to encourage popular participation in planning appears, on the face of it, to play on the emotion of neighbourhood. Despite rhetorical intentions of empowerment and greater control - described by a language of 'rights' and 'social action' to fix a broken system - state deployed Localism may simply represent a further relentless advance of a post-political condition. Opposition to previous New Labour spatial planning approaches appears to have coalesced as a result of the post-political condition of consensus, ironically parting the ocean to allow Coalition reforms. A symptom of the post-political condition is one within which objection to development is drowned out to deliver normative agendas of 'sustainability' and 'growth', packaged as 'governance'. The paper has charted the rise of a post-political policy, as a catalyst for the development of other post-political responses at the local and neighbourhood level.

Neighbourhood Planning is an attempt from Government at the macro- scale to manage conflict and reduce objection to new development, which it is hoped will succeed by only allowing the creation that is neutral or pro-growth. It is clear that Government intended Neighbourhood Planning to

facilitate growth, carefully managing conflict and resistance to development. Government aimed to "...give people real choice, real influence and real reasons to say 'yes' to development" (Clark, 2011, no page), but not no. Neighbourhood Plans cannot plan for less development than that contained within the local authority's plan. Neighbourhood Planning elevates the Forum creating a plan to a new status. Neighbourhood is created as a legal entity and the Neighbourhood Plan becomes part of the local plan. Therefore, the policy is structured in such a way, using a mixture of legislation, regulation and policy, that it is only possible to achieve the 'correct' outcome.

Competition from various actors is responded to by the local authority using a variety of means, whereby its function is primarily as a mediator and facilitator. Within the Neighbourhood Planning system, where antagonism appears to erupt from within processes, the local authority's role is to 'police' the way forward. It does so using the structure of Neighbourhood Planning to guide it. Political debate is largely residualised to 'grown-up' discussion and debate, as is the intention of Government and where antagonism cannot be resolved, the local authority makes the practical decision to get the plan going in the name of efficiency.

Keywords: Mentalities of mega projects, infrastructure project selection, East – West Link project Melbourne

*The East West Tunnel, an AUD5.3 billion contract signed 29 September 2014 between the State of Victoria, Australia and East West Connect consortium, will not be going ahead under the new government elected in November 2014. The project was defeated because the community used their electoral power to revoke the right of the sovereign who had selected the project to conduct it. That is, the community elected an alternative government that would not support the project. This revoking of sovereign power was a last resort, after the community failed to compel the stopping of the unpopular project during community consultation processes. Several papers have already begun to document the process of community action through which this project was brought down. However the mentalities which brought the project into being in the first place are less well known. This paper documents this case study of a failed mega project, uncovering the knowledge, technology and rationality which combined to bring the project into being – and to sustain its existence despite widespread unpopularity and community objection. The paper uses Sturup's (2010) understanding mentalities of mega projects to tease out how this project was selected, and supported, even to the point of electoral loss. It focuses on the government and private-sector actors and their stakes in keeping the project alive and maintaining their right to decide which projects should occur. In doing so it validates and expands our understanding of the features of the art of government of mega projects.*

## 1. Introduction

This paper seeks to identify the "mentalities" of the mega project referred to as the East West Link, or East West Tunnel ('EWT')[1], in Melbourne Australia. This project was ultimately stopped at great public cost, after an election in which the political party attempting to complete the project lost electoral support and was removed from power. In identifying the mentalities underlying the project, we are seeking to document the knowledge, technology and rationality (Dean 1999) that combined to bring the project into being – and to sustain its existence despite widespread unpopularity and community objection. We then consider possible explanations for the apparent attachment to the project in terms of the theoretical functioning of mentalities of mega projects put forward by Sturup (2010). This theory indicates that key features of the art of government of mega urban transport projects are that they are strongly sovereign in the structuring of power, that they are difficult to observe critically from within because of the personal attachment people within the project acquire, and that they are difficult to unhinge because of an inescapable logic demonstrated by the construction of the project as a solution to some problem which can only be solved by the project.

[1] We are calling the project the East West Tunnel ('EWT') for clarity and to distinguish it from the larger East West Link which is a proposal to build a road link from the Western ring road through to the Eastern Freeway, of which it is part. Note that many references call this project the East West Link.

The first section of the paper sets out the methodological framework for the research and the key findings from Sturup's (2010) thesis. The second section documents the evolution of the EWT project, and the mentalities that went along with it. The final section discusses the findings from the project against those outcomes expected by our working hypothesis.

## 2. Method

This paper is based on findings from Sturup (2010), and examines the mentalities of mega project as they operate in the project referred to as the EWT in Melbourne. Sturup (2010) posits that the mentalities of mega projects can be understood as an art of government (Foucault, 1991), or world view from which people within the project operate, and from which what is logical to do emerges. Sturup (2010) found that key features of this kind of art of government, or mentalities, or world view, can be uncovered through development of case studies that closely examine the technologies, rationalities and knowledge used and produced in the project. These technologies, rationalities and knowledge are revealed through policy documents, legislation, public statements, public dialogue, and technical plans, and through interviews conducted using a story-telling mode (Snowden, 2003), and hypothesis based questions.

In this research, information was first collected from secondary sources including policy documents, legislation, public statements, and public dialogue. Because the project had not yet been built, few technical plans were available. Information was collected back to the first recognisable mention of the project in any form. A list of interviewees was generated from these secondary sources including government employees, politicians, community activists and academics. Interviews were sought from this selection of people, and snowballing technique used to determine further candidates. Because the project had been stopped following a change of government, and there have been accompanying legal proceedings, it proved difficult to obtain interviews from key persons involved in crafting the project. Most of the interviews collected have therefore come from those who opposed the project, or were observing proceedings at some distance. Our conclusions are at present preliminary as we have not yet completed our efforts at obtaining relevant interviews.

All information collected was coded using Nvivo software. Coding was initially completed against the nodes knowledge, technology and rationality, and against further nodes of interest that emerged from the data. Methodologically these codes of knowledge, technology and rationality are derived from an understanding that arts of government can be understood from observing shifts in technology and knowledge leveraged by institutions over time (Dean, 1999) and that projects emerge in a process of development of the problem and the project as a solution to that problem (Li, 2007). In the analysis of this data, what we are seeking is what is pointed to, or is in the unsaid, guiding actions and language. In this project, given we are looking to verify and validate a conceptual framework which has already been identified, we run the risk of finding what we seek. We use the inductive coding as a way of validating this, checking that there are not undercurrents hidden in the data that we are not directly using. Because Nvivo allows the same data to be coded easily against multiple nodes, we can also verify that the data we are using is not interpretable in a way inconsistent with our expected findings.

## 3. Theoretical Framework

Sturup (2010) found three main features of the art of government of mega urban transport projects. Firstly, the art of government is strongly sovereign in its power structure. The project comes about because someone with the power to do so said that it would be so. From this point all action in the project is based on the fact that the project will be happening. The question of whether the project should occur is no longer relevant and thus cannot be heard. Secondly, that mega projects are

developed as the particular solution to a problem, which is constructed during the process of developing the project as a kind of nexus. In this process of problem and solution construction, the problem is defined as solvable by the project. This creates political imperative to put in place the solution (since it is the job of government to solve problems, especially ones that are solvable). The problem solution nexus reinforces the impossibility of questioning the logic of doing the project as it has been defined, and creates sticky rationalities which keep re-emerging even if project construction does not begin immediately. Finally, mega projects have a kind of sublime, a succubus-like attraction, not only because of their engineering marvels (Trapenberg Frick, 2008) or their political appeal (Altshuler & Luberoff, 2003), but also because as a project they offer the opportunity to deliver the impossible without questioning whether it should be delivered. Mega projects require unwavering commitment, they use up those within them. They offer the opportunity to expend all of oneself in the service of something great (Shaw, 1973).

## 4. The Project's Historical Context

The piece of road represented by the EWT project, has a relatively long history of being proposed and then defeated. In fact, protestors against the project tend to refer to it as a zombie project, referring to the fact that they keep killing it but refuses to remain dead (per com Quantock, R. 2013). This indicates the kind of sticky logic found in many mega projects has occurred in this project (Sturup, 2010). As the until recently confidential EWT Business Case shows least one of the rationalities of the project is related to the irrationality of having a freeway that 'just ends' and the older dialogue that 'perceives of cities as circulatory systems and concurrently congestion as bad (Heynen, Kaika, & Swyngedouw, 2006)' (Sturup 2010 p.79). The East – West Tunnel Business case justification for building the eastern section before the western section of the project was "if constructed first, the Western Section will be another freeway-standard road that comes to an end in the inner city (similar to the current Eastern Freeway), potentially generating further congestion while still not offering a cross city alternative to the M1 corridor" (State Government of Victoria, 2013, p. 16).

There have been several attempts to build parts or all of the East West Link Project. The Project was originally proposed in the 1969 Melbourne Transportation Plan (Metropolitan Transportation Committee, 1969) as part of an inner city ring road, and adopted as policy in the 1971 'Planning Policies for Metropolitan Melbourne' document (Gleeson, Curtis, & Low, 2003). Despite major community protests about its path through the Yarra Valley, part of the inner-city ring (now the Eastern Freeway) was constructed. Fierce community resistance resulted in then Premier Bolte scrapping the segment of the inner-city ring similar to the EWT (Gleeson et al., 2003; Rundell, 1985).

A proposal to extend the Eastern Freeway as far as Nicholson St (approximately one third the length of the EWT project) was again proposed in 1994. Again it was scrapped after community resistance, when the resident group 'Coalition Against Freeway Extensions' set up a blockade of household junk in the Alexandra Parade median (Farrant, 1994).

The defeat of these earlier manifestations of the project cannot be put down to a general malaise of freeway building. Throughout this time, other major freeway projects were constructed, including the Westgate Freeway (1978), Extension to the Westgate Freeway (1987), the Western Ring Road (1992 – 1999), and City Link (2000). For a time after 1994 the EWT project lay dormant. The 2002 metropolitan strategy, *Melbourne 2030*, contained no reference to the Project, although it included another large-scale freeway now known as EastLink, which has since been completed (Department of Infrastructure, 2002).

The *Northern Central City Corridor Strategy Draft (NCCCSD)* of 2003 included a discussion of the Project. The NCCSD was centred on consideration of travel needs, and congestion problems of those in the inner north area of Melbourne, virtually the same area as the project area of the EWT project. The report found that through the implementation of *Melbourne 2030*, and by furthering the use of active and public transport, traffic along the Project corridor would be at or below 2003 levels by 2030. The report explicitly recommended against the construction of the Project, as the additional capacity would not be needed (Department of Infrastructure, 2003). An updated version of Melbourne 2030, known as Melbourne @ 5 Million, was released in 2008, and contained no reference to the Project (DTPLI, 2008).

The first stirrings of the zombie project can be seen in the release of *Investing in Transport - East West Link Needs Assessment (2008)*, by Sir Rod Eddington (*the Eddington Report*), which indicated that the EWT might be required around 2034. The Eddington Report provided a comprehensive analysis of potential future east-west travel needs in Melbourne, with a study area between the Western Ring Road at Deer Park and the Eastern Freeway at Abbotsford. It was considering traffic flows in an area much larger, and further west than the project area. The report predicted major increases in east-west travel volumes by 2031 – up to 42% on the M1 Corridor (south-west of Melbourne CBD) and up to 38% at other Maribyrnong River crossings. It recommended a suite of transport megaprojects to alleviate congestion and provide better east-west connectivity (Eddington, 2008). Among the projects included in the Eddington report was a complete East West Link, from the Western Ring Road to the Eastern Freeway terminus, via the Port of Melbourne and intersecting with the CityLink freeway. Importantly, Eddington noted that the Western section of the project should be built first as it would provide another crossing point for the Maribyrnong river. The eastern section was considered likely not needed until at least 2034, and the report modelling indicated that this section would not actually resolve the congestion issue along the roads between the CityLink and the Eastern Freeway no matter when it was built. As per Eddington's recommendations, the Western section of the Project ('Westlink') was included in the subsequent *Victorian Transport Plan* (VTP) (Department of Transport, 2008) and the Eastern section of the project (the EWT) was not. The VTP stated that while the eastern section of the Project would be worthwhile in the long-term, there were greater priorities that needed addressing in the shorter term.

In November 2010 Victoria held a state election which led to a change in the party governing the state. The incoming government was elected on a platform of public transport improvements, says Cr Fristacky in interview: "there was some elation that when they came in they would be supporting public transport projects […] which they had adopted and announced just three weeks before the election". For her, the EWT "wasn't part of the election platform".
Between 2008 and 2012 no further Victorian policy documents mentioning the road were released. The story of the project however continued in a new Federal forum, Infrastructure Australia. Funding for transport megaprojects in Australia usually comes from a mixture of sources. The States and Territories have a limited ability to raise taxation revenue, which is mostly collected and distributed by the Commonwealth. In 2008, Infrastructure Australia was created to distribute Commonwealth infrastructure funding through a merit-based process. It produced a series of annual 'Infrastructure Priority Lists' to the Council of Australian Governments, indicating projects of national significance. The 2010 Priority List contained reference to the Westlink project (Infrastructure Australia, 2010). In 2012, the original Westlink submission was updated to become the entire East-West Link (i.e. from the end of the Eastern Freeway to the Western Ring Road via the Port of Melbourne) (Infrastructure Australia, 2012). By December 2013, the Westlink component of the road is dropped, and this is where we see the Project in its current form finally appear in a public document (Infrastructure Australia, 2013).

There is political context to these developments, which altered the projects selected by Infrastructure Australia for Commonwealth funding (Interview Newman 2015). On April 4, 2013, then Leader of the Federal Opposition, Tony Abbott, made the following promise in the context of an upcoming parliamentary election (due September 2013):

> Now the Commonwealth government has a long history of funding roads. We have no history of funding urban rail and I think it's important that we stick to our knitting, and the Commonwealth's knitting when it comes to funding infrastructure is roads (Abbott, cited in Carey & Gordon, 2013).

This effectively meant that, were Tony Abbott's party to win a majority in the parliament and were he to become Prime Minister, funding to "build the roads of the 21st century" (Abbott, 2013) through Infrastructure Australia would be prioritised, and funding would be cut for urban public transport projects. As Newman noted in interview (see below), this came as something of a surprise to those in Infrastructure Australia.

Abbott's coalition of parties subsequently won the 7 September 2013 election leading to a major shift in major transport project funding across Australia. In newspapers and public statements, the EWT Project was suddenly labelled the most important piece of infrastructure to the future prosperity of Melbourne. Other projects, such as the Melbourne Metro, which until then had been reported by the Federal advisory body on infrastructure, Infrastructure Australia, as 'shovel ready' were heavily modified or effectively shelved. While providing one indication for the shift to prioritisation of roads in Victoria, this does not explain why the western stage of the project favoured by the Eddington Report and successive governments of Victoria (Westlink) was relegated to a less important status over the eastern stage, which according to the Eddington Report, the NCCC Strategy and the Victorian Transport Plan would not be needed for at least another 25 years.

The first mention of the EWT in a Victorian document was when it was declared as the East West Link Project (Eastern Section) under s 10 of the Major Transport Projects Facilitation Act 2009 in the Victorian Government Gazette 20 December 2012 (State Government of Victoria, 2012, p. 2893). This Gazetting was not accompanied by any discussion in the media or Parliament on the project, nor mention that the East West Link project had been limited to its eastern portion. Indeed in December 2012 the only parliamentary mention of the project was by Mr Elsbury who was expounding on the benefits of the Western portion in removing trucks from roads in Footscray and Williamstown. On May 15th 2013 the government announced $294m over two years for consultancies to support development of the project in its budget papers. There followed some media interest in the Age newspaper (Sturup & Low, 2013). In May 2013, the Victorian Government announced its intent to tender and construct the Project . The project would be delivered through a public-private partnership and cost up to $8 billion, with funding from the Victorian Government, private finance and a tied grant of $1.5 billion from the soon to be elected Liberal Federal Government through Infrastructure Australia. The Linking Melbourne Authority began to complete formal approvals and undertake procurement. Interestingly, consultation for the project would start after these processes. In July 2013, the Project was approved under s 77 of the MTPF Act 2009 (Gazette ref put in here).

## 5. Project Mentalities

The preceding history of the project demonstrates that the key features of mega project mentality identified by Sturup (2010) were indeed present. Further analysis shows however that these mentalities were functioning in different ways than in successful projects studied previously. We can see that although the project displays strongly sovereign structures of power, there is confusion in

which sovereign was the governing power. There is clear deficiency in terms of project commitment, not from political leaders, but from those who were to develop the project. We can observe clear demonstration of an inability to rationally critique the project from within, and the fact that this inability was never ameliorated by a proper gestation period for the project.

## 5.1 Sovereign Decision Making

From the public record, one could easily conclude that the EWT was an agreed major public priority. Plan Melbourne (DTPLI, 2014) is the most recent strategic and transport plan for metropolitan Melbourne. This document contained specific reference to the Project, enshrining it into the metropolitan land-use and transport strategy. Plan Melbourne argued the need for the Project, stating it was necessary for a more resilient and better connected road network, improved freight connections, improved local amenity and improved local and cross-town public and active transport connections. Further, the Project would be a major city-shaping project, fundamentally altering how residents interact with their city (DTPLI, 2014, p. 86).
However, as the previous section demonstrates, discussion of the EWT as a matter of public policy and action did not appear in the formal public discourse until 2013. This announcement was so low-key that it did not even make it into either of the major local newspapers, *The Age* or *The Herald Sun*, the next day. There is considerable evidence that the project simply sprang into existence following the announcement of the Federal Opposition Leader. Says Peter Newman, then on the Advisory Council for Infrastructure Australia,

> I think the pivotal event was Tony Abbott picking up the tab. Essentially the project was not even on the agenda until it was suddenly announced as a part of the election campaign. It had never been considered as a viable project on our table at Infrastructure Australia. It was not an option worth considering.

Key actors involved were also surprised by how the Victorian government brought the project into being. One example of this is in the interaction between government and the Ministerial Advisory Committee (MAC), a committee comprised of local academics and community leaders to advise the Minister of Planning on the development of a new metropolitan plan, *Plan Melbourne.* The MAC began work with the mandate to develop, among other chapters, a chapter on transport planning for the new strategy. They began months of extensive consultation which was then suddenly overturned. The Chair of the MAC, Roz Hansen, said in interview that during a committee meeting, the Planning Minster's Chief of Staff presented with a separately drafted version of the Transport Chapter of *Plan Melbourne* – which contained, no less, reference to the EWT. Hansen continues, explaining that the MAC Board resigned over the implementation of this 'other' Plan Melbourne. The willingness of public officials to eschew processes they themselves had devised in the assembly of the MAC, provides new information about how sovereign decision mentality effects the public service especially when combined with the eternal logic of road building. Says Roz Hansen:

> I also think that there was an underlying arrogance in this whole project, arrogance from ministers and [Victorian Premier] Napthine, arrogance from public servants, arrogance from people within transport, the department that were pushing the road. Engineers love building roads. ….So for them, to have the number one project in their department is a very powerful position in government…. [w]e've given that department and engineers in that department too much power. And they don't like giving it away.

## 5.2 Problem - Solution Nexus

For a mega project a gestation period of only five years does not provide 'time to breathe' which has been identified as critical for successful mega projects especially complex ones 'characterized by … agglomeration or secondary objectives' (Dimitriou et al, 2011, p.5). This gestation process is important for developing a logic or a nexus through which the project arises as the only solution to the particular problem it is supposed to solve. This nexus is critical to generating agreement about the project need, without which the project cannot be judged a success. This nexus was never properly formed in the EWT project, although it was in part formulated from the project articulated in the Eddington Report.

The historical development of the project demonstrates that although this project has a long history, much of the recent discussion of the project (NCCCSD and Eddington Report) were about how the project wasn't needed. Although there was a reasonably strong effort to develop the logic of the Westlink, or the entire East – West Link, the logic of the EWT had not been discussed, since it had been presented as a solution to the problem of 'freeways that simply end' in 1969. Its sudden emergence on the public agenda meant that the gestation period for the project was very short. The project has since been plagued by people asking 'but what is it really for?'

The Eddington report developed the logic of the East West Link as a project designed to solve the problem of traffic congestion on the Westgate freeway and limited crossing points of the Maribyrnong River. This document specifically precluded the EWT from the logic of the project. As noted above, even after the project was gazetted as only the Eastern section, people failed to make a case for the Eastern section. What problems the East – West Tunnel solved was never properly articulated. In fact initial public documents simply co-opted the problem solution nexus from the Eddington report even though that document suggested that the East – West Tunnel section may never be needed. The first newsletter on the project provided as part of the consultation process, documents the whole Eddington East – West Link, and claims that the project is needed because an extra 430, 000 crossings of the Maribynong River were forecast. This argument makes little sense in support of the EWT, because the project does not cross the Maribyrnong (Linking Melbourne Authority, n.d).

Even the Business Case for the project does not provide a convincing problem solution nexus. The Victorian Government refused to release the documents outlining the business case. In retrospect, the reason for this is clear: the government's own analysis projected to return a benefit-cost ratio of 0.4. To make it positive, the inclusion of wider economic benefits was necessary, as was the incorporation of ancillary works on the CityLink and Eastern Freeway (State Government of Victoria, 2013, p. 19). The stated objectives in the business case are related to solving congestion, providing alternative cross-town links, improving public transport, and to facilitate greater social and economic inclusion by increased access to services, education and employment (State Government of Victoria, 2013, pp. 14-18). The Project would support wider economic growth, and was needed due to changes in economic structure from being based on manufacturing to a globalized, service-based economy (State Government of Victoria, 2013, p. 12). Most of these benefits did not stand up to scrutiny from data which was publicly available (Dodson et al, 2014). Additionally, the business case was highly flawed, not specific about the data that it used, and did not provide data publicly so results could be verified independently.

Further doubt exists within the Business Case in terms of traffic demand and the road's purported necessity in reducing congestion levels. It accepted that due to "a number of high profile financial failures in the toll road sector in Australia […] the market has a much more limited appetite for taking on full demand risk in the absence of proven traffic volumes for a new toll road" (State Government of Victoria, 2013, pp. 20-21). To this end, the State Government accepted the demand risk, whereas the

selected contractor would accept construction and operation risk. The potential future private partners were not convinced the EWT would attract enough traffic. Following this process, a preferred bidder was named on 11 September 2014 – a consortium comprising Lend Lease, Bouygues, Acciona and Capella Capital. From this point, contract negotiations began, which was to be named East West Connect (EWC).

This lack of an understandable problem that the project was supposed to solve is also evidenced in the way those dealing with the project from outside the government felt when it suddenly emerged. Then-Mayor of the City of Yarra, Jacky Fristacky, stated

> I was mayor of the new council elected in 2012 for those critical two years of the East West link project…. [T]he [liberal] government was in opposition. I liaised extensively with the opposition over transport policy and they had picked up …. virtually everything from a 12-point program we put to [them]. [T]hat involved Rowville rail, Doncaster rail, airport rail, a range of other transport projects…. They did win the election on a platform of supporting picking up those projects. And so, there was some elation that when they came in, they would be supporting public transport projects. ….

Fristacky goes on to describe how she felt when it became apparent that rail projects had been deprioritised in favour of the EWT: "So as mayor, I was particularly horrified. All of us were horrified by that." Peter Newman from Infrastructure Australia describes how the tunnel never developed as a project outside of political circles:

> The project was never a viable project, and it was a dream…. It was never something that anybody would take seriously up until that point. But it became an election issue, which essentially meant that for Infrastructure Australia – because we'd never been able to support it – it became a 'rogue' project, a political project.

## 5.3 Attachment to Project and Inability to Rationally Review the Project From Within:

The previous section demonstrates how little rational consideration had gone into the project prior to its announcement as the EWT. The actions of the government after the project was announced, indicates an inability to rationally review the project from within. Sturup (2010) concluded that this inability stems from a combination of personal commitment to the project, and the requirements of the logic of sovereign power. This project brings to the fore how powerful the inability to question sovereign decisions actually is.

Throughout this period of construction of justification and project approval, an increasingly mobilised public began to openly resist the discourses and rationalities presented by the State. There were increasing calls for the forthcoming election to be a 'referendum' on the project, with an alternative government elected who would repeal the contracts. This proposition, which directly questioned the right of government to make unilateral (or sovereign power type) decisions was met with alarm. Suggesting that such action would create a condition of sovereign risk whereby future contracts would be burdened with extra costs. The legality of revoking contracts after they were signed was questioned. At a public seminar on the issue, the government's right to revoke previous government agreements under the constitution was demonstrated (Seddon 2014).

The City of Moreland and City of Yarra lodged an appeal against the Project in the Supreme Court of Victoria in September 2014. This appeal was essentially directly attacking the rationalities used by the Minister in approving the Project under the relevant sections of the Transport Integration Act 2010 and

the Planning and Environment Act 1987. These arguments related primarily to the purported social and economic benefits of the Project ("Moreland City Council and Anor v Minister for Planning and Ors [2014] VSC 468," 2014).

During these proceedings, the Minister for Planning responded:

> In considering the economic justification for the Project […] I do not rely on a business case. Further, it is not necessary for me to do so. It is sufficient for my purposes that the East West Link *(authors note - meaning the EWT)* is enshrined in Plan Melbourne […]. It follows that it is established as a matter of policy that the delivery of the Project will implement relevant planning objectives. It is axiomatic that, in the context of the approval decision, the Project will deliver a range of economic benefits (Guy, in "Moreland City Council and Anor v Minister for Planning and Ors [2014] VSC 468," 2014).

The opposition Labor Party received legal advice to the extent that, were the Supreme Court to hold that the s77 approvals made by the Minister for Planning on 30 June 2014 found the be invalid, then the State lacks the executive or statutory power to enter into a contract for the Project (Gordon & Cook, 2014). This led to the Opposition Leader, Daniel Andrews, to promise on 30/9/14 to tear up the contracts if the Labor Party were elected to office.

At this point it was clear that significant momentum had been gained around preventing the project by electing an alternative government which would not complete the project. Given the time between when the contracts were ready for signature and when the government had to cease government business due to the election was only three weeks, many would consider it reasonable and rational to have held off signing the contracts. Instead, these legal developments prompted the Treasurer of Victoria to enter into a secret side agreement with EWC (not actually made public until 4th February 2015), which stated that were the contracts to be voided, then the termination payouts in the contracts would nonetheless be met. EWC had informed the Treasurer that they would not be able to meet financial close were this extra agreement not signed.

## 6. The Aftermath

The November 2014 State election was argued to be a referendum on the EWT, with the governing Liberal-National coalition in favour and the opposition Labor Party against the project. Labor gained a parliamentary majority in the election, was able to form government, and claimed a mandate to stop the construction of the Project. The new Premier, Daniel Andrews, ordered a cessation of all work on the Project on 12 December 2014, and entered into negotiations with EWC to exit the project agreement. It was revealed during this process that the initial Finkelstein legal advice holding the contracts to be invalid due to administrative questions about project planning approvals was rendered inert by the Side Letter agreement entered into with EWC in the lead up to the election. During these negotiations, the Business Case and the Project Agreement were also made public. A final settlement between the State and EWC was reached on 15 April 2015. This settlement involved no new moneys being paid to the consortium (other than the AUD339,000,000 already paid), the consortium being purchased for one dollar ($1) by the State (ABC News, 2015), the LMA being disbanded (Premier of Victoria, 2015), loan facilities for the EWL being repurposed and the Commonwealth continued refusal to use the guaranteed project funding for non-road transport project.

Even in the aftermath, the Federal government is attempting to perpetuate rationalities around the project. Prime Minister Tony Abbott continues to insist that the funding set aside for the EWT can

only be used for the EWT. The rationality of constructing roads to reduce congestion has appeared on a billboard in Melbourne's Eastern suburbs, suggesting that voters blame the State Government for being stuck in traffic (Worrall & Tomazin, 2015) The zombie project may again resurrect; we will be watching this space.

## 7. Conclusion

The EWT project provides the opportunity to explore the workings of these features of mega project mentality under adverse conditions. We can observe a diminished and truncated process of developing the project as a solution to a particular problem in Melbourne. This led to a weak problem/solution nexus that allowed the subsequent Labor Government to decide not to continue with the project. The weak explanations provided for what the project was supposed to deliver were exploitable. The secrecy and connection to political manoeuvring at the Federal level provided an alternate story, kept below the surface, that this project was simply a political stunt. Combined, this created room for an alternate logic that the project was not needed, and that other projects were better.

Although we have not been able to directly discuss the mentalities of those in the project, we can observe that at least at the political level there were those willing to fall on their swords over their commitment to the project. There is evidence that the commitment of the public servants to the project was less than whole hearted, that it was more a perfunctory following of orders than a strong personal commitment. This suggests perhaps that one effect of creating a standard process for major projects is that it diminishes the personal courage and commitment required to produce them. In Victoria the Major Transport Projects Facilitation Act 2009 creates a standard process for planning and funding projects worth billions without parliamentary or public debate. The Linking Melbourne Authority was created to house project teams which would deliver billion dollar projects as a matter of daily business. This cannot but reduce the hype and individual conviction which can be seen in other projects. On the one hand this reduction could lead to better projects by reducing the sublime of these project, but on the other hand this may well make them much less likely to be built.

Sturup (2010) suggested that the sovereign power structures in projects make them difficult to question from within. In this project it can certainly be seen that the sovereign who had made the decision (the Liberal-National government at both levels) was unable to question its own decision. Even when it was apparent that there was strong opposition, which might well lead to an election loss, the Government held to its decision. Even after the project has been completely closed down the Federal Government and State Opposition are attempting to resurrect it. When the opposition suggested they would cancel the contracts on winning, the Government responded by agreeing to draconian cancellation clauses and signing the contracts in an attempt to bind future governments to the decision. This attachment could be explained through a desire, not simply to protect the project, but also to protect the sovereign's right to make decisions. This later has been called into question in the fall out of this project. It remains to be seen whether there has been sufficient reframing of sovereign rights around the cancellation of the project to have re-established these rights.

We set out in this paper to explore the mentalities of mega projects as they were expressed in the EWT project, and to learn more about these mentalities through observing how they have been expressed in a failed mega project. We have found that each of the three features of mentalities of mega projects, sovereign power, problem solution nexus, and a kind of sublime can be observed, although in this project they function somewhat differently. The logic of sovereign power was clearly apparent in this project, and emerged as a centre of direct concern. This was because this logic was used against the project to defeat it by electing an alternative sovereign. The project problem solution nexus was ill conceived and poorly developed. Thus its function to support and provide an uncontroversial

rationality to the sovereign decision never emerged. Finally we observe in this project a deep and as yet inexplicable attachment on behalf of the government to this project. This attachment is best reflected in the obsession with signing off the contracts before the election, and attempting to force the next government to abide by them. The work to date does not yet provide evidence whether this was a result of a kind of sublime, or an attempt to protect the right of sovereigns to make sovereign decisions. It is possible it was a result of a deep personal investment in the project by members of the government, a personal investment that was held despite never reaching the hearts and minds of either the public servants, or the public.

There remain many unanswered questions in this project, it stands as an example of how bizarre mega projects can become. Further research, and in depth consideration of the discussion started in this paper is necessary.

# The Community Space Delimitation of Fuzzy Responsibility ——Based on the Comparative Study of Two Community in Shanghai

Ze Zhang[1], Ying Gu[2]

[1]Tongji University, Zhangze47@126.com
[2]Tongji University, 931782016@qq.com

*Abstract: In the Planning and construction of community, clear and definite public space is a necessary, and all community residents should be responsible to the public space. In China, however, with the acceleration of urbanization and the frequency migration of the residents, the responsibility for community public space has become blurred. Community wall construction was an Effective method for community governance，and now it was also used to delaminate of "fuzzy responsibility public space and Facilities"，which were considered to be open and shareable for the whole community when they were constructed. Thus, several problems appeared, such as the Residential segregation and the Security problems. Based on the six census data of Shanghai's communities and field research, two typical community was selected for the comparative study: the rental rate was 80% and the self-occupied housing rate was 20% in Sichuan north Road community, while the rental rate was 20% and the self-occupied housing rate was 80% in Quyang Road community. Finally, by associating the spatial distribution of communities walls in two communities, this paper eventually 1: found a complex relationship between community residential structure and spatial distribution of community walls between buildings; 2, indicated that the community walls reflected the community property cognitive differences between different resident groups; 3, put forward some management recommendations under the existing regulatory framework accordingly.*

Keywords (maximum 3): Party walls, Residential segregation, Comparative study

## 1. Introduction

### *1.1 The migrant population increases continuously in the metropolis of China*

With the continued advance of urbanization and employment opportunities continued to convergence in large urban areas, huge attraction are also produced by urban areas for the people of surrounding areas. In large cities, the proportion of foreign population gradually increased. In Shanghai City, for example, from 2008 to 2013, the population grew by 2,332,000 people, which means an average annual increase of 466,000 people, the proportion of the resident population of the resident population rose to 40% (National bureau of statistics of the people's republic of China, 2011).

Table 1. Population changes in Shanghai City, 2008-2013

| | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 |
|---|---|---|---|---|---|---|
| Permanent Residents(million) | 21.41 | 22.10 | 23.03 | 23.47 | 23.80 | 24.15 |
| Native Residents(million) | 13.91 | 14.00 | 14.12 | 14.19 | 14.27 | 14.32 |
| Migrants(million) | 7.50 | 8.10 | 8.90 | 9.28 | 9.54 | 9.83 |
| Percentage of Migrants（%） | 35.02 | 36.63 | 38.66 | 39.54 | 40.06 | 40.69 |

### *1.2The confusion of rights and obligations for community public space*

Community public space was an important content in the construction of community planning, and all community residents are the owner of the community public space, and they should supply finance

support for the maintenance of community public space and facilities. However, with the enhancement of community residents liquidity, both "people who live in the house does not have the ownership of house" and "people who own the house does not live in the house" dual phenomenon are becoming increasingly apparent, community residents' groups in of China are becoming increasingly decentralized (Massey, 1988). This trend was not conducive to the maintenance of the atmosphere in the community building and community public space, and it also caused the fuzzification of the main responsibility of the community public space (Waters M C, 1990).

## 2. Residential segregation of Shanghai

In 2010, 39% of Permanent Residents of Shanghai are migrants, and the percentage of rent housing was also 39%. To prove the correlation between the migrants percentage and rent housing percentage, a spatial comparison was made as following:

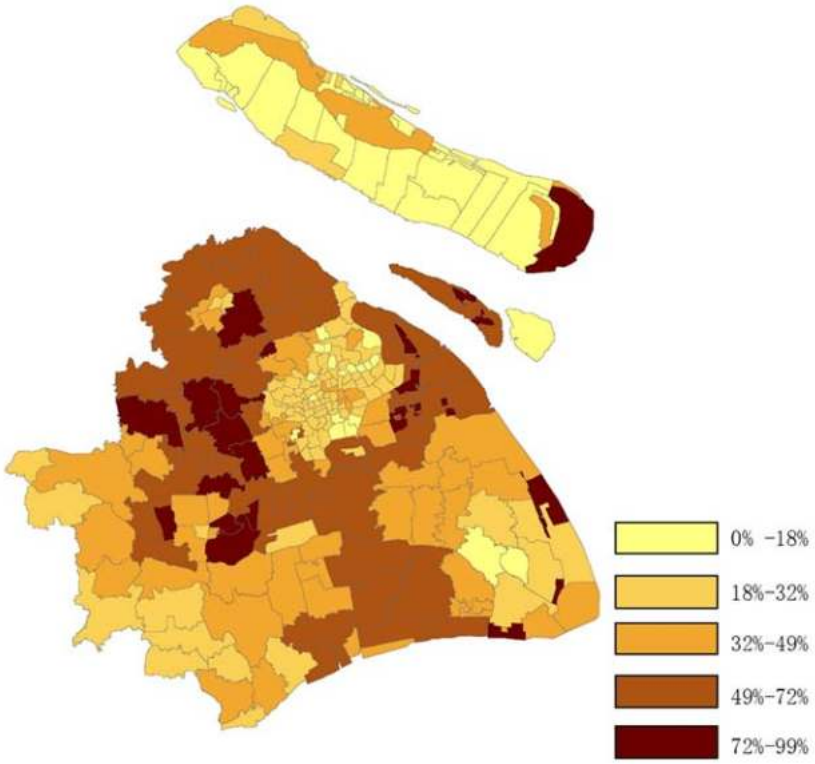

Figure 1. The Spatial Analysis of Migrants Percentage in Shanghai, 2010

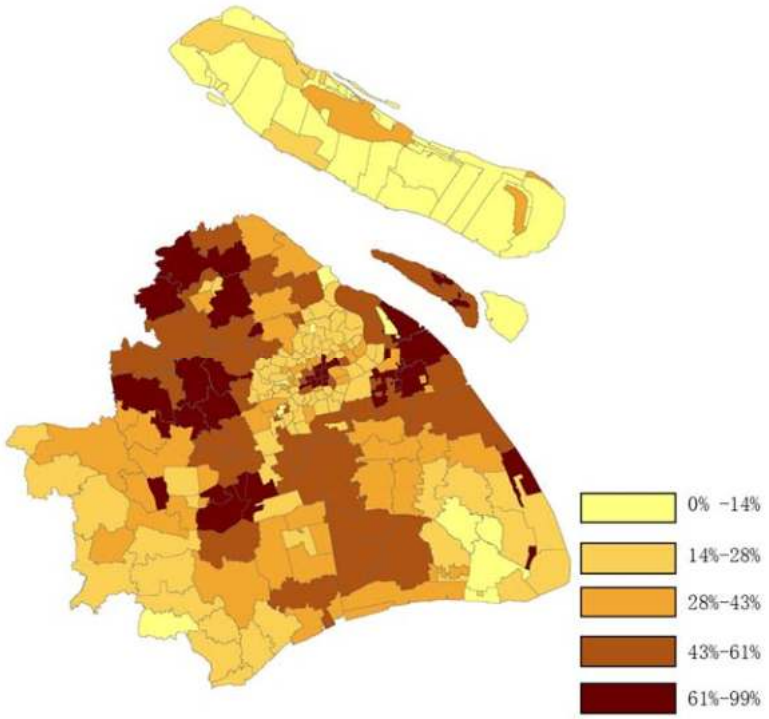

Figure 2. The Spatial Analysis of Rent Housing Percentage in Shanghai, 2010

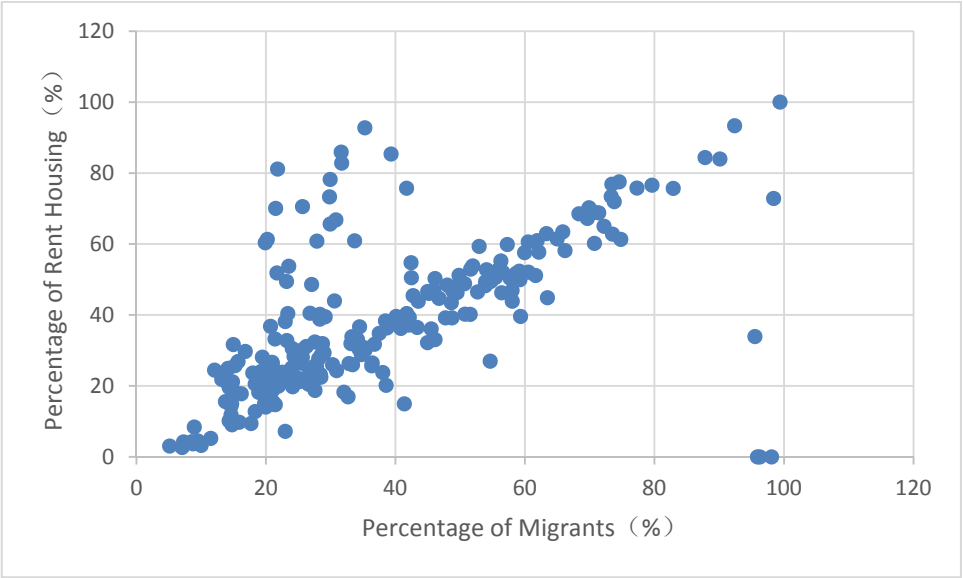

Figure 3. Correlation between migrants and rent housing in Shanghai, 2010

The positive correlation between the migrants percentage and rent housing percentage was characterized by figure 3. Generally speaking, a community with high percentage of migrants always show high percentage of rent housing.

### 3. Party wall as a symbol of residential segregation

A party wall was a dividing partition between two adjoining buildings (or units) that was shared by the tenants of each residence or business. When built for this purpose, the builder will lay the wall along a property line dividing two terraced flats or row houses, so that one half of the wall's thickness lies on each property. This type of wall was usually structural. Party walls can also be formed by two abutting walls built at different times. The term can be also used to describe a division between

separate units within a multi-unit apartment complex. Very often the wall in this case was non-structural but designed to meet established criteria for sound and/or fire protection between residential units.

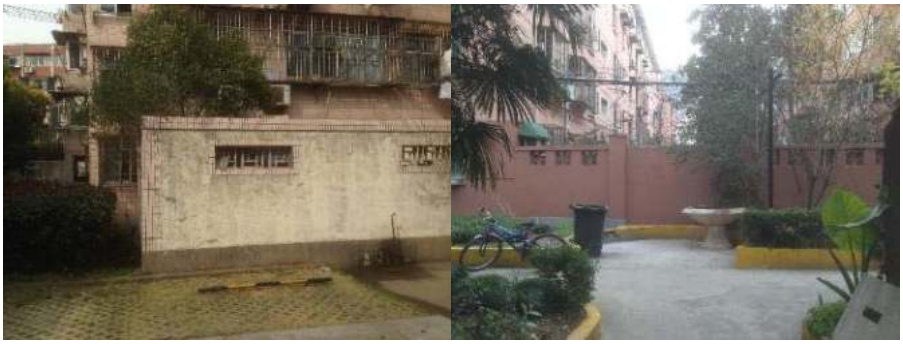

Figure 4 . Party Walls in Shanghai's Communities, 2014

The so-called adjacent relationship refers to the relationship between the rights and obligations of the neighbouring parties due to the exercise of ownership or the right to use. The fact that the wall space was established means that at least one of the rights of the neighbour was the default, and the violation of the wall was equal to the infringement of the right of the other party. Through the construction of community interior wall, the access control and community unit of residential community were divided, and the effective governance of community units was attempted. However, the construction of the community wall also led to the fragmentation of residential blocks and community groups, was not conducive to the creation of public life among community groups.

## 4. Comparative study of two communities in Shanghai

### *4.1Quyang Community*

Quyang community was located in the north of Hongkou district, Shanghai. With an area of 3.05 square kilometers, it had a resident population of 10.26 million, including 2.04 million migrants resident, which accounted 19.86%. The residential land of Quyang streets was 142 hectares, 13.8 square meters per person (National bureau of statistics of the people's republic of China, 2011).

Figure 5. Quyang community, 2012

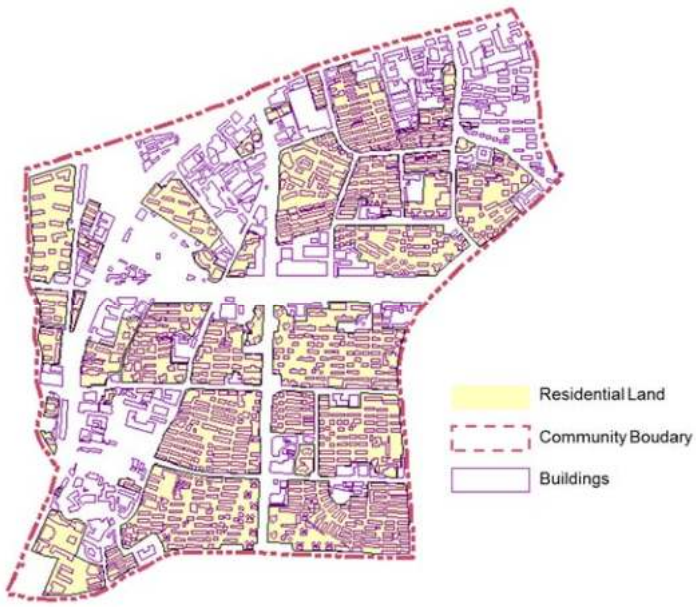

Figure 6. Residential Land of Quyang community

Through the investigation, 80 party walls were found in the Quyang community, and the longest was 362 meters, while the shortest 20 meters, the total length of 12216 meters, and the average length 152 meters. The 39 residential blocks were divided into 118 basic space units in the community by 80 party walls.

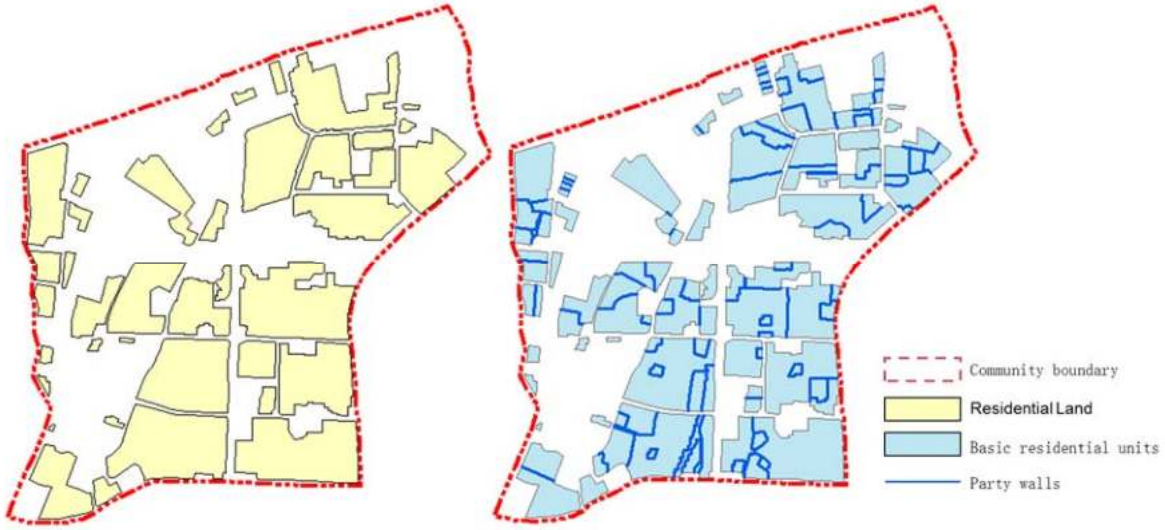

Figure 7. Spatial Layout of Residential Plots (left) and Basic Residential Units (right)

The residential land was made up with 39 plots, with the largest area of 13.62 hectares, the smallest area of 0.06 hectares, and an average of 3.66 hectares. The 118 basic residential units showed a different feature: the largest area of 11.09 hectares, the smallest area of 0.06 hectares, and an average of 1.22 hectares.

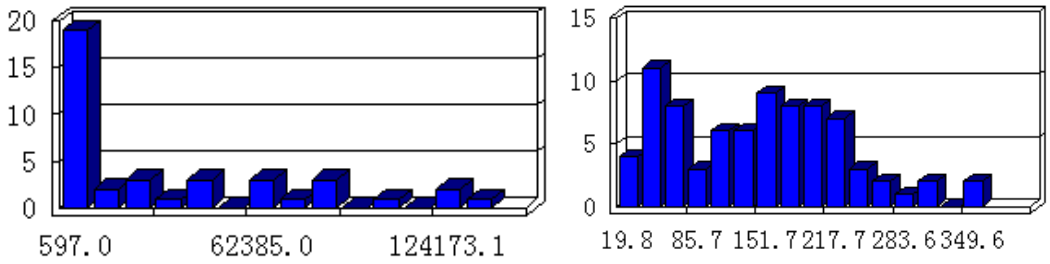

Figure 8. Statistical Chart of Residential Plots (left) and Basic Residential Units (right)

*4.2 North Sicuan Community*

North Sicuan community was located in the south of Hongkou district, Shanghai. With an area of 2.29 square kilometers, it had a resident population of 8.74 million, including 2.62 million migrants resident, which accounted 29.94%. The residential land of North Sicuan community was 142 hectares, 10.86 square meters per person (National bureau of statistics of the people's republic of China, 2011).

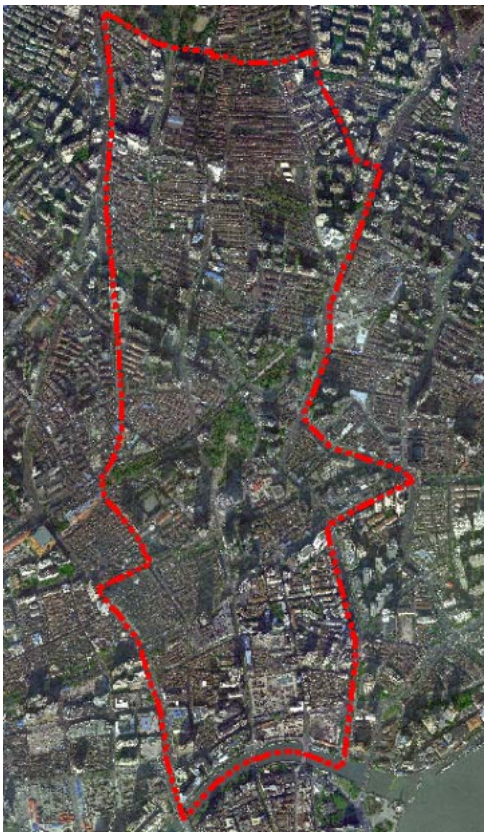

Figure 9. North Sicuan Community, 2012

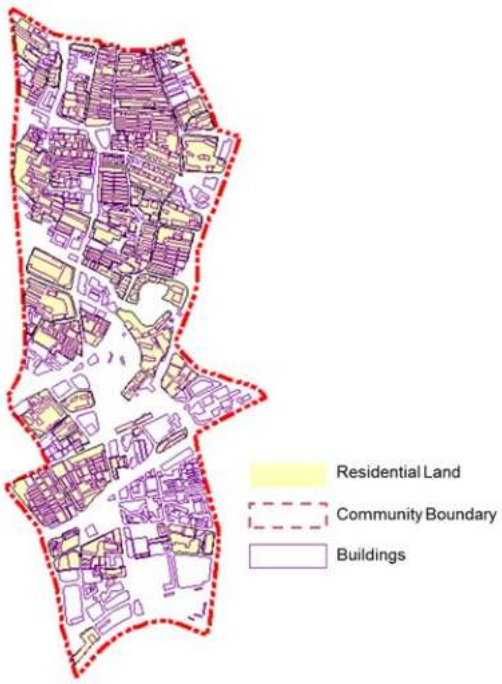

Figure 10. Residential Land of North Sicuan Community

Through the investigation, 33 party walls were found in the North Sicuan community, and the longest was 349 meters, while the shortest 19 meters, the total length of 3915 meters, and the average length 119 meters. The 58 residential blocks were divided into 90 basic space units in the community by 33 party walls.

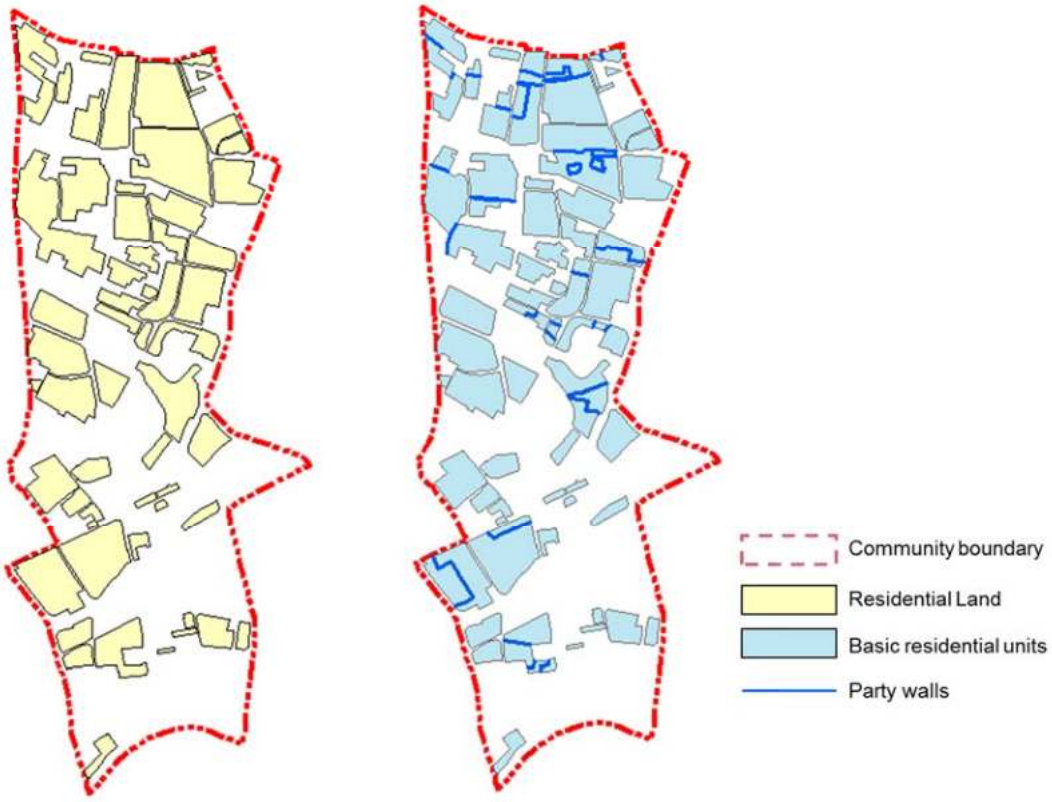

Figure 11. Spatial Layout of Residential Plots (left) and Basic Residential Units (right)

The residential land was made up with 58 plots, with the largest area of 69 hectares, the smallest area of 0.09 hectares, and an average of 1.64 hectares. The 90 basic residential units showed a sample feature: the largest area of 4.34 hectares, the smallest area of 0.06 hectares, and an average of 1.06 hectares.

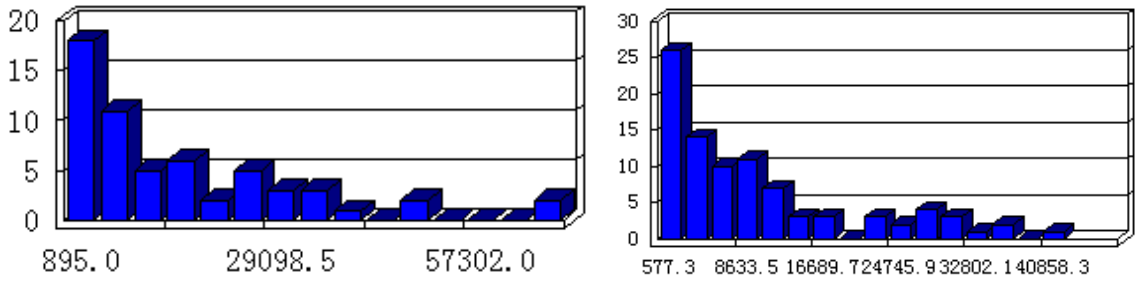

Figure 12. Statistical Chart of Residential Plots (left) and Basic Residential Units (right)

*4.3 Results*

Table 2. Compare between two communities

| | Residential land (hectare) | Length of Party Walls (meter) | Density of Party Walls (meter/ hectare) | Percentage of Migrants （%） | Percentage of Rent housing （%） |
|---|---|---|---|---|---|
| Quyang Community | 142 | 12216 | 86.03 | 19.86 | 18 |
| North Sicuan Community | 95 | 3915 | 41.21 | 29.94 | 78 |

As we can see in table 2, party walls density of Quyang Community was significantly higher than that of the North Sichuan community, while migrant population and rental housing had significant negative correlation. Therefore, one conclusion could be reached: with the increase of migrant population, the construction of party walls was slowed down, and the dilemma of residential separation was also improved (Semyonov M, 1981).

## 5 Conclusions

The difference between different living groups was constantly strengthening, and the party wall between different units was becoming a common phenomenon (Gieryn T F, 2000). The party wall also has an impact on the adjacent relationship, which defines the property rights of the property owners, but also brings some negative social impacts, such as the space segregation and the hindrance path (Miaoxi Zhao & Zilai Tang, 2007).

With the acceleration of the urbanization, more and more migrants occupy a more and more important study on the separation of the residence. However, through this study, we found that there was a positive correlation between the proportion of migrant population and community rent in Shanghai. And through the comparison between Quyang community and North Sichuan community party wall construction, it shows that with the increase of migrant population, the proportion of rental housing will increase, but the construction of the party wall in the community was somehow reduced, which also showed that the migrant population contributes a lot to alleviate the residential segregation.

# TRACK 05

# Legal Environment for Effective (Good) Governance and Efficient (Sustainable) Use of Land

## Track description

Co-chairs: **Rachelle Alterman**, **Leonie Janssen-Jansen**

Almost all countries have laws, regulations and government institutions that determine a significant number of issues related to planning. These issues range from procedural matters that affect quality of governance, to substantive policies and instruments that may enable the creation of "definite spaces" and sustainable land use. However, the governance aspects of planning often encounter "fuzzy responsibilities". In recent years planning law (comprised of legislation and court decisions) faces additional challenges that go beyond the domestic domains into the even fuzzier, global arena. Can the laws and institutions that govern planning meet the challenges posed by climate change, sustainability, and increasing uncertainty? Are planning laws geared to handle distributive justice issues within cities, countries, and across borders? This track aims to provide a platform for sharing research on any of the following and related topics:

- Statutory (regulatory) planning systems and instruments: How well can they accommodate emerging economic, socio-demographic and environmental realities?
- Governance structures and procedures: How does planning law structure the relationships between central governmental control, local government, markets, and non-governmental organizations?
- How does the law frame public participation and dispute resolution;
- Regulatory land use instruments: local statutory plans, zoning, building permits, agreements with developers, "exactions" or "planning gain", regulation of open space and natural resources, historic-building regulation and other;
- Property rights: tensions between public/ private rights and responsibilities; land for public services, customary collective / private rights, expropriation, compensation, land readjustment, taxation of land values, transfer or development rights.

Contributions may look at the general theory of planning and law or investigate particular issues, focusing either on a particular country or cross-nationally. Since legal and planning systems vary greatly from country to country, authors should make the legal structures and procedures as transparent as possible.

# Conformance and performance in Taiwan and England: pragmatism in approach?

Janet Askew[1], Tzuyuan Stessa Chao[2]

1 University of the West of England, e-mail: Janet.Askew@uwe.ac.uk
2 National Cheng Kung University, e-mail: tychao@mail.ncku.edu.tw

Keywords: planning system, flexibility, discretion, certainty, regulation

## Abstract

There are two distinct planning systems: the discretionary system, such as that of the United Kingdom and the zoning system, typical of Taiwan and Europe. Askew and Chao (2012) have previously compared Taiwanese and English planning systems with regard to advertisement controls, using the conformance and performance models of planning (Steele and Ruming, 2012).

Rivolin (2012) and Buitelaar (2010) submit that these distinctions are being broken down across Europe. There is a view that the UK discretionary system (performance) is flexible, whilst the European (and Taiwanese) conformance model, offers certainty to developers, albeit very rigid. This inflexibility might result in development occurring outside the legal plan (Buitelaar, 2010), and probably means that the Dutch planning system does not provide the legal certainty it purports to do. The discretion of the UK system is becoming more attractive to countries with a conformance system, and vice-versa. In Taiwan, the zoning system prevails in urban areas. However, in rural areas, the system is more discretionary (Chen and Shih, 2010). In the UK, developers are suggesting that the allocation of land in a local plan, for, say, housing, should remove the need for further planning permissions – in other words, to create a legally binding plan (UK Treasury, 2014).

In comparing planning systems, there appears to be more similarity than there was. Whilst Rivolin (2012) considers that the mixture of systems is not good for Europe, can it be shown to be a useable and pragmatic option for Taiwan and the UK?

## 1. Introduction

Planning systems and regulatory regimes are extremely important in guiding land use and shaping cityscapes in every country. There are two distinct planning systems: the discretionary system of the United Kingdom and the zoning system of most the rest of the world, including Taiwan. Within these two systems, there are different approaches, many of which have emerged due to a rise in market economics and neoliberalism, including development-led and plan-led practices (Janssen-Jansen & Woltjer, 2010; Salet, 2006; Balz & Zonneveld & Nadin, 2014) which are adapted by different governments and result in very different planning approaches and outcomes.

But the purpose of this paper is to consider the application of discretionary and zoning systems, and the extent to which the two main approaches are being used side by side. Both

have their pros and cons in terms of development efficiency, flexibility and interpretation of how the planning system should fulfil its duty. As urban planning is considered as an applied science expected to evolve with time and needs, there are many hybrid attempts to mix two systems in the Europe and Asia. Even regarding the UK's long standing discretionary system, there are discussions about its suitability to encourage and manage development – especially since the system has assumed new levels of complexity in its regulations and legal processes for plan and policy making.

In the UK, developers are pressurising the government (for example, ref) to move towards a hybrid system whereby once land has been designated for development in an adopted local plan, then planning permission should not be sought again – rather the designation should confer permission for the principle of development. Such demands are highly controversial and represent a real change away from usual practices in the UK.

In addition, it is believed that further research will expose the dilemmas over flexibility and certainty in other countries, such as USA, Canada and Australia, where similar discussions are taking place (Booth, 1996).

These two approaches to planning are often considered to be opposites in the regulation of development, and are referred to as *performance* and *conformance* models, the former offering much flexibility, whilst the latter offers more certainty (Steele and Ruming, 2012).

The following table outlines the main differences between the two models:

| Performance (England) | Conformance (Taiwan) |
|---|---|
| Discretionary | Legally binding /zoning plan |
| Flexibility | Considerable detail |
| No certainty | Regulatory certainty |
| Policy base: primary material consideration is a statutory development plan | Rigid, based on zoning and building codes |
| Decisions based on a set of criteria/performance indicators | Decisions have to conform to codes and zones |
| Not land use based (necessarily) | Property rights important |
| Decisions built up through legal cases | Efficiency, accountability, transparency |
| Regulations devised nationally/centrally(England); applied locally | Regulations devised locally. |
| The point of decision is after an application for development is made | The point of decision is when the zoning plan is legally accepted |

*Table 1: Performance and conformance models (adapted from Steele and Ruming, 2012).*

In an earlier paper, Askew and Chao (2012) compared different approaches to advertising control in the UK and Taiwan, and applied this model. It was important then to see if the two different systems produced the desired outcomes of planning – in particular with regard to sustainability and place-making. In Taiwan and England, both systems are rooted in very different cultures, but in both, planning outcomes are underpinned by very similar objectives. These might be, for example, sustainability, good design, historic conservation, or economic

prosperity. So the research tried to answer how do regulatory regimes contribute to this? Despite such diversity, are the outcomes similar? Furthermore, what can each country learn from the other? These questions can be applied to development and planning systems more generally.
