In the four-party subject, the government is the controller and server; the enterprises are the leader and investors; villagers are the actual practitioners and the tourists are the drivers. As the controller and the server, the government should take the responsibilities of determining the development direction of the area, guiding the industrial upgrading, making space planning, improving infrastructure construction, implementing the control measures and multi-channel promotion etc. While supervising the enterprises, villagers and tourists, it also provides service platforms for the other three roles. The enterprises concern more about the problems of the amount and means of investment, industrial chain construction, featured products development, projects integration and operation mode chosen etc. Under the supervision of the government, the enterprises are supposed to strive to integrated into the area leading the area to the

modernized, efficiency and high-quality development; providing more employment chances for the villagers to help them improve their self-competence and skills and increase their streams of revenue; providing the tourists with featured agricultural products and souvenirs. Villagers are the subject of the countryside society and the key group in participating the countryside industry, organizing the rural society and reviving the rural cultures. Under the control and service of the government as well as the abstraction of enterprises, they provide extensive market for the labor force employment in the area's development and the rural space experiencing sites and services for the tourists that are distinctive with that of cities. For the tourists, they are under the control of the government and receive multi-level tourism services from government, enterprises and the villagers, exporting various resources, capital, and information elements and facilitating the element movements between city and countryside, which strengthens the values of countryside renaissance indirectly.

### *3.4Providing guarantee strategies*

To ensure the realization of "formulating the integrated development renaissance pattern for all the rural communities that takes the city as the serving object, countryside as the carrier, agriculture as the foundation, tourism development as the method and the cultural renaissance as the root", this research gives renaissance guarantee strategies from the following three aspects:

(1)Planning scientifically: improve the overall spatial layout, traffic organization at all levels and security and construction work of public service facilities of the area and this work will mainly organized and completed by the government.

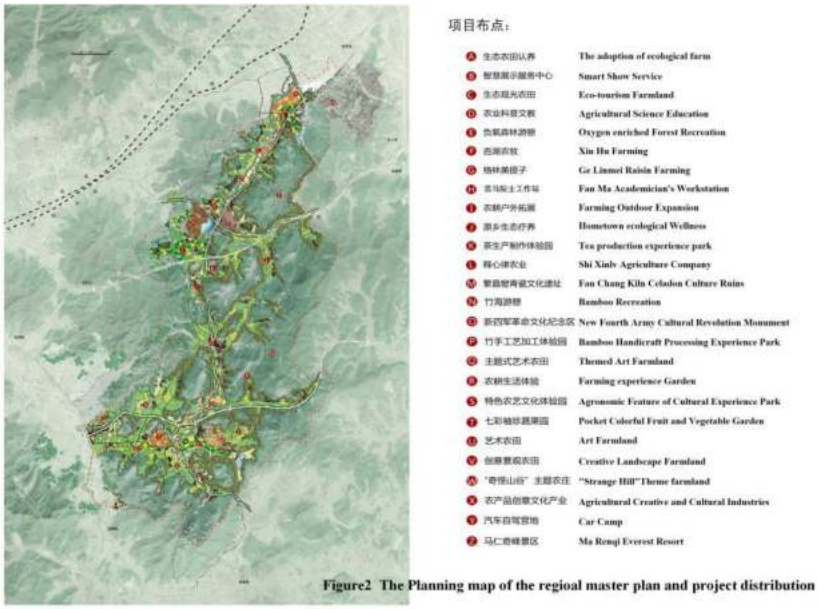

Figure2 The Planning map of the regioal master plan and project distribution

In the planning area of 45.784 km$^2$ including 11.138 km$^2$ basic farming lands, 2.655 km$^2$ general lands and 1.324 km$^2$ countryside construction lands with the remaining of water areas, mountainous areas, woodlands and scenic spots. On the basis of analyzing thoroughly of the attributes of the lands and their using conditions, relying on the countryside construction lands and farming lands the planning arranges the spatial distribution of the whole area, with its emphasis on putting the 26 different projects into the rural

production, living and ecological spaces(Figure2).

The area's transportation and ancillary facilities have also been scientifically disposed in the overall plan. The plan on transportation module is on the basis of taking the two railways of Hutong railway and Ning'an intercity railway, as well as the 5 expressways of the Yanjiang expressway, Huaijiu road, 216 provincial road, 043 and 053 county road as the main transportation lines connecting internally and externally of the area, 2 5m wide slow passable green roads are built allowing passage of both motorized and non-motorized vehicles; integrated with the mountainous lines, several 3.5m wide brand roads that mainly support non-motorized vehicles and pedestrians and several trials that are set along the internal mountains and only allowed for pedestrians are built. The ancillary facilities mainly arranged the 4 categories of bus stations, parking spaces, medical sites and public toilets and dumpsters. Among these a bus station is set in every 500-1000m; 5 more parking spaces and 3 camping bases are newly built along the Huaijiu Road; the radius of medical facilities services is no more than 3km; set up public toilets and dumpsters according to bicycle stops and camping sites, whose serving radius is no more than 1.5km to be convenient for tourists' needs.

The plan also designed the important points in the area in detail, such as constructing guiding rules design to the north entrance that is of 74.5 hectares. The plan observes the principle of low cost and keeping the original appearance, relying on the existing important villages, the 216 provincial road and Huaijiu road which are crossing the area and the Liwen Agriculture Co. Ltd. to spread the design. The Tiemen Village Committee's buildings are reconstructed and the Fanchong canal is renovated to form a coast leisure belt. A great number of ancillary facilities of functional projects, parking spaces, commercial service sites and medical outpatient clinics are newly built including Dazhuang parent-child agricultural experience park, Xiaotuan Hill Park, pedestrians entrance square, marking building for vehicle entrance and Seven color agriculture presentation field.

In short, scientific planning as the basis of government control and services has played an important role in aspects of guiding the orderly economic development of the area and efficient facility allocation

(2)Protection first: in the three fields of ecological protection, living environment protection and agricultural civilization protection and their detailed 9 domains establish the management and control system of protection first(Table 2). Then,take the management and control system of succeeded traditional culture for example. The detailed management and control content and measures are illustrated in Table 3.

Table 2. Table of the whole management and control system

| Field of management | Range of management and | Content of management and control |
|---|---|---|

| and control | control | |
|---|---|---|
| Ecological management and control system with low impact construction | Water environment | Water quality |
| | | Landscape environment |
| | Mountainous bio-resources | Rare and old trees |
| | | Forests and bamboo groves |
| | Atmospheric environment | Air quality |
| | Solid waste | Daily life waste |
| | | Waste in production process |
| Management and control system of respecting for the countryside subject originality | Residential buildings of village communities | Overall appearance of the villages |
| | | Ancient mansion/folk houses |
| | Rural residents | Lifestyle |
| Management and control system of succeeded traditional culture | Agricultural civilization | The succession of the pastoral landscape |
| | Community life and culture | Protection of folk house culture |
| | | Community autonomous organization |
| | Rural art culture | Continuation of the traditional arts and crafts and traditional cultural activities |

Table 3.able of management and control system of succeeded traditional culture

| Range | Content | measures |
|---|---|---|
| Agricultural civilization | The succession of the pastoral landscape | 1. The protection of pastoral landscape, the carrier of farming culture, should be put to the position of priority with strict control.<br>2. Actively build a platform for cultural exchange and the organization of related farming activities to promote the dissemination and awareness of farming culture.<br>3. Strict implementation of rural land use approval system, prohibiting unjustified appropriation of farmland and the crop farming structure can be appropriately adjusted. |
| Community life and culture | Protection of folk house culture | 4. Strengthen the protection of the ancient Zhongfen village and the historical attractions of Fanchang cave dwellings.<br>5. On the basis of "three lines and the trilateral regulations", efforts should be made to preserve and build residential building appearance along the Huaijiu line.<br>6. Repair and renovate residences in certain damage, protect the residential buildings with traditional culture. |
| | Community autonomous organization | 7. With the development of rural tourism, the original community family living atmosphere and culture should not be abandoned, displaying rustic atmosphere and positive neighbourhood to others.<br>8. Improve the overall cultural quality of rural residents to build the spirit of the new face of beautiful countryside<br>9. Actively building activities in rural communities and create a harmonious neighborhood community atmosphere, and retain the simple folk interaction between traditional farming neighbourhoods. |
| Rural art culture | Continuation of the traditional arts and crafts and traditional cultural activities | 10. Through the construction of the Fanchang caved dwelling museum, inherit and develop the Blue and White Porcelain culture.<br>11. The extremely distinctive arts and crafts, should be considered for official protection by application of intangible cultural heritage<br>12. Take the Marenqifeng blessing events as an opportunity to spread the blessing culture. |

(3)Common benefit of the four parties: in the renaissance process of rural areas on both sides of the Huaijiu Road in Fanchang, we can see the bidirectional logical relationships among the four parties of government, enterprises, villagers and tourists.

Firstly we are going to explain the logical relationships of tourists-government and enterprises-villagers. The population flow, capital flow and information flow introduced by the tourists drive the industrial transformation in the countryside. Under such a huge influence of rural tourism market, the government and enterprises are all injecting new and enormous production elements such as capital, technology and information. The assembling of such elements results in the rural productivity relocation in the countryside space and recombination and optimization of the resources in the area. The reassembling and combination of the resource elements introduced the fundamental power for the renaissance development of the peri-urbanized rural areas. The influx of tourists and the investment of government and enterprises at the earlier stage helps the rural area on both sides of the Huaijiu road in Fanchang transform into the traditional agricultural production, agricultural scale production and tourism consuming services pattern. Accompanied with such transformation, the channel of employment is expanded on the one hand with the improvement of employment enthusiasm and levels as well as their incomes accordingly; on the other hand, some of the migrant workers began to reflux to be employed or self-employed, which nurtures the renaissance of the rural homeland. Thus the assembled production elements such as the enormous population, huge capital, high tech, diversified information as well as it scientific layout lays a solid enough foundation for the countryside renaissance in terms of economics.

Now we are going to analyze the logical relationships of villagers-enterprises and government-tourists reversely. The villagers can choose their own production operation mode that is suited for themselves under the circumstances of market demands and government and enterprises' guidance. For example the villagers can choose from the modes of autonomous operation, "community + company + farming household", "government + company + farmers tourism committee + travel agency + farming household", "enterprise + farming household + base + cooperation" and "enterprise + farming household + government" etc. It can optimize resource allocation and improve the service level and skills to realize the increase of income and self-improvement. It has to be mentioned that from these modes we can see the renaissance in rural social aspect. For example the previously mentioned social organization forms of community, cooperation and farmers tourism committee etc. are all autonomously organized by farmers and also the organization platform of farmers conducting countryside social autonomy. The economic and social renaissance activities autonomously organized by farmers must facilitate the enthusiasm of further investment by government and enterprises and further injection of capital, population and information, which forms a benign interactive relation of the three ones. Such a benign interactive relation will definitely produce rural products of higher quality (including the general and featured agricultural products as well as the derived products, pastoral space and tourism services etc.) to the tourists to formulate the win-win interactive mechanism of the four-party cooperation.

## 4. DISCUSSION

The countryside renaissance research targeting on the rural area in both sides of the Huaijiu road in Fanchang is based on its local development planning. The proposal of its modes, analysis of the subjects' relations and guarantee strategies' study is started from the peri-urbanized deterioration problems of this area, taking its local resource endowment and development conditions analysis as the foundation and the rural economic, social and cultural renaissance as the objective. The renaissance objectives, methods and contents mentioned in this plan have gained the extensive recognition and support from the local government, enterprises and the villagers through 1 year's communication with them. At present, this plan is in the final revision process. Although the plan has not been completed, the government, enterprises and villagers have begun to conduct the countryside renaissance works according to the core content of the plan. The foremost one is the improvement and optimization of space environment's quality. The 4 villages in the urban fringe, 4 villages in the scenic spot fringe and 16 villages in the expressway and railway fringe have basically completed the public environment sanitation improvement work within the limit of sights to provide a neat community environment for both the villagers themselves and the tourists. The second foremost one is the recombination and padding of the industries. There are agricultural and travelling companies continuously launching in the area. To avoid vicious competition brought by homogenization among the enterprises, they began to refer to the relevant contents in the plan under the guidance of the government to follow the way of differentiated and collaborated development. Thus provides more employment opportunities and diversified skill training services to the villagers and also provides more diversified products and services to tourists. More importantly, the village is recombining the rural population and updating the countryside governance pattern. The countryside makes the "new rural people group" including the regular peasants, returned migrant farmers and enterprise entrepreneurs the permanent resident population in the new era, formulating the diversified population structure. Some of the villages establish production cooperation and farmer tourism committee etc. on the basis of the existing village committee according to development needs and also introduce NGO to manage the rural issue together. Thereupon the rural economic and social renaissance has been on track and for the cultural renaissance, we are planning now and will mainly be conducted with in the way of managed, controlled and protected by the government and participated by the villagers. It concerns more about the spatious expression, lacking studying in depth.

## 5. CONCLUSION

As an important guarantee of China's sustaining and stable development in the new era, the study of countryside renaissance is a significant topic that cannot be neglected. This paper starts from the connotation of countryside renaissance, pointing out the positive meanings of China's city-countryside integration by the countryside renaissance form the two dimensions of content and values. The contents involved in the study of the connotation was explained and practiced through the development planning case of the rural areas on both sides of the Huaijiu road in Fanchang. The modern countryside

renaissance pattern in the new era is proposed that not only helps countryside communities to realize self-sufficiency internally and prosperous development, but also facilitates its harmonious co-existence with the outer cities, which is to "formulate the integrated development renaissance pattern for all the rural communities that takes the city as the serving object, countryside as the carrier, agriculture as the foundation, tourism development as the method and the cultural renaissance as the root." It also pointed out the methods to bring back the total vitality of the whole rural area and produced and strengthens its unique exporting values from the two perspectives of studying the renaissance subjects and guarantee strategies.

"As a systematic concept, the content of countryside renaissance is complicated and diversified…it is also closely related to the change of city-countryside relationship, the change of the rural land system as well as the change of social consumption structure. The expectation of rural studies in future China requires a grander context, deeper degree of field investigations and more valid evidences to explore the diversified and concrete way of realizing the countryside renaissance." (Zhang Jingxiang, Shen Mingrui, Zhao Chen, 2014) This means in the study and practice of city-countryside planning theories in the future that more attention should be paid to the countryside renaissance problems. Meanwhile this requirement will also be reflected to the planning education. The rural planner system has been established in Sichuang Province in China, with the planner in villages serving better to the villages' development; the course system of city-countryside planning programs has been added relevant courses concerning countryside planning principles and designing in universities represented by Tongji University and Huazhong University of Science and Technology, to serve better to the national and professional demands. In the future there will be more and more researches about policy, system and professional education for Chinese countryside renaissance.

# TRACK 08

# Planning 'in' or 'for' Multicultural Societies. Diversity, Social Justice and Democracy

## Track description

Co-chairs: **Lia Vasconcelos**, **Angelique Chettiparamb**

Multi-ethnicity, multiculturalism and factionalism along multiple grounds such as religion and language are increasingly becoming features common in European cities and regions today. Although, multiplicity and the presence of the 'other' through trade and travel have always defined cities in Europe, the scale, pace and nature of change is now largely perceived as being unprecedented or different. The compression of space and time in cities jostles various types of traditional ways of life entrenching some identity positions and threatening others. This track explores issues around mediation of diversity and conflict, seeking to examine ideas of social justice, human rights, and democracy in the wake of multiplicity. Specific questions include:

- How can we describe and understand the nature, potential and challenges of diversity in contemporary European societies?
- How can planning respond to diverse values and capabilities whilst retaining a commitment to ideas of spatial social justice?
- What are the roles for planners in multicultural territorial communities?
- What planning approaches at various scales have been adopted for conflict resolution in divided societies?
- How might planning contribute to ideals of democracy that define most contemporary European polities?

# "PLANNING GOING DOWN TO THE COUNTRYSIDE": HOW RURAL PLANNING IS INTEGRATING RURAL SOCIETY AND RURAL SPACE IN CHINA FROM THE PERSPECTIVE OF STATE-BUILDING

Guosheng Ding[1], Weiqiang Wang[2], Sheng Jiao[1]

Keywords: state-building, Balancing Urban and Rural Development, Socialism New countryside Constructions

## 1. Introduction

Today's China is undergoing practices of rural reconstructions and rural planning at a large scale. This phenomenon has aroused wide attention of scholars and literatures covers issues of rural development, rural land use, rural planning and rural residential design etc. (Van der Ploeg, Ye & Schneider, 2015; Siciliano, 2012; Long, Zou, Pykett & Li, 2011;Long, Heilig, Li & Zhang, 2007). Especially, scholars from planning disciplinary in China has done lots of works to research on how to formulate and implement rural plans (Wang, etal., 2012; Shen, Jiang & Yuan,2012; Long, Zou & Liu,2009;Yansui,2007). Those efforts help us understand what is happening today in rural society of China.

However, majority of literatures consider issues of rural planning practices from the inside perspective, such as describing rural practices phenomenon and discussing how to formulate and implement rural plans etc., while the outside perspective usually is neglected. Obviously, it is very important to examine rural planning practices from the outside perspective if we want to know what role rural planning practices are playing in our society. Regarding this situation, this paper tries to provide an outside angel to examine rural planning practices under the theory of state-building in China. From the perspective of state-building, this paper aims to explore the political meanings of rural planning practices and discuss the role of rural planning practices in the process of state-building. By this approach, we are expected to know essences of rural planning practices in the power layout of the state-building process. Then, we may know how to improve rural planning practices and finally contribute to the sustainable development of rural China.

Following the introduction section, the second section will discuss the perspective of state-building and establish the analytical framework for the whole research. The third section belongs to empirical study part, mainly discussing rural planning practices of "Balancing Urban and Rural Development" and " Socialism New countryside Constructions". Finally, conclusions are obtained and some prospects are discussed for rural planning practices of future in China.

## 2. Perspective of state-building and analytical framework

### *2.1 About state-building and state-building of China*

Generally, state can be divided into traditional state and modern state. Modern state is a term compared to traditional state. Usually, traditional state can be regarded as a small community composed of clan, family, tribal, ethnic and other small local communities(Xu,2006). Due to the limited governance capacity, the power of traditional state can't penetrate the traditional rural society completely and the interior of traditional state is separated and scattered(Ding,2014). In other words, fracture properties can be one obvious symbol of a traditional state. Therefore, state-building can be considered to be a process that one state is reconstructing and integrating itself. The process of state-building is to change fundamentally the fracture properties of the traditional state, and to achieve effective integration of politics, economy, society, culture and space in traditional state and rural areas. Each state has its own state-building process with different characteristics. Since the aim of this paper mainly focuses on Chinese issues of rural planning

practices, the following part will briefly discusses the process of state-building in China and find how state-building can provide us a special perspective for analyzing rural planning practices nowadays.

Starting with the Opium War, China was forced to start the process of modernization and state-building, and the old traditional state had to undergo a long and painful transformation and reconstructions process to adapt itself to the development of all human society(Ding,2014; Xu,2006). However, during this process, traditional rural society suffered great damage, causing serious problems of rural development. A nation-wide and sustained decline of Chinese rural society during 1920S-1930S was a good example for such a great damage of rural development in the process of state-building(Ding,2015). This situation attracts lots of attention from scholars such as Shuming Liang and Yangchu Yan and caused massive rural construction movement, to make the relief of rural society and the revitalization of state come true. At that time, Nanjing national government also launched series of measures such as land system reform and promotion of rural development activities to reconstruct the whole nation and the state-building. However, the Communist Party of China is the one who can reconstruct rural society completely and promote the process of state-building by rural land system reform and class divisions movement(Ding,2014).

People's Republic of China was founded in 1949, and this event can be treated as an important milestone in the process of state-building. After the founding of New China, the biggest challenges for the state is how to further enhance national capacity and to achieve national prosperity. The central government led by the Communist Party of China finally decide to launch the development strategy of industrialization as a breakthrough for state-building. However, because of the international environment at that time, industrial development and state-building can only rely mainly on rural areas. In this context, the new government launched a new round of rural society integration by implementing the commune system in the vast rural areas to support national and industrial construction. Until the reform and opening up in 1978, the state mainly rely on the commune system and a set of corresponding purchasing and marketing system to achieve resources from rural society to support the primitive accumulation of capital for the country's industrialization and eventually establish a fairly comprehensive preliminary industrial system(Ding,2015). However, this kind rural development practices caused serious problems for the whole rural society such as rural economic stagnation and many farmers living in poverty. This situation eventually led to the rural reform and set off a wave of reform and opening up nation-widely.

After the reform and opening up in 1978, the Household Contract System become the basic economic system in rural society. The labour enthusiasm of farmers were released by the implementation of the Household Contract System and those reforms promoted the rapid development of rural areas, increased farmers' income and improved rural living environment in rural society. While series of intuitional reforms based on the Household Contract System promoted rural development, the loyalty and identity of farmers to the modern state was highly enhanced and the modern state could further integrate the rural society. However, after the start of urban reforms during the mid-1990s, rural development entered a slow and lag stage, and then the gap between urban and rural areas was growing. All those finally caused serious problems for the whole society, namely "Three Issues Concerning Agriculture, Farmers and Rural areas". In order to combat with serious problems of rural development, get rid of urban-rural dual structure, reduce rural conflict, and integrate urban and rural development, the modern state launched a series of new programs and practices in rural society, including Balancing Urban and Rural Development, Agriculture Tax Reforms, Public Finance Reforms in Rural Areas and Socialism New countryside Constructions etc..

*2.2 State-building as a perspective and its analytical framework*

Based on the above, we can clearly concluded that the state-building of China is highly related with rural development and rural planning practices. As we know, China is a old country with a long traditional civilization. Therefore, the state-building of China has to transform and reconstruct

traditional rural society, and to some extent the process of reconstructing traditional rural society can be regarded as the state-building itself. Therefore, state-building can provide an important perspective to examine rural development and rural planning practices. Actually, lots of literatures which researches on rural politics, rural governance, and rural society shows that the state-building does provide an new and important perspective for examine the phenomenon of rural development and rural planning practices.

As a perspective for analyzing rural development and rural planning, state-building mainly focuses on practices and by those practices concludes how modern state is integrating rural society and rural space. In other words, the following section of this paper mainly investigates series of important rural development and rural planning practices to show how the modern state integrate or reconstruct the rural society nowadays. Considering the current situation of rural development and rural planning practices, this paper mainly discusses practices of "Balancing Urban and Rural Development" and " Socialism New countryside Constructions".

## 3. "Balancing Urban and Rural Development " and "Socialism New countryside Constructions"

### *3.1 "Balancing Urban and Rural Development " and its case of Chengdu City*

In 2002, the central government of China launched "Balancing Urban and Rural Development" to promote the modern agriculture, develop the rural economy and increase farmers' income. As a fundamental national strategy, "Balancing Urban and Rural Development" aims to reverse our long-term urban-rural dual structure and treat the urban-rural relations as a whole and complementary relationship to keep resources free-flowing across the urban and rural areas, such as labor, land, capital and other resources, etc.. Under this strategy, different kinds of practices of rural-urban integration occurred. The following paragraph will take practices of rural-urban integration of Chengdu City as an example to show how modern state is integrating rural society and rural space in local places and examine how those practices influences the development of local rural society.

The City of Chengdu is located in southwest of China, with an area of 12,390 square kilometres, and enjoy the reputation of "Land of Abundance" in China. The City of Chengdu is a large city with large rural areas when the total population is 10.28 million in 2002 and the rural population accounts for 60% (Ye & Jiao,2014). After that the central government launched "Balancing Urban and Rural Development", the local government of Chengdu also started a program of "Balancing Urban and Rural Development" to solve "the three issues concerning agriculture, framers and rural areas". Since 2003, the City of Chengdu had made many reforms in rural areas to promote the sustainable development.

According to Ye and Jiao(2014) a, those reforms mainly includes the following seven aspects. The first one is the transformation of government functions to build a service-oriented government, including the decentralization of economic and social management functions for the local government, the pilot town to expand its powers and the implementation of grass-roots democratic reforms. The second one is that the local government keep planning a leading position and make master plans of urban-rural integration with the content including zoning, spatial structure, rural planning, and rural development planning management, etc.. Third, the local government promotes the integration of urban and rural basic public services, including the financial transfer payment system and an equalization of public services. Fourth, the local government tries to cultivate new industries, promote new industrialization and make more employment opportunities. Fifth, the government of Chengdu tries to build a new market to promote resources free-flowing such as labour, land and capital, etc.. Chengdu Public Resources Trading and Service Center is a good example for the unified market for the trading of land and other resources between urban and rural areas. Sixth, the local government launched lots of reforms on rural grassroots democratic governance, such as the construction of village council, the Executive committee, and other economic organizations. The last one is that the local government tries to promote the modernization of agriculture and rural development, reform the rural property rights system, build

the new democratic governance, change the management of public services supply system and promote the comprehensive improvement of rural land and other infrastructure projects.

By series of reforms, the City of Chengdu achieved a rapid economic and social development and win a reputation of "a city where once you are, you never want to leave", with a effective mechanism of urban and rural integration and a high urban competitiveness capacity(Ye & Jiao,2014; Ye &LeGates,2013). The survey shows that more than 89% of the population hold a satisfaction attitude to the reforms of urban and rural integration strategy(Ye & Jiao, 2014). More observations from the macro level also shows that the strategy of urban and rural integration had a very positive impact on the local rural society. Land Comprehensive Improvement Project of Zhanqi village in Chengdu is a good example. Zhanqi village is located in the Tangcang town of Pi country, 30km far away from the downtown area of Chengdu and covers an area of 2.1 square kilometers, with nine villagers groups and the population of 1700. Land Comprehensive Improvement Project of Zhanqi village in Chengdu was launched after the strategy of urban and rural integration was implemented in Chengdu City. The procedures of Land Comprehensive Improvement Project of Zhanqi village is the following: (1) the formulation of rural planning ;(2) a new company which raised 98 million Yuan from the Urban Investment Company was set up for the implementation of land improvement and community construction project; (3) by the implementation of Land Comprehensive Improvement Project, Land indicators of 208 Mu was saved and they were transacted with those of urban areas and earns 130 million yuan (625000 yuan/mu); (4)finally, those earnings can be used to pay financing and its interest and to support the modern agriculture and its infrastructures. By the implementation of Land Comprehensive Improvement Project of Zhanqi village, farmers could live in a new rural community, and the property of the collective and the income of farmers was highly improved. Besides, the built environment of rural areas, the infrastructure and public services, the protection of rural environment and the development of modern agriculture were highly improved.

We can learn from the case of Chengdu City that " Balancing Urban and Rural Development " of the central government can be transformed into local rural planning practices by the operationb of the local government. Hence, we can treat " Balancing Urban and Rural Development " and rural planning practices as an art of how the modern state is integrating rural space and rural society.

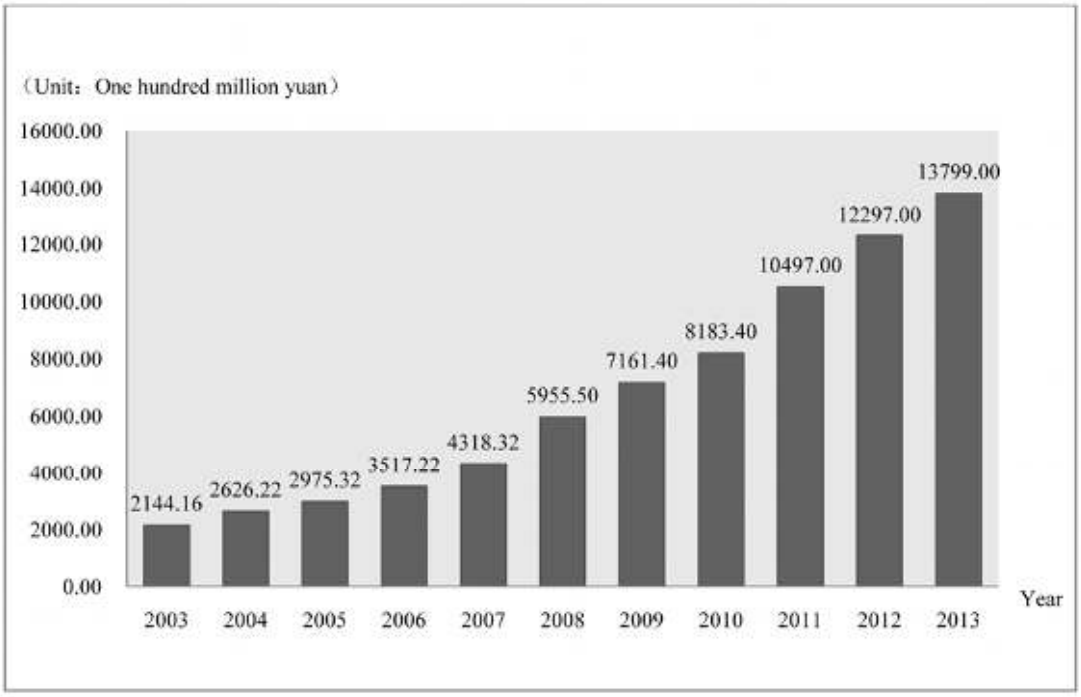
*3.2 "Socialism New countryside Constructions" and its case of Jiangsu Province*

"Socialism New countryside Constructions" can be treat the counterpart of " Balancing Urban and Rural Development " since the new century. In 2005, the central government planned to launch "Socialism New countryside Constructions" to promote the development of modern agriculture, deepen rural reforms, improve rural public services and increase income of farmers. The key of "Socialism New countryside Constructions" are "growth of production, well-to-do life ,civilized rural atmosphere, neat rural face, democratic administration". The policy of giving more , taking less and loosening control is the central measure of "Socialism New countryside Constructions". we can see from figure 1 that the central government had spend total 7.35 trillion Yuan from 2003 to 2013 for rural development concerning "agriculture, rural areas and farmers"(Ding,2014). Meanwhile, the central government tried to reduce the burden of farmers and reform the fiscal and taxation system. Besides, the central government reformed institutions and policies, gave farmers more autonomy and encouraged farmers to start their own entrepreneurship to increase their incomes(Ding,2015). In one word, the central government aimed to solve serious issues concerning agriculture, farmers and rural areas since the new century.

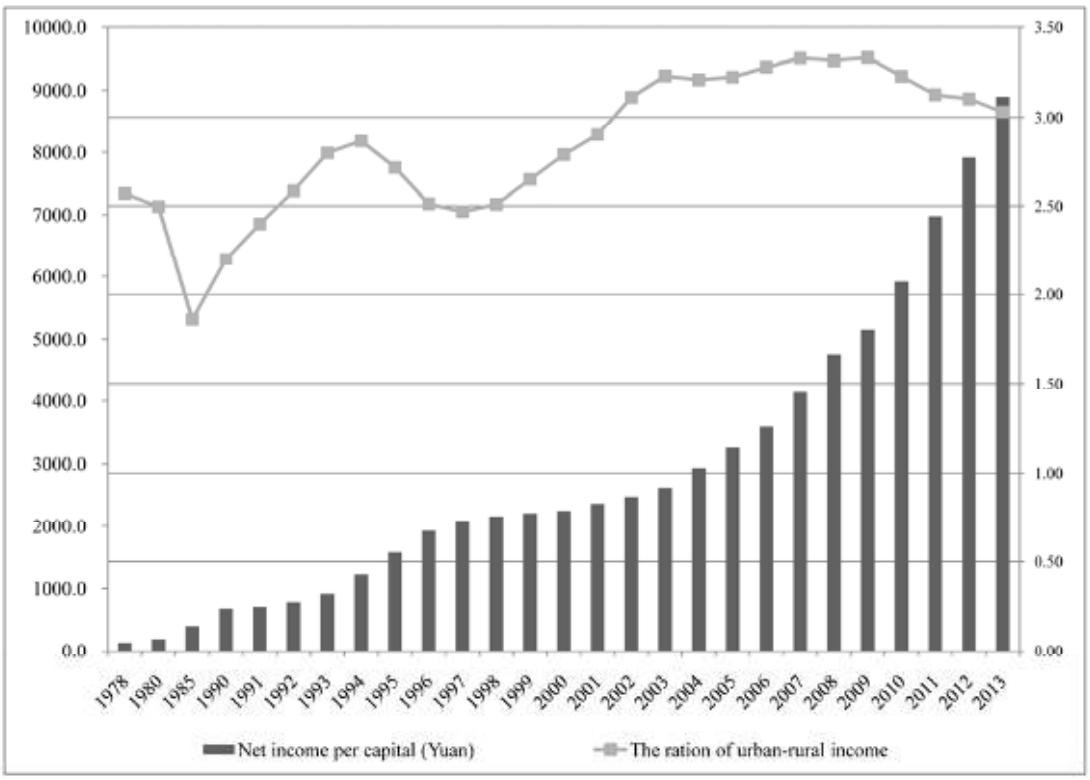
"Village environment comprehensive improvement action plans" of Jiangsu Province was a good example to show how "Socialism New countryside Constructions" was operated in local rural areas. As one of the most developed provinces in China, Jiangsu province has achieved many positive results and posted itself as one of the most low level of the gap between urban and rural areas. However, the gap between urban and rural areas in infrastructure and public services was still large. Therefore, at the background of "Socialism New countryside Constructions", Jiangsu province launched a program named "Village environment comprehensive improvement action

plans" and treated it as one of the most important part of national rural development strategy. The goal of "Village environment comprehensive improvement action plans" of Jiangsu province is to improve the environment comprehensively in 3-5 years. In order to promote the project of "Village environment comprehensive improvement action plans", 18 leading groups were set up and the ratio of village environment improvement was treated as one of key indicators for the cadre promotion. Totally, nearly 5 billion Yuan were invested by the government to promoted "Socialism New countryside Constructions" of Jiangsu province(Zhou, 2014). The government of Jiangsu province mainly focused on rural infrastructure improvement including village garbage treatment, clean water supply, rural road improvement and rural river clean, etc. to completely improve the rural built environment. After the implementation of this program for more than three years, many positive results are achieved, including the following: (1) this program were implemented in two-thirds of villages and the built environment were generally improved; (2) more than 20 million of farmers were directly beneficed; (3)more than 87.3% of residents of Jiangsu province showed their satisfaction to "Village environment comprehensive improvement action plans", ranking the number one of all other programs(Zhou, 2014).

Actually, like the program of "Village environment comprehensive improvement action plans" in Jiangsu province, practices of "Socialism New countryside Constructions" in other local places also had achieved great success that can be shown by many development indictors. On the production of agriculture, the main crop production remained a situation of steady rise, and grain output reached 601.94 million tons in 2013, with an increase of approximately 31.70% compared to 2002(Ding,2015) . On the income of farmers, the trend of the large gap between urban and rural areas was stopped and reversed. Figure 2 shows that the income gap between urban and rural residents begun to narrow steadily, declining from 3.33 times in 2009 to 3.03 times 2013(Ding,2015). Besides , the supply of rural public services and rural infrastructure such as roads, water and energy, rural education, rural culture and rural medical services were highly improved.



Figures1. The expenditures for "three issues concerning agriculture, farmers and rural areas" by the central government of China from 2003 to 2013



Figures 2. The diagram of changes of the net income of family in rural areas and the ration of urban-rural income from 1978 to 2013

## 4. Conclusions

From cases of "Balancing Urban and Rural Development" in Chengdu City and "Village environment comprehensive improvement action plans" in Jiangsu province, we can see measures, process and impacts of how the modern state is integrating rural space and rural society. Since the new century, the modern state launched "Balancing Urban and Rural Development" and "Socialism New countryside Constructions" and those policies or strategies were finally transformed into local rural development and rural planning practices by the operation of the local government, related institutions renovations and the large scale investment, posing an very positive influences on local farmers and reshaping and integrating rural space and rural society.

"Balancing Urban and Rural Development" by the modern state was aimed to change the urban-rural dual structure and eliminate the gap between urban and rural areas for the goal of the integration of urban and rural areas. Case of "Balancing Urban and Rural Development" in Chengdu City shows that by the operation of the local government and series of institutions renovation, the national development strategy of urban-rural integration really promoted the free-flowing of resources like labour, land and capital across urban and rural areas, and improved the integration development of urban and rural areas and have a very positive impact on the urban and rural dual structure. In the process of implantations of this national strategy, rural society and rural space was totally reconstructed and regenerated, the competiveness of urban and rural development was highly improved, and of course the modern state was in a great progress.

"Socialism New countryside Constructions" by the modern state was aimed to solve three issues concerning agriculture, farmers and rural areas, increase incomes of farmers, narrow the gap between urban and rural areas, and finally promote the progress of rural society. Case of "Village environment comprehensive improvement action plans" in Jiangsu province illustrated how the

modern state is integrating rural space and rural society. In this process, rural space and rural society were reshaped and reconstructed, the rural built environment was improved, and the rural social welfare was increased. Also, the urban and rural dual structure was integrated, and the identity and loyalty of farmers to the modern state were highly promoted.

Hence, from the perspective of state-building, we can treat rural development and rural planning practices as important arts of the modern state integrating rural space and rural society from cases of "Balancing Urban and Rural Development" in Chengdu City and "Village environment comprehensive improvement action plans" in Jiangsu province. Those practices will transform the traditional rural society into the modern agriculture and then realize the modernization of rural development. We also can see that the process of state-building is one the most important factors influencing the development of rural space and rural society. As we know, since China is a state with a long history of farming, the process of the modern stating integrating rural space and rural society can be regarded as the growing-up of the modern state and those practices finally realize the modernization of state. In other words, practices of state-building actually produce rural planning and rural development practices, and those practices can be described as "planning going down to the countryside". In the whole process, the modern state is enlarged and the capacity of the modern state is highly improved by integrating rural society and rural space.

**Key words: urban regeneration, cultural route, restoration**

***Abstract***

*The first half of the 20th century was a milestone in the historical, social and cultural development in Greece as it involved changes that still affect current policies. Among the most significant changes has been the massive influx from the East of refugees of Greek descent who had to be urgently accommodated in housing complexes like the ones in Alexandras Avenue in Athens. The modern architectural approach of the specific buildings, their symbolism, but also their prolonged abandonment, created the need for the development of an appropriate proposal regarding their preservation, reuse, rehabilitation and their reintegration in the surrounding urban fabric.*

*The paper proposes the preservation and the rehabilitation of this settlement in consolidation with the neighboring "Stegi Patridos" refugee housing complex. The two complexes will create a cultural route and thematic park, the key elements of which will be the revival of historical memory, along with the promotion of the common elements among the different cultures involved, such as the Greek, the Anatolian and the Islamic culture of the present and past.*

*The approach is based on the ever-increasing need for more qualitative living environment in large urban centers. It incorporates actions, such as:*

- *the enhancement of the area's public space, as a field of interaction and social participation,*
- *the preservation and restoration of architectural heritage and*
- *the integration of the new cultural pole as a living organism in the city's everyday life.*

*The intervention is anticipated to improve the image of Athens, while avoiding forms of gentrification in the area.*

## 1. Introduction

The accommodation of refugees in Greece has been a milestone in the history of the country. It contributed to a range of social and urban transformations, such as the approach to social housing, which has been one of the most ambitious components in the development of the Greek social welfare state. These transformations still affect the country today. The refugee housing complex in Alexandras Avenue constitutes a significant scheme which is characteristic of the refugee accommodation campaign of the 1920s. Its architectural approach (modern movement), its symbolism, but also its abandonment for years, led to an extensive controversy and research regarding its maintenance, re-use and reintegration in the Athens urban fabric.

The result of this research is the proposal for the integration of refugee settlements in the Alexandras Avenue with that in Stegi Patridos in the neighbouring Lycabetus Hill along with the development of a

thematic park. The main objective of this proposal is the revival of historical memory and the understanding of different cultures.

The present study comprises three sections. The first section describes the theoretical background, while the second the historical background. The third one describes the study area along with the proposed urban regeneration. In more detail, the first section develops theories regarding public outdoor space, cultural routes and city branding, while its following part is dedicated to the protection and enhancement of the architectural heritage, along with the ways that historical listed buildings can be restored and reused. The second section refers to the historical context and the social and urban impact of the refugees' accommodation in Greece. The third section starts with a short description of the area and its historical development along with the analysis of its individual focal points, and presents the proposal for an urban regeneration and the concerns relevant to its implementation.

### 2.1 Urban Regeneration

The term *urban regeneration* is associated with an ideological approach, the objective and the type of intervention in urban problems. It is adopted in degraded areas with problems both in the building stock and their uses, such as urban densities, deficient public facilities or lack of protection in the historical, archaeological and cultural assets and in the activities within the region (Karavia, 2006, pp.9-10; Moschidou, 2011, pp.19-20; Bampouka, 2013; Chatzopoulou et al, 1995, pp.25-36). It consists of any type of intervention associated with the existing built urban environment. It is determined by a multitude of parameters relating to the social and economic conditions of the areas and their relationship with the wider environment. At present, urban regeneration constitutes the most appropriate approach to improve urban development and ensure social cohesion (Mitoula, 2002, p.177 Bampouka, 2013; Chatzopoulou et al, 1995, pp. 26-29).

Urban regeneration interventions may either be radical, eg. involving radical transformations in the areas where it is applied, or mild, aiming to improve the built and communal urban areas by small scale interventions. The radical type of regeneration also tends to involve 'gentrification' as it may promote the expulsion, voluntary or compulsory, instantaneous or gradual, of the existing population of the area and its replacement with more affluent new residents. This form of interventions can constitute a risk in an urban regeneration scheme (Aravantinos, 2007; Karavias, 2006, pp.6-8; Mitoula, 2002, p.177; Moschidou, 2011, p.15). A way to overcome gentrification is through the engagement of wider social groups in the decision-making process, even from the early steps of the planning, introducing the approach of the participatory planning (Aravantinos, 2007, pp.89-90).

## 2.2 Urban open space

Urban open space is the terrain where the urban population experiences everyday life in all its variety and activity. It is a field of action, interaction, a field of exchange of ideas and viewpoints as well as, a point of social life reference. Gehl (2002) among others even believe that humans' presence in public space is their most important social activity. The way people perceive open space depends both on the built environment around it as well as their personal background, their beliefs and their approach to issues such as democracy, discrimination, marginalization, political action and memory and symbolism (Belavilas & Vatavali, 2009, p. 21). According to the Greek legislation, public space is the entire space within the urban fabric that is collectively used regardless of its size, area, materials or arrangement (Giannakou & Eppas, 2011; Zourna & Danadiadou, 2011). Public space is a part of the city which may be used individually or collectively without being dominated or subjected to claims. Public space is directly available to all users irrespective of their social, economic, political, religious or national identity provided they do not deny to anyone else the right to use (Gehl, 2002, p. 229).

Urban open space constitutes a very important element that contributes to the shaping of the urban environment and its influence in the city. Thus, according to its use, it may be classified as local, supra-local or metropolitan space, as public or non - public, and may be classified as green space or meeting space according to its function. More specifically, it comprises squares, streets, pavements, urban parks, kindergartens, public or private gardens and natural formations in and around the city fabric. Still it may include space that is necessary for urban development such as a deserted plot in the center of town or an abandoned camp. Green space is the space of which the largest section is covered by vegetation (Belavilas &Vatavali, 2009, pp. 19, 86; Belavilas et al, 2010, p. 210; Pouliou, 2007). In many European countries like England, public space is treated in a paradigmatic manner while concrete incentives and policies are provided for its creation and management. One of the reasons that led to this has been the problematic quality of life during the industrial revolution (Pouliou, 2007, p. 39).

## 2.3 City branding and Cultural routes

Kavaratzis (2004) and others suggests that city branding is an appropriate approach to promote a city thought its focus on building and communicating a unique city image. Brands can serve as sources of identification and differentiation (Mommaas, 2002). At the same time, the practice of employing arts and culture as urban regeneration tools and as a means to enhance local distinctiveness is not a new phenomenon (Evans, 2003). Branding a city through heritage sites and places of cultural interest implies that city attributes and symbolic values will be mainly based on the cultural and architectural 'capital' of the area. The process of branding may seek to associate the city with specific assets or elements, like the Guggenheim Museum in Bilbao and the Barcelona Gaudi buildings, or it can aim for a more pluralist set of cultural representations, as for instance in London's 'multi-themed' branding strategy.

A potential way of increasing the city attractiveness and diversifying its brand and tourism offer is by developing cultural routes or culture trails (Puczko & Ratz, 2011). Cultural routes provide a platform for linking different assets together - such as historic buildings, monuments and museums - encouraging synergies and creating 'magnets' for visitors to experience the built environment and intangible heritage of a place (Briedenhann & Wickens, 2003). Their purpose is also to protect and enhance the cultural heritage (Khovanova-Rubicondo, 2011). The integration of archaeological sites and other places of cultural interest on cultural routes may also increase the number of visitors to less popular and more distant points of cultural interest (Moulin and Boniface 2001). Such routes are more commonly theme-based, for example Dublin's literary walking tour or Boston's Freedom trail, although the subject and type of heritage that they highlight can vary greatly. The latter suggests that cultural routes are both flexible and suitable for promoting city uniqueness and distinctiveness. Thus, their development within a city, as part of its city branding policy, allows for bringing together the different pieces of the local urban landscape puzzle.

Cultural routes are flexible tools in their design, and they can be used and adapted to different spatial scales. In practical terms, that means that there is a large freedom in determining the extent of travel, depending on the specific territorial characteristics of the place (Hayes and MacLeod, 2008; Murray and Graham, 1997). Their success in based on the organization of the signaling, the information facilities for the visitors, the public information through upgraded publications, the view of the route's topic, events, etc. (Augerinou, 2009).

## 2.4 Protection and enhancement of architectural heritage

Architectural heritage constitutes an important component of cultural heritage. It has been acknowledged since the 19th century that the conservation of the historic fabric of cities and their architecture has been of singular significance even when it is merely related to the preservation of ancient structures (Pendlebury, 1999). Nowadays, the protection of architectural heritage relates to a system of social, economic, cultural and political issues including elements of the community that hosts them, while it may also operate as the means to reestablish its cultural identity and symbolism (Nomikos, 2004, p. 3). It may involve actions such as reversing the modern interventions to older building stock and urban space, securing their structural integrity as opposed to pure 'facadism' that appears particularly popular recently. The enhancement of architectural heritage improves urban space and allows its community and visitors to re-experience fundamental principles of the past while the rehabilitation of specific building stock may offer opportunities for novel cultural activities. Alternatively, its demolition is considered as annihilation of human culture and disturbed succession of the past into the present, causing the alienation of society from its historical memory (Stamatiou, 2002, p. 750).

## 2.5 The international scale initiatives and the Greek approach

The significance of architectural heritage and its relevance to urban design has attracted a lot of consideration in the beginning of the 20th century and specifically during the Charte d' Athènes in 1933. No international scale consensus on the manner to treat historic structures had been achieved prior to the end of WWII, when the need to keep and promote the links between the present and the future was expressed. Based on this, historic sites have been approached in the Charte of Venice (1964) as sites of particular historic, cultural and aesthetic significance that must be protected, in contrast with isolated historic buildings which have been identified earlier as such. Later, the declaration of Amsterdam (1975) enlarged the notion of architectural heritage to involve building complexes, neighborhoods and even villages of historic or cultural interest that need protection. In addition, the historical periods that are characterized as heritage were expanded to include modern architecture followed by the refurbishment of old structures with novel uses to meet contemporary functional demand. Today the issue of protecting and enhancing architectural heritage is approached holistically aiming at the development of the area in question in a sustainable manner (Stefanou, 2003).

At a European level, the UK is a country with a developed and precise system of rules and legal instruments relating to the protection of architectural heritage. The "Listed Buildings and Conservation Areas" 1990 Act classifies historic buildings in two categories, Grade listed I and Grade listed II, according to their respective interest. It is noted that during the 1990s the British legal framework has extended the issue of protection of cultural heritage so as to include social housing estates, similar to the refugee settlements in Greece.

There are three different approaches on the issue of protection and enhancement of architectural heritage are outlined by Pendlebury (1999) i.e., (a) the approach of "The Society for Protection of Ancient Buildings" (SPAB), the approach of the geographer MR Conzen and the basically aesthetic Urban Design approach. The first approach tends to center on the protection and occasionally even preservation of heritage, Conzen on the other hand is interested in preserving the entire historic area and not just the buildings, while the third approach promotes "facadism" leading to the cultural consumption of the city.

## 2.6 The legal framework of the protection of heritage in Greece

The interest in protecting ancient, Christian and medieval heritage in Greece through a number of generally fragmented legal instruments dates from the foundation of the modern Greek state in 1830. The first law directly pertinent to the issue was issued in 1950. The article 24 of the Greek Constitution of 1975 relates to villages and building complexes of exceptional architectural character, the protection of which has been reinforced by several more recent legal instruments. Nevertheless the urban sprawl of the recent past, which involved excessive demolition, has had a negative impact of any attempt to conserve and renovate. For several decades after WWII the protection of heritage mainly aimed at preserving ancient remnants and specific buildings of historic or aesthetic value but nothing else. The relevant European legislation and directives were adopted by the Greek state many years later, as in the case of the Granada Convention of 1985 that was incorporated in Greek legislation in 1992. Greece focused on protection of cultural heritage only since 2002, although the law still does not adopt the terminology of the Granada Convention, as it confuses ancient with architectural heritage (Charkiolakis, 2003; Doris, 2002; Nomikos, 2004, pp.1-2; Chatzopoulou et al, 1995, pp.171-175).

## 2.7 Protection bodies and means

As provided by article 24 of the Greek Constitution, the body responsible for the protection of heritage is the Greek state and the Ministry of Culture and the Archaeological Agency, which has been the authority in charge until 1968. Nevertheless many heritage issues relate directly to the Ministry of the Environment which has sometimes expressed opposing approaches with the Ministry of Culture as in the case of the refugee settlement of Alexandras Avenue in Athens. There have been other interesting modern heritage cases that have not been satisfactorily covered due to the lack of integrated protection and enhancement programs (Doris, 2002, p. 678; Stamatiou, 2002, p.759).

In other European countries like the UK, central and local governments cooperate through “English Heritage”, a non-governmental organization. Similarly in France the body responsible is “Monument Conservation Office”, yet it is apparent that the owners of historic buildings surely play a significant role in this. Italy has developed a wider network of heritage protection bodies both at central and at local level by the relevant Ministry of Culture and bodies such as the “Centro di Restauro” in Rome and the “Instituto delle Pietre Dure” in Florence respectively (Tsaoussis & Sakkas, 2009, pp.35-54).

Cultural heritage protection mechanisms in Greece are either regulative or monetary in character. The existing planning framework consists of a number of regulations that control building construction without hindering the expression of creative architectural approach. Likewise measures of economic character comprise loans, development incentives and tax relief mechanisms aiming to promote the protection and enhancement of architectural heritage.

## 3.1 Historical context

The period after the Greek disaster in Anatolia in 1922 and the Treaty of Lausanne of 1923 was characterized by the urgent need of the Greek state to accommodate 1.2 million refugees of Greek origin who had been forced to vacate the Turkish Middle East. The task to provide proper housing for these people within Greek territory, either urban or rural, had proven to be a particularly difficult burden for a state of only around 5 million inhabitants and of limited social, economic and organizational capacity. Newcomers exerted excessive pressure in the exploitation of land and increased the population of existing urban communities while also acted as catalyst towards the development of these communities. The dramatic boost in the country’s population generated a

number of urban and social transformations (such as the urban block of flats), the *antiparohi* system (in which small businessmen cooperate with small scale landowners to develop urban land) and, lastly, the phenomenon of illegal building that characterized the urban sprawl of the 20th Century in Greece (Gizeli 1997, pp.42, 47; Baltas, 2002, pp. 3, 11; Polyzos 1984, p.51; Filippidis 1984, p.149).

### 3.2 Organizations responsible for the accommodation of refugees

The accommodation of refugees was carried out by chiefly three statutory bodies. Firstly, the Refugee Care Fund (RCF) which was founded in 1922 to cater for the immediate needs of refugees providing urgent accommodation and medical supplies during the initial phase of their settlement in Greece (Georgakopoulou 2002; Gizeli 1984, p.136). The second body was the Refugees Rehabilitation Committee (RRC) which was established in 1924 with the task of housing the refugees (Vlachou et al 1978, pp. 117-8). After 1927 the RRC activity was replaced by the third body the Urban Refugee Settlement Agency of the Ministry of Welfare, in collaboration with the Ministry of Agriculture, which dealt with the accommodation of refugees in the rural areas. In addition to the statutory bodies, the private sector was also involved in to the refugees' rehabilitation, such as the National Bank of Greece, as well as, a number of organizations of the voluntary sector, the American and the Swedish branch of the Red Cross, the 'American Near East Relief' and the migrant clubs of Greeks living abroad especially in the US (Vlachou et al 1978; Georgakopoulou 2002; Baltas 2002, pp. 6, 14; Papadopoulou & Sarigiannis, 2006, p. 9).

### 3.3 Social impact

The neighborhoods of the new settlers functioned as the space needed for the economic and psycho-social rehabilitation of refugees. Still their settlement there allowed a twofold social discrimination to develop: first between them and the indigenous population and, second, among the refugees themselves. This impact has been generated by the inconsiderate locational parameters of the settlements, as well as, the procedure adopted for the distribution of dwellings that discriminated well-off from poor settlers. In addition to the above, most neighborhoods suffered from unemployment or underemployment experienced by the majority of refugees who often lived below the threshold of poverty line similar to the condition of the British working class during the industrial revolution as described by Engels (Polyzos, 1984, pp.39, 43).

### 3.4 Urban impact – Legal concerns

The accommodation of refugees has not only influenced urban development in the large urban centers but also the housing policy and building typology. It also provoked questions concerning the employment of these policies for housing vulnerable social groups in general. The legal framework relevant to town planning and housing after 1922 amended the existing legislation of that time in issues such as the building requirements for housing, for the need for safety in construction works but also urban development in general and building settlements in the periphery of the urban fabric in particular (Gizeli, 1984, p.265). During that period, new legal instruments were directed to the housing of specific social groups such as the disabled by war, the 'poorest social classes' and the pensioners. On the other hand, it is noted that the decision to develop extensive refugee neighborhoods in the periphery of cities had adverse consequences to the development of big cities like Athens as it neglected redevelopment needs of a number of central districts such as Patissia and Kypseli. Moreover, the state tolerated the phenomenon of urban sprawl mostly in the form of self-housing involving excessive illegal building without any city plans and relevant infrastructure works (Gizeli, 1984, p.277; Biris, 1997, pp.50-2).

## 4. The study area[1]

The history of the area is more than 100 years old, with a key milestone to be the period after 1922. At the beginning of the 20th century, a significant section of the area had been planned and new buildings, along with some important public buildings and the stadium of football club of Panathinaikos, were constructed. In addition, in the area adjacent to the stadium, one of the first organized refugee settlements was set. Today, there are un-built sites, municipal sports halls and school buildings. During the '30s, the first complex of blocks of flats, both on Alexandras Avenue and in the area of Lycabettus Hill was constructed. After the WWII, the area gradually downgraded, while just after 1985 a qualitative regeneration program for the refugee housing complex in Alexandras Avenue and the surrounding area was developed. However, until the present times there are no actions towards this regeneration.

### 4.1 The identity of the focal points

Towards a better understanding of the study area and the urban problem that the proposal is called to resolve along with the benefits for the region and the city of Athens, it is appropriate to describe in some detail the focal points of the proposed urban regeneration intervention.

#### 4.1.1 The residential complex of Alexandras Ave.

The residential refugee complex in Alexandras Avenue is part of the wider installation in the area of Ampelokipi. It was built between the years 1933-1935, based on the designs of the architects Dimitris Kyriakou and Kimona Laskari, by the Welfare Ministry and it was funded by the State. The complex, as a whole, displays excellent urban quality and represents the concept of relationships between the volume and the free space of that era (Gizeli, 1984, p. 267; Demertzis, 2010, p.90). It represents an important moment in the history of Greek architecture and the modern movement of the '30s in Greece. Designwise, it was influenced by the Bauhaus movement (Fillipidis, 1984), while, its unique "decorative" element, the traces of the December 1944 street fighting on its walls, reflects the country's recent history. It also marks the use of buildings as a solution to the refugees' housing rehabilitation, for the first time since precarious accommodation forms had been practiced.

The complex is situated in 14.5 acres, 30% of which is built, while the remaining 70% is characterized as public space. It consists of 228[2] apartments, divided into eight rows of block of flats. Each one of these block of flats has three levels, with two apartments per floor, 45sqm each, with a central staircase for every 6 apartments.

Figure 1. Areal Photo from 1937
1. Alexandras Av. refugees' complex
2. Panthinaikos football stadium
3. Kountouriotika refugees' camp
4. Stegi Patridos refugees' complex

1 The 'Ampelokipoi' estate

2 In the present days only 51 of them are legally inhabited, while the remaining 177 have passed to the state privatisation fund 'TAIPED'

Their construction method was indicative of the interwar era, using domestic materials and reinforced concrete plates, along with off-white stonework. Currently the apartment buildings have obvious damages, but these are not related to its structural competence. Furthermore, there are no irreversible deteriorations (Papadopoulou – Sariyannis, 2006, p.41; Bersis, 1936, pp.607, 611; Filippidis, 1984, p.225). In 2009 the complex has been characterized as a historical monument by the Ministry of Culture.

### 4.1.2 Apostolos Nikolaidis stadium in Alexandras Ave.

The story of the stadium began in 1922, when a few acres of the wider Ampelokipi estate were given to the team of Panathinaikos. In 1928 the first wooden seats, towards the side of Lycabettus Hill were build. Since then, there were several periods when the stadium was transformed and expanded, increasing its capacity and its uses as the swimming pool and the indoor basketball court were constructed. The area is characterized as a public urban space by the strategic plan for Athens in 1985.

### 4.1.3 'Kountouriotika' refugee settlement

Apart from the refugees' complexes, within the study area, one of the first refugee settlements was created. It was consisted of booths that were arranged in four rows. It was funded by the Greek immigrants of America, in collaboration with the R.C.F. There is no evidence of the construction method or the materials that had been used; however, it was probably constructed by cement blocks. The settlement was maintained until the early 70s, when the last residents were evicted, by the Greek coop (Papadopoulou-Sariyannis, 2006, p.122). In 1974, according to the urban plan of Athens, the area had been gradually planned in urban blocks; however, since 2006 the area was included to the wider urban regeneration plan of Athens – Attica 2021 (Strategic plan for Athens - Attica 2021).

### 4.1.4 The residential complex of Stegi Patridos

This complex constitutes yet another exemplary of work of K. Laskaris. It has been constructed between 1933-1936 in the same design, style and way of construction, as that of the Alexandras Avenue[3]. It consists of seven, three-storey buildings, with 120 apartments. It is arranged into rows, where the central row it is split and a small square is fitted. Today the complex is in a good condition, having no structural problems (Papadopoulou – Sariyannis, 2006, p.176).

## 4.2 SWOT Analysis

Table 1: Swot Analysis table

| **Strengths** | **Weaknesses** |
|---|---|
| • The location of the area in the urban fabric<br>• The refugee complex of Alexandras Ave. is characterized as a historical monument.<br>• The historical memory of the wider region<br>• The un-built area, which can be | • The visual condition of the refugees' complex, especially of those in Alexandras Av.<br>• The isolation and marginalisation of the present residents in refugee complex in Alexandras Ave.<br>• The considerable cost of investing in |

3 According to Papadopoulou and Sariyannis (2006) is likely similar designs with the Alexandras Ave to be used, with slight variations

| | |
|---|---|
| redeveloped - based on the (Strategic plan for Athens - Attica 2021)<br>• The ability to renovate and re-use the existing building infrastructure<br>• The majority of the Alexandras Ave. refugee complex belongs to the Greek estate. | existing economic conditions<br>• The necessity of expropriations for the completion of the regeneration |
| **Opportunities** | **Threats** |
| • The area is incorporated in the Strategic plan for Athens - Attica 2021<br>• The ecological route between Lycabettus hill and Tourkovounia hill<br>• The cultural route of Toyrkovounia hill, Lycabettus hill, Arditou St. and Pedion areos Park<br>• the ability to install new uses in the area<br>• The urban regeneration funding or the lending programs by resources from NSRF, the European Refugee Fund and the Deposit and Loans Office<br>• The residents' and organizations interest for an urban regeneration and the rehabilitation of the refugee complex.<br>• The relocation of the stadium of Panathinaikos | • The declassification of the listed refugee complex due to its privatization by the State<br>• The constant efforts from the Greek state to demolish the existing settlement and allow the construction of new buildings based on the current building regulations and site coverage<br>• Interventions on the buildings' envelope<br>• The economic environment of Greece<br>• the potential cancellation of the relocation of the stadium and the redevelopment of the area<br>• the abandonment and the deterioration of the area's urban environment |

The opportunities for the wider urban regeneration in the area, such as those described in Table 1, along with the strong points, such as the location in the urban fabric and the preserved building infrastructure, can contribute significantly to the elimination of the weaknesses. However, the current economic condition, along with the prevailing policies on the "reclamation" of the area's public property and the efforts towards the demolition of the refugees' complex in Alexandras Av., may cause delays or even cancellation of the regeneration plan, allowing other forms of "exploitation" to be chosen.

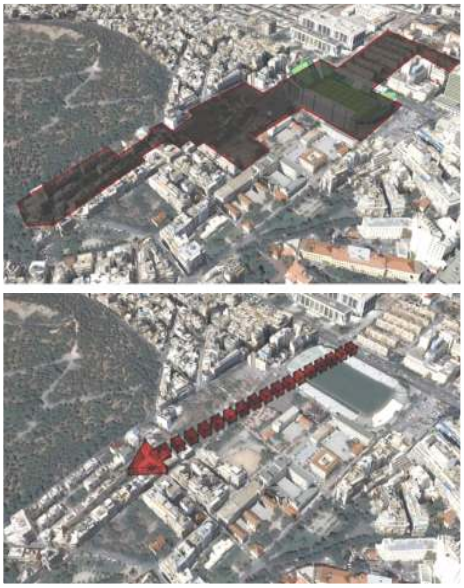

Figure 2. Areal photo. It shows the study area and the consolidation among the two complexes

## 4.3 The proposal

Given the relationship between the focal points of the area and its history, as well as advantages and the disadvantages of the area, this study proposes *'an urban regeneration plan which incorporates the consolidation and transformation of two refugee settlements in central Athens, the revival of the historical memory and the promotion of the understanding of different cultures'*.

The proposal aims to solve problems in the infrastructure and the land use of the area, along with its cultural and aesthetic enhancement. This intervention constitutes a mild urban regeneration scheme aiming to transform the selected area into an attractive urban space, utilizing the abandoned social housing stock of the refugees' settlement of Alexandras Ave. and reintegrating it in the city's urban structure, improving both built and open urban space. Its key elements are the revival of the historical memory, the understanding of different cultures and the cultural enhancement. The aim is to inform and bring in to sight the collective memory, along with the history and the interpretation of the phenomenon of exile. Furthermore the redevelopment will aim to relate directly to the issue of incoming migration from the East and South which is currently becoming particularly critical. Thus the project will be addressed to people who are interested to know the cultural, the historical and the social aspect of the refugees' life. Moreover and as the area may provide information both about the past and the present, it is suggested it will function as a "new" city hub, bringing back to life this currently desolated area. This regeneration scheme becomes more important presently as the area is included in the cultural route linking Tourkovounia and Lycabettus Hills, being part of the wider ecological path of Tourkovounia Hill, Lycabettus Hill, Ardittou St. and Pedion Areos Park outlined in the draft document of Strategic plan for Athens - Attica 2021. Its building stock and intermediate public space are the focal points of this route, in which a series of cultural activities and mixed uses are included.

Overall, the proposal deals with the redevelopment of the study area, including the recovery and re-use of the building shells, the land uses and the protection and enhancement of the environment, with simultaneous protection of the owners of the refugee residences. Besides, a proposal aiming to revive the historical memory of refugees must not ignore the existing situation and problems faced by current immigrants. It should also be noted that this proposal does not foresee any addition of new homes or the exploitation of the complex of Alexandras Ave. for residential use, in order to avoid the phenomenon of gentrification and commercialization of the building stock. The proposal also aims to avoid extensive harassment activities that are often expressed in the areas of refugee settlements, uses that could however be placed in the outdoor urban park area, such as refreshment facilities and Bazaar in certain days and hours, which will attract visitors to the area. The proposal for the broader redevelopment of area fulfils the most of the requirements described in the Greek law of 1997.

The main interventions in the study area will be:

1. The restoration and the re-use of buildings of Alexandras Ave. which includes:
    - Interventions which bring buildings back to their original condition, with the smallest possible change in its internal arrangements, in order to avoid altering its internal plan, while preserving its architectural value and the traces of the Athens history embedded on its walls.
    - An anti - earthquake reinforcement and an upgrade for energy saving.
    - The configuration of access and parking spaces for the disabled in the wider area of the settlement and the formation of public spaces.

An important approach to this intervention is the way in which we demonstrate the historicity of the settlement and the cause for its construction. It is important to note that all actions must be decided and implemented in collaboration with the remaining residents.

- Besides the exploitation of existing buildings, the intervention promotes the reintegration of the settlement in the urban fabric.

It is also important that before any restoration, rehabilitation and reuse, the urban design plan of the area is needed to be revised, as the existing one was approved back in 1975. In addition before any intervention, a modification of the land uses in the region must be promoted, in order for new uses to be allowed, especially in the Alexandras Av. complex, such as:

- the establishment of a Museum and Archives of the refugees' accommodation
- a library for the Technical Chamber of Greece and the Technical Documentation Unit (Demertzis, 2010, p.89)
- guesthouses for the patients' relatives of the adjacent hospital

2. The restoration of the external building envelope of the Stegi Patridos refugee settlement
3. The demolition of a part of the football stadium. The remaining part will be used as a space for events and conceivably as a 'border' to the Avenue. Furthermore, a museum for the athletic team of Panathinaikos, along with a cafeteria and recreation areas will be placed.
4. The integration of the 'Kountouriotika' area, along with the demolished section of the stadium, where a theme park will be planned. This urban intervention includes new paving, planting, outdoor setting areas and street lighting.

The park will provide samples of the architecture and the daily life of the refugees from the past or the present, in to a single outdoor module and it may operate as a follow-up to the museum. It will also provide an integrated and multidimensional perception of the collective memory, the promotion of the understanding of the different cultures and the history and interpretation of the phenomenon of exile (Bounia, 2004; Nikonanou, 2005). In addition, its goal is the recognition of the migrants' contribution to the local society, as well as the defense of the cultural identity and diversity.

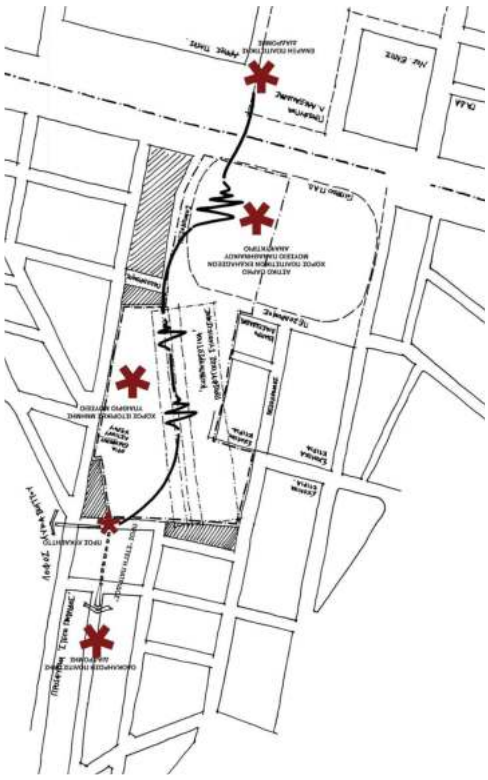

Figure 3. Schematic representation of the proposed regeneration and the cultural route

Furthermore, through the emphasis on the present, the proposed intervention will have additional targets, such us, the information and the awareness of the problems of immigrants in modern Athens, the degradation of stereotypes, along with the improvement of the social and multicultural cohesion. The above interventions are also in line with the international initiative of Unesco (2006)[4] for the creation of the museums about immigration throughout the world, a program in which the proposal could be included. It should also be noted that in order to proceed with this project, the urban plan in the area should be amended, as it is currently split in urban blocks.

- The construction of an underground car park in the area below the current football field with an urban park on top. The car park will serve both visitors and the inhabitants of the area.
- Traffic changes around the current football stadium, as well as, the wider redeveloped area

4 http://www.unesco.org/new/en/social-and-human-sciences/themes/international-migration/projects/unesco-iom- migration-museums-initiative/ - http://www.unesco.org/new/fileadmin/MULTIMEDIA/HQ/SHS/pdf/Final-Report-Migration-Museums.pdf

should be planned.

With regards to the proposed route consolidation, the starting point is the complex of Alexandras Avenue. Then, through a pedestrian bridge the visitor will pass to the opposite side of Alexandras Avenue, where the transformed section of the current football stadium and the remaining seating is. This area will also serve as a reception and a transition to the main part of a public outdoor area, the thematic park. This area, in correspondence with the theme park, will include tourist and leisure facilities, creating an integrated pole which attracts visitors (Sikka 2006). The aim of the park is to promote multi-cultural activities, freedom of expression and to serve as a place where the people can interact. More specifically, this space will:

- provide information for the periods of the refugees' settlement
- stimulate the historic memory, taking advantage of the memories of people who have experienced similar circumstances
- contain reference points which will inform the visitors on key events of the accommodation campaign
- illustrate the living conditions of the refugee, through a reconstruction of a small representation of the former refugee camp

It is extremely important, that the historic documentation of these events should be presented beyond any emotional or biased approach and beyond any political and ideological pressures (information gathering, oral testimony, governmental sources, etc.). The cultural route will end at the refugee settlement of Stegi Patridos from where the visitors, the residents or the walkers, will have the opportunity to continue their walk up to the Lycabettus Hill.

## 4.4 Control and management

The control of this urban regeneration and the consultation between the citizens and the institutions of the project will be achieved through an online platform, which will allow access to the information, communication and exchange of ideas among the groups that are involved. It should be noted that the success of such urban regeneration schemes, according to Stergiou (2008), depends on the political will and the acceptance of the intervention by the majority of the citizens. Finally, the project will be managed by a management agency once it is completed, so as to assure the viability of the regeneration.

## 4.5 Ways of financing the proposal

In order to implement this proposal, a plan regarding the financial resources is needed. This plan should take into account costs such as:

- the acquisition of the privately owned land in the area Kountouriotika
- the refinement of the area, the land restoration and the configuration of the theme park
- the demolition cost of the selected part of the football stadium
- the restoration cost of the buildings in the refugees complex
- the costs related to the establishment of the Panathinaikos museum in the remaining part of the stadium
- the cost to construct the walkways and the underground car park

The financial resources that could fund the above costs are:

- The EU programs such as: the ECAC or the Jessica program for sustainable investment in urban centers, with the participation of private capital
- The Urban Development fund
- The European Refugee Fund

- The Fund depository and loans. This source of funding is widespread in France end it provides loans and guarantees or even makes investments for urban regenerations in residential cooperatives, municipalities and individuals. Through this source the urban redevelopment in the area of Tauros in Attica was funded (Dimitrakopoulos 2006, pp. 24, 49).

With regards to the owners of the refugee settlements in Alexandras Avenue and Stegi Patridos, the reconstruction and the upgrading of the building envelopes will join the redevelopment program, while regarding the internal repairs some incentives in form of tax relief, low-interest loans or grants may be given. The sale of the commercial uses of the urban park i.e. the snack bar or the underground parking, could still provide part of the required financing.

## 5. Conclusion

In the recent years, the need for high quality living environment in large urban centers becomes imperative, making the actions for its upgrading a necessity. In an ideal state, the protection and enhancement of urban outdoor space is a primary concern, having recognized the importance of the field of action, interaction and social participation. At the same time, the cultural and architectural heritage of the site must be maintained and integrated into the urban daily life as a living organism, as a free thinking zone, a field of memory and emotions and a core of experience within the city. In addition, all the conservation activities and rehabilitation of historical records must be related to their urban and architectural dimension. These actions are also aiming to improve the buildings stock, the urban equipment, the network traffic and the local activities, without altering the identity of the region or causing unacceptable economic, social, cultural or environmental harm. Furthermore, a basic principle for every rehabilitation and inclusion of new uses in historic buildings is the respect and enhancement of the typological and morphological characteristics, as well as the preservation of the building's authentic integrity, in order allow the new users to enjoy the original historic and aesthetic values

Taking into account all the above, this study proposes an urban regeneration of the wider region of the refugee complex in Avenue Alexandras avenue in Athens, the site of Panathinaikos football stadium, the former refugee camp adjacent to the football pitch and the Stegi Patridos refugee complex in Lycabettus hill. In the above regeneration, the refugees' complex in Alexandras Avenue has an significant role as it is an important testimony of the establishment of refugees of 1922 as well as an integral part of the historical memory and the identity of the location. Accordingly, the preservation of the region seems to be particularly important, as the accommodation of refugees of 1922 in Athens has been a milestone for its historical, social and cultural development. It is also an excellent example of the influence of the modern movement in Greece.

However, until now, there is not any comprehensive program for the implementation of this objective. Thus, the present study seeks to fill this gap, by proposing a realistic solution to this existing problem. The present proposal is essentially a mild urban regeneration project aiming to transform the region to an attractive area through the exploitation of abandoned housing stock and the reintegration of the region into the city's structure.

# Gaps in 'Spatial Capital' between Haifa's Neighborhoods

Amnon Frenkel[1] and Moran Aviv[1]

1. Faculty of Architecture and Town Planning, Technion, Israel

ABSTRACT

*The study under progress is designed to help identify the level of disparities between neighborhoods through the definition of 'spatial profiles'. Spatial profiles are constructed through categorizing the distribution of goods and services within the local authority, based on the theory of capital assets. These profiles form the basis for a tool to help formulate policy recommendations for effective spatial distribution of urban resources; according to environmental, cultural and social assets. On a spatial level, capital assets are complex, reflecting the capabilities of the city and its neighborhoods in the context of innovation, productivity and development. From the resident's perspective the capital assets reflect the production, accumulation, and transmission of spatial capital.*

*In order to measure the accumulation of capital assets, a field survey by household interviews using a structured questionnaire specifically built for this purpose was conducted in three neighborhoods in the city of Haifa, Israel. Data on the relevant capital assets was collected and examined at a neighborhood level: social capital, cultural capital, and economic capital. In addition, the living environment was analyzed by observation and classification, in an attempt to better understand the relationship between the different characteristics and opportunities for individuals living in it and their interactions. The data was analyzed to build a spatial profile of each neighborhood thereby understanding the nature, potential and challenges of diversity in contemporary societies and help to formulate urban policy to create neighborhoods' capabilities.*

*Key words: Social Capital, Diverse Neighborhoods, capabilities*

## 1. Introduction

Spatial equality has become an integral part of the urban planning domain, and in recent years it has played a prominent role in the public and professional discourse alike. It is expressed in the spatial distribution of economic and monetary resources over territory, as well as in the distribution of environmental, cultural and social assets. The Measuring and quantifying the latter assets are complex undertakings; hence, the importance of examining and translating these variables into measurable and comparable values.

The present study examines the relationship between the allocation of goods and the distribution of capital assets over space, and the opportunities this allocation and distribution create for both the individual and the household. The neighborhood is examined as the living environment that links the physical space, the community and the network connections and opportunities that characterize it. On a larger scale, the neighborhood unit creates the latitude for civil activities, economic opportunities and the positioning of the individual's status and social role (Kearns & Parkinson, 2001). Despite the changes in lifestyle resulting from technological and transportation changes and despite the rise of different communities that are not based on geographical location, the neighborhood unit still remains influential and plays a meaningful role in the individual's affiliation and involvement in the economic and social fields (Atkinso & Kintrea, 2004). Nevertheless, there is a lack of empirical data on the

allocation of resources among neighborhoods in the city and on the role of the neighborhood unit in the accumulation and distribution of different capital assets (Kearns & Parkinson, 2001).

In order to measure the accumulation of capital assets, a field survey was conducted in which data were collected on relevant capital assets at the neighborhood level. A residential area in each of three neighborhoods in the city of Haifa, Israel's third-largest city, was sampled. The contribution of the study lies in its investigation of social and economic phenomena relating to the heterogeneous population of small geographical units in order to obtain an in-depth social-spatial picture of these neighborhoods' capital assets.

## 2. Background

### 2.1 The Forms of Capital

The theory on forms of capital developed by leading thinkers in the social sphere and the area of planning (Friedmann, 2002; Bourdieu, 2001) serves the present study as a basis for estimating the level of resources and their distribution across residential neighborhoods. This approach extends the debate that usually focuses on purely economic capital to other forms of capital, whose accumulation and then transfer to future generations may have a great impact on well-being, in both the spatial and the private sphere.

Capital forms have spatial substance, as they express human interactions that exist in a certain place and at a specific time. Their aim is to produce advantages in a series of fields of life that could be transferred to other fields in a cumulative and reinforcing process (Savage et al., 2005). At the spatial level, capital forms are the main resources used to create sustainability and the city's productive ability, thereby affecting its inhabitants' life opportunities. At the individual and the household levels, the accumulation of capital forms and the ability to influence their value provide power and reflect the ability to capture social and economic positions. Thus, an injury to the ability to accumulate these resources may harm the principle of equal opportunities (Bourdieu & Wacquant, 1992). Life chances are affected by patterns of the spatial distribution of resources. According to the French sociologist Pierre Bourdieu (1996), three forms of capital constitute the social space: economic, cultural and social.

*Economic capital*—refers to income, monetary assets and other forms of financial resources (Bourdieu, 1986; Lucas, 1988; Jaeger & Holm, 2007; Becker & Woessmann, 2009). Economic capital promotes outcomes through either direct investment (e.g., payment for activities, products or services) or indirect investment (e.g., financial subsidization of offspring). The effect of economic capital at the neighborhood level is considerable in regard to the physical infrastructure and maintenance of the shared living environment, as well as housing ownership rates, which affect the social involvement of local residents (McCabe, 2012; Forrest and Keams, 2001). In addition, economic capital is conceived as a sort of insurance for material welfare, a facilitator of the procurement of cultural accessories and even a reducer of social deviance, whether crime or psychological morbidity (Lovell, 2002; Gatrell et al., 2004).

*Cultural capital*—expresses the quality of human resources in the community. This is usually quantified through literacy, employment skills, general knowledge and education level. Friedmann (2002) defines cultural capital according to the urban– spatial configuration, which refers to the built heritage and cultural life of the city. Bourdieu refers to the connection between the built environment and the individual, but his thinking focuses on individuals and the balance of power among them, not on space. Bourdieu expanded the debate on inequality and stratification beyond its physical and economic significance and gave importance to the cultural and social variables as autonomous factors in the relationship among groups. According to Bourdieu (1986), cultural capital comprises not only educational qualifications and achievements, but also tastes, preferences and general "know-how" and knowledge; it affects cognitive skills and the knowledge of normative codes through socialization processes.

Bourdieu (1986) distinguishes three forms of cultural capital: "Institutionalized," "Embodied" and "Objectified." "Institutionalized Cultural Capital" is composed of university degrees, matriculation attainments and dropout rates, which act as antecedent roots in explaining institutionalized credentials (both academic and non-academic). According to Bourdieu (2001), human capital embodies institutionalized cultural capital. Similarly, Friedmann (2002) defines human capital as an embedded value in higher education and vocational training. "Embodied Cultural Capital" relates to both consciously acquired and passively inherited properties of one's self through socialization processes over time. "Objectified Cultural Capital" relates to Embodied Cultural Capital through material objects and visual media, such as paintings, book collections with literary masterpieces, and monuments, and becomes an indicator of visual status. As a material capital, this cultural capital is readily transferable, since it can be purchased materially by economic capital and symbolically by cultural capital.

*Social capital*—is defined as the total extent and quality of social networks and connections that one uses to promote personal interests (Bourdieu, 1986). Social relationships enhance networking ability and knowledge transfer and also provide support in times of trouble (Adler & Seok, 2001). Social capital is the outcome of the mutual emotions of trust, solidarity and gratitude among members in a social network, expressed in acts of assistance and support for members within the community (Dore, 1983; Coleman, 1988; Putnam, 1995; Adler & Seok, 2001).

Bourdieu suggests that the accumulation of the three last forms of capital (Economic, Cultural and Social) determines a social space that defines class-related inequalities in a variety of spheres of life (Bourdieu, 1989; 1985). In this social space, the different forms of capital enable an individual and his/her respective social peer groups to achieve a variety of social goods in diverse fields of life (Bourdieu and Wacquant, 1992). These social goods might later be translated into capabilities or life-chances for the social subject (Bowman, 2010).

### 2.2 Life-chances

An individual's life-chances, created from birth, depend on the circumstances and life events that are beyond one's control, but they have a direct impact on the quality of life. The community in which the individual grew up (e.g., neighborhood) and the status of the person's parents, as well as the social structure and policy and political forces, have decisive influences on the individual's circumstances and choices (Blacksher, 2002).

Amartya Sen (1992) defined two concepts in this context: Capabilities and Functionings. According to his approach, capabilities will be equal only when all individuals have the same opportunity to function well in different social fields. This opportunity stems from the ability to convert services and goods (i.e., education, money, health and social relations) into real functioning (Nussbaum, 2006; Sen, 1992).

The two terms, Capabilities and Functionings, signify the opportunities (or life-chances) that enable people to choose the kind of lifestyle they wish to pursue and to function effectively in fields of life that they value (Robeyns and Brighouse, 2010). In clarifying this definition, Sen argues that ""a functioning is an achievement, whereas a capability is the ability to achieve. Capabilities… are notions of freedom, in the positive sense: what real opportunities you have regarding the life you may lead" (Sen, 1987: 36). As such, capabilities and functionings together define the life-chances of the individual and determine the equality of opportunities in a given space and at a given time.

Life-chances may be influenced by the living environment (e.g., the neighborhood) where different forms of capital are accumulated. A mix of capital forms may reflect the ability to achieve social positions. Therefore, the individual's exposure to life- chances in different living environments may have a direct impact on that person's ability to fill positions and roles in society.

Many studies have pointed to the neighborhood as the most significant influential unit on access to goods and, accordingly, on the individual's choices and life opportunities (Akom,

2011; Atkinson & Kintrea, 2004). Kleit (2001) found that neighborhoods with a diverse mix of incomes have the potential to increase an individual's life-chances. This is due to the benefits that result from better access to institutions, such as better schools, civil service and public agencies, and to better-quality and more stable jobs. These benefits lead to lower rates of crime and violence, compared to neighborhoods with concentrations of poverty (Galster, Andersson & Musterd, 2010).

## 3. Methodology

### 3.1 Research Hypotheses

This study aimed to assist in identifying the gaps among different neighborhoods from their spatial capital profiles. The study hypothesizes the existence of a relationship between this profile and the exposure of a neighborhood's residents to a set of life-chances.

***Hypothesis H1****:* Social space consists of different accumulations of capital forms within the physical space of a city's different residential neighborhoods.

Living environments that reflect a class topography consist of capital profiles describing social stratification in space and exhibiting the unique capital profile of a particular residential neighborhood.

***Hypothesis H2****:* The characteristics of the social space (i.e., the way in which capital forms are accumulated) affect an individual's life-chances in various spheres of life.

The amalgam of capital forms characterizing each individual in the social space enables identifying interpersonal differences that affect the conversion of capital forms into "capabilities" and "functionings" in different social fields.

***Hypothesis H3****:* Households in different neighborhoods in a city exhibit differences in the accumulation of capital forms

Residential neighborhoods differ in the characteristics of the physical environments affecting the urban living space, as well as in the ability to regenerate, recover and attract a population with a high level of accumulative capital. This difference is reflected in gaps among neighborhoods in the accumulation of economic, social and cultural capital. The accumulation of these capital forms provides a more sensitive measure of social-spatial stratification.

***Hypothesis H4****:* As the level of the accumulation of capital assets increases, the extent of an individual's exposure to life-chances will also increase.

The individual's accumulation of capital forms has an impact on exposure to life- chances. Given the assumption that differences in the characteristics of accumulated capital characterize a city's residential neighborhoods, it is conceivable that a gap also exists in the life-chances of the different individuals residing in the city's neighborhoods.

### 3.2 Research Methods

In order to examine the first and the second research hypotheses, which deal with the existence of a social space associated with the physical living environment, Explanatory Factor Analysis (EFA) was employed to serve as a Data Reduction procedure (Robson and Sanders, 2010; Cattel, 1965). The justification for this step is that the concept of social space is a general idea that is difficult to describe using one variable or a simple and direct measurement (Bourdieu, 1986). It requires a multivariate setting and the use of quantitative analysis of numerous measures. This is true, too, of the concept of life-chances relating to a set of capabilities and functionings, which are measured in the present study using quantitative analysis that involve a wide set of indicators.

EFA was employed on a set of variables derived from the literature and collected through a field survey that represented the concepts of social space and life-chances. It enabled a grouping of the variables in each capital form and in selected life-chances into major factors.[1] Each factor comprises a linear combination of all measures in each relevant

[1] Main factors were defined by eigenvalues >1.

field of knowledge and contributes to the total explanation of the variance (Kim and Muller, 1978). The dominant variables in each factor enabled a categorization and labelling of the unique "identity" of the factor[2]. Thus, it was possible to examine whether the variables chosen are indeed logically related to the typology proposed by the literature. The EFA created a capital profile through latent variables obtained from the analysis, thereby defining the social space as well as the profile of opportunities that denoted capabilities and functionings in the study area.

The results obtained from the EFA were also used to test the third and fourth hypotheses regarding spatial variation among the city's neighborhoods. In order to do this, the factor scores ascribed to each observation through the EFA model were employed. These scores indicated the accumulated capital that characterized the household: the higher the score, the higher was the household's accumulated capital, and vice versa. Similarly, higher factor scores for the life- chances factors identified were indicative of a greater level of a household's exposure to life- chances, and vice versa. These standardized scores were then used to examine whether a significant difference in accumulated capital and exposure to life-chances existed among a neighborhood's inhabitants. The examination was conducted by analysis of variance through the Mann-Whitney a-parametric test.

## 4. Data Collection

### 4.1 Population and Research Area

The empirical study took place in the city of Haifa, which is located in northern Israel and serves as the core of the Haifa metropolitan region. The city is Israel's third largest, with a population of 273,000 (CBS, 2014). Haifa was selected for the empirical study, since it presents the qualities of a medium-size city exhibiting great variety in its neighborhoods in terms of average apartment size, density (persons/sq km), age distribution, occupations, education level, and other demographic variables. In addition, the city's population is heterogeneous, 24.5% of its residents being former residents of what was the Soviet Union, who came to Israel with the great wave of immigration from that country during the early 1990s and 10.3% of its residents being Arabs. Because of this diversity, we can assume that there are differences in the level of accumulation of capital forms among the city's neighborhoods. For the empirical study, three neighborhoods were selected to represent the diversity of the city's social class: Hadar, Ramat Sapir and Ramat Golda.

The Hadar neighborhood, located on the northern slope of Mount Carmel, is the middle step between Haifa's downtown and Central Carmel atop the mountain. It offers nearby commercial centers, public institutions and access to public transportation service. In addition to historical and architectural textures, many of the city's cultural institutions, such as the Municipal Theater, Al-Midan Theater, Museum of Art and Science Museum, are also located in this neighborhood. The residential area in the Hadar neighborhood that was sampled is characterized by residential buildings of 3-4 stories that were constructed in the 1920s and 1930s. The area contains 1,700 households and Haifa's largest concentration of immigrants from the former Soviet Union.

Ramat Sapir is located in the eastern part of the city. The neighborhood, purely residential, was built in the early 1980s. Saturated building characterizes the neighborhood, with structures of 8 stories and taller. The population of the residential area in this neighborhood that was sampled has 1,100 households and an ethnically homogeneous, most belonging to the middle class.

Ramat Golda also purely residential is located on the Carmel Mountain adjacent to the main transportation route of the mountain. The neighborhood, built in the 1980s and populated in the 1990s, is characterized by detached houses and low-density buildings, as

[2] Dominant measures were defined as those with an absolute value of a component coefficient greater than 0.5. These measures were taken from the Rotated Component Matrix table produced from the Principal Components procedure by the Varimax method of rotation.

well as almost no public spaces or intensive open space. The neighborhood's residential area that was sampled has 900 households and an ethnically and economically homogeneous population.

The three residential areas were chosen for the empirical study based on an analysis of the socio-economic characteristics of Haifa's population. The main differences that served for their selection related to the labor force participation rate, level of education, occupation, means of getting to work, home ownership rate and housing density as shown in Table 1.

**Table 1**

A field survey was conducted in 2013 among households in the three residential areas selected; this survey provided the research population for an examination of social space and exposure to life-chances.

### 4.2 Questionnaire Design

Data were collected by means of a four-part questionnaire that was constructed for the purpose of this study. The first part, which was devoted to education and cultural characteristics, enabled characterizing the accumulation of cultural capital by household heads, their parents and their children. The second part related to characteristics of the production and accumulation of social capital; i.e., social relationships. The third part addressed the material aspects of economic capital. The fourth part asked respondents to indicate their exposure to life- chances, such as the ability of the household head to find alternative work in the event of a loss of employment (whether through resigning or being fired) and to finance the children's academic study. Finally, residents were asked about housing ownership, residence choices and the living environment.

Most of the data collected were converted into categorical variables. Some of these variables demanded redefinition and the construction of complex variables to represent the common accumulation of capital by household heads and their common exposure to life-chances. The new variables created indices that represented both of a family's household heads (in households with two heads) effectively as a single unit (i.e., a household).

## 5. Results

### 5.1 Characteristics of the Sample

Data were collected through personal interviews conducted with the heads of households in the residential areas selected. A total of 170 completed questionnaires were received, representing 4.6% of the total households in the three residential areas. The sample was representative in terms of the economic and educational characteristics of the population in the study area, but less so insofar as demographic characteristics (there was greater representativeness of an aging population in the sample in both Ramat Sapir and Ramat Golda; CBS, 2008). The respondents' socio-economic characteristics are presented in Table 2.

**Table 2**

The majority of households consisted of two or fewer persons (60%), but the differences among the three residential areas are not statistically significant. Ramat Sapir's population is characterized by young household heads relative to the two other neighborhoods and the differences are statistically significant. The income level of households in Ramat Golda is significantly higher than that of households in Ramat Sapir and particularly of those in Hadar. This gap also applies to educational level. The percentage of household heads with an academic degree in Ramat Golda and even in Ramat Sapir is significantly higher than among household heads in Hadar. This last finding was reflected in the significant differences in respondents' occupations. The rate of household heads employed in academic professional positions and as associate professionals, technicians and

managers in Ramat Golda and Ramat Sapir is more than double that of household heads in Hadar. Housing density also showed a significant difference: the rate of households with more than two rooms per person in Ramat Golda and even in Ramat Sapir is significantly higher than in Hadar.

### 5.2 Extraction of Capital Forms and Life-chance Concepts

As explained in Section 4.2, the existence of social space at the neighborhood level and the concept of life-chances were obtained by means of factor analyses of instrumental variables collected in a field survey. The data were used to construct compound variables representing the common value attributed to both heads of a household (the investigation unit). A total of 25 variables measuring economic, cultural and social capital, based of Bourdieu's theory, and 9 variables measuring capabilities and functionings, based on Amartya Sen's approach (and representing life-chances), were employed in the models. Table 3 presents the 34 variables and their means and standard deviations.

**Table 3**

The relative high standard deviations indicate in general a large variance around the average. This may reflect the heterogeneity of the population that lives in the various neighborhoods in the city. It thus supports the assumption of this study regarding the existence of spatial disparities among neighborhoods in the city of Haifa and can assist in mapping and understanding these gaps.

Tests of internal consistency and sample adequacy constituted the necessary preliminary conditions for conducting EFA and obtaining meaningful results. The Spearman correlation matrix among the indicators provided the input for both the tests and the factor analyses. The activity-pattern items obtained in the survey demonstrate good internal consistency(Cronbach's alpha = 0.726-0.831) and appropriate sampling adequacy for performing EFA according to the overall Kaiser-Meyer-Olkin measure (KMO = 0.760-0.771). The Spearman correlation matrix contains correlations with absolute values of 0.001-0.740, and the value of its determinant is 0.001; hence, the existence of correlations without multi-collinearity is established. The result of the Bartlett's sphericity test rejects the null hypothesis that the correlation matrix is an identity matrix ($p = 0.000$).

Exploratory principal axis factor analysis with orthogonal rotation (Varimax rotation with Kaiser normalization) produced seven factors (in the case of capital forms) and three factors (in the case of capabilities and functionings). These results, derived from a combination of scree-plot analysis and the Ricolfi measure, aimed at conveying as much information as possible while maintaining the parsimony of the model (see Prato et al., 2005). The factor loadings are presented in Tables 4 and 5. A factor loading threshold of 0.43 served for retaining the items for factor analysis and for factor labeling (although most of the variables received factor loading higher than 0.64).

### 5.3 Social Space

Seven concepts together explaining 64% of the variance and representing capital forms were obtained from employing the EFA procedure on the 25 observed variables (Table 4). These concepts are consistent with Bourdieu's theory on capital forms, thereby confirming our hypothesis, which underlies the social space concept of the study area.

**Table 4**

The first three factors, each explaining about 11% of the variance, are the dominant concepts representing the social space of the residential areas examined. The first factor, loading six variables, relates to fondness for various literature genres, along with the number of books read by heads of household. This factor may represent "Embodied Cultural Capital,"

because these variables are related to investment and self-learning, which over time are embedded in the individual, and to the socialization process, which affects the evaluation and integration of certain genres over others.

The second factor also relates to cultural capital. It associates with Institutional-symbolic Cultural Capital, referring to academic degrees and diplomas, which have social and economic importance in the society. The three dominant variables, representing a common foundation for heads of household, are built on a hierarchy of capital, in which the highest category is a situation in which all heads of household earned a Master's degree or Ph.D. They received the degree in professions or fields most in demand in the employment market and at academic training institutions and acquired it from one of the elite academic institutions in Israel or other Western country. The fact that the first two factors represent cultural capital indicates their significant effect on social stratification.

The third factor, loading two variables, indicates cumulative material capital: a household's income level and the number of privately owned cars. This factor allows one to identify neighborhoods having a significant proportion of wealthy residents, with economic strength and power-monetary material. This factor also includes frequency of participation in conferences, which indirectly can also be seen as an input contributing to positioning the employment status of household heads and, therefore, belonging to economic capital.

The results regarding the first three dominant factors support Bourdieu's theory. They allow the identification of households that enjoy a high accumulation of Institutional-symbolic Cultural Capital. As such, they represent institutional training and academic achievements, which compose as part of the individual's cultural abilities and are converted into economic capital and vice versa.

The following three factors represent Social Capital through their defining of three circles (different scales) of relationships that build trust among community members in the study area. Each of the factors explains 8%-9% of the variance. The fourth factor, Support and Social Control, belongs to Social Bonding Capital (Putnam, 2000), which characterizes pattern of participation and relationships within social units having a shared identity. This concept relates to variables that support the living environment (i.e., the neighborhood): volunteering in the neighborhood, shared values and mutual help among neighbors. The dominance of this factor (over the following two social capital factors) reinforces the concept of the present study regarding the meaning of the neighborhood as the arena where capital is accumulated and strengthened or, alternatively, eroded.

The fifth factor identifies the second circle in Social Bonding Capital – Family Cohesion. The dominant variables under this concept indicate the social contextual family circle. The sixth factor, which marks the third circle by creating social cohesion, relies on the existence and empowerment of a wide circle of friendships. According to Bourdieu's approach, personal friendships constitute an important element in creating social capital. Therefore, measuring the extent to which the individual enjoys a relationship with friends is an important component of Empowerment and Social Bridging. Through these relationships, for example, the individual may promote personal affairs (Robson and Sanders 2010).

Finally the seventh factor can imply the existence of Objectified Cultural Capital through fostering cultural inputs, but it is also an integral part of the investment and long-term learning embedded in the individual (see Embodied Cultural Capital above). The factor explains only 7.5% of the variance; however, with respect to social capital factors, it may indicate a connection between fostering cultural input investment by heads of households and empowering their social capital through social bridging alongside family cohesion.

## 5.4 Life-Chances

Three concepts, together explaining 60.1% of the variance and representing capabilities and functionings, were obtained from employing the EFA procedure on the nine observed variables (Table 5). These concepts represent the life- chances of household heads in the study area, based on Sen's approach.

## Table 5

When capabilities and functionings are constructed into principles of life-chances, they are treated as complementary principles, since functionings are, in effect, the capabilities that the individual chooses to implement in practice. In this study, four variables represented the functionings of household heads in three social fields, employment, housing and academic-professional training, from an intergenerational perspective. Along with the five variables defining capabilities, the nine variables formed the foundation for an operational definition of life-chances (see Table 3). The choice of variables was dictated by the need to focus on consensual areas of action regarding the individual's definition of a "worthy" life in a liberal-democratic society.

The first factor obtained, explaining about 24% of the variance, is the dominant concept and represents the social-economic ability to stabilize the nuclear family. The variables loaded in this concept represent stability and constitute the social conditions promoting the individual's dignity and development. These variables are capabilities relating to the ability to raise children and maintain a stable family (household size) and to upgrade and ensure educational resources for the next generation, along with functionings in the housing field (home ownership and the existence of a second home).

The five variables that are dominant in this factor are positively related and represent a hierarchy of opportunities for improving the household's living conditions, which are associated with homeownership. The potential of higher education and the capability of the heads of households to finance it (the first variables in this factor) represent the economic stability of the household, even if this capability has not yet been realized. The next three variables relate to economic stability as reflected in the housing field. The last variable in this factor refers to the number of persons in the household, and the sample data indicate that these are families consisting of 3-5 persons that enjoy a high capability of funding academic studies for the next generation. These families represent stable nuclear cells, since it is assumed that households of this size allow their children to develop a healthy and stable lifestyle (Maralani, 2008; Demo and Cox, 2000).[3]

The second factor, the ability to feel control over one's life and material environment, is also a dominant concept, explaining 21% of the variance. The factor represents the individual's ability in the job market, based on the person's subjective assessment. The two variables loaded in this factor represent the individual's assessment regarding an ability to find alternative employment, thus reflecting a feeling of job security and an assessment of the ability to improve one's working conditions. As such, this factor serves as a significant element in the assessment of the exposure to life-chances. The literature refers to the ability to work and earn a living, to attain fair employment conditions and to seek employment on an equal basis as a universal capability in regard to all the capabilities that make up the individual's access to life-chances (Robeyns, 2010; Nussbaum, 2006).

The third factor, functioning in the field of employment and academic training, explains 14.2% of the variance. This concept consists of two variables, the first of which has a higher loading value and refers to functioning in the field of academic and professional training when examined from an inter-generational perspective. This variable represents the actual performance of the individual in the academic field. The second variable relates to the prestige of the jobs held by the heads of the household and reflects the ability to engage in high- status professions, thereby achieving positions and duties in the upper rank of the employment field. According to Sen (1992), these variables present the conversion of individual capabilities into real functionings, which the individual wants and respects, and assist in the mapping of equal opportunity in space.

[3] Confirmation is found in the field survey, which showed that 83% of households with 3-5 persons are households with two heads. Moreover, the finding regarding income groups showed that households belonging to the upper class (tenth decile) are those with a relatively large household size (average of 3.4 persons).

### 5.5 Inequality among neighborhoods

Factor scores obtained from the EFA were used to examine spatial differences among households in the three Haifa neighborhoods surveyed in regard to social space components, as well as to their exposure to life-chances. This examination was undertaken by means of a Mann-Whitney a-parametric analysis. The dependent variable was the factor scores that each observation received from the EFA model, while the spatial location (neighborhoods) served as the independent variable. The results are presented in Tables 6 and 7.

*Social Space Inequality*

High standard deviations exist for most of the capital forms in each of the three neighborhoods (Table 6). This indicates that the population in each neighborhood is quite heterogeneous with respect to accumulated capital forms. Still, interesting significant differences among the neighborhoods were found in some of the capital forms.

**Table 6**

The most diverse form of capital is Economic Capital, which indicates the existence of a polarized spatial structure. Material capital inputs held by households in Ramat Golda were higher than those in Ramat Sapir, and the latter was higher than households in Hadar. These differences, which are highly statistically significant, point to deep gaps in the social space of all the capital factors identified (Z value of -4.5 - -7.0). This result was expected because we had selected the three neighborhoods in the sample based on differences in their economic and social characteristics; at the same time, however, significant differences were also found in other accumulated capital forms.

In part, these differences are reflected in the field of higher education as expressed in their Institutional-symbolic Cultural Capital accumulation. In this sense, the institutional training and academic qualifications of the household heads in Ramat Golda surpass those in the two other neighborhoods (the differences between those two neighborhoods were not significant). It seems that households in Ramat Golda manage to transform their institutional cultural capital into economic capital. Similarly, though probably in the opposite direction, households in Ramat Golda manage to convert the economic capital they accumulated into Objectified Cultural Capital. That Ramat Golda households received a higher average factor score in fostering cultural inputs suggests that their investments in long-term learning were larger than those of the two other neighborhoods, and the differences are statistically significant. No significant differences were found, however, between households in Ramat Sapir and Hadar in this context. The difference between the Ramat Golda and Hadar neighborhoods in this capital is interesting, since it relates to the frequency of visits to the theater, museums, exhibitions and galleries, many of which are located in Hadar. This finding suggests that Hadar's residents do not consume culture from their neighborhood's cultural institutions despite the physical accessibility. The explanation for this is probably due to the low level of economic capital of these residents. In contrast, no significant differences were found among the three neighborhoods in the average factor score relating to Embodied Cultural Capital. The reason for this is probably very little dependence by any of them on self-learning through various genres of literature on economic capital.

Finally, interesting findings regarding differences in the accumulation of Social Capital were found among the three neighborhoods in the sample. Of the three spheres of social capital that were obtained from the factor analysis, Social Bonding Capital was found to be of prominent importance. Highly and statistically significant differences were found among the three neighborhoods in the average factor score for the Support and Social Control concept, which contribute to the living environment. However, the results are inconsistent with the findings in relation to economic capital and cultural capital (see above). The level of volunteering in the neighborhood, shared values and mutual help among neighbors are most prominent in Ramat Sapir, with Ramat Golda far behind and Hadar even further back.

Hadar in this case represents a mixed residential area with a relatively high immigrant population rate. As a result, households in this neighborhood not only demonstrate low level of economic and cultural capital, they also fail to produce neighborhood cohesion. On the other hand, the prestigious neighborhood of Ramat Golda is a good example confirming the argument over the difficulty in converting economic capital into social capital, unlike the ability to convert economic capital into cultural capital and vice versa (Savage et al., 2005), which has been shown empirically in this study.

With respect to the two other circles of social capital, Family Cohesion and Empowerment and Social Bridging, statistically significant differences were found only among some of the neighborhoods in the sample and at a moderate level. Households in Hadar maintain social cohesion, built on the existence and empowerment of friendship relationships, to a greater extent than do households in Ramat Golda. On the other hands, family cohesion characterizes households in Ramat Sapir to a greater extent than households in Hadar.

*Life-Chances Inequality*

The interesting question is whether the differences among the three neighborhoods in the accumulation of these capital forms (described above) are expressed in the ability of households to translate these forms into capabilities and functionings in various social fields so as to enhance their life-chances as hypothesized. The results obtained from employing the Mann-Whitney test on the life-chances factor scores largely validate our hypothesis. Neighborhoods where households have a high level of accumulated capital forms that significantly differ from those of households in other neighborhoods benefit from more exposure to life-chances.

Statistically significant differences were found among the three neighborhoods in the social-economic ability to stabilize the nuclear family factor (Table 7). The ability of the nuclear family to ensure stability for household heads, as well as for their offspring, is significantly higher in Ramat Golda than in the two other neighborhoods. And it is significantly higher among households in Ramat Sapir than in Hadar.

**Table 7**

In regard to the second concept (Table 7), it seems that households in Ramat Golda are characterized by a heightened ability to feel a sense of control over their lives. These households have a better chance to ensure continuity of income inputs than do households in Ramat Sapir and Hadar; this advantage holds, as well, in regard to Ramat Golda households' having the mental capability to change their workplaces while achieving effectiveness and economic well-being, even in the event of an involuntary loss of job. The finding in regard to Ramat Golda is striking in light of the ageism phenomena, which is common in the Israeli labor market, given the high percentage of residents aged 41-65 in Ramat Golda relative to the two other neighborhoods. These components, which are significant parameters in estimating the exposure to life-chances, point to a polarization among the three neighborhoods and may indicate the existence of spatial inequality in the urban space.

The third life-chance concept relates to the individual's freedom of occupation and the ability to obtain social positions, which reflect functionings in one's field of academic-professional training when examined from an intergenerational perspective. Household heads in both Ramat Sapir and Ramat Golda received higher prestige jobs on the upper social ladder than did household heads in Hadar, and the differences are statistically significant. The gaps in this concept that relate to intergenerational mobility in the household are consistent with the literature, which shows that the living environment continues to affect inter-generational mobility and life-chances even in the Global Era (Atkinson & Kintrea, 2004). The spatial patterns of reproduction may thus be transferred to the next generation in the absence of an adjusted urban policy.

## 6. Conclusions

Most of the studies that examined and measured spatial inequality have done so from the perspective of economic growth. Many scholars use economic indices in their measurement of spatial–social gaps and costs, primarily income, employment and education data, in order to assess their effect on urban and regional economic growth.

In the present study, we suggest extending the spatial inequality examination by looking at the allocation of different capital forms. We based our analysis on Bourdieu's sociological theory of the three forms of capital: Economic, Social and Cultural. A field survey provided data to allow us to build a large number of complex variables that measured the level of accumulated various capital forms possessed by household heads in the three neighborhoods sampled. Seven concepts of capital forms, obtained from employing an explanatory factor analysis on the measured variables, confirmed the existence of social space in the study area. The social space identified comprises one form of economic capital, three forms of cultural capital and three forms of social capital. Based on Sen's approach (1992), we also collected data on capabilities and functionings through our field survey. Three factors were obtained from employing EFA on those variables that exhibit life-chances concepts: a social-economic ability to stabilize the nuclear family, an ability to feel control over one's life and material environment, and functioning in the field of employment and academic training.

The analysis showed statistically significant differences in various forms of capital among the three neighborhoods examined. Household heads in Hadar are at a great disadvantage in most forms of capital compared to the two other neighborhoods in the sample. In contrast, household heads in Ramat Golda benefit from accumulated capital to a larger extent than do household heads in Hadar in terms of Economic, Institutional-symbolic Cultural and Objectified Cultural Capital. Of the three forms of social capital the most striking differences were obtained for the concept of Social Bonding Capital through Support and Social Control at the neighborhood level; household heads in Ramat Sapir enjoyed significant accumulated social capital compared to the two other neighborhoods.

Consistent with previous studies on the subject (Kearns & Parkinson, 2011), the living environment (neighborhood) was found to be a significant factor in social reproduction, an arena to gain or erode capital accumulation. Spatial variance in creating trust, cohesion and social control strengthens the argument that a neighborhood is a function of economic and social fields and capital accumulation.

As a result, it became clear that significant gaps existed in household heads' exposure to life-chances among the neighborhoods sampled. Residents of Hadar, who do not have a high level of capital accumulation of various types, are inferior in relation to residents in the two other neighborhoods in their exposure to life-chances that would improve their social and employment mobility. That households in Ramat Golda and also in Ramat Sapir enjoy greater exposure to life-chances is probably the result of the different types of capital accumulated by household heads in these neighborhoods. The interpretation of these findings suggests that the ability to use different forms of capital in order to build capabilities that can be translated into life-chances does not necessarily rely on economic capital.

Thus, household heads with a high level of different capital forms may benefit from exposure to similar life-chances as reflected in their functionings in the field of employment and academic training. It was expected that a significant accumulation of economic and institutional cultural capital, such as that characterizing household heads in Ramat Golda, would allow them to perform better in the field of employment and academic mobility than would household heads in Ramat Sapir and Hadar. However, our data indicate that household heads in Ramat Sapir benefited, too, from this kind of life- chances. In this sense, they used their significant social capital rather than economic or institutional cultural capital to gain support and social control. The findings of the present study can be helpful in formulating policy recommendations that will deal more effectively with the spatial and equal distribution of forms of capital within urban areas.

* At least one of the household heads is in the older age category.

**Table 3.** Variables used in the Explanatory Factor Analyses*

| Concept | Capital Form | Variable Name | Mean | S.D. |
|---|---|---|---|---|
| Social Space | Cultural Capital | Average number of books read by heads of household per month | 2.59 | 2.63 |
| | | Fondness for fiction literature | 2.49 | 1.69 |
| | | Fondness for romance literature | 3.59 | 1.86 |
| | | Fondness for historical, biographical and autobiographical literature | 3.27 | 1.81 |
| | | Fondness for reference books and popular science books | 2.82 | 1.63 |
| | | Fondness for self-instruction books and DIY | 2.05 | 1.43 |
| | | Frequency of attendance at conferences and professional workshops | 2.28 | 1.29 |
| | | Frequency of going to the theater | 2.48 | 1.41 |
| | | Frequency of visits to coffee shops | 3.67 | 1.68 |
| | | Frequency of attendance at performances of a concert/opera/ballet | 2.22 | 1.34 |
| | | Frequency of visits to galleries, exhibitions and museums | 2.46 | 1.26 |
| | | Highest academic degree obtained by the heads of the household | 2.94 | 1.46 |
| | | Prestige of academic certificate as determined by the extent of the demand for the department/faculty in which household heads earned their highest academic degree | 3.84 | 1.92 |
| | | Prestige of academic institution where household heads acquired their highest academic certificate | 4.12 | 2.13 |
| | Social Capital | Frequency of indirect social contacts with family (i.e. cell phones and internet) | 4.52 | 0.95 |
| | | Frequency of direct social contacts with family (i.e. face to face meetings) | 3.71 | 0.94 |
| | | Frequency of indirect social contacts with friends (i.e. cell phones and internet) | 4.30 | 0.89 |
| | | Frequency of direct social contacts with friends (i.e. face to face meetings) | 3.61 | 1.03 |
| | | Scope of the social network used for counseling on major issues | 2.86 | 0.74 |
| | | The extent to which neighbors share similar values | 4.52 | 1.61 |
| | | Neighbors' willingness to help | 3.71 | 1.33 |
| | | The extent to which adult neighbors are responsible and serve as a source of authority for young people in the neighborhood | 4.30 | 1.68 |
| | | Frequency for volunteer activities in the neighborhood | 3.61 | 1.10 |
| | Economic Capital | Household's income level | 2.50 | 1.32 |
| | | Number of privately owned cars | 1.05 | 0.79 |

**Table 3.** Continue

| Concept | Attribution | Variable Name | Mean | S.D. |
|---|---|---|---|---|
| Life Chances | Capabilities | Ability to find a job in the event of a need for change | 1.48 | 0.58 |
| | | Ability to find new job in the event of involuntary loss of job | 1.96 | 0.82 |
| | | Household's financial ability to improve housing conditions | 2.74 | 1.38 |
| | | Household's ability to fund academic studies for children | 3.60 | 1.39 |
| | | Number of persons in household (indicating the ability to raise children and maintain a stable family) | 2.49 | 1.28 |
| | Functionings | Social-academic mobility between household heads and their parents' generation | 3.01 | 0.89 |
| | | Prestige of the jobs of household heads | 1.82 | 0.81 |
| | | Residence tenure (homeowner/renter) | 1.61 | 0.61 |
| | | Second home ownership | 0.37 | 0.67 |

* The variables in the social space and life chances were built on ordinal scales in order to express the value of the variable common to both heads of household. Mean and standard deviation of each variable were calculated according to the ranking that the observations received in the sample.

# RESEARCHING MULTICULTRUAL SOCIETIES: BENEFITS, LIMITATIONS AND CHALLENGES OF CO-ETHNICAL RESEARCH DESIGN IN URBAN PLANNING

Heike Köckler[1]

[1]TU Dortmund University, School of Spatial Planning, Department of Urban and Regional Planning, heike.koeckler@tu-dortmund.de

Keywords: co-ehtnical research, procedural environmental justice, intercultured society

*One fact of a multicultural society is that people with migration background are often more deprived than those of the majority of society. Although the group of migrants is usually very heterogeneous, the factor migration makes a significant difference for participating in important parts of life like health, education, and housing (Gosine; Teelucksingh, 2008). In standard surveys migrants are frequently underrepresented; consequently, data having a bias regarding the diversity of contemporary societies is used for urban planning.*
*To understand and represent differences of multicultural society specific research methods like co-ethnical survey designs are needed: questionnaires need to be translated into corresponding languages, interviewers of the addressed ethnic group are required and quota samples need to represent different groups equally. Using such a research design a survey on the topic of procedural environmental justice comparing Germans and Turkish migrants was carried out in the Ruhr, Germany. The data shows both existing and lacking capabilities of households having a migration background. No differences were found in communal mastery and social networks between Turkish migrants and Germans, but the Turkish migrants reported less participation in decision making than Germans, although their intention was similar.*
*The method of co-ethnical surveys will be explained using the example of the survey on procedural environmental justice. Also a new survey-design dealing with possible difference in energetic renovation will be presented. Both will be discussed in the light of planning as public policy in an intercultured society.*

## 1. Introduction

*„A final problem with a narrow understanding of racism is that it limits claims, thereby reproducing a racist social order."* (Pulido, 2000, p. 13)

This quote by Pulido is part of the environmental justice discourse. Environmental justice is dealing with social differences in access to environmental amenities and exposure to environmental burdens as well as social differences in meaningful involvement in environmental decision making. Such differences are not just analysed as inequalities, they are judged as being unfair and therefore categorised as inequities (Bolte *et al.*, 2012; Walker, 2012; Schlosberg, 2007). Inequities in access to environmental amenities or exposure to environmental burdens are termed as environmental distributional injustice, while inequities in the meaningful involvement in environmental decision making processes as well as the initialisation of such processes are termed as environmental procedural injustice.

The field of environmental justice is manifold. In this paper I focus on the social differences amongst ethnic groups concerning environmental procedural justice. Schlosberg (2007: 75) puts procedural justice at the core of environmental justice and therefore as a determinant of distributional justice: *„For the environmental justice movement, the demand for more public participation and procedural equity in the development, implementation, and oversight of environmental policy is the key to address issues of distributional equity, recognition, and capabilities."*

Environmental injustice towards ethnics groups are often called environmental racism in the North-American discourse (Cole and Foster, 2001; Gosine and Teelucksingh, 2008). Coming back to the introducing quote by Laura Pulido I have to ask myself as researcher in the field of planning: How can I contribute to a broader understanding of racism and make a claim for planning in a diverse society?

Agyeman and Erickson (2012, p. 359) raise a more rhetorical question to planners emphasising that equality is on more than distribution: *„But is this redistributive justice in and of itself sufficient to fulfil our ethical obligations as professional planners and planning educators to increase equality, social justice, choice, and opportunity for all persons?“* The answer to this question is no, for sure; especially when following the concept of an intercultured society in the sense of Amin (2002, p. 967): *„The term `intercultured' is used to stress cultural dialogue, to contrast with versions of multiculturalism that either stress cultural difference without resolving the problem of communication between cultures, or versions of cosmopolitanism that speculate on the gradual erosion of cultural difference through interethnic mixture and hybridisation.“*. Communication between cultures on their spatial needs has to be part of planning procedures, if planning is understood as a process of mediating different interests concerning use of space. Therefore in the following I will deal with procedural justice as a prerequisite for the meaningful articulation of interests as a first step to integrate different cultures in planning.

In standard surveys migrants are for different reasons frequently underrepresented. Consequently data having a bias regarding the diversity of contemporary societies is used for urban planning. To broaden our understanding of a diverse society we have to be critical and not re-producing dominant discourses (Dryzek, 2008). So data collection is a crucial point. In the context of difference and diversity Davys approach of polyrationality is path breaking: *„Polyrationality therefore has little to do with approaches to planning which focus on special needs and special interests. Gender planning (planning with a view to avoid sexism) or environmental justice planning (planning with a view to confront racism or classism) are also concerned with different voices, different rationalities.”* (Davy, 2008, p. 309) But how can urban planning capture different rationalities like Davy requires and go beyond a narrow understanding like Pulido claims? I see the recognition, empowerment and capability of all people for meaningful involvement in decision making processes as one prerequisite for a cultural dialogue encompassing different voices and different rationalities.

To learn about the capability of people for meaningful involvement in decision making processes I developed the MOVE-model as an explanatory model on procedural environmental justice. In its empirical test one research question was, whether differences between Germans or people with Turkish migration background can be identified. Therefore the method of co-ethnical interview design was applied in the survey. In the following the MOVE model is explained briefly and the focus is laid on the method of co-ethnical interview design. Then results on differences and similarities amongst the Germans and Turkish migrants are presented. Finally the method is discussed in the light of planning in a diverse society and future research.

## 2. Researching differences in environmental procedural justice

### *2.1The MOVE-Model*

MOVE stands for „model on households' vulnerability towards the local environment" and aims to predict peoples' intention and behaviour to improve their local environment, depending on their vulnerability. Therefore it is meant to learn about causes of environmental injustice from a households' perspective. Household understood as a social entity living together at the same place in the same environment. The basic assumption is that households who are more vulnerable are able to carry out fewer coping-behaviour than people with more capabilities. (Köckler, 2011)
The MOVE-model has been developed to identify factors that predict peoples' intentions or behaviour to deal with environmental stress (understood as pollution or lack of environmental amenities). The MOVE model thus seeks to identify indicators that go beyond indicators like social status and migration background common in distributional justice analysis. Since these indicators represent

vulnerability only as the latent variable, their validity is limited. Therefore, they do not provide specific information for interventions and strategies for more environmental procedural justice.
To predict coping with environmental stress in the MOVE-model (Figure 1) Hobfolls' Conservation of Resource Theory (COR) is used as a heuristic to identify predictors (Hobfoll, 1989). He explains stress through availability, investment and loss of resources. Hobfoll groups resources in object resources, personal characteristics, conditions and energy. As the MOVE-model is to predict behaviour, and not the stress level of a person, the Theory of Planned Behaviour (TPB) (Ajzen, 1991) is put in the centre of the model. The Theory of Planned Behaviour is a model including three variables attitude, subjective norm and perceived behavioural control to predict peoples' intention and behaviour. The following figure 1 shows the theoretical MOVE Model, combining both theories. A description of an earlier version can be found in (Köckler, 2011).

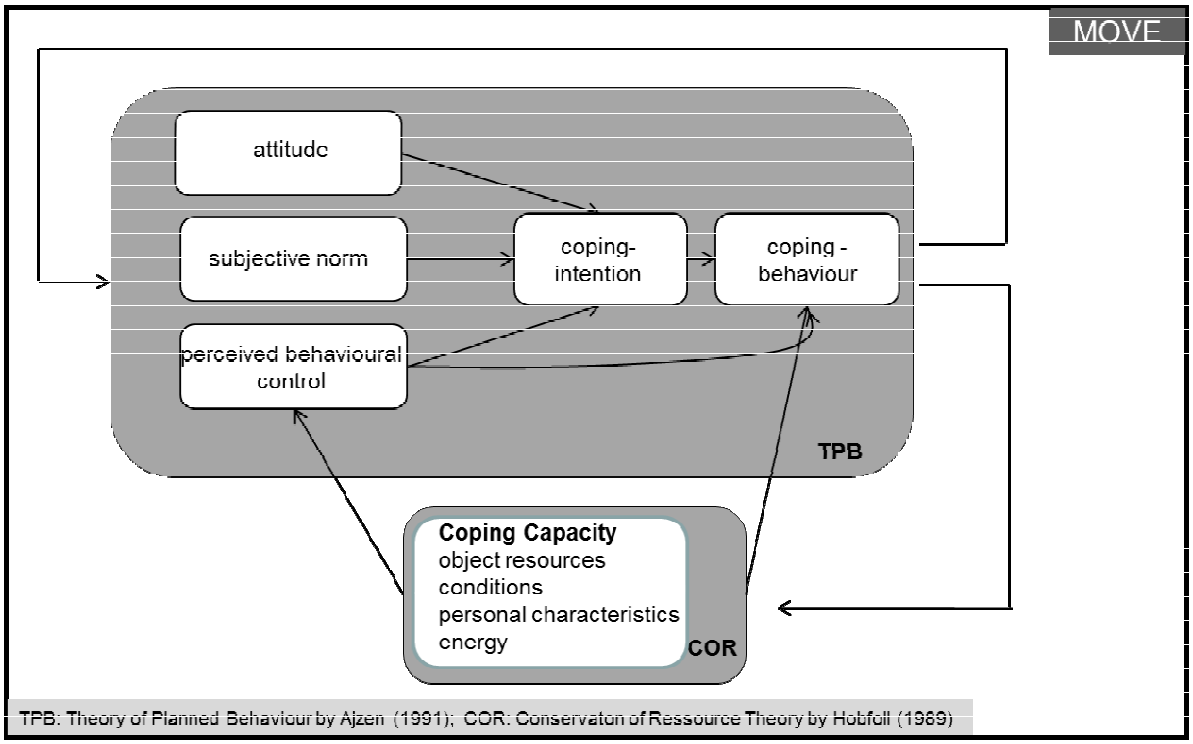

Figure 1: The MOVE-model (Model on households' vulnerability towards the local environment)

The MOVE model was used to test different hypothesis empirically. It was assumed that perceived behavioural control has the greatest power to predict coping-intention and behaviour. Furthermore it was assumed that the coping capacity, represented by resources according to Hobfoll, predicts difference in perceived behavioural control. Researching environmental procedural justice it was of additional interest to analyse if there is any difference in the responses amongst Turkish and German respondents.

*2.2 Testing the MOVE model with a co-ethnical research design*

To analyse if there is social inequality amongst Germans and people with a Turkish migration background, it was aimed to reach as many Germans as Turkish people in heavily and less polluted neighbourhood. This quota sample approach was selected to control for combined effects of environmental quality and migration background.

To reach diverse groups of society the method of co-ethnical interviews is applied. This concept goes beyond facing possible language barriers. Baykara-Krumme, (2013, p. 261) refers to the concept of joined heritage ("Abstammungsgmeinschaft" Weber 1972: 237) and existing socio-cultural

commonalities and cultural identities, including a consciousness of solidarity (Heckmann (1992) within ethnic groups. Therefore people who belong to the same ethnic group like those who are addressed by the survey, are functioning as interviewers. This leads to social matching and liking of interviewer and interviewee (Baykara-Krumme, 2013, p. 261).

The theoretical MOVE model was tested empirically based on data collected in a telephone survey being carried out in winter 2010/2011 in the Ruhr (N= 312 ). The Ruhr is a densely populated agglomeration in western Germany with high social and environmental gradients. Due to the hypothesis a quoted survey aimed at reaching households without and with migration background (represented by migrants from Turkey) in polluted and less polluted neighbourhoods (due to noise and air quality) equally.

The telephone interviews have been conducted with co-ethnical Turkish and German interviewers. The Turkish interviewers were fluently in both, German and Turkish language and a team of two men and two women. We chose a team of mixed gender because (Baykara-Krumme, 2013, p. 268) found matching of gender between interviewer and interviewee in surveys carried out with Turkish interviewees. The interviewees have been selected from an online telephone directory for streets with high levels of noise and air emissions, which we identified based on existing environmental data. The interviewees have been contacted in advance by post.

*2.3Methods of statistical analysis*

The hypothesis on relevance of perceived behavioural control as well as that on resources has been tested by multiple linear regression. The test of difference according to the grouping variable migration background (yes/no) was run by t-Test or Mann-Whitney U-Test, depending on normal distribution of the variables. All statistics were run by IBM SPSS 22.

*2.4Results on differences between respondents with and without migration background*

Table 1 gives an overview of the sample. The quota was fulfilled: almost 50% of the respondents have been reached in heavily and less polluted areas. In total more Germans have been reached (64%). But the migrants that have been reached are distributed equally in heavily and less polluted neighbourhoods. 82,1 % of the migrants have a Turkish migration background.

Table 1: Sample of the survey

| | **Heavily polluted** | **Less polluted** | **total** |
|---|---|---|---|
| **Total number** | 48.1 % | 50.6% | 100 % (N=312) |
| **% male** | 49.7 % | 49.7 % | 53.2 % (N= 299) |
| **Year of birth (MEAN)** | 1955 (1921-1992) | 1955 (1920 – 1990) | 1955 (N= 298) |
| **Foreigners** | 24.2 % | 19.9% | 22 % (N= 305) |
| **Migration background** | 37.9 % | 34.8 % | 36.3 % (N= 300) |

The results of multiple regression analysis show that the influence of perceived behavioural control has the greatest influence in predicting variance in coping intention. The overall model predicts 26% of the variance of coping intention. Figure 2 shows a lower perceived behavioural control for respondents with migration background. The difference is highly significant Mann-Whitney U-Test ( $p < .000$). A linear regression to predict coping behaviour shows that coping intention and perceived

behavioural control explain 23% of variance in coping behaviours. Both predictors have a moderate significant influence.
Differences in coping-intention comparing respondents with and without migration background cannot be found in box-plots (Figure 3). Tough some outliers show the mentioning of numerous coping-intention by people with migration background only. The difference between migrants and non-migrants considering coping intention is statistically not significant (Mann-Whintey U-Test $p = .961$). Concerning migration background and coping-behaviour a statistical significant difference between people with and without migration background was found (Mann-Whitney U-Test $p < .000$), at which the median of respondents without migration background is higher. This means that they reported to carry out more coping-behaviour than people with migration background. Figure 4 shows extreme outliers for migrants.

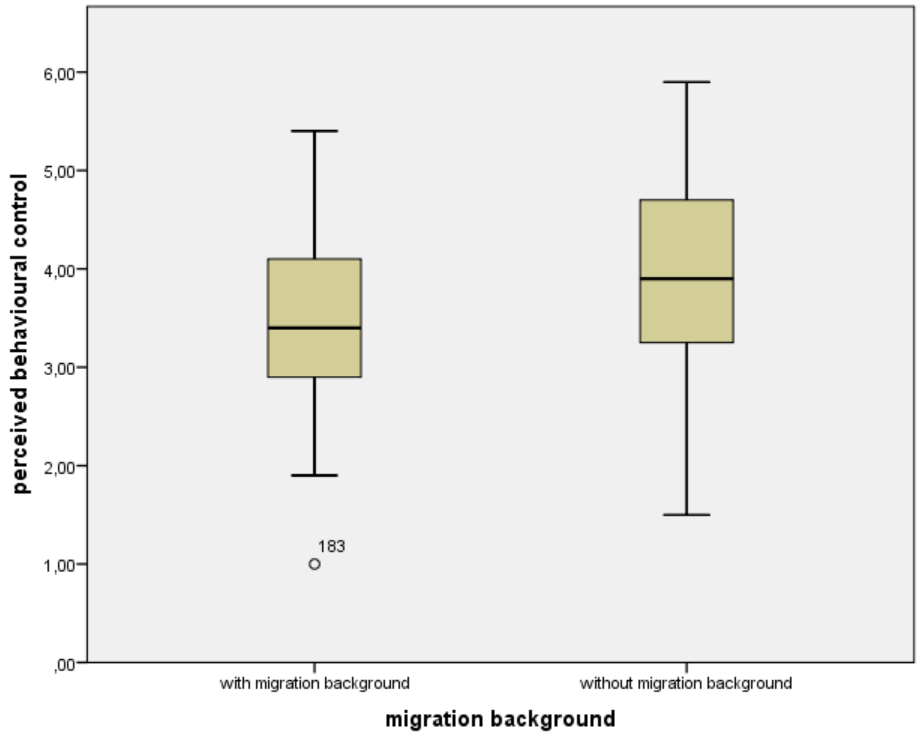

Figure 2: Differences in perceived behavioural control comparing respondents with and without migration background

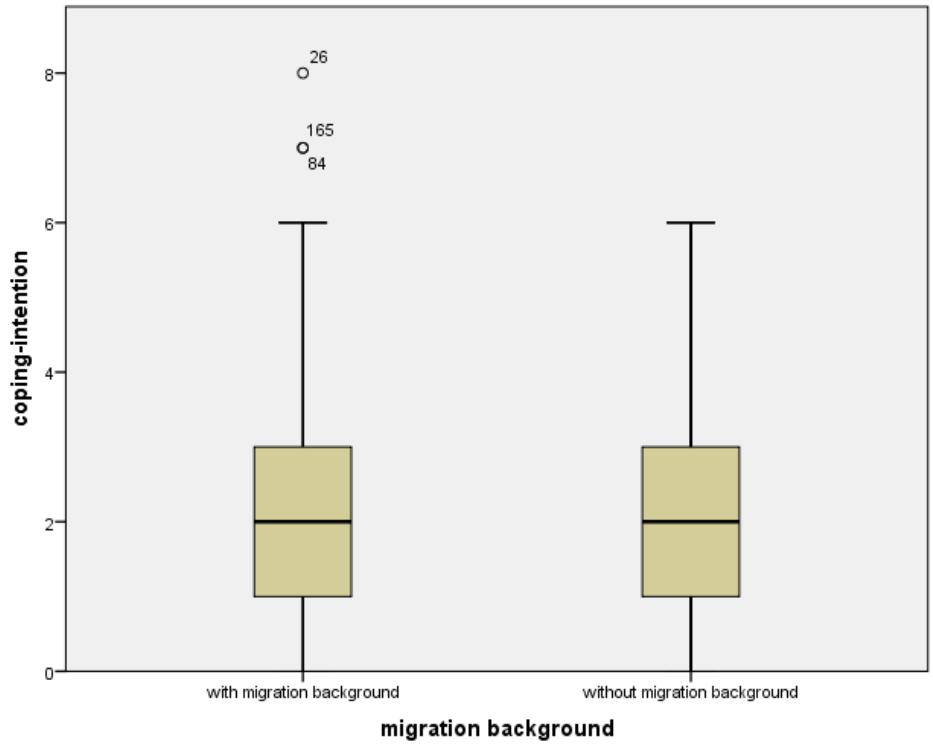

Figure 3: Differences in coping-intention comparing respondents with and without migration background

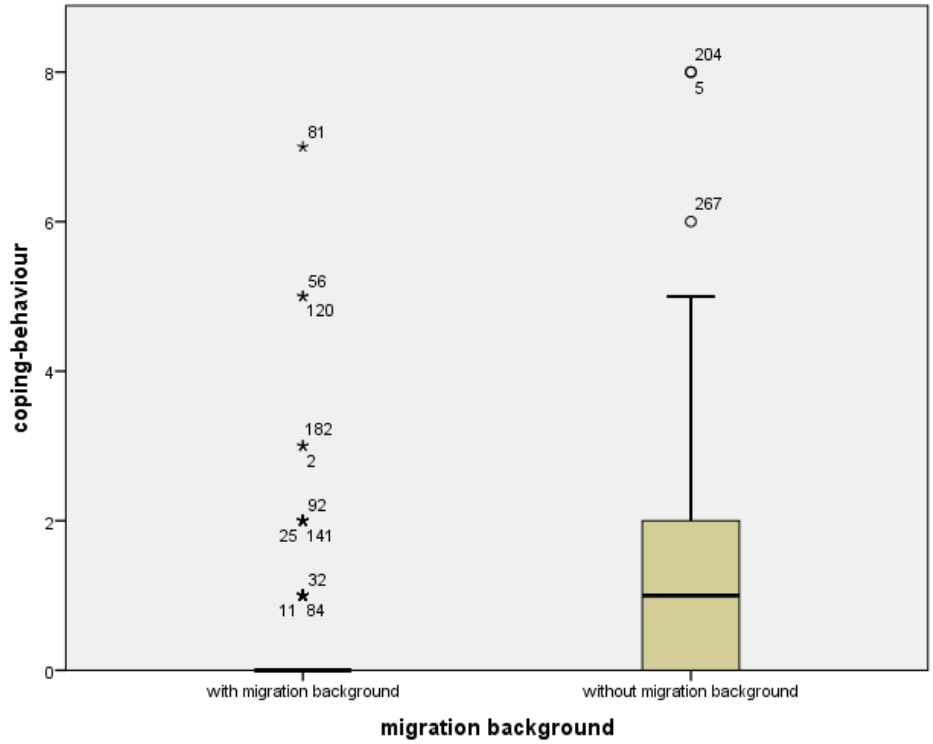

Figure 4: Differences in coping-behaviour comparing respondents with and without migration background

The results of multiple linear regression analyses to predict perceived behavioural control show, that each of Hobfolls categories produced significant variables to predict variances in perceived behavioural control. These are communal mastery, social networks, income and home-owner vs. tenant. Regarding the grouping variables migration background the picture is manifold. Table 2 reports data on those variables that have been significant to predict the variance of perceived behavioural control. Table 2 shows that people with a Turkish migration background differ significantly from people without migration background regarding per capita household income only.

Table 2:Differences between interviewees with and without migration background concerning ressources

| | With migration background | Without migration background | p* | effect-size* |
|---|---|---|---|---|
| **Object Resources** | | | | |
| being a tenant | 70.3% | 69.3% | | |
| **Conditions** | | | | |
| Social networks | 1.417 | 1.48 | | |
| **Personal Characteristics** | | | | |
| communal mastery | 3.859 | 3.903 | | |
| **Energy** | | | | |
| Household income per capita | 820 | 1232 | .000 | –.329 |

Mean average for metric variables, % for dichotomous variables
* only significant values are reported

*2.5Findings on co-ethnical interview design*

88 out of the 92 respondents (=95.7%) with a Turkish migration background carried out the interview in Turkish language. The graph on self-perception of German language skills presented in Figure 5 shows that almost 50% of the respondents with a Turkish migration background reported rather good or very good German language skills. Considering the self- perception of German language skills of those with a Turkish migration background not having a German citizenship most respondents reported language skills of middle-rate. For this ANOVA shows a significant difference ($F$ (1, 88) = 4.597; $p < .035$) within the group of people with Turkish migration background: Language skills of those with German citizenship are better ($M$= 4.08, $SD$ = .954) than those with Turkish citizenship ($M$ = 3.51, $SD$ = 1.19), while *1* represents *very bad* and *5 very good* understanding of German language.
Gender matching between interviewer and interviewee could not be found in the empirical test of the MOVE model.

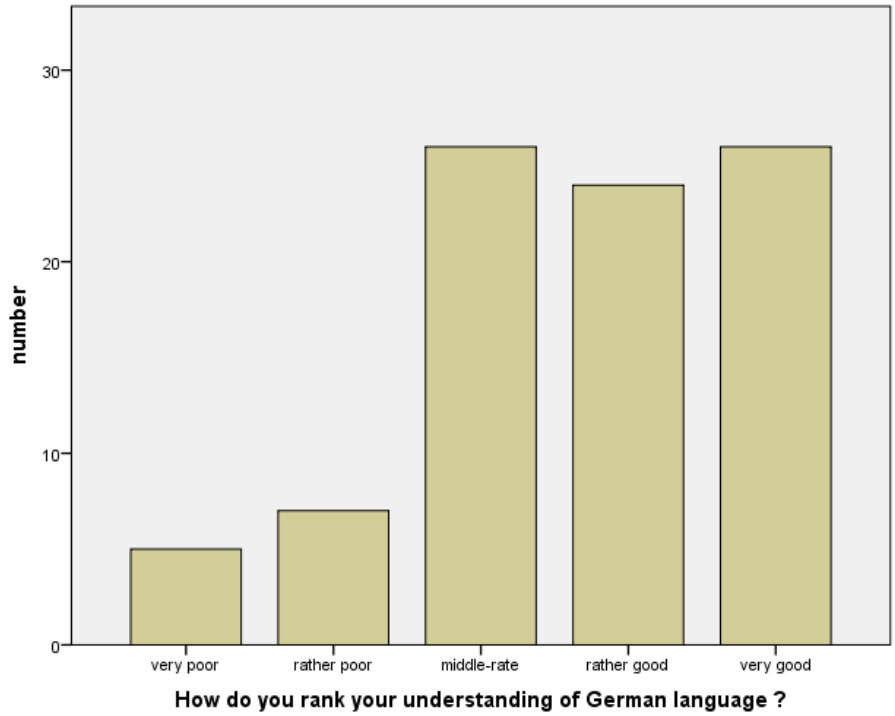

Figure 5: Self perceived language skills Turkish migrants (N=92)

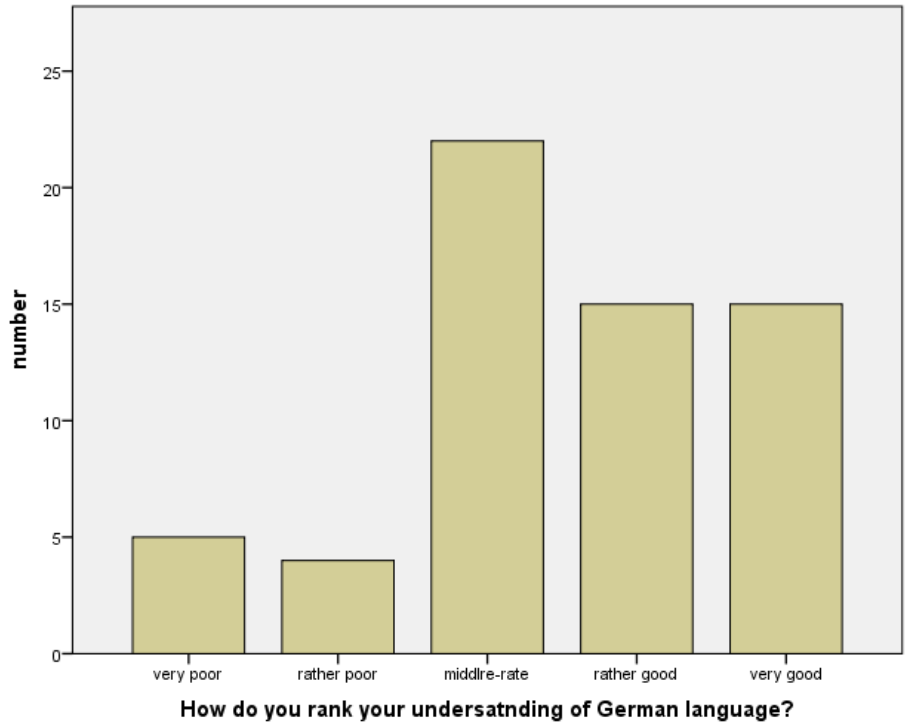

Figure 6: Self perceived language skills Turkish migrants without German citizenship (N=64)

## 3. Concluding findings on co-ethnical research design and future research perspectives.

The research presented here is limited in reaching migrant groups. Although we have been successful reaching migrants in polluted and less polluted neighbourhoods equally, we might have reached more and other people if we would have been able to carry out face-to-face interviews. Furthermore we have been able to reach 312 people in total and 92 people with Turkish migration background. This number is rather small to get an insight in such a heterogeneous group like that of Turkish migrants. So co-ethnical research always is a challenge and requires both financial resources and cultural as well as methodological competencies of researchers.

This methodological approach and results on procedural justice are dealing with prerequisites of planning in an intercultured society: the determinants of procedural justice. To make planning procedures inclusive to different cultures and rationalities the corresponding people have to be able to contribute to these procedures. The good news is, that for the respondents from the Ruhr (Germany) with Turkish migration background, we could not find any difference compared to Germans concerning social networks and communal mastery which are two of the relevant predictors for institutionalised coping, which have been identified in this survey. Also no statistically significant difference was found concerning the intention to cope by different options of institutionalised coping. At the same time the data showed less self-reported coping by people with Turkish migration background and les perceived behavioural control.

So relevant capabilities and intention exist, but they do not lead to intended behaviour, especially not for the group of Turkish migrants. Therefore those responsible for decision making, like planners, have to be empowered themselves to be able to include different rationalities by different groups. Therefore paper like that by (Agyeman and Erickson, 2012) dealing with the education of planners are of high relevance.

Based on the lessons I have learned from the analyses of the MOVE model, I make the claim that urban and environmental planning has to take vulnerability of people into account. Concerning procedural justice a lack of capabilities for meaningful involvement stands for vulnerability. Therefore I claim to introduce the Vulnerability of the Population Principle into urban and environmental planning. (see Köckler 2014)

Learning about different rationalities is not limited to procedural environmental justice. Therefore we use the method of co-ethnical surveys in other fields. At present we contribute to a project on strategies on the municipal level to promote energetic renovation of privately owned dwellings. Here again we get into dialogue with groups of society that are underrepresented today. We hope to contribute in providing information on rationalities for urban planning in an intercultured society.

***Acknowledgement**: The development and testing of the MOVE model was part of the SAVE project, which I was able to conduct while working at the Center for Environmental Systems Research (CESR) at Kassel University. The project on promoting energetic renovation is a joint research project named Sandy (www.sandy-projekt.org) financed by the Federal Ministry of Education and Research (BMBF).*

# 'They have different ways of doing things'[i] Cemeteries, diversity and municipal spirituality

Keywords: cemeteries: multiculturalism: identity

Dr Katie McClymont[1]

*Abstract*

*Cemeteries offer a unique window into questions of multiculturalism in contemporary European cities; and a unique set of problems for planners to deal with. As the second largest type of urban greenspace, cemeteries form an important if forgotten aspect of most cities. However, as places of bodily disposal and remembrance, as well as (potentially) recreation and biodiversity, they present different challenges for planning than those of other green infrastructure, especially in the context of a multifaith population.*

*This paper draws on research from cemeteries in the UK which questions their role in presenting and promoting local identity, and accommodating multifaith and multicultural practices. This reveals different understandings of group and individual identities- between those seen as 'indigenous' or 'immigrant' with assumptions of homogenous wishes for members of the latter category- demonstrating the ongoing power of ideas of ethnic or religious difference - or deviance from an imagined 'norm'.*

*The paper goes on to suggests that a more nuanced understanding of cultural and religious difference can not only provide more appropriate places of remembrance for everyone, but also demonstrate the importance of a different type of sacred space. This is defined in the idea of municipal spirituality: places which demonstrate and allow access to non- instrumental, or transcendental values without being part of, or 'owned' by any organised religion. This is not only important in the planning of new cemeteries, but in reasserting the value of other places which can also fulfil this purpose.*

Keywords: cemeteries, place attachment, multiculturalism,

## 1. Introduction

Cemeteries, and 'deathscapes' (Maddrell & Sidaway, 2010) more widely (all places of death and remembrance), express something intrinsic about the meaning of existence, the beliefs, hopes and emotions of both individuals, families, communities and wider society (Kellahear, 2007). Moreover, public cemeteries, although sharing many characteristics with other 'deathscapes', hold a unique position in as much as they aim to serve the entire local population regardless of faith. They are simultaneously public open space with all the attendant issues of (in)appropriate behaviour that this engenders (Deering, 2010). They are places where fundamental beliefs about existence and meaning can be simultaneously expressed and practiced in divergent ways. They function as 'a cultural text about society and the individuals that have found their last place of rest in its burial lots' (Reims, 1999, p150) and by their nature, multi/non-faith cemeteries provide a public record of the deceased inhabitants of that place, become a physical representation of the changing cultures who live and die within that city.

However, the meaning and interpretation of this space by and for diverse groups is not readily accessible. This is especially the case in relation to their role in facilitating 'continuing bonds' between the dead and living (Maddrell, 2009a, 2013). Cemeteries, and other 'deathscapes', can be the

[1] Department of Geography and Environmental Management (University of the West of England, Bristol, UK) katie.mcclymont@uwe.ac.uk

physical location of relationships between bereaved people and their deceased friend or relative. As such, they are important in the maintenance and expression of identity, of both the living and the dead. They mediate representations of personal, group and civic identity. As built form, they are part of the public representation of collective memory, or the landscapes which influences our ability to make sense of our own lives (Hayden, 1997). This complex role as a material repository for memory has implications for the public memory of the city: 'public memorial practices, monuments, and other highly symbolic markers inscribe meaning on space' place' (Graham & Whelan, 2007, p488, see also Burk, 2003). Place and identity are entwined in a complex symbiosis. Within these physical and psychological battle grounds the way diverse groups are constructed and dealt with by the state are negotiated. The physical manifestation of identity are played out within dominant power structures, with certain groups being more able to claim somewhere as theirs, or as part of their story: 'particular narratives will always be privileged in attaching memory to place'(Graham & Whelan, 2007, p488).

This paper presents research into contemporary UK cemeteries which begins to unveil divergent conceptions about place attachment and memorial practice between those who are seen as ethnic or religious 'others', versus the majority 'indigenous' population. To do this, the paper draws on interviews with cemetery managers, and extensive visual data of the cemeteries in the same cities.

## 2. Research Background

This research engages with the current discussion within academic literature around cemeteries, place attachment, and about multicultural and national identity. It raises issues which frame the consideration of cemeteries' role in multicultural cities.

### 2.1 Cemeteries in the city

This section will outline the ideas and issues relevant in discussions of cemeteries and place identity, and public history. It is now a well-rehearsed argument (Massey, 2005) that places and spaces are not static backdrops to be filled with meaning by actors or by a notion of culture which can be separate from the place in which it happens; "space, like other commodities, is *itself actively produced"*(Merrifield, 2006, p105, p107 emphasis in original). More specifically, the paper begins with a discussion about the role and purpose of cemeteries, and what the implications of this are for thinking about multicultural cities: or how the production of cemetery space represents and creates the society within which it is found.

Contemporary cemeteries simultaneously play both a public and private role in society, however their exact status is less clear now than in previous decades. Established in the eighteenth century are a 'proper place of death', cemeteries were seen as a hygienic alternative to overcrowded churchyards. Moreover, their expansive green landscapes were seen as offering recreational spaces to a wider population than the deceased and their families, and also playing a symbolic role as public landscape (Rugg, 2006). Since their inception in the eighteenth century, their status as a 'proper place of death' has become eroded. These different aspects of cemetery space place competing demands on the same site, only added to by the increasing diversity of cities, and the attendant range of diverse faith based requirements these contain. Francis et al (2005) see potential issues with the cemetery's role as green space, seeing parks as active places, but cemeteries, particularly referring to Abney park cemetery in London as places of tranquillity and *inaction.* This issue will be discussed further with reference to the notion of municipal spirituality, or the role cemeteries could play in offering inclusive, spiritual spaces.

This ongoing tension between cemeteries as a place of public promenade, and private reflection, coupled with a shift away from burial and towards cremation further confuses their spatial significance. As Rugg (2006) argues, "after World War II, cemeteries had begun to lose their importance as a communal context in which grief could be framed" (p225). The notion that cemeteries have been losing their shared meaning in the post war period also has implications for memorialisation of other parts of the city. Partly due the loosening ties of religion and societal convention, and partly due to changes in technology, Kellacher and Worpole (2010) argue that there is

"increasing temporal and spatial separation of the forms of bodily disposal and rituals associated with the commemoration of the deceased" (p161). This implies that as the context for grief and mourning has become more personal or individualised, the shared space of the cemetery in the city no longer holds shared meaning amongst its citizens. The diversification of faith and cultural practices will play a part in this, however, they are not explicitly considered within this literature This loss of shared meaning has implications for both how practices within the cemetery can been deemed legitimate or not and its overall role in the city.

This notion of (il)legitimate behaviour is especially visible in the debates about (in)appropriate memorialisation. As has been well documented in both academic literature and the popular press, the ways in which graves and other memorials in cemeteries are marked has caused recent controversy. Issues around what sorts of items are suitable to be left on graves or trees, as well as inferring assumptions about good taste, also relate to ideas of what is legitimate in a space which is neither exclusively public nor private. Woodthorpe argues 'there are powerful normalising discourses in the cemetery about what constitutes 'fitting' memorialising activity" (2010, p131). This in turn has implications for practices which are deemed as outside the UK cultural norm: practices pertaining to 'other' faiths and traditions. Further, "memorialisation can be interpreted as a form of mourning activity that can be subjected to scrutiny" (Woodthorpe, 2010, p123). It is something which can be observed, and from these observations judgements can be made about what sort of practice this is. This raises the question of who is doing the judging, and how personal memorialisation interacts with public policy or civic and national ideology. Cemeteries and other public memorials are placed within their wider context, and contribute to the politics and meaning of this context. Looking at mourning practice therefore investigates more than just cemetery aesthetics. As Graham & Whelan argue, 'individual and collective identities are inflected by conflicting ethnonationalist ideologies that entwine private grief with memorial practices sited in public space' (2007, p478). This is vital when considering the role of cemeteries as part of the public memory of multicultural cities. The methodological implications of this are discussed in greater depth later in the paper.

These issues raise further questions about the role of the cemetery in the city: what is their role when cities are no longer so unitarily ordered, and places take on multiple individualised, personalised or privatised meanings? This links to concerns about public management of multicultural identities and 'alternative' spiritualities. Further, what legitimacy do civic authorities have in deeming behaviour as appropriate or inappropriate? Despite these concerns and questions about their civic function, 'each and every cemetery is the most concentrated repository of mystery and secret that is available to modern, urban twenty-first century people" (Francis et al, 2005, p215). Cemeteries, or 'deathscapes' more widely offer access to a sense of 'something beyond' the materiality of everyday life. Without being owned by of any given religion they are places for 'expressing continuing bonds embodying and evoking an active sense of the absence-presence of the deceased in the lives of the bereaved' (Maddrell, 2013, p510). Therefore, they are very importance, if not sacred, places to a wider range of people who may not express this attachment in the same way. It is therefore necessary to consider ideas of place attachment, and what this means in contemporary multicultural, multi-ethnic multifaith cities.

## 2.2 **Place attachment and belonging**

There has been a marked increase in research around ideas of place attachment in the last ten to fifteen years, with the literature spanning geography, economics, ecology and social psychology (Lewicka, 2011, Manzo & Devine-Wright, 2014), discussing both the personal and societal implication of attachment to place, how it manifests amongst different groups and in multiple geographies and time periods, and the appropriate methods for researching the concept. Lewicka argues 'that despite the growing number of the so called non-places…not only have places not lost their meaning but their importance in the contemporary world actually may have grown'(2011, p209) invoking the persistence of 'dwelling' as a key aspect of being human (Heidegger, 1962; Tuan, 1977). This is something which is echoed in the deathscapes literature, around places of continuing bonds.

Lewicka's (2011) review covers an extensive range of issues such as difference between urban and rural attachment, homogenous and heterogeneous communities, issues of scales and notions of 'home'. However, this review reveals little research into in-migrators sense of place attachment, be these people from different regions of the same nation or beyond. There is some consideration of visitors to places of high natural amenity value, and suggestions that length of residence increases place attachment, but beyond this, the topic remains largely unresearched in these specific terms.

However, issues around immigrant groups and established minority communities role in the symbolic making of the nation raise important issues for thinking about place attachment. This is considered in work about immigrant identity and hybridity (Bhabha, 1994, Hall, 1996). Hybridity is the merging or blending of an 'old' identity with a new one, based on a shift in geographic location: or migration. The concept has been criticised for assuming stability or naturalness of identity (in either old or new context) and for not seeing the temporal, cultural or political construction of these identities. However, the concept of multiple, differently rooted identities, and how these play out politically on the built form of cities, specifically within cemeteries, is important and underresearched. Importantly, 'the question is how well the immigrant sense that he or she is indeed 'home' and the extent to which he or she can shape this new home to reflect his or her own sensibilities'(Kaplan & Chacko, 2015, p129). With regard to deathscapes and memorialisation this raises importance questions around final resting places, connections with the (new) home versus bodily repatriation to country of birth or ancestry. This matters beyond the cemetery as 'places of memory act as a means to give them visibility as persons and citizens in the countries of reception' (Buciek & Juul, date p119). Cemeteries therefore hold the possibility of establishing the legitimacy of immigrant and minority ethnic groups as part of the 'host' society. However, this is a difficult and complex issue as expressed by Reims in her research into Swedish cemeteries and immigrant graves:

> 'Because Swedish identity is the norm at a Swedish cemetery it does not need to be enhanced. Symbols and customs have to deviate from the norm, thereby creating a boundary against the majority in order to serve as markers ad expressions of ethnic or cultural identity. However, when practices in accordance with Swedish norms are deployed on immigrant graves, *they deviate from the tradition of provenance* and consequently become significant as markers that express a far from self-evident identification with the surrounding culture '(Reims, 1999, p152, emphasis added)

This means that it is not as simple as migrant/minority groups simply assimilating to 'host' practices to become part of that nation. Their very nature as 'other' disallows this, and in turn, unsettles the meanings of the traditional indigenous practice. Moreover, these issues raise more fundamental questions about who can be part of a 'nation', and how identity is claimed or denied to different groups. This process of differentiation, or 'othering' is shaped by the legacy of colonialism and creation of a nation by a process of excluding those deemed as others (Anderson, 1983, Said, 2003 Gilroy, 1986, Young, 2000). The legacy of this ideology remains and goes beyond immigrant groups: people born in the UK, whose parents were also born in the UK are still placed into this 'other' category because of assumptions about their religion and phenotype, and how this differs from the assumed 'norm' of the nation of Britain. This leads to certain groups being reified and fixed as stable 'others' with specific needs and requirements which deny differences within that group.

As Beebeejaun (2012) clearly argues in relation to minority ethnic community engagement in planning, laudable 'efforts (for inclusive public participation) were undermined by the persistence of an older discourse of race and ethnicity which stressed the essential, natural, cultural nature of difference, and downplayed the socially constructed, contingent and contested nature of communities'(p545). Local government officials consulted with established faith or cultural group 'leaders' to try to understand the needs and wishes of these groups whose voices had been previously excluded or underrepresented. However, by establishing these groups as the spokespeople of the 'others', their position as beyond mainstream UK society is reinforced. Moreover, by establishing certain fixed groups who have specific and unchanging ways of doing things, power relations within those designated groups are reinforced, with negative implications for many, but especially women and younger people (Okin et al, 1999).

This research illustrates the ongoing impact of this orientalist thinking, and considers what it means for cemeteries as sites of public memory in diverse and multicultural cities.

## 3. Methodology- visual and verbal

The paper has so far presented discussion of theories of identity: both place identity and perceived or imposed national identity, and the importance of these ideas for thinking about the role of the cemetery in the contemporary, multicultural city. This section outlines both the methods undertaken to investigate these issues- interviews and photographs-and considers their relevance, importance and limitations as ways of knowing about multiculturalism and (place) identity. In particular, it discusses the importance of visual methods in this research, and in researching cities more generally.

By their nature, places provide 'an assault on all ways of knowing'(Hayden, 1997, p18), so the question of how they can be researched and represented is a perennial one in geography and related spatial disciplines. Discussion of visual, and other non-textual methods is becoming well developed within geography, anthropology and sociology (Pink, 2001, Rose, 2012Harper, 2012). This covers both the analysis of photographs as (neo-colonial) text, photographs for use as discussion points in interviews, and creative methods in which participants are asked to take photographs, often as part of wider 'sensuous' ways of understanding places (Johnston & Lorimer, 2013).

Photography is associated with demonstrating a 'true reality' of any situation and of documenting everyday life, conveying a feeling that 'visual methods give better access to the immediate lived and felt everyday world. Hence, visual methods can help researchers to 'come closer to lived life' (Oldthrup & Cartsensen, 2012, p226). However, this idea of photography as anything other than another produced interpretation is widely critiqued (Crang, 2010). Photographs are as situated, constructed and interpreted as any other form of research data: 'the meaning of photographs are arbitrary and subjective; they depend on who is looking' (Pink, 2001, p51). This does not undermine the importance of visual evidence and experience, and insurmountable difference between it and written or spoken material remains: 'the world that is photographed, drawn or otherwise represented visually is different from the world that is represented through words and numbers'(Harper, 2012, p4).

When research multicultural identity in cemeteries, my position as a white western researcher is problematic. In looking for immigrant and minority ethnic grave markings/memorial practices, I define, and therefore reinforce these orientalised, supposed boundaries of who is an 'insider' and an 'outsider' from a position of power, both in my cultural upbringing and also my position as an academic. This may be particularly problematic in photography as the object photographed has no voice in the way interview participants do. However, the photographed object itself is represented more literally, more completely, than edited and analysed interview transcripts. However, my choice of what to photograph and present is unavoidable.

With these considerations in mind, this research consists of in-depth, semi-structured interviews with nine cemeteries managers from across England and Wales. When quoting from the interviews, the text has been anonymised with a number replacing a name/place of work. This is so that the reader can identified quotes from the same person. It also consists of photographs from the cemeteries in the same cities. The paper presents a small sample of these, and the comments and analysis are made on the basis of the wider range of images. In the following discussion about identity and exclusion, photographs are used to both support and challenge the assumptions which come out of the interview data. Although readers will interpret them in different ways depending on individual background, experiences, and interest, positioning the photographs in this way- as illustrates- position them within the argument they are there to illustrate.

## 4. Findings

The following sections discuss how cemetery managers perceive place attachment in their sites, and how this is represented visually. Both accounts clearly demonstrate the importance of local identity in continuing bonds with the deceased. Further, the interviews with cemetery managers demonstrate their understanding of the need for culturally sensitive provision in multi-ethnic, multi-faith communities. However, these two understandings of the public diverge, and faith needs or attachments replace place ones, rather than overlap or mingle. This reinforces the notion of insiders and outsiders, those who belong, and those who are guests. Moreover, the research also indicates that matters may not be this simple. Firstly, cemetery managers observe that practice amongst 'non-indigenous' groups does not simply adhere to stipulated religious or cultural rules or norms. Secondly, as demonstrated by the photographic research, non-indigenous religious or cultural practices do not necessarily exclude local place attachment. These points are set out in turn below, with detailed discussion of photographs and interview data.

### 4.1 Place attachment matters

Figure 1: Flag above graves in Blackley Cemetery, Manchester; Scarves on memorial bench in Allerton Cemetery, Liverpool; Wales flags on graves in Thornhill Cemetery, Cardiff

Visually, cemeteries demonstrate that place matters. Within the cemeteries photographed in this research, place of origin or residence of the deceased what frequently inscribed on gravestones and memorial plaques (See also Maddrell, 2009b) or grave markers (flags, balloon, trinkets, scarves) express locally based identity. Figure 1 further illustrates this.

All interviewees mentioned both local attachment to cemeteries and different (minority) religious/immigrant groups. There was a strong view, across all cities, that local residents remained closely attached to their local cemetery, rather than happy to use any within the city that offered space, better financial value or any extra facilities. A sense of shared belonging in local identity was expressed in statements such as 'they're disappointed that they haven't still got their local cemetery' (Cemetery manager 1), and 'its almost a tribal thing where they're linked to that particular cemetery'(Cemetery manager 2) emphasising a collective being (they), when referring to the difficulties seen in some cities with getting people to accept new sites. This sense of neighbourhood identity was so much so that it was often cited as influencing disposal choices: 'families that are local there, would even consider cremation...rather than be buried at (other cemetery on other side of the city)( Cemetery manager 3). Managers stated that they either provided space, or planned to provide space, for the scattering of ashes and memorial plaques in cemeteries which were otherwise full, for residents of that neighbourhood or local community. This sense of local attachment often went beyond a desire to be buried/memorialised near to living loved ones, as many managers stated that a sense of local identity was so strong that people often wanted to be buried back in cemeteries which are close to their 'original' home, despite where they may have resided at the time of death. This

further suggests that there are 'continuing bonds' with place as well as with people, and that place identity is fundamentally intertwined with individuals' sense of their self, that place is part of the 'sacred quality...associated with a sense of 'continuing bonds' (Maddrell, 2009b, p36).

### *4.2 A different sort of attachment?*

Issues surrounding cemetery provision for multicultural, or more frequently, multi-faith communities came up in all of the interviews. Cemetery managers saw their sites as mirroring the society and cities of which they are a part, 'we all...live...with different beliefs and denominations when we're alive, you know, so why not when we're dead?'(Cemetery manager 4)

Figure 2 (clockwise from top left): Chinese war graves, Efford Cemetery, Plymouth; Grave with Sikh markings, Blackley cemetery, Manchester; Polish Roman Catholic Grave, Hollybrook Cemetery, Southampton; Belgium war graves, Southampton Old Cemetery

Figure 2 illustrates some of the different national, religious and ethnic identities visible in the cemeteries within the study. Simply by marking the death of much of a city's population, they provide public memorials to the diversity of the city. There are important caveats about both faiths and individuals who choose not to be buried, nor to have their cremated remains marked in a public cemetery, but cemeteries physically memorialise and display a more diverse public history that any other aspect of most cities (cf Hayden, 1997). The images of Belgian and Chinese war graves illustrate a less seen war history, questioning a notion of nationhood, and national soil dominant in such narratives. Symbols of Sikhism and Roman Catholicism are evident next to graves without such notable religious markers, and are illustrative of many multifaith areas seen and photographed across the nine cities. The images represent a small sample of the visual material evident in UK cemeteries, demonstrating their potential in telling a more diverse history of their attendant cities that dominant nationalist discourse may show.

The above images illustrate UK cemeteries as mixed multi-faith, multicultural spaces. This was backed up by the comments made in interview by all the cemetery managers. Most stated the importance of non-denominational, interfaith space in statements such as '*I have Hebrew and Muslim and they're next door to one another...that's what this cemetery's about'* (Cemetery manager 5), however, this was not always reflected in practice and interaction with community groups. Most managers stated that they had been approached by faith groups wanting to establish specific areas

within the cemetery. Responses ranged from ambivalence about whether this would cause future problems by not leaving enough space without designation, to responding positively to requests: *'if we've been approached by any particular culture that have asked us to reserve an area for them, that's something we've done, and would still be willing to do'* (Cemetery manager 3). Further, some national or cultural groups, though not creating officially designated areas within the cemetery, would be buried close to others from a similar background as *'they tend to want to be in the same sort of location'* (Cemetery manager 6). This illustrates the diverse practice in the management of cemetery space, but one which is informed by a mind-set of 'insiders' and 'outsiders'. Cemetery managers talked about the general public as 'they', but differentiated this 'they' from the seemingly established and fixed group identified given to those belonging to an 'outsider' community. This is further illustrated in the following quotes:

*'The West Indian community for example, generally the women will sing and the men will backfill the grave at the end of the service, you know, and that's something that the West Indian community often do' (Cemetery manager 4)*

'*The Polish Community tend to be right on the case in terms of maintenance, and do visit regular. Whereas some of the other faiths, you don't see people from one year to the next' (Cemetery manager 6)*

*One of the reasons the Asians come here is they can park their coaches, they can't park them at (facility in neighbouring authority' (Cemetery manager 2)*

The way cemetery managers dealt with faith/cultural/national groups is markedly different from their discussions of members of the public not designated in this way. The importance of local identity in relation to the cemetery is not mentioned. Identity for those groups is about their religious or cultural needs rather than any continuing bonds with the local area. This is not to be critical of cemetery managers, or to suggest that they making prejudice assumptions or treating certain people in a less valued way. Judgements which divide between 'insiders' and 'outsiders' in terms of national identity are framed by dominant ideologies of the nation, which frame how public official deal with 'diverse groups'(Beebeejaun, 2004, 2012).

### 4.3 Hybrid attachments?

However, evidence from the research illustrates that this is more complicated. A number of managers noted that memorial practices did not always stick to the 'rules'; either the rules of the cemetery, as is well noted more widely in the literature (Woodthorpe, 2010) or the 'rules' of the religion. Specifically managers commented on large ostentatious headstones on Muslim graves[2], when the assumed 'rule' is not to mark the plots: *'the Jewish section particularly is very strict and controlled, like the good old days of the other cemetery. The Muslim section is now, is actually starting to get away from it, they now are having western headstones, and they also have an awful lot of solar lamps'* (Cemetery manager 1). This comment which is typical of many made by cemetery mangers illustrates that cultural practices are neither fixed nor bounded. Further, there are local differences rather than static religious practices which do not alter between locations, as evidenced by the range of services offered in different locations. Some authorities offered burial within twenty-four hours, including weekends,

[2] The majority of such comments were directed towards practices in the local Muslim community, rather than Jewish or other faith groups. This may be because Muslim populations were larger and more prevalent in the cities in this research than other faith/immigrant groups. Further, it may be because, at the time of writing, British Muslims were subject to a large amount of Islamaphobia and hence their practices coming under sharper scrutiny by those outside the faith. It may be because Jewish burial ground and space within municipal cemeteries are more historically established and hence more taken for granted rather than problematized. It is beyond the scope, focus and findings of this research to do more than speculate on this matter, but it has been noted as both potentially important and interesting.

for religions that 'required' this; others did not as there was not seen as the demand for this, especially if it meant an increase in burial fees despite areas having similarly sized Muslim and Jewish populations. Despite cemetery managers working assumptions about cultural or religiously bounded identities, evidence from cemeteries suggests that this is an oversimplification. One manager commented on this, saying *'I think we're a bit hoodwinked…I think because we don't really know, we tend to listen, and different parts of the community want different things, and we end up jumping through hoops in case we get it wrong!* ***I think we deliver far over and above that they would actually deliver for*** *themselves' (*Cemetery manager 7 *emphasis added)*. This quote is revealing on two grounds. First, it acknowledges that there are difference between Muslims, and that cultural practices can be, and are, negotiated on grounds of practicality and cost. Second, despite doing this, it reinforces the idea of 'them' and 'us', as evidenced in the final part of the quote. The next section turns to the photographic data to discuss why this position is potentially inaccurate and problematic

Figure 3: Efford Cemetery, Plymouth, Hollybrook Cemetery, Southampton Gravestone, Highwood Cemetery, Nottingham

Figure 3 illustrates three examples of gravestones which demonstrate the complexity of identity and reject simplistic, discreet and fixed notions. They can be seen as examples of hybridity, but going beyond a notion of this as something which is only meaningful for 'immigrants'. The first photograph illustrates graves of people both of SE Asian (Chinese) descent and of while British origin. It is traditional for SE Asian graves to display photographs of the deceased, but what can be noted here is this is also displayed on the white British grave, paralleling cultural interchange discussed by Reims (1999) but in this case with 'natives/nationals' taking on 'immigrant' practices, raising problematic questions about authenticity, and suggesting hybridity can be a two way concept. This seen elsewhere in the cemeteries visited. Dual, or multiple, identity- simultaneously a Jewish and British war grave, but also located in a particular place (Southampton) are can be seen in the next photograph. This suggests connection to place, country and faith/culture; tentatively indicating that these identities are not mutually exclusive. The third photograph is perplexing and hard to draw any definite conclusions from. A western/English name and inscription are below stylised Arabic characters, suggesting some sort of cultural crossover/blurring of boundaries, again problematising hybridity as a phenomena only of 'incomers'.

Figure 4: Muslim graves, Hollybrook cemetery, Southampton, Gravestones (2), Filton Cemetery, Bristol

The photographs in Figure 4 further emphasise this point. The first, bearing an inscription partially in Arabic, and located within a Muslim section of the cemetery, point to minority faith adherence, whilst the statement 'resident of this isle since March 1958' indicates the importance of local place attachment. The second two gravestones in this figure express local place attachment for people born outside of the UK: 'finding freedom, peace and final rest in Bristol' and 'great Hairdresser to the community'. If this was not of importance to either the deceased or their relatives, it is unlikely that it would be included on a gravestone inscription.

All the images in figure 4 suggest a greater degree of cultural flexibility and multiplicity than a simplistic notion of a majority who negotiated continuing bonds, and connect to community and meaning through their local place, and a minority who do the same only via religion or national (diasporic) identity. It further undermines claims of insiders and outsiders, based on shared national identity and values, placed in opposition to 'foreigners' who are constitutively different. The photographs are representative of other graves, but as stated in the methodological section, products of the research and open to interpretation. The paper suggests that these images undermine dominant discourse of nation and belonging, rather than understand the motivations or emotions of those who placed these stones. This, in turn, raises questions about the role of the cemetery in the city, as places which can firstly represent (and promote) a different understanding of local identity, and secondly offer a space which connects with spiritual or transcendental values without being owned by one designated, fixed identity. The following section explores the implications of this in greater depth.

## 5. Discussion

The paper has illustrated that cemeteries in contemporary UK cities act both as markers of national, religious and cultural diversity, and concomitantly question the meaning, fixity and interpretation of these categories of identity. Their practical and symbolic functions in the city are therefore contested. Practically, they are 'multifunctional' (Woodthorpe, 2011), offering space for both recreation and remembrance, and having to manage the competing interests that these different functions bring. Symbolically, as 'cultural landscapes (they) function as significant sources for unravelling present geographies of contested political and cultural identities'(Graham & Whelan, 2007, p477). Moreover, they are places which remain largely forgotten by UK planning (McClymont forthcoming b). This leaves then as complex, important spaces which UK planning does not deal with satisfactorily. This may be because of this complexity of meaning and function, but also because cemeteries offer access to non-instrumental values, something that planning has limited or no vocabulary for. Cemeteries offer spaces for public memory which illustrate different constructions of identity that those within dominant discourses. Simultaneously, they are places of spirituality and mystery, of connection to that which is beyond material existence (Francis, etc al, 2005, Maddrell, 2013). Furthermore, public, local authority cemeteries do this outside of any established religious framework, offering spaces of 'municipal spirituality' (McClymont, forthcoming a). Municipal spirituality is a language which planning could use to promote and defend places such as cemeteries, which offer access to shared human values which are beyond instrumental rationality. In so doing, it would be able to promote their value as shared, diverse, tangible civic history, one which diverse identities can legitimately claim shared yet separate local place attachment.

## 6. Conclusions

Cemeteries are places where both grief and continued bonds with the dead are allowed to continue beyond the 'legitimate' timescales afforded by modern sociality (Maddrell, 2013.) Attachment to this space is therefore of utmost importance. Cemetery managers can see this with regards to the needs of bereaved people being their key priority. But the way they see the bereaved is still framed by neo-colonial ideas of ethnicity and difference, meaning that ethnic/religious others are given faith/cultural attachment instead of local place attachment. This leads to questions of how the cemetery operates as a material site of public memory. On the basis of the interviews, public memory is one of separateness, rather than one of shared and changing of local history. However, the photographs suggest that this is not the case: local place attachment and minority ethnic religion are not necessarily mutually exclusive.

Managers' differential views of minority and (assumed) majority groups are problematic, as it appears to suggest that minority religious faith/practice and local place attachment in the UK are non-compatible. In terms of practical considerations, there were no discussions as to whether groups or individuals from minority religious faiths would also prefer cemetery space in their immediate locality, whether local identity also was part of their notion of continuing bonds.

The importance of the cemetery, according to the managers, is different for 'immigrants' than for the indigenous local populations, and the groups are articulated as discrete entities. For the former it is about expressing a religious, and different (Reims, 1997) identity- and it is within this religious practice and tradition that continuing bonds, and all the attendant meanings described above, are expressed. For the latter, it is about expressing attachment to place and continuing bonds with the deceased- through place and local identity- what it means to be me.

Moreover, this maintenance of 'insider/outsider' as primary categories of (local) identity diminishes the role of cemeteries as public memory of whole, multi-cultural city. Instead, it still operates as finding a space for 'immigrants' positioned as guests rather than participants or citizens. These assumptions and relations have specific implications when considering cemetery *space*. Whether planning is able to rearticulate these spaces as places of shared access to different sets of values- ones which stand against the dominance of economic rationality remains to be seen, as does whether these places could challenge the neo-colonial discourses of 'otherness' in place attachment.

# Schools as instruments of neighbourhoods

Dipl.-Ing. Stefanie Oestreich, M.Sc.

TU Dortmund, Faculty of Spatial Planning, Department of Urban and Regional Sociology,
Stefanie.oestreich@tu-dortmund.de

Key words: neighborhood development, school segregation, gentrification

*The paper discusses the importance of bringing different professions and actors together in order to create new approaches to deal with challenges in multicultural and socially diverse neighbourhoods. It puts its focus on education in neighbourhoods and points out that urban planning cannot be reduced to the physical environment but needs to include social issues for neighbourhood development.*

*The paper concentrates on the project "Campus Rütli-CR²" in the district of Berlin-Neukölln, which is the concept of integrating primary and secondary schools to a community school imbedded in an education network of day cares and recreational facilities as well as social institutions and education projects. Campus Rütli-CR² understands itself as a living environment with the target of a positive neighbourhood development and identifies the multicultural diversity as a great opportunity (Bezirksamt Neukölln von Berlin, 2015[1]).*

*Based on own researches, the paper discusses the significance of schools as part of neighbourhoods Many areas with special development needs are facing the problem that well-educated parents are moving once their child reaches school age (Häussermann, 2006). Schools are one cause of segregation tendencies within cities which spatial planning needs to consider (Frank, 2011).*

*In this paper I am arguing that education networks and schools are essential instruments for neighbourhoods which ask spatial planning to work closely together with professions of the field of pedagogues.*

## 1. The city and its neighbourhood and schools

The city is a social space which is in Germany increasingly dealing with socially and economically unequal neighbourhoods due to a polarization of incomes and the differentiation of life styles. In the selection of different milieus through residential segregation is the desire for living in neighbourhoods with your own kind in which a similar way of living is practiced of great importance (Häussermann and Siebel, 2004). These segregation tendencies are spatially identifiable: middle-class and financially stable neighbourhoods and neighbourhoods in which manifold problems and a high percentage of inhabitants with migration background concentrate and which can be even detached from the cities general development are shaping contrasting social and spatial conditions. With an increasing segregation the homogeneity of students in the neighbourhood schools is also increasing. German urban development discussions are pointing out that the student selection at primary schools is reflecting the social situation of neighbourhoods (Fritsche et al., 2011). Focusing on the segregation of students with a migration background a German study underlines that the unequal allocation of students with migration backgrounds at primary and secondary schools is the result of an unequal distribution of people with and without migration background in German cities (SVR, 2013).

This leads to challenges at schools in multicultural and social diverse neighbourhoods which pedagogues are facing. In these areas the conditions at schools are often a reason why middle class families and families with strong educational ambitions are moving once their child reaches school age (Häussermann, 2006). And those who stay are developing strategies to enrol their children in schools in other neighbourhoods with better reputation (Noreisch, 2007, Simon-Philipp, 2011).

Challenges in social diverse and multicultural diverse neighbourhoods should not only be addressed by physical improvements of the neighbourhood´s infrastructure. An approach that has been identified and is included in urban development programs which aim to improve the living conditions in neighbourhoods of manifold problems such as the German urban development program ´Soziale Stadt´.

The same program was also the frame in which the first steps for the education project ´Campus Rütli – CR²´ were developed. The project is located in the capital of Germany, Berlin, in the northern part of the district ´Neukölln´ in the neighbourhood ´Reuterkiez´. The ´Reuterkiez´ can be characterized as multi-cultural and socially diverse. It belongs to one of Berlin's hot spot districts of manifold cultural and art life as well as a going out area reflecting multiculturalism. Facing on the one hand an increasing number of financially stable inhabitants belonging to the middle class and on the other hand a decreasing number of economically deprived inhabitants the area has been under strong socioeconomically and sociocultural changes in the last 15 years (TOPOS Stadtforschung, 2011).

The strengthening of education opportunities, especially for children in the neighbourhood, had been an important part of the work in the neighbourhood. One of the biggest projects which is in its realization process is the creation of a central space for the neighbourhood with an agglomeration of manifold education, social and neighbourhood oriented facilities including a community school. The whole project ´Campus Rütli – CR²´ is following an innovative approach and is carried by manifold stakeholders which get parallel connected.

Focus with regards to content of the research of which the `Reuterkiez` neighbourhood is one example is the combination and dependency of urban design and social issues in the connection of schools and neighbourhoods. Focus with regards to methods is that the cases studies will all reflect areas of multi-cultural and social diverse neighbourhoods to deepen the knowledge for these areas.

This paper is focusing on the underlining of the importance of social development with urban design development in neighbourhoods and reflecting the interdependency for neighbourhood development. It outlines the rank of communication and cooperation of stakeholders of manifold fields and emphasizes the significance of education for urban development.

## 2. Schools as instruments of neighbourhoods

Why are innovative schools and education approaches important for neighbourhoods and especially for those with multi-cultural and socially diverse conditions?

From society's point of view the investment in education is indispensable naming reasons as integration and equal opportunities. From spatial planning's perspective it is argued also with the great importance of integration and with activating neighbours as positive aspects for the neighbourhood (BMUB, 2014). In a globalizing world the importance of education is rising as the quality of education systems is becoming an indicator for a society´s international competitive capability (Braum and Heitele, 2010). In the United States the quality of schools in the district has a great value in real estate business and the relationship between neighbourhood choice and school quality is causally linked with each other. Real estate mangers are providing potential home buyers with college attendance rates and test scores of schools. Hence, schools get directly linked to urban economics in neighbourhood choice questions (O´Sullivan, 2007). The direct economical connection of school quality and neighbourhood choice has not been the case in Germany. Objectively, there are no standardized measures in Germany which display the outcome of a primary school available for the public (Noreisch, 2007). With the publication of the first PISA studies in 2000 the discussion about equal opportunities in German education systems has been recovered in the centre of education discussions due to the fact that the study reflected the strong correlation of social injustice and education equity in Germany which was the highest among all OECD countries (Hepp. 2008). The poor results lead to wider discussions about

schools and education in German society involving municipalities and planning professions (e.g. Deutscher Städtetag 2003, Leipzig Charta 2007).

The fear of parents with strong educational ambitions that their child is not getting appropriate educational conditions is present in our society. As mentioned in neighbourhoods with a high percentage of people with migration backgrounds and of socioeconomically deprived inhabitants parents are leaving the neighbourhoods in order to enrol their children in schools of other catchment areas (Häussermann, 2006). Noreisch (2007) has analysed the selective behaviour of enrolling children in primary schools in Berlin and outlines that the appearance of choice is a recent development in Germany, "choice was not traditionally or historically anchored in the German consciousness" (Noreisch, 2007 p. 1313). This emphasizes the upcoming importance of schools for middle class parents. Simon-Philipp (2011) outlines that especially for young well-educated families of the middle class the education supply in a neighbourhood has become a crucial location factor (Simon-Philipp, 2011).

From an international perspective there have been several studies which discuss the importance of local inner-city schools for neighbourhoods in order to attract or keep middle class families in the in these specific areas naming another reason why schools are important especially for inner-city neighbourhoods (e.g. Karsten 2003,2007, Kimelberg and Billingham, 2013)

In areas of special development needs in Germany the program ´Soziale Stadt´ aims in its concept to improve the living conditions in the neighbourhood for the local citizens. Since 1999 the state supports the stabilization and upgrading process in disadvantaged districts and neighbourhoods in terms of urban design and economic issues as well as socially deprived. With investments in the living environment, in infrastructure and in the quality of housing more inter-generation fairness and family friendly neighbourhoods shall be generated. The aim is the increase of chances of integration and participation of the local citizens. Target of the state funded program is to promote lively neighbourhoods and the strengthening of social cohesion (BMUB, 2015[1]). The program in total classifies ten fields of activity including local housing and housing environment, social activities and social infrastructure, the living together of diverse social and ethnical groups, school and education, local economy, health promotion, environment and transportation, city district culture, sport and regeneration, image improvement and publicity (BMUB, 2015[2]).

In the field of activity "schools and education" manifold education projects have been developed such as education networks of local actors. These have become an often used practice in program areas. Education networks are having first of all a connection of manifold stakeholders in the field of education in a neighbourhood in mind to discuss challenges and opportunities together and develop cooperation strategies. The aim is the improvement of educational opportunities for the local children.

The question is how planners can develop or conserve educational institutions and schools in multicultural areas and socially diverse neighbourhoods to become a locational advantage instead of a locational disadvantage. The results of a German pilot project `Bildung als Motor der Quartiersentwicklung` - translated 'Education as the engine of neighbourhood development' outline the importance of cooperative planning. The project emphasizes that urban regeneration needs to be closer connected with education policy. Further, it lobbies for the alliance of different policy areas for urban regeneration such as education, social issues, health, culture and employment (Simon-Philipp, 2011). The project outlines the following aspects in school development as transferable to other school and neighbourhood development projects:

- An interdisciplinary approach
- An early connection of education institutions in the urban design plannings

- An early discussion about the pedagogical profile of the school
- The location decision in the functional as well as in the urban design centre of the district
- Education and children stand in the centre of the project
- Educational institutions function as social meeting point to enliven the central space in the district/neighbourhood
- An cooperation with other stakeholders in the area

(Hochschule für Technik Stuttgart, 2009)

So the idea of putting a focus on schools in multi-cultural and social diverse areas appears to be quite obvious from a spatial planning's perspective when multicultural neighbourhoods shall be developed and to generate positive neighbourhood changes. But it is a perspective which asks planners to step out of their own field and approach another profession. It is not only the physical appearance which makes out the quality of a school but the quality of teaching pedagogical approaches to deal with the students perspectives in these areas.

Although spatial planners claim to involve the different views and interests which make out cities, it is always a step to the unknown of daily pedagogue's life experience, a different professional language which is used and sometimes varying anticipations (Uttke et al, 2013).

## 3. Manifold institutions and one shared concept - Campus Rütli-CR²

In 2005 the local neighbourhood management began with the first preparations to strengthen education opportunities in the `Reuterkiez` located in the northern part of Berlin in the district of `Neukölln`. The first project introduced intercultural moderators to the neighbourhood schools in the beginning of 2006. (Bezirksamt Neukölln von Berlin, 2015[2]). The area became famous in a negative kind of way in whole Germany due to an emergency-letter which was sent from teachers of the secondary school `Rütli-Haptschule` to the federal education board describing terrible circumstances at the school including aggression and students unable to be taught. The `Rütli-Hauptschule` became a synonym for failed integration in the media.

The pilot project Campus-Rütli has been pursued since 2007 by the district office and an education foundation of Berlin, `Stiftung Zukunft Berlin`. "The project aims not only to grapple with pressing current problems but also to help developing transferable problem-solving strategies. […]The project seeks primarily to put in place a new and sustainable educational concept which includes the creation of collective social space […]) (ibidem, n.p.) The project aims to create a new social space as a campus "in which the emerging generation will find a comprehensive and integrated socialization- and education offering" (Campus Rütli-CR² Administration of the County Mayor of Berlin-Neukölln, 2009, 5). For these existing boundaries among departments and social space were broken up to bundle competences on the campus.

The campus space is located in one street named `Rütlistraße`(figure1). The street is already nowadays a private street not allowing cars to enter in order to ensure a space without the barrier of traffic. From an urban planning's perspective, the street is at the currently designed as an agglomeration of two day-care facilities for children, a social care institution, a playground, the comprehensive school, sport facilities and at the moment fellow land for future buildings for further school and neighbourhood facilities The redesign of the street space for an increase of habitation quality as well as the remodelling of the entrance situations on the campus are planned such as the construction phases, the financing is secured (Bezirksamt Neukölln von Berlin, 2015[3]).

**1** School | **2** Day-Care Villa Kunterbunt, neighbourhood education workshop | **3** Gymnasium | **4** Youth Recreational Facility Manege, Occupation promotion for youth| **5** Day-Care Rütlistraße, Children and Youth Medical Service | **6** Neighbourhood Hall (fertigstellt 11. 2012)

**1** New Construction: economy, labour and technics | **2** New Construction occupational workshop (financing submitted) | **3** New Construction: school expansion | **4** New Construction: mixed use

Figure1: The Campus Rütli Space with existing and future buildings (Schulz@Schulz Architekten in Bezirksamt Neukölln von Berlin, 2015 [own translation and annotations])

To the campus belongs a community school which is the union of a primary and two secondary schools since 2008/2009. At the `Gemeinschaftsschule auf dem Campus Rütli` children are taught from first grade up to the 13th grade allowing all graduating certificates including the `Abitur`, the German university entrance certificate. The school understands itself as a closely connected neighbourhood school (Bezirksamt Neukölln von Berlin, CR² - Campus Rütli, 2015²).

The two child care centres as well as the youth centre located at the `Rütlistraße` have merged with the Campus Rütli. The Campus- CR² has its own structure and a project management being responsible for the overall development. The "Freudenberg Foundation´s programme "One Square Kilometre of Education", Campus Rütli is giving rise to a unified place of learning which enables young people to pursue their entire school careers from preschool to vocational training within a single space[…]Campus Rütli means that the entire spectrum of care, guidance and educational institutions for young people are for the first time collaborating and jointly shouldering responsibility. […]Children from the catchment area, nearly 90 per cent of whom hail from immigrant families, receive optimal support here, with their parents also included. Cultural diversity and multilingualism are treated opportunities and are nurtured". (ibidem, n.p.).

The realization of the project has been very complex and is divided into different levels including the content pedagogic level, the construction level, the participation level, the administrative level as well as public relations (Bezirksamt Neukölln von Berlin, 2015[4]). Recently, the finances for the next stage of construction have been released. The next step will be the development of a construction schedule for three new buildings (figure 1) as well as for the surface broaching. The objects will include a school expansion and necessary conversion in the inventory, a school building for economy, labour and technics along with a third building for a mixed use for a parent's centre and café, a pedagogical workshop, youth welfare service, dental services as well as for the adult education centre. The construction on the outdoor space will convert the entrance situations including a new footpath to increase the accessibility to the campus (Bezirksamt Neukölln von Berlin, 2015³).

## Developments in the neighbourhood `Reuterkiez`

The `Reuterkiez` neighbourhood in the district of `Neukölln` in Berlin Germany is an area with mainly Wilhelminian style architecture. With respect to statistics, the area has a population of 27.427 inhabitants[1] (31.12.2012) (Senatsverwaltung für Stadtentwicklung, 2013). The ethnical differentiation is divided into inhabitants with migration background 44% (in comparison Berlin 26%) and 28% inhabitants with foreign citizenship (in comparison Berlin 14%) (31.12.2010) (Senatsverwaltung für Stadtenwticklung, 2012).With that the part differs from many other areas in Berlin but is similar to other neighbourhoods in the northern part of the district of `Neukölln` in comparison to the social data.

In 1995 individual plots were declared as redevelopment zone and belonged to the `Sanierungsgebiet Kottbuser Damm-Ost`. One focus of the redevelopment was the improvement of infrastructure in the area especially for children and youth. The aim was to create social institutions as well as neighbourhood green and playing areas. Since 2007 recreational and day care facilities were created or developed and about 4500 sqm playground space had been created (Bezirksamt Neukölln von Berlin, 2012) The supply with playgrounds and green space is still not sufficient in the area reaching 45% supply with playground space and 15% supply with green space in the neighbourhood development zone (Quartiersbüro Reuterplatz, 2015[1]). In 2001 the southern part of the district became redevelopment zone belonging to the `Sanierungsgebiet Karl-Marx Straße/Sonnenalle`(Senatsverwaltung für Stadtentwicklung und Umwelt, 2015). That is reflecting the poor quality of infrastructure, economics and public space in the area.

The poor socio-economic conditions of the inhabitants in the neighbourhood is among other things reflected with the establishment of the area as a development zone of the `Soziale Stadt` program in 2003. Manifold projects have been initiated with neighbours and stakeholders of the area trying to improve the living conditions in the neighbourhood according to the goals of the urban development program `Soziale Stadt`.

[1] The official neighbourhood management area is smaller than the statistical area`Reuterkiez. It covers 70 hectares and has a population of 19.633 inhabitants (Quartiersbüro Reuterplatz, 2015[1]).

When the neighbourhood management started its work in 2003, 35% of the shops in the area were vacant and the area was printed of unemployment and poverty and families who were able to afford it moved away when children had to attend school. Today many things have changed positively (Quartiersbüro Reuterplatz, 2015[1]). When walking through the area vacancy is a problem which does no longer exist. Bars and restaurants as well as individual fashion and music shops are dominating the offering in the basement shops of the old Wilhelminian buildings. Expulsion processes of pioneer bars have begun. One famous example became the bar `Freies Neukölln` which belonged to one of the first bars for a Pioneer target group in the area which recently had to close because of rising rental prices. Young middle-class families are filling the streets and playgrounds and enjoying home manufactured ice-cream and buying children clothes in small boutiques. This picture is today still enriched by the inhabitants who used to print the picture in the neighbourhood in the late 1990s and in the beginning of the 2000s.

The neighbourhood has become a popular residential area which is expressed in rising rental prices and the transition from rental to freehold flats (Bezirksamt Neukölln, 2015[5]).

According to a study which was executed in order of the senate for urban development in Berlin in 2011, 25 % of the inhabitants in the `Reuterkiez` neighbourhood can be classified as gentrifiers and about 20% belong to the group of pioneers. 23% of these two household groups have children (TOPOS Stadtforschung, 2011). These two groups are almost making out half of the inhabitants and facing the group of long-term, permanent residents who have a significant lower financial situation. Their equivalence income lays about 30% under the average of Berlin and about 25% under the neighbourhood average. In this group about 31% of the households are with children (ibidem). The results of the study show that the area is in a changing process.

Due to these changes the area is released as a development area of the program `Soziale Stadt` in the end of 2016. At the moment it is in a two year lasting conservation phase in which the neighbourhood management is leaving the area stepwise. Their work in this phase is next to the finishing of projects the preservation of created cooperation structures, networks and committees as well projects (Quartiersbüro Reuterplatz, 2015[2]).

The area will no longer be funded by the program `Soziale Stadt` not because there are no problems in the area anymore but simply because other neighbourhoods in Berlin are in more need and the social and economic datas have improved and are in comparison to other areas supported by the `Soziale Stadt` among the better ones (Difu, 2013). The neighbourhood managers are pointing out though that between gentrifiers and deprived inhabitants parallel worlds are arising. Segregation within the neighbourhood with a concentration of problems in individual streets or buildings is seen as one of the biggest challenges of the neighbourhood (DifU, 2013). The social situation in the area is ambivalent today. On the one hand there is a more and more arising cultural hot-spot neighbourhood with financially stable middle-class inhabitants and on the other hand there are deprived inhabitants with problems. Recently, in March 2015 the district administration has given out the order for an independent study to proof if the housing in the area shall be protected by law (`Milieuschutz`) to not be converted to luxury housing and further freehold flats. Aim is the preservation of social diversity in the area (Bezirksamt Neukölln, 2015[5]).

## 4. Examination of pilot projects to gain knowledge about the significance of schools and strategies to knot neighbourhoods and education institutions - Methodology

The community school Campus Rütli located on Campus Rütli-CR[2] is one example out of manifold approaches which has been developed within the frame of urban development programs and projects. Schools and neighbourhood managements have been developing various projects which are documented differently concerning their qualities. The case study is the first case to be included in a

doctoral research. The goal is to look at the individual projects closely to increase the knowledge about how to connect schools with the neighbourhood, from an urban design as well as a social perspective. In particular focus are those schools in multicultural and social diverse neighbourhoods.

The work is following a case study approach using a mixture of qualitative research methods of interviews with experts of the neighbourhood and observations as well as literature research. The work is enriched by the outcomes of ongoing TU Dortmund Spatial Planning Projects researching about child friendliness in the district of Neukölln and the `Reuterkiez` neighbourhood. Within these teaching and research projects manifold stakeholders and parents have been qualitatively interviewed, schools have been visited and children have been participating to allow telling their perspective on the neighbourhood. The case study is backed up with existing literature about school and neighbourhood development in Germany and from an international perspective.

The case study `Campus-Rütli and Reuterkiez` is planned to be the prelude for a doctoral research study about the connection between schools and neighbourhoods in multicultural and social diverse areas.

## 5. Analysis with discussion of findings

Campus Rütli CR² is an example for a new approach including a school designed for the neighbourhood demands. It is in its concept innovative for Berlin and the costs of more than 34 million € for the campus illustrate the huge scale of this pilot project. The political efforts to get stepwise finances for the implementation have been approached after the first concept was developed in 2007 (Wolter, 2015). Hence, in the focus of the concept stood the idea and strategies instead of developing a concept within a certain financial frame. The project is carried and supported by many protagonists. According to the project management it was the continuous cooperative work of stakeholders in the area next to the cooperation with district administrations, politics and civil society as well as foundations and a famous patron which led to the realization of the project (Wolter, 2015). The amount of individuals who have been involved in the project and their important professional positions reflect the awareness of importance for changes in the situation at schools in the district of `Neukölln`. Especially the former major of the district has been geared for the media first the problematic challenges at the schools and then the positive changes at the community school. To be questioned is if the successful realization could have also been supported and caused by the attention through media and society in this case.

In high dense inner-city neighbourhoods space is limited and is often leading to a conflicting use. In the case of Campus Rütli the advantage was that plots were able to be bought or already state owned to be able to get converted for the campus idea. That was not without oppositions, though. The closing of the street for traffic and parking for the creation of a playing area in between the gates lead to repeated violence of the gate locks, probably through car owners (Wolter, 2015). Especially the demolition of a garden plot `Kleingartenkolonie Hand in Hand` that had been there since 1935 for the planned extension of the campus lead to wider critiques. The plot users were fighting by court against the decision especially because the financing for the extension buildings was not secured at that time and because of the neighbourhood's lack of green space. Losing the process the green garden lots were demolished leaving fellow land. This underlines the political back up for the realization of the concept.

Education has been one of the main focuses of the work of the neighbourhood management team. To keep middle-class parents and education oriented parents in the neighbourhood it is important to generate appropriate education infrastructure. To increase chances of children from low educated families and increase integration conventional schooling was not sufficient in the neighbourhood when the area was declared as target zone of the urban development program `Soziale Stadt`. In the multicultural and social diverse neighbourhood `Reuterkiez` this meant a task which included

manifold areas involving various administrative fields and professions which were brought together to develop strategies and ideas which lead to the concept of Campus Rütli- CR². At the schools there are today still more than 95% of the students from a non-German speaking family background (Quartiersbüro Reuterplatz, 2015[1]). And more than 50% of the children in the area are living from public aid money (Senatsverwaltung für Stadtentwicklung und Umwelt, 2013). The challenge is to deal with heterogeneity in the area in context of social, ethnical and performance-related backgrounds (Wolter, 2015). To encounter parallel worlds between these inhabitant groups high quality education and recreational facilities are important as the space where children and parents can mix. Professionals in the district state that the challenge lies in the varying living environments outside the institutions where children with different backgrounds do usually not mix due to different layouts of their spare time. So much more important is the supply with space at day-cares and schools for recreational activities in form of clubs to be able to generate integration space besides the formal instructions.

At the moment the transition of children from day-care to the school is still field of action of the community school. The problem of middle-class families moving once their child is reaching school age still exists. Analysed interviews with day-care institutions indicate that the reasons for that is still the fear of poor performance outcomes but also the habitus of the potential future classmates.

The increase of education oriented parents with school children is rising in the neighbourhood though. This is getting visible by stakeholders in the area through the attendance at parents meetings and specific questions which are asked (Rostalski, 2015). First analysed statements of local protagonists in the district indicate that other close by public schools to Campus Rüli seem to struggle with the competition for middle-class students at their schools. The differentiation among schools in the area is also pointed out by the neighbourhood managers. They state that while to one school children from education oriented parents are sent to again, in other schools the situation is as it was when they started their work in 2003 (DifU, 2013). The school choice process of middle-class parents have been recently analysed in a study for Boston. Coming to the conclusion that „despite the fact that individual middle-class parents express a preference for a diverse educational environment, the way in which they settle on a school ultimately produces a ‚clustering' effect in a small number of city schools, potentially amplifying intradistrict segregation by race and class" (Kimelberg and Billingham, 2013). The gentrification situation in day-care facilities in the `Reuterkiez` neighbourhood is further advanced than the one in schools. The neighbourhood managers state that the expulsion of children from low educated households through children from high education families is the new dilemma in the neighbourhood (DifU, 2013). The further developments at Campus Rütli –CR² and the social structure in the area and district will show if intradistrict segregation will also become a bigger challenge at the school level for the neighbourhood and district. The district administration and schools will have to deal with the challenges when creating a sticking out pilot project in an area which is located in a district with social data which lays among the lowest in the whole city and in which in almost every neighbourhood of northern `Neukölln` the state funded program `Soziale Stadt` tries to improve the living conditions in the neighbourhoods.

Campus Rütli combines two important aspects of school development in neighbourhoods. It is embedded in an education network and bundles the important facilities for the neighbourhood in reference to education, health and social issues. The conversion has been done with wide participation possibilities for inhabitants and after the finishing of the creation of the campus at least five institutions will explicitly address neighbours of the area and district (Wolter, 2015). The recreational youth facility `Manege` for instance is a meeting point not only for students from the community school but supplying the neighbourhood and district youth with offers such as free tutoring. In the institution also parents are engaged offering home-made cooked food for the visitors. This is reflecting the integration and the direct connection of the campus with its inhabitants.

## 6. Conclusions

The `Campus Rütli-CR` is a good example for how planners worked together with other institutions. It's a unique pilot project from a German perspective. If you want to make changes as a planner more than the physical appearance is of great importance. With increasing importance of education, neighbourhood as learning environment and the connection of educational and social care institutions is rising. The conversion of the campus space with its new buildings for the school and neighbourhood as well as the conversion of the accessibility and quality of the street space will show how the campus will merge in the neighbourhood. Especially the future changes with the closing of the neighbourhood management office, the potential protection of the social mixture of inhabitants through restoration and renting policies will show how the area will socially and economically develop.

For the planning education practice I state that it is important to outline the increasing importance of education in our society for the importance of integration and for planning. When working with students, most of them coming from middle-class households, I realized how big the prejudices are against schools in the district of `Neukölln` with its high percentage of multicultural and deprived inhabitants. Also the questioning why institutions needed to be visited from the inside and the use of talking to pedagogues lead to misunderstanding. The understanding after the excursions has been high leading to target group shaped results and a great reduction of prejudices usually admiring the schooling conditions. As for many other fields education is one for which planners need to listen carefully to the demands and cooperate closely with pedagogues and social workers in order to find individual strategies shaped for the target area.

# PAPER TITLE: Participatory Planning: State Spatiality and Discursive Spatial Scales

Maxwell Okrah
University of Reading
m.okrah@pgr.reading.ac.uk

**Abstract**
The recent proliferation of institutional geography of state power provides insight into the analysis of socio-political dynamics of multi-scalar participatory decision making. This review examines how discursive strategies of state spatiality may be mobilised to interrogate the rationale for translating decisions at one scale into decisions at another scale. My approach draws together three complementary strands of literature – participation, state spatiality and scale. I first review how participation have been conceptualised, including the nexus between participation and decision making. I also review the literature on state spatiality in conjunction with state spatial projects and state spatial strategies to explain spatial privileging and socio-economic intervention of the state. I then describe the theoretical perspectives on the scalar discourse. The paper concludes by arguing that while spatialisation of socio-political contestations within multi-scalar configurations of state spaces may be scale-sensitive, the rationale for translating decisions at one scale into decisions in another has lacks explicit explanation.

**Keywords:** Participatory Planning, State Spatiality, Spatial Scale, Discursive Strategies, Multi-scalar

## 1. Introduction

Planning literature has placed significant emphasis on participation as a means for balancing and rationalising varied interests and preferences. This has also helped in the creation of participatory spaces across a spectrum of institutions and scales. The justification for increasing the role of participation in planning includes, among other things, the improvement of the quality of planning decisions (Kaza, 2006; Cornwall, 2008; Brownill, 2009). However, significant changes have occurred within the planning decision making environment that provide different contexts for the socio-political and spatial contestation across spatial scales. One of such changes includes the proliferation of institutional geography of state power and the decision making processes that fundamentally shape political outcomes (Allen and Cochrane, 2010). For instance, within the last three decades or so, the processes of spatial rescaling had contributed to the creation of more fragmented spaces with the opportunity for different groups to articulate their interests (Meadowcroft, 2002). These processes of spatial rescaling or devolution do not simply imply changes in the coordinates of socio-political struggle but also involve inter-scalar decision making that may be articulated in spatially selective forms and may target different actors across scales of state intervention (Brenner, 2004). At the core of the analysis of the roles between tiers of governance is the perception that the institutional geography

of state power and their decision making processes are greatly transformed by the reconfiguration of the scales that govern their activities (Jessop, 1990; Brenner *et al.,* 2003; Brenner, 2004).

One theoretical approach that shed much light on how the concept of state has a central role in socio-political discourse as well as embedded with political strategy is Bob Jessop's strategic-relational approach to state theory. Strategic-relational theory emphasises the dynamic interaction between state structures and the selective strategies adopted by social forces to advance their divergent interests. In this sense, the diverse societal forces and their interests are institutionally mediated through structurally inscribed strategic selectivity (Park, 2008). By strategic selectivity, I mean, if the state is considered as a social ensemble, then it has specific and differential impact: privileging some interests, spaces, scales, strategies and actors over others (Jessop, 1990; 2002). In other words, the relational character of the state and its attendant concern with strategic selectivity implies differential ability of social forces to seek their interests through selective strategies (Jessop and Sum 2006). Strongly influenced by Jessop's (1990) theoretical arguments, Neil Benner demonstrates how the state theory can be spatialised to provide the foundations for a strategic-relational-spatial conceptualisation of the state as well as spatial selectivity of state institutions. He sees spatial selectivity as the processes of 'spatial privileging and articulation' through which state policies are differentiated across territorial space in order to target particular geographical scales (2004: 89). Even though some state policies may privilege particular geographical spaces and scales, it does not defy the logic that state spaces and the diverse social forces are continuously interacting through the state at various geographical scales (Park, 2008).

Related to the interconnectedness of spatial scales is the call for mullti-scalar arrangement for bottom-up decision making, particularly within political geography, political economy and planning. As the brief account on state spatiality from the preceding paragraph has shown that state regulation and political struggle often unfold at a variety of intertwined spatial scales, it may be fruitful to deploy multi-scalar institutional arrangements for participatory decision making. Some might argue, in this respect, that under multi-scalar decision making organisation, some decision tradeoffs have to be made both between actors' preferences and between spatial scales. But because some scales or layers of state power are subordinate to others, it is not every level of political authority that can be said to constitute, in itself a distinctive state apparatus (Shaw, 2000). To be sure, the existence of scalar mismatch (lack of fit between discursive processes and the scope and mechanisms of institutions to address of institutions a given problem) and the potential overlap of strategic interaction across may create uneven and variable outcomes in particular time and space. To some extent, this view is discussed later in the paper. Swyngedouw (1997b) emphasises that the 'metaphorical use and material construction' of geographical scale can easily move from one scale to the other (p.140). However, depending on the scale at which the metaphorical and material processes operate, scale may affect

different people in different ways due to differential discursive strategies. Similarly, accepting that strategic multi-scalar decisions are products of socio-political strategies imply that the achievement of a particular preference over the other will not solely depend on the scale itself but on the agenda of actors who are empowered by the scalar strategy (Born and Purcell, 2006).

Though the multi-scale nature of state spatiality has been acknowledged and useful theoretical frameworks developed to engage with scale and its strategic actors (Brenner, 2004), how multi-scalar decision tradeoffs are made and the kind of specific impacts scale choices might have on decision making have received far less attention (Karstens *et al.,* 2007). Yet it is acknowledged that translating felt needs at a lower scale into decisions at a higher scale often raises fundamental questions, not only about analysing the multiple perspectives within and across scales, but also about the strategies for aligning and harmonising lower and higher scales' decisions. These considerations open up two fundamental theoretical questions. First, how does participatory planning across scales take into account the tendency of the state to privilege particular preferences over others? Second, what are the rationales for translating lower scale decisions into decisions at a higher scale?

In this paper, I reflect on these questions, drawing on the theoretical approach that spatialises the strategic-relational theory of the state (Jessop, 1990, 2002; Brenner, 2004; Park, 2008) to provide insight into the analysis of socio-political dynamics of multi-scalar participatory decision making. Specifically, my account draws together three complementary strands of literature: the concept of participation; state spatiality; and the scalar discourse. I argue that the conceptualisation of discursive strategies of spatial scales may be fruitfully mobilised to interrogate and inform our understanding about the rationale for translating decisions at one scale into decisions at another scale. Specifically, the paper focuses on two key issues: (a) how participatory planning takes into account the tendency of the state to privilege particular interest over the other in participatory decision making framework; and (b) the rationales for translating lower scale decisions into decisions at a higher scale, particularly within inter-scalar decision making structure. To do this, I structured the paper into two interlinked sections. It starts by examining the concept of participation and the impact of participation in planning on decision making. It seems to me that public participation and the possibility of translating its outcome into a decision does not necessarily occur together, and thus deserve analytical scrutiny. The subsequent section presents an overview of the theoretical discourse on state spatiality, with specific focus on strategic selectivity and spatial selectivity as structural features of state organisation. Developing the argument on state spatiality further, I shall examine the theoretical perspectives on spatial scale. The paper concludes by arguing that while spatialisation of socio-political contestations within multi-scalar configurations of state spaces may be scale-sensitive, the rationale for translating decisions at one scale into decisions in another has lacks explicit explanation.

**2. Conceptualising Participation**

This section attempts to broaden our understanding of participation in planning by addressing two key concerns. The first part addresses some of the conceptual underpinnings of participation. In the second part, I examine the argument on how public participation in planning may be an integral part of the decisions that may emerge. In other words, to what extent does public participation represents an exercise in decision making? Participation and its decision outcomes have to be investigated fully if one is to take any critical stance on the explicit links between the participatory planning process and its resultant decisions. However, it is not my intention here to deal substantially with the theoretical foundation of decision making except to point out that improving public participation in planning may not be a substitute for establishing the nexus between public participation and decision making. My argument is that, analysing participation and its impact on decision making is problematic. The reason is that, while some genuine commitments may be made towards public participation in planning, the ultimate decision-making authority is retained by decision makers. This underscores the fact that participatory processes can conceal undemocratic tendencies and the complexity of incorporating public preferences and interests into decisions. Thus, inclusionary approaches that are required for a decision to emerge from public participation in planning may be fraught with difficulties and ambiguity (Creighton, 2005; Aitken, 2010).

In what Follows, I attempt a brief discussion on conceptualising participation. Although the concept of participation has been continuously debated in the development, planning and political science literature, its meaning, function and importance lacks consensus. Also, the term participation is often used by people with different ideological positions, who invariably give varied interpretations of its meaning (Nelson and Wright, 1995). Given the variation in usage and orientation of commentators, it is not surprising that the concept of participation has been conceptualised differently.

Despite varying interpretations and a wealth of differences in conceptualising ‘participation’, Sherry Arnstein’s (2011) definition is insightful and worth discussing. According to Arnstein, participation is ‘the redistribution of power that enables the have-not citizens, presently excluded from the political and economic processes, to be deliberately included in the future” (p. 3). This conception of the participatory project encompasses the sharing of relevant information, broadening the framework of planning and policy discourses as well as allocating the benefits thereof. Arnstein’s position is that the redistribution of power is not accidental but is a conscious effort to empower the excluded. Whereas political scientists, economists and development administrators may look at participation in terms of public involvement in decision making, sharing in benefits and the roles people assume in implementation respectively (Fecade, 1994 in Kinyashi, 2006), Arnstein’s (2011) definition encompasses all these three dimensions. Emphasisng on participation-decision making nexus,

Creighton (2005: 7) also defines participation as 'the process by which public concerns, needs, and values are incorporated into governmental and corporate decision making'. The key concern, from Creighton's conceptualisation of participation is that, it is not just an exercise to provide information, but also that members of the public who choose to participate should have some level of impact or influence on the decision being made. Taking into consideration the definitions and explanations of participation that I have discussed so far, Creighton's work is more appealing in the context of what this section set out to examine - how public participation in planning may be an integral part of the decision making process.

Based on the foregoing discussion, public participation has been entangled with an ongoing debate between commitments to participatory planning on the one hand, and the opportunity it offers the public to influence decision making processes and/or outcomes on the other (Creighton, 2005). In this view, contemporary scholars of the participation discourse and political scientists are thus confronted with the task of deciphering the rhetoric of participation and active involvement (acting in and through state institutions) of participants from translating public input into decision thereof. Recent literature responds to this task from two strands of arguments. First, the view that participation in planning and decision making are deeply complementary and can be considered both as means and ends, and as processes and outcomes respectively. The second perspective is that, although planning processes may be described as being inclusive, it does not necessarily guarantee that the outcomes of public participation are integral to planning decisions. In the analyses to follow, I examine these strands of argument in turn.

Those scholars who celebrate the causal link between participation in planning and decision argue that participation forms an integral component of decision making processes as it upholds the effectiveness and quality of the planning process and validates planning decisions (DTLR, 2001; Lane, 2003). Relatedly, public participation can assist in producing a 'better' policy outcome. Arguably, 'better' policy could mean that the outcome of participation is more in tune with society's values and preferences or tied to using participation to achieve stated goals (Rydin and Pennington, 2000). Puri (2004) argues that the causal link between participation and the effective use of public input in the decision making process can be presented in two dimensions: efficiency-based participation; and agency-based participation. The former understands participation as instrumental means to attaining a defined public interest, but the latter focuses on the role of human agency, defined as actions that bring about change in public policy planning. Given the growing interest in the ideas of 'people-centred' approach to decision making, at least at the rhetorical level, the second dimension (agency-based participation) seems to dominate. The underlying presumption about the agency-based dimension of participation is that human agency is preeminent in determining the success or failure of 'state-society' planning and decision making processes (Puri, 2004). Also empirical evidence from Agrawal and

Ribot's (1999) study seems to support the agency-based perspective on participation when they assert that the opportunity to participate in planning and decision making is a positive good in itself – it democratises decision making and governance.

In contrast, some commentators argued that meaningful public participation in planning and decision making process requires not only the creation of the opportunity to participate but also involves designing the mechanisms for incorporating the results of public deliberations into decisions (Gregory, 2000; Albrechts, 2002). As Alterman et al. (1984) emphasised in their work on 'the impact of public participation on planning', the general public do not lack the capability to provide useful input into planning decision making but it is only a small proportion of their comments affect the final decision. Another pessimistic account of the impact of participation on decision making posit that making participatory practices more inclusive for the previously marginalised groups and individuals, while using the same structures of power which excluded them previously is simply an act of getting the public to 'rubber stamp' a decision (Kothari, 2001; McCoy *et al.,* 1994; Kaza, 2006). This presupposes that public participation in planning does not always equate with public influence over the resultant decisions (Brownill and Carpenter, 2007; Purcell, 2009). Purcell (2009) further contends that the nexus between participation and decision may not be realised because of the nature of the participatory decision arenas or systems. The point is that, the form of governance and its participatory spaces that are more attuned with consensual methods of decision making may only help to maintain the dominance of the powerful interests and voices over a range of issues. In part, and in some cases, consensual systems may highlight in-built power imbalances and as well eliminate genuine political space of disagreement to unfold in a participatory decision making setting (Ploger, 2004; Swyndegouw, 2009).

In addition, Alterman et al. (1984) work on the impact of participation on planning decision making made an incisive observation. According to these authors, each stakeholder group employs participation as a strategy to achieve its own goals vis-à-vis the participation strategies of other groups. From this perspective, participatory settings can be perceived as the spaces for the deployment of a set of strategies toward the attainment of set goals by the participating groups. Kaza (2006) shows very clearly that one of the purposes of participatory planning is to identify the different positions and strategies of the diverse social groups. However, because it is possible to know the preferences and values of other groups beforehand, two issues are likely to emerge: (a) thus, certain groups actors may misrepresent their positions and/or obscure their intent so as to prevent others from gaining strategic advantage over them, and/or (b) those with prior knowledge about others' preferences may resort to strategic posturing. An analogous argument is that, the possibility of misrepresentation and the adoption of strategic posturing by some actors have the tendency to privilege particular interests and strategies over others in a participatory setting.

In the foregoing section, I have defined and explained the concept of participation. I have also carried forward the discussions by addressing some of the arguments on how participation in planning may be an integral part of the decision making process. In a limited way, I relate this discussion to the agency-based perspective on participation and its causal link with decision making. Even though the above arguments have provided valuable insights into the relation between participation and decision making, the participatory literature rarely examines how participatory decision making can be organised under the processes of state spatiality, and how these processes at diverse institutional sites and geographical scales may be deployed to investigate multi-scalar decision tradeoff. In the following section, I propose to build upon the participatory planning debates by integrating questions of state spatiality and spatial scale in an attempt to understand the discursive effects of multi-scalar decision making of the state.

**3. State spatiality: A Framework for Analysing Participatory Decisions**

This section presents an overview of the theoretical debates regarding conceptualisation of state spatiality as a form and action of the state. Specifically, I examine how state spatial organisation may offer a framework for analysing multi-scalar decision tradeoffs. I shall also devote some attention to the conceptual discussions on scale. My argument is that state spatial organisation and practices, including state scalar configurations have significant impact on how decisions at a lower spatial scale are translated into decisions at a higher scale. I emphasise that Brenner's (2004) 'State Spatiality' approach to state theory provides the theoretical basis on which the above claim may be further elaborated. It requires further elaboration because the socio-spatial and political forces that operate within and across state spaces are not explicitly specified. And given the fact that these socio-political forces of the state increasingly influence decisions at a variety of intertwined spatial scale, there is the need for a systematic reflection on the dialectical interaction of state spatiality and how it may impact on multi-scalar decision making. In order to make an incisive inquiry into this, it is first necessary to explore the theoretical interpretations of state spatiality.

Brenner's (2004) concept of 'New State Spaces' is partly influenced by Jessop's (1990) theoretical approach on strategic-relational theory of the state. Basically, Jessop's work combines two important concepts – strategy and social relation. First he argues that strategy is often deployed to mediate between structures of the state and human action. He further proposes that the state operates as the site of strategies, the generator of strategies and the product of strategies. Based on this, Jessop defines the state as a system of strategic selectivity. I will return to a detail discussion of the concept of strategic selectivity later. Secondly, he conceives the state as a social relation that derives its specificity from the interaction between state structures and the efforts of diverse social forces to influence or promote their interest in a particular context (MacKinnon and Shaw, 2010). From this perspective Jessop

(1990, 2002) broadly conceives the state as an ensemble of socially embedded and strategically selective institutions which unity cannot be taken for granted. Accordingly, the state has no inherent substantive unity. However, the state can be unified through specific 'state projects' for the mobilisation of its various configurations. In order to modify the balance of forces and/or regulate the economy, the state also intervenes in society and the economy through 'state strategies' (Brenner, 2004; MacKinnon and Shaw, 2010).

Brenner (2004) spatialises Jessop's strategic-relational approach to state theory, with particular emphasis on the production of state spatiality. He conceptualises that state spatiality, like all other aspects of the state form, is never permanently fixed, but represents an emergent, strategically selective, and politically contested process (p. 89). He also points out that, political contestation is often mobilised within multi-scalar politico-institutional terrain on which diverse social forces attempt to influence the geographies of state territorial organisation and state regulatory activity. This perspective heavily relies on the assumption that the diverse social forces which are acting through the state are in constant search for the optimum combination of state structure and political strategy. In such a case, the search is also about the best means of using state structures to be able to implement the political strategies of social forces. Interestingly, what come to the fore here are the relationships between state structures and the various strategies social forces adopt, the outcome of which is open to further transformations (Goodwin *et al.,* 2006). Given the above, Brenner (2004) is convinced that, established configurations of state spaces always represent expressions of a dialectical interaction of ongoing regulatory strategies and socio-political struggles. In this sense, both the existing state spaces and the emergent state spaces are contingent in character. It also means that the strategies and regulatory activities adopted may have differential impact across space or lead to what Brenner terms as 'spatial privileging and articulation' – a situation where policy intervention leads to asymmetrical privileging of particular scale, space and place over others, partly with the aim of achieving political control (Jones, 1997; Jessop, 2002).

While understanding the role of dialectical interaction between regulatory strategies and socio-political struggles is critical to understanding spatial privileging and articulation, I want to argue that our understanding about spatial privileging would be augmented if we extend the analysis to cover the frameworks of state spatial projects and spatial strategies. By state spatial projects, I mean the initiative to differentiate the internal operations of the state, which are functionally coordinated within an organisationally coherent regulatory geography. Basically, state spatial projects are the embodiment of internal scalar partitioning among diverse tiers of administrative jurisdictions. On the other hand, state spatial strategies refer to how the state interacts with society more broadly to promote economic and social development across a wide range of policy areas. In other words, it is the spatial dimensions of state intervention in socio-economic processes within a given territory, including both spatially

targeted interventions and indirect spatial effects of aspatial actions (Brenner, 2004; Goodwin *et al.,* 2006; Breathnach, 2010; MacKinnon and Shaw, 2010). Together, state spatial projects and state spatial strategies can be mobilised as an integral part to the analysis of spatial selectivity.

Before we can engage with the literature on dialectical interaction and spatial privileging with the framework of state spatial projects and state spatial strategies, one additional concept need to be clarified – Strategic Selectivity. I choose to follow this line of argument because of the belief that both strategic selectivity and the frameworks of state spatial projects and state spatial strategies result from the dialectic of strategic interactions and socio-political struggles. Also, both have the tendency to privilege particular forces, spaces or scales over the other. Hence, in an attempt to expand our understanding about their effects on spatial privileging, they can be examined together. My argument is not that the notion of dialectical interaction and those of state spatial projects and state spatial strategies converge around a single theoretical foundation. I am suggesting, rather, that if strategic selectivity, state spatial projects and state spatial strategies are the outcome of dialectical relationships and political strategies with spatially selective and privileging effects on space, place and scale, then analysing them together can advance our understanding about spatial privileging.

Even though strategic selectivity has been defined in the introductory section of this paper, it is quite appropriate to reiterate it here. From Jessop's (1990, 2002) conceptualisation, strategic selectivity aims at developing a framework for examining how political strategies may influence institutional structures and strategies of socio-economic intervention of the state. For Jessop, even though the state can be best understood as an outcome of ongoing socio-political contestation, it can produce specific systems of structurally-inscribed strategic selectivity. This situation is capable of producing a form of political class domination in terms of specific configuration of state institutions and its branches. By implication, the state can neither be equally accessibility to all social forces nor be controlled or resisted to the same extent by all strategies, or be available for all purposes on equal terms. More generally, we can safely assume that, if structures of the state are not accessible, cannot be controlled, and may not be available for all purpose on equal terms, then strategic selectivity has the tendency to create uneven spatial effects of state policies (Jessop, 1990, 2002: Brenner, 2004). Meanwhile, uneven spatial effects cannot wholly be attributed to structural and institutional constrains. As argued by Jessop (2002) and MacKinnon and Shaw (2010), institutional structures may contain in-built biases but it is the strategies adopted by the actors that increase their prospects of gaining access to the state institutions and resources. And the manifestation of strategies is always found in and through discourses in a socio-politically contested manner. I believe that understanding how the strategic discourses and the reasons why actors privilege particular strategy and/or state space over others are problematic, particularly when this is analysed within multi-scalar configurations (I intend to take this argument up in the last portion of the section).

Equipped with this conceptual reflection of strategic selectivity and its spatial effects, I now turn to examine the conception that the framework of state spatial projects and state spatial strategies are critical for understanding spatial privileging. By taking note of this, one important task immediately emerged – analysing co-evolution of state spatial projects and state spatial strategies and its impact on spatial privileging. Starting off, I draw from Brenner's (2004) conceptualisation of state spatial projects and state spatial strategies to argue my case. On the most basic level, the conceptual distinction between state spatial projects and state spatial strategies is that whereas the former aims at functional unity, operational coordination, and organisational coherence of state institutions, the latter mobilises state institutions concerning particular forms of socio-economic intervention (Jessop, 1990; Brenner, 2004). The frameworks of state spatial projects and state spatial strategies may be conceptually separated, but my purpose here is not to establish their distinctiveness. Rather, I have tried to illustrate how the mutual transformation of the two frameworks can transform spatial effects of regulatory strategies and socio-economic intervention of the state.

As mentioned elsewhere in this paper, the framework of strategic selectivity examines how political strategies may influence institutional structures and strategies of socio-economic intervention of the state. By analogy, both state spatial projects and state spatial strategies are bestowed with strategic selectivity and by extension, spatial selectivity. For example, the struggle to influence the evolving institutional structures of state power (under state spatial projects) and the evolving role of state regulatory strategies (under state spatial strategies) often offer privileges to particular social forces over others. Brenner argues that, successful mobilisation of state spatial projects and state spatial strategies result in relatively coherent state spatial organisation of state institutions as well as modify the political and institutional terrain in which state spatial intervention (state action) occurs. From this perspective, state spatial projects and state spatial strategies can mutually condition and constrain one another partly, because they are endowed with a dialectical relationship between strategic interaction and socio-political contestation of social forces.

Another issue of importance to the co-evolution of state spatial projects and state spatial strategies is political strategy. Here, I shall briefly consider the role of political strategy in the evolution of institutional structures and socio-economic intervention of the state. Jessop's (1990) conception of strategic selectivity, which Brenner (2004) later spatialised, observes that the state often provides specific opportunity to some but not all categories of political strategy. The ongoing political strategies may be used by social forces to shape the evolving institutional structures as well as alter the modes of socio-economic intervention. This suggests that, both state spatial projects and state spatial strategies can mobilise political strategy, though, towards different interest and agenda. In the course of

mobilising political strategy, state spatial projects and state spatial strategies continually transform the political geographies of state regulation. The key message is that while state spatial projects and state spatial strategies may harness political strategies simultaneously, their co-evolution may occur in the mid of uneven spatial effects of state policy through spatial privileging. Against this background, Brenner points out that:

> 'As diverse social forces struggle to mobilise state institutions towards their own ends, state space is continuously reconfigured, whether through explicit projects to reorganise the geographies of state territorial organisation and state intervention, or as indirect outcomes of ongoing regulatory experiments and socio-political conflicts' (2004: 111).

Quite clearly, linking the above discussions under state spatiality to participatory planning in the first section of this paper raises a key question. Thus, if the strategic context of taking a particular course of action by social forces (individuals and/or collective) produces differential privileging effect, then how does the discourse on scale and multi-scalar decision making take account of this? In the present context, I shall not attempt a comprehensive narrative of scale. Instead, the following investigation focuses on a brief account of scale and how it affects participatory planning within multi-scalar configurations. I shall argue that, either on the same level or not, discursive strategies of actors at one spatial scale can be embedded into another through multi-scalar configurations. The issue of scale is worth incorporating into the present discussion for two main reasons. One, it extends the discourse on state spatiality and tease out the ways in which scale shapes socio-political struggle. Second, the scalar discourse will help us to ask deeper questions about socio-spatial relations of governance activity with respect to participatory decision making within multi-scalar configurations of the state. In what follows, I present a brief account on the concept of scale.

Generally, earlier conceptualisation of scale perceive it as the nested hierarchy of bounded spaces of differing size, such as the local, regional, national and global. However, an attempt to treat geographic scale simply as pre-given and fixed hierarchy of bounded spaces at different levels of political organisation and action is fiercely challenged (Delaney and Leitner, 1997: 93) for its failure to capture the myriad of socio-spatial configurations that are continually evolving within and across state space (Brenner, 2001, 2004; Marston *et al.,* 2005). In an attempt to unpack and present a steady conceptual meaning of scale, some political geographers and economic geographers have been spawning an impressive body of literature (Moore, 2008). In spite of the burgeoning literature on scale, it is appropriate for the present purpose to briefly review the theoretical position on the scalar discourse.

According to Swyngedouw (1997a), scale is the 'embodiment of social relations of empowerment and disempowerment and the arena through and in which they operate' (p. 169). This suggests that scale is not an independent definable geographical territory, but correspond to real material processes and spatial formations. Just as spatial selectivity which has the potential of creating uneven spatial effects, Swyngedouw's conceptualisation also acknowledges that scalar processes may not offer equal opportunity for all actors. Swyngedouw (2000: 68) later observes that 'scale … has always been the terrain of the political where socio-political tensions were fought over, mediated, and negotiated, resulting in ever-changing forms of territorial or geographical organisation and in territorially shifting forms of governance'. In this sense, the theoretical and political priority should not focus on particular scale, but rather on the discursive processes through which a particular scale may be (re)constituted (Swyngedouw, 1997b). For Leitner et al. (2008), scale is 'a relational, power-laden and contested construction that actors strategically engage with, in order to legitimise or challenge existing power relations'. In the process of actors' strategic struggling, new scales are constructed, and the relative importance of different scales is reconfigured (p. 159).

An emerging issue of concern is that, if the (re)constitution of a particular scale is more defined by an ongoing dynamics of socio-political struggle, then, how do specific discursive strategies of actors condition and/or constrain socio-spatial and political relations in a multi-scalar decision making configurations? To illustrate my argument, I will describe how analysts of scale in the field of political geography and planning have attempted to address issues of multi-scalar decision making. This line of thought is greatly influenced by the argument that planning problems manifest themselves at variety of scales and that, in order to address them accurately, discursive action should reckon with these spatial scales (Buizer *et al.,* 2011). A complementary argument from Morinville and Harris (2014) is that, though multi-scalar governance processes may be established, the ability to mobilise the discursive strategies of the diverse social forces across scale is not a given.

To demonstrate how scale can be used to address multi-scalar participatory planning problems, I structure my argument into two parts: (a) the argument in favour of the rationale for multi-scalar decision making; and (b) those against multi-scalar decision making structures. Starting with the first segment is the view that participatory governance and decision making often involves multiple stakeholders whose needs cut across scales. Within this logic, multiple levels of interactive decision making might prevent the problem of 'one-size-fits-all recommendations (Ostrom, 2009). Viewed through a planning lens, Leino (2012) also posits that participatory planning procedure is multi-disciplinary and as such it requires input from multiple stakeholders and fields of knowledge. In order to confront multi-scalar planning problems, people have to negotiate and tradeoff their competence and interest with other actors across scale. This may be explained in part by the fact that, the scale at which a particular problem is experienced, discussed and analysed may not neatly correspond to the

scale at which implementable decisions are taken (Tower, 2000). Some may argue that multi-scalar interaction that is conditioned by the above scenario is problematic. However, this view is contested by Swyngedouw (1997b). He points out that, though socio-spatial relations of scale may operate over certain distance, neither the larger nor the smaller geographical scale is considered as a preeminent site for interactive decision making.

However, the notions of multi-scalar decision making within spatially organised governance processes across scales are not left uncontested. For instance, in policy and management studies, Cash et al. (2006) explain that interactions that may occur within or across scales of decision making are embodiments of dynamic relationship. These dynamics – ignorance, mismatch and plurality – which determine the choice of scale can also as a challenge. By ignorance, I mean lack of understanding about how a solution to a given problem at one scale may engender new problems at another scale. Plurality also refers to the ability to recognise that there is no one scale, representing the whole system that is best to focus solutions on. The fundamental issue is that, at any given time, a particular scale would be best only to a select group. Finally, mismatch is the challenge of matching the discursive processes and the scale at which decisions are made (Buizer *et al.,* 2011). Following this line of argument, it can be suggested that poor articulation of issues of ignorance, plurality and mismatch may constrain effective use of multi-scalar settings for participatory decision making. Hence, until the challenges associated with ignorance, plurality and mismatch are recognised and their opportunities exploited, the existence of multi-scalar structures per se will not provide enough basis for analysing planning problems.

Another contrasting view is that public participation at all scales is limited by the problem of inequalities of power (Pickering and Minnery, 2012), including multi-scalar organisation of state spaces. Some writers, including Swyngedouw (1997b) believe that, even though scale is fundamental to temporal transformation of existing socio-spatial power relationship, neither the local nor the global scale offers a viable option for power neutrality. This often raises a fundamental question about the scales at which planning problems need to be analysed and/or solved. Swyngedouw remind us that scale do not emerge only as a site for domination, but also as an arena where compromises are negotiated through a series of socio-spatial struggles. So, in a multi-scalar configuration of the state spaces, the role and interpenetration of a particular geographical scale are determined by nested socio-spatial relationships. Of course, spatial scales are deeply heterogeneous with embedded ongoing transformative socio-spatial power struggles, but the struggles will always lead to three things – changing the importance of certain scales, reassert the importance of other, or new scales may be created entirely. In short, as power coordinates shift, though temporally, new actors join or the existing actors reinforce their power position (Swyngedouw, 2005). In this sense, the power and control of some scales will be strengthened while others are disempowered. Even though a given scale of state

power may encompasses and constitutes other scales of political authority, with the latter still playing significant roles within the wider multi-scalar institutional structure (Brenner, 2004), the capacity to make strategic use of any spatial scale typically varies greatly among stakeholders (Swyngedouw 1997b). This suggests that the discursive strategies and/or strategic selection by the actors are fundamental to analysing, incorporating and solving planning problems.

It is important, nonetheless to recognise that despite the ongoing debates on scale's conceptual potential and limitations, decision makers and other socio-political actors continue to engage with scalar concepts within and across varieties of geographical scales. Some even assume that decision makers possess an unlimited processing capacity to be able to translate strategic choices of the public into decisions that are relatively acceptable to all stakeholders (Sanz de Acedo Lizarraga *et al.,* 2007). However, the central importance of multi-scalar decision making becomes distorted when the analysis of scale is not in tandem with these three factors: (a) decision features; (b) situation factors; and (c) individual differences. A balance between these factors will be useful in trading off decisions across spatial scales. For instance, this will help to incorporate regime factors (Jessop, 1990), and the socio-political context of the decision (Mackinnon and Shaw, 2010). In sum, while spatialisation of socio-political contestations within multi-scalar configurations of state spaces may be scale-sensitive, the rationale for translating decisions at one scale into decisions in another has lacks explicit explanation.

In relation to the present section, I examined how state spatial organisation may offer a framework for analysing multi-scalar decision tradeoffs. Using the concept of state spatiality, I discussed how the dialectical interaction between regulatory strategies and socio-political struggles affect the institutional structure and socio-economic intervention of the state. I also distinguished between state spatial projects and state spatial strategies dimensions of state spatiality, and how together they can be produced and (re)produced through spatial privileging and/or uneven spatial effects of state policies. I end the section on the scalar discourse. This cover the conceptual debates on mobilizing scale for multi-scalar decision making. Here, the insight I draw is that multi-scalar configurations of the state may or may not offer a viable option for participatory decision tradeoffs. The strategic choice of actors, both within and across scale is more critical for trading off decisions.

**Conclusions**

The paper considers how the participation discourses, state spatiality and spatial scales provide the context for participatory planning within multi-scalar decision making arrangement. I argue that the conceptualisation of discursive strategies of state spatiality can be mobilised to interrogate and inform our understanding about the rationale for translating decisions at one scale into decisions at another

scale. I begin the discussion on the concept of participation, and how participation represents an exercise in decision making. I contend that the nexus between participation and decision making is more than the commitment towards public participation in planning. To be able to draw on some of the implications of state spaces on the participation discourse, I carried forward the discussion into how state spatial organisation may offer a framework for anaysing multi-scalar decision tradeoffs. My argument is that state spatial organisation, including its scalar configurations have significant impact on how multi-scalar decisions are being traded. Here, I draw heavily on the spatialised version of strategic-relational theory of the state to argue my case. In doing that, I show that state spatial projects and state spatial strategies dimensions of state spatiality can be produced and (re)produced through spatial privileging and/or uneven spatial effects of state policies in a reciprocal manner. I end the discussion on the scalar discourse with specific focus on discursive strategies of actors and how they condition and/or constrain socio-spatial and political relations across spatial scales. Though socio-political and spatial forces continue to use scale discursively, the conceptual explanation on the rationale for translating and/or recomposing decisions at a lower scale into decisions at a higher scale has not been explicit.

# AN INQUIRY INTO SOCIO-SPATIAL SEGREGATION: CASE OF SYRIAN URBAN REFUGEES IN TURKISH BORDER CITY

Nil Tuzcu[1]

[1]Massachusetts Institute of Technology, tuzcu@mit.edu

Keywords: marginalization, urban refugees, socio-spatial segregation

*Massive influx of displaced people into urban areas reshapes cities' economic, social, political and spatial structures. This research creates a broader understanding of the displaced person phenomenon as one of the main drivers of the urban transformation through analyzing formation of urban marginality in the case of Syrian refugees in a Turkish border city, Gaziantep. This paper uses the findings from the fieldwork that I conducted in Gaziantep including in-depth interviews with both refugee and host communities, and a series of mapping exercises showing the spatial distribution of urban refugee in the city. The urban marginalization explored in the research reveals that the city itself as a social and physical entity is as important as policy interventions in the integration process of refugees.*

## 1. Introduction

UN High Commissioner for Refugees (UNHCR) stated that more than half of the world's 10.5 million refugees live in the urban settings rather than the designated camp-based settlements (UNHCR, 2009). In other words, almost 5,5 million people have fled into cities, creating new forms of urban marginality and inequality. Cities are being reshaped by diversity, conflict and rapid population growth due to urban refugees, yet urban studies still fail to address the question of displaced people. Undocumented refugees in urban areas are considered to be the most vulnerable group due to their inability to claim any right or justice (Grabska, 2006). I argue that if we are to discuss spatial social justice in cities for refugees and other persons of concern, we need to understand the mechanism and the facilitators behind the social and spatial inequalities. This paper aims to create a broader understanding of the displaced person phenomenon as one of the main drivers of the urban transformation through analyzing formation of urban marginality in the case of Syrian refugees in a Turkish border city, Gaziantep.

Since the first uprising against the Bashar al-Assad government of Syria there has been an ongoing-armed conflict between different rebel groups and the government that cause destruction of urban settlements and massive displacement of local population to Syria's neighboring countries of Turkey, Lebanon, Jordan and Iraq. UNHCR (2015) reported that Turkey is hosting 1,759,846 Syrian refugees and as expected, more than 70% of them live in cities and towns as urban refugees (AFAD, 2013). What does it mean for the city? How does the displaced population establish their lives in the urban area and consequently transform the urban fabric? These two key questions have become the standpoint of this research.

This paper analyzes the social and spatial transformation in Gaziantep, Turkey as the most affected area from the massive urban refugee influx (Figure 1). Within the research framework, I define the transformation as a mutual process in which displaced population produces a new spatiality constituted through their social, economic and spatial activities, and simultaneously this new formation reshapes the city's existing structure. Urban spaces are not only social and physical configurations in the city but also critical political entities of the urban fabric (Sanyal, 2014). Although the perceived transformation is predominantly marginalization, the process of segregation is rather complicated with multiple actors, institutions and political forces. Unfolding the marginalization requires an agenda that enables the understanding of different facilitators and their interrelationships. The major organizers of urban refugee's restructuring in the city, as seen in this paper, are refugee policies and the city itself as a socioeconomic and physical entity.

## 2. Related Research

Research on refugee integration requires interdisciplinary approaches combining various branches of social sciences including political science, economics, sociology, anthropology and urban studies (Castles *et al*., 2002). This paper particularly focuses on the relationship among refugees, urban marginality and the city in order to bridge the gap between forced displacement studies and urban studies. Integration level of refugees defines the extension and model of transformation in urban areas; therefore providing a definition of integration is critical for the purposes of this paper. The concept of integration is ambiguous and controversial because it has been described in various ways by different disciplines. Other terms such as assimilation, acculturation and inclusion have also been studied and used instead of integration (*ibid.*). Berry (1997) defined integration as a mutual accommodation situation where both host and refugee populations maintain their original cultures and identities while connecting with the broader society through daily interactions. The concept becomes more complicated when different modes of integration such as social, cultural, economic and political are considered. Besides the objective dimensions of adaptation such as employment and education, refugees' perception on their integration is a critical subjective indicator for understanding and measuring the success of integration (Montgomery, 1997). Different definitions, standards, and measures used in refugee literature do not only affect the scholarly research but also influence the policy decisions and implementations in practice (Korac, 2003). Building upon these arguments, I define the integration with spatial, economic and social equality and inclusion as well as perceptual integration of both populations.

A significant portion of refugees build informal livelihood in urban settings through their engagement with illegal employment and trade. A case study in Eastleigh, Nairobi where the population was composed of predominantly Somali refugees revealed that the urban refugees built trade networks and business in the informal economy and eventually started providing employment for the host society (Campbell, 2006). Similarly, according to a research on Sudanese refugees in Egypt, despite of the economic, social and political marginalization of refugee population, Sudanese refugees reshaped the urban spaces in Cairo (Grabska, 2006). They established schools, centers and housing networks as a new spatial layer in Egypt. Consequently, they became social and economic actors of the society as well as important labor resource for the economy.

Integration process of the displaced people into the host community largely depends on the efficiency of the policy intervention. However, the major challenge is that host governments do not usually recognize urban refugee rights in policy (Buscher, 2001). Even in the circumstances where there are proper institutional integration programs and legal frameworks, mode of integration greatly varies based on the success of programs and policy terms. A comparative research on Yugoslavian refugees in Netherland and Italy shows that policy frameworks and reception strategies of the countries shape the perception towards the refugees in the new societies, which eventually affects the social and economic inclusion of the newcomers (Korac, 2003). Besides the impacts of policy concepts, Reitz (2002) points out that existing social structure of the receiving society is a critical factor for the

inclusion of the migrants. Established ethnic and racial communities as well as the existing immigrant groups in the society create a social framework where the diversity helps the integration process of the newcomers.

## 3. Gaziantep, Turkey

Gaziantep is the financial center of the Southeastern Anatolia and the largest city in the region. Between 1990 and 2000, the population was increased by 31.25% due to immigration related to economic growth (TUIK, 2005). In 2008, 1 out of 3 people was rural immigrant and 69.5% of these people immigrated because of economic purposes (Genis and Adas, 2011). Consequently, Gaziantep as an internal migration-receiving city has been struggling with housing and employment problems. In 2011 when the refugee influx began, the population of the city was 1.753.596 and the official unemployment rate was around 16%. Because of the high unrecorded employment in the city, the actual rate of unemployment is unknown.

The first influx of Syrians fled across the border to Turkey in April 2011 and In October 2011, Turkey declared an open door policy for Syrian refugees and established a legal framework known as the temporary protection (Dincer *et al*., 2014). Majority of the refugees came from the regions close to the Turkish-Syrian border including Aleppo, Idlep and Raqqa. Close to half of them indicated that their homes in Syria were not inhabitable due to the severe damage. Many of refugees showed security reasons for their departure and a smaller portion of them reported political reasons (AFAD, 2013). The number of Syrians that crossed Turkish border has dramatically risen with the increasing use of violence. Gaziantep, a city in southeastern Turkey, has become the destination for displaced Syrians due to its economic resources and its proximity to the border. The number of registered refugees in the Gaziantep is 314,917, as 240,000 of them being urban refugees out of camps (GMM, 2014). Because of the open door policy, the exact number of displaced people out of camp settings is unknown. However, many local authorities claim that the real number of Syrian migrants is far more than the official records including the undocumented refugees.

## 4. Research Questions

The framework of this research is built on a number of questions. What are the main drivers behind urban marginalization of refugees? How does the city's existing socioeconomic and spatial structure affect the urbanization process of refugees? What determines the spatial distribution of displaced population in the lack of policy implementation? How do the policy terms associated with refugees contribute to the integration or marginalization process? In order to answer these questions, I conducted a field investigation in Gaziantep during August 2014. Fieldwork included series of mapping exercises showing the general spatial distribution of urban refugees in the city and extensive in-depth interviews with the key informants from both refugee and host communities.

In parallel, and complementary to the field investigation, I analyzed the refugee policies, socioeconomic profiles, and spatial distributions of refugees. The study method had four components. The first part was to focus on overall process of social exclusion by using findings from the interviews. The second part was to analyze local refugee policies in relation to their roles in urban marginalization process. The third part was to compare socioeconomic identities of host and refugee population. Finally, the fourth part was to examine mapping studies produced during fieldwork in order to explore formation of new spatial patterns and configurations.

## 5. Field Investigation

As a part of the fieldwork in Gaziantep, I conducted open-ended interviews with Syrian refugees and members of receiving community. The main goal was to map the process of social exclusion in a chronological order and to explore the reasons of segregation. In the literature, qualitative interviewing is a common method for refugee research and mostly focuses on the voices of

refugees, their experiences and subjective evaluation of their integration. However, this approach ignores that integration is a mutual phenomenon since it disregards the perspective of existing population. Therefore, this research is based on the voices of both newcomers and existing community. While the interviews with refugees intended to gain information about their use of city, economic activities and the settlement locations since they crossed the border, the interviews with the local residents focused on their interaction with the migrant population.
Despite the availability of camp residency, Syrian refugees preferred to live in non-camp settings because they already had relatives and business contacts in the city. The economic relations across the border over the years have created kinship relationships between the Turkish and Syrian communities, and many refugees used their family routes upon arrival in Turkey. When the refugee inflow began in 2011 and the population of urban refugee was considerably small, integration of displaced people with the host society was established through pre-existing networks. Humanitarian support by the local community provided housing and livelihood for the newcomers thus they gradually constructed their lives in the city. The successful integration of the first Syrian community has led to subsequent chain migration of refugees into the urban areas. However, growing population of forced immigrants in the city started to have severe impacts on housing and labor markets.

Urban refugees are obligated to find their own accommodation, in spite of the refugees in the camps settings who are provided with shelters and basic services such as water, sanitation and electricity. High demand on housing led to extreme rise in rental prices and housing scarcity, which had been an already-existing problem in Gaziantep. According to the interview with the President of the Association of Real-Estate Agencies, monthly rents for apartment units increased from 300 TRY to 900 TRY in 2013. Housing market problems emerged as a potential source of tension between refugee and the host community. One Turkish interviewee, a landlord, explained that she rented her apartment to a 7-person Syrian family, however, the family began hosting other refugees and the total number of people in the apartment went up to 20, causing unrest and infrastructural problems in the building. Similar stories indicated unwillingness to rent housing to the urban refugees. On the other hand, many refugee respondents stated that illegal status of tenant-landlord arrangements caused exploitation and abuse of the refugees. High rental prices, scarcity of housing, and discrimination against the refugees have forced Syrians to find shelters in public parks, abandoned buildings and vacant areas of buildings such as garages, roof terraces and storage rooms (Figure 2). As a result, the Syrian population is largely located in the inner city, where they find vacant buildings and ruins.

Figure 2. Left: A vacant house occupied by 30 Syrian refugees.
Right: A vacant garage used as a market place by a Syrian refugee

Besides the housing problems, another dramatic impact of rapid population growth is on the labor market. Because the Turkish Government does not issue work permits for the refugee status, Syrians built up illegal livelihoods in urban settings. Many Turkish business owners took advantage from

refugees' inability to engage in formal employment, and forced them to work under exploitative conditions. The data collected from the interviews shows that the urban refugees provided labor at below market rates without demanding any benefits from the employers. Consequently, refugee workers replaced local workers and unemployment rate in the host society increased dramatically. During the fieldwork, I interviewed Turkish employers from three different businesses. The first respondent, owner of a contract manufacturing business, stated that when he saw that Syrians provide the same quality of work at a lower salary, he started to hire them. Over time, because of the language barrier he had to make a decision to have either all Turkish employers or all Syrians so that they could communicate with each other. At the time of the interview, all the workers were undocumented Syrian refugees who replaced Turkish workers. The second respondent, owner of a pistachio orchard, said that he hired both Turks and Syrians as temporary agricultural workers. Although they worked for exactly the same hours, Turkish workers earned 35TL per day, and Syrian workers earned 18TL. The third respondent, owner of a small grocery store in the city center, stated that he is going out of business because the new residents of the area, Syrian urban refugees, preferred to go to Syrian-owned shops. Turkish interviewees mentioned the existence of "Little Aleppo" or "Little Syria" in the city as the second commercial center that belongs to the refugee community. As a result, both receiving and migrant population are severely damaged by the lack of refugee employment policy. In the case of refugees, they are subject to exploitative employment conditions and serious protection problems, which creates hatred towards the host country and society. On the other hand, local community holds refugees responsible for rising unemployment rate and lack of labor opportunities.

Growing unemployment and rising rents due to the increasing demand by the urban refugees gave rise to social tensions and protests against the Syrian population in Gaziantep. Threats against Syrians have also impacted daily lives and routines. One Syrian informant stated that he had to sell his car that had Syrian license plate because the car was attacked several times by Turkish people. Another Syrian interviewee explained that they did not feel secure going outside of their home because their Turkish neighbors threatened them with eviction. Multi-dimensional conflicts have emerged gradually through complications in housing and labor markets. Findings of the fieldwork indicate that social tension is an outcome of a 2-year long interaction between host and refugee communities.

## 5.1 Refugee Analysis

What is the contribution of policies related to urban refugees in the process of social and spatial transformation of the city? Refugee policy terms have various levels of involvement with either the marginalization or the inclusion of refugee communities. The subject of policy can be discussed in multiple scales such as UN policies or Turkish Government policies as well as specific policies including border, security or registration strategies. For the purposes of this paper, I chose the policy decisions that have direct impacts on the social, economic and spatial restructuring of the new population in Gaziantep. I used the policy reports provided by the Gaziantep Metropolitan Municipality, City Council (2014) because they primarily organize the urban life of refugees.

The Gaziantep Metropolitan Municipality classified the complications with refugee influx as security, housing, health, social, environmental, education and economic problems. On the municipal reports, policy proposals and decisions are introduced for each problem statement. In terms of housing, the local policy focuses on the relationship between homeowner/landlord and refugee tenants and introduces a legal framework for contracts and rent control by the municipal authorities. The framework also requires landlords to only rent their properties to the registered refugees in order to encourage them to legalize their status. Although there are policy proposals to build affordable housing for the refugees, there hasn't been a serious attempt to put it into practice. Policy response to refugees' accommodation problems does not address the most serious problems of inadequate housing and refugee right to housing, although they remain effective on reducing conflicts of landlord-refugee tenant relations.

Employment policy introduces two critical points: first, the policy avoids generating a pull factor for the future immigration and second, it aims to preserve the civil peace and prevent social conflict. The

policy suggests that every institution can only have 10% of its employees to be Syrian who should have the same employment rights with Turkish citizens including the insurance plan and the minimum wage. Similar to the housing policy, employment strategies also fail to address the broader problem of unemployment and the exploitative employment conditions. There is also a number of unanswered questions remain as potential sources of future conflicts: what will happen to the thousands of urban refugees who are already employed illegally? Under what condition urban refugee will gain legal work permit? Besides the potential conflicts, the policy doesn't make any recommendation on when the policy goes into operation and who is responsible for controlling the employment conditions.

In the case of public services, urban refugees have been holding free access to medical care and education. Although refugees' access to state hospitals has been a successful implication, access to education has failed because of the language barrier and the curriculum differences. The only policy that is directly targeting the integration process is the language program in which the municipality runs campaigns for encouraging refugees to learn Turkish language.

Refugee studies scholars advocate gaining legal status for refugees as an important step towards sustainable and permanent solutions (Grabska, 2006), which is also embraced by the Gaziantep Municipality. Through the policy interventions in employment and housing, Syrian urban refugees are obligated to obtain legal status in the city. However, overall evaluation of refugee strategies shows that refugee integration into the receiving society has not been the part of policy approaches. The lack of state-led attempts on integration results in severe social and spatial segregation and creates isolated refugee communities. Moreover, The Turkish government has been criticized for inadequate governmental policy that causes the weak coordination between local and global humanitarian help (Dincer *et al.,* 2013).

## 5.2 City as a Social Entity

How does the city's existing socioeconomic structure affect the urbanization process of refugees? The city as a social entity plays a critical role in the integration process of refugees. Depending on how similar or different the newcomers and local people are, social and economic conflicts may rise between communities and eventually lead to segregation of refugees. Republic of Turkey Prima Ministry Disaster and Emergency Management Presidency (AFAD) conducted a profiling survey in 2013 as face-to-face interviews with the refugees. By using AFAD survey results (2013), I conducted comparative analysis between the host and the refugee communities based on the indicators directly related to housing and employment focuses.

| | REFUGEE POPULATION | RECEIVING POPULATION |
|---|---|---|
| HOUSEHOLD SIZE | 6.2 PEOPLE | 4.8 PEOPLE |
| GENDER DISTRIBTUION | MALE: 51.4 FEMALE: 48.6 | MALE: 51 FEMALE: 49 |
| WORKING AGE (19-54) | 45% | 44.50% |
| ILLITERATE | 18.80% | 14.20% |
| SCHOOLING | 72% | 85.10% |

Table 1. Comparison between refugee and receiving populations

Table 1 shows the comparison list based on education level, age distribution, household size and gender distribution. Within the employment subject, the most crucial finding is on the age distribution showing that in both communities the working age group forms the largest proportion of the total with %45 for the refugees and %44,5 for the receiving society. Massive influx of working age population into the city added heavy pressure to the existing unemployment problems. In the matter of urban refugees settlement, critical benchmarking factor is the greater household size of the refugee population, which creates a new layer of settlement problem. Housing typology in the region is developed in accordance with the typical household size of the local population, thus both building infrastructure and the models of housing units are not capable of hosting larger number of people. In addition to the similar age distribution, both populations have greater percentage of male and

education level is slightly lower in the refugee community, which indicates that the two populations share similar demographic characteristics. A case study of community relations in a refugee settlement shows that similar identities in terms of gender, age and language help the interactions among refugees, migrants and existing residents, and provide close relationships across differences (Dale, 2007). However the case of Syrian refugees in Gaziantep has a reverse situation because the similar identities compete for the same social, economic and educational resources in the city, which causes social tensions and segregation of refugees.

## 5.3 City as a Spatial Entity

What determines the spatial distribution of displaced population in the lack of state-led resettlement process? The mapping exercises that are produced as a part of fieldwork show that the urban fabric facilitates the distribution pattern of refugees. Existing spatial configurations in the city become the pull and push factors that determine the movement directions and the settlement areas. The major challenge of the mapping study was the lack of data on refugees; hence the study relied on the qualitative data collected during the fieldwork. Data collection involved interviews with municipal authorities, real estate specialists and NGO members as well as Syrian urban refugees who were asked to explain their reasons why they chose to reside in the particular neighborhood. Refugee respondents were also asked questions targeting to understand their use of city, such as the places they go more often, which streets they know in the city, what kind of transportation they use, and where they go to socialize.

Figure 3. The map of Gaziantep, areas of urban refugee settlements.

As shown in the Figure 3, spatial organization has a main spine that became the attractor point pulling new refugees to the surrounded area. The main spine, namely Inonu Street, is the commercial and business center of the refugee community in the city. Most of the businesses on the street are either owned or managed by Syrians. Main reasons that made this area an attractor point are the pre-existing Syrian-owned businesses that were located in the area before the refugee influx and the intercity bus, which is the main gate to the city for the people who cross the border from Syria. The secondary neighborhoods that have high refugee populations are the existing marginalized areas and urban poor shown as area 1, area 2, area 3 and area 4 on the map.

Besides the Inonu Street as the commercial center, small sized industry has the largest number of

Syrian workers. Area 5 became the refugee worker zone where most of the small sized factories are located in the city. Although this area is defined as the business zone, refugees work all around the city in various businesses, which is very difficult to map due to undocumented refugee employment. In the case of public space use, interviews showed that public park-1, public park 2, public park 3 and public park 4 are mostly used by Syrian population. Figure 4 attempts to visualize possible flows in the city by connecting public spaces with housing and business zones of refugees.

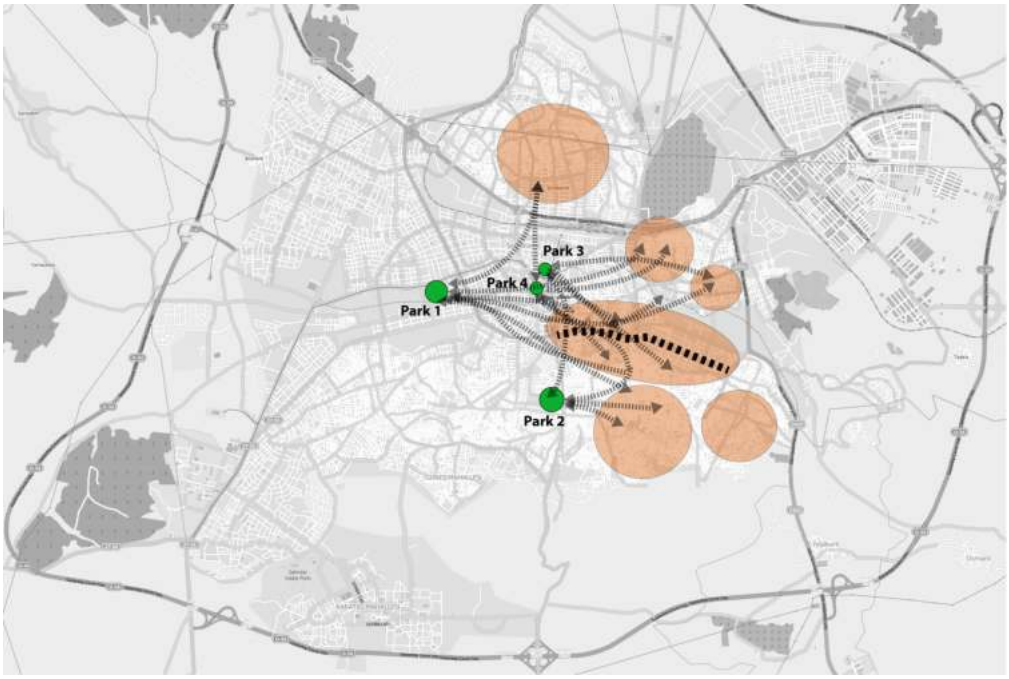

Figure 4. The map of Gaziantep, public space use of Syrian urban refugees

To sum up, urban fabric is the main organizer of refugees' spatial distribution in the urban settings. Mapping analysis demonstrates a number of notable spatial features of urban refugees.

- Urbanization of refugees is centered on a business main spine.
- Transit stations and its surrounding areas are pull factors for urban refugees.
- Neighborhoods of urban poor and ethnic communities are pull factors.
- Neighborhoods where vacant houses are available are pull factors.
- Small industry sites and service sector zones are pull factors.

**6. Conclusions and Discussion**

Massive influx of displaced people into urban areas reshapes the cities' economic, social, political and spatial structures. Systematic analysis of refugee segregation in this paper demonstrates that the generators of urban refugee marginality are multifaceted with complex interrelationships and require interdisciplinary research. A new layer of urban marginality and inequality is emerged in Gaziantep through social and spatial exclusion of Syrian urban refugees. This paper documents that social exclusion of refugees is not an immediate outcome; rather a gradual process with multiple actors and factors. The drivers of social exclusion in the case of Syrian urban refugees are the conflicts emerged from the labor market and housing issues. These problems can only be addressed with proper policy regulations that recognize refugee's right to housing and employment.

This research also reveals that understanding and analyzing the spatial distribution of refugees is a significant component of the refugee research because it identifies the potential areas of marginalization. Spatial organization of the refugees in the urban settings is highly dominated by the pull and push factors of the city's spatial configurations such as existing urban poor, neighborhoods of the same ethnicity and transit stations as the entry points of the city. This key finding about the role of city's spatial fabric in refugee integration brings up two critical questions for future studies: Is there a typical spatial model that urban displaced population produce? Can we predict the spatial distribution of urban refugees before the migration begins? I argue that successful integration strategies and policy concepts rely on the understanding of the distribution patterns of displaced population in urban areas together with their facilitators.

# TRACK 09

## Energy and Space as Resources / Limits for Planning Decisions

### Track description

Co-chairs: **Thomas B. Fischer**, **Giancarlo Cotella**

With rising fossil fuel prices and growing concerns about their wider environmental and social impacts, there is great interest in sustainable energy solutions. Communities need reliable and affordable, as well as environmentally and socially sustainable energy. Whilst there are many ways for reducing the need for energy, demand is unlikely to reduce dramatically in the near future. With regards to sustainable energy supply, there are a number of renewable energy options, many of which are already implemented widely (i.e. hydro, wind and solar), whilst others are still being experimented with (e.g. tidal). However, whilst these renewable options are able to deliver comparatively clean energy, there are other problems, in particular with regards to an extensive spatial footprint with associated impacts , in a context of definite space and often fuzzy responsibility, for both, space and energy provision.

In this light, the integration of energy efficiency strategies into the planning process constitutes a challenge for policy and decision-makers active at the various territorial level. There are particular problems due to European and globally uneven geographies of energy security and energy economics. These have various negative implications on the development of policies and strategies for e.g. low carbon societies. We invite papers to this track that explore challenges and constraints, as well as solutions in support of sustainable energy solutions further.

# "THE IDEAL OF SUSTAINABILITY IN PLANNING: A STUDY ON CONSUMPTION FACTOR RELATED TO THE GREEN ECONOMY"

Ayse Akbulut[1], Ozlem Ozcevik[2],

[1]PhD Student (Istanbul Technical University), ayseakbulut8801@gmail.com
[2]Assoc. Prof. Dr.,(Istanbul Technical University), ozceviko@itu.edu.tr

## Abstract:

*In this study,green economy subject is examined within the scope of rebound effect issue by consecutive questions in the light of the world's main goal of the sustainable development.The components of sustainable development known as 3E(economy-ecology-equity) has been studied since 1987.There are discussions on this subject about the significance,comprehensiveness and integration into countries of these components.The economy represents a significant role in these discussions.Economic and environmental attitudes that globally adopted; use-distribution of natural resources and waste shows that the world moves away from sustainability.It is stated that placing green economy approach to 3E supports sustainable development by the various disciplines.However the consumption creates the subject of debate in this situation. Sustainable development is affected negatively in all economies by the consumption-oriented lifestyle.Game theory approach could establish the link between the consumption with environmental issues. In this context, the main problem question that directs the study is: even if all technological developments and new economic regulations will be provided, can sustainable development be achieved in consumerist society?In conclusion; these evaluations can be carried out when trying to understand environmental issues by different game theory approaches from the perspective of urban planning: All the living thing on the earth wants to maximize their profits independently of each other.But human is tend to interfere with the systems of the other living or non-living thing.Unless there is no sense of near-term profits individually, sense of unconscious consumption doesn't disappear.At this cycle, planning is canalized to unsolvable questions.*

**Keywords (maximum 3):** sustainable urban planning, green economy, consumption.

## Introduction

More for the extension of the practice of urban sustainability, these practices are also supported by both public administrations and the private sector that will contribute to achieving the purpose of the provision of urban planning, it is believed of the city; the host offered by them in the residential area of population, housing area, work area, employment conditions etc. because of the features that can be increased in the way the city enters into a direct relationship with the system environment. Therefore, the individual and the community gradually working to meet the needs of the urban system, sustainable development is meeting at this point. The expression of sustainable cities, indicate the appropriate actions to be found in most of the city (Nijkamp,1998). The reasons for the creation of indicators that determine the suitability of this be listed as follows: II. Major breakthrough of industrialization after World War II was experienced, towards the end of the 1960s, air pollution, lack of infrastructure, population growth and mass deaths begin to occur because of hunger (Douglas,2012). Therefore, strengthening environmental sensitivity starting in the 1960s, and in the 1970s, the result of moving to the international platform today, the concept of sustainability (Yönet & Yirmibeşoğlu, 2005). Starting in the 1970s, urban planning agenda and increasingly after 1990 and therefore constitutes the main framework of the main goals of sustainability (Munda,2006). In the report Our Common Future (UN,1987) as noted, economic development, sustainable development,

ecological conservation and intergenerational equity considerations strives to provide a compromise in between. While doing this approach emphasized the necessity of the adoption by countries globally 3E. These economy-equity-ecology is defined.
The triple bottom components are in equilibrium with each other when in the area and by the nature of the components in approach, a resource conflict between economy and ecology, Ecology and development conflict between equity, there is ownership conflict between them. (Godchalk,2004). All end this conflict and urban planning approaches that are being developed in order to produce solutions (new urbanism, Smart City, green city, eco-city, etc.) it is known that one of the main purposes of sustainable development. However, the components that can be achieved for a sustainable balance between residential systems still are being put in the effort. Questionable relationship to the present day, while the components with each other since the year of 2010, the components themselves in the science of urban planning also has begun to be questioned (James, 2015). The adoption of a global economic system and process, the level of economic development between countries and the diversity of the diversity of the possessors of natural resources between countries, between countries and socio-cultural values in the difference, therefore, accepted the obligation to consider the diversity dynamics of urbanization among countries is a fact. If that is the situation common to all systems are "the economy" component on all components of domination and oppression. Therefore, by countries, global and national economic insights, for the purpose of a sustainable future, is born out of the necessity to be revised. The goals of sustainable development that is compatible with the other components of the economy more realistic, an approach that puts a floor when you enter a search for "green economy" is the only approach that can meet these expectations. The green economy approach; as a concept, especially focuses on generating alternative sources of energy and efficiency. Encountered as a researcher, "consumption efficiency that eliminates the element of "rebound effect" (Hahn,2013) has created some of the systematic study of the phenomenon.

This study of the components of sustainability accepted by querying the relationship with each other to discuss how to update the tools of Urban planning is made accordingly for the purpose of the think piece. The first hypothesis of the proposed study; the phenomenon of consumption in societies that exists for various reasons, internal and external, and the latter with a permanent tension between sustainability therefore is based on where it is located. Practice is as followed:

-How are the components of sustainable development and relationship between them interpreted in history?
-Are the components of sustainable development and "green economy" approach compatible?
-Changing the name of the economic approach and the concept of sustainable development can produce a solution to the goal?
-Why the green economy approach in the rebound-effect phenomenon is emerging?
-Why sustainable consumption is not done?
-Non-sustainable consumption, How does that affect the concept of urban planning?
-Urban planning tools in this context, How can be re-editable?

The literature on the questions in the interpretation of the results from a general result by associating them with each other shall be made. This thought in the following way conveyed graphically the relationship of the questions and content of the work (see fig1):

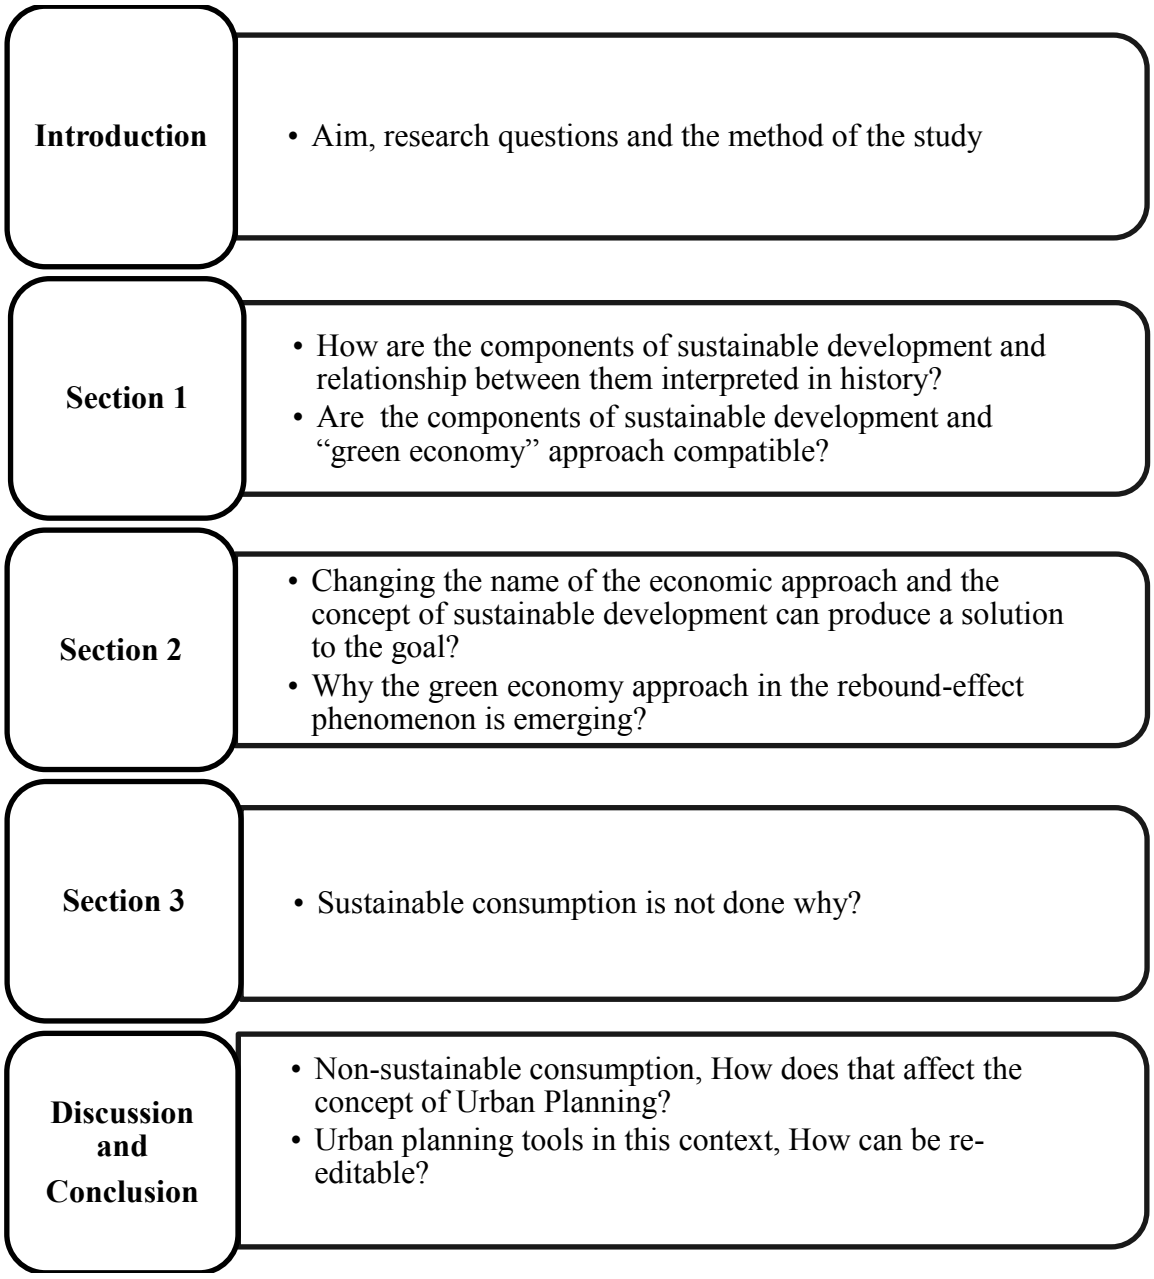

**Figure 1:** Thinkpiece Questions in the Content of the Study

## 1. The Components of Sustainable Development and Green Economy Approach

All three components of sustainable development in the 1970s and 80s ( community-nature-economy) began to appear on the public agenda and in the planning at the same rate. In the 1990s, environmental problems all over the world has become visibly noticeable (see Fig2). In response to this effect to the work of civil society organizations, in particular, sustainable development of the components of the "environmental" more focus on the phenomenon was born of necessity.

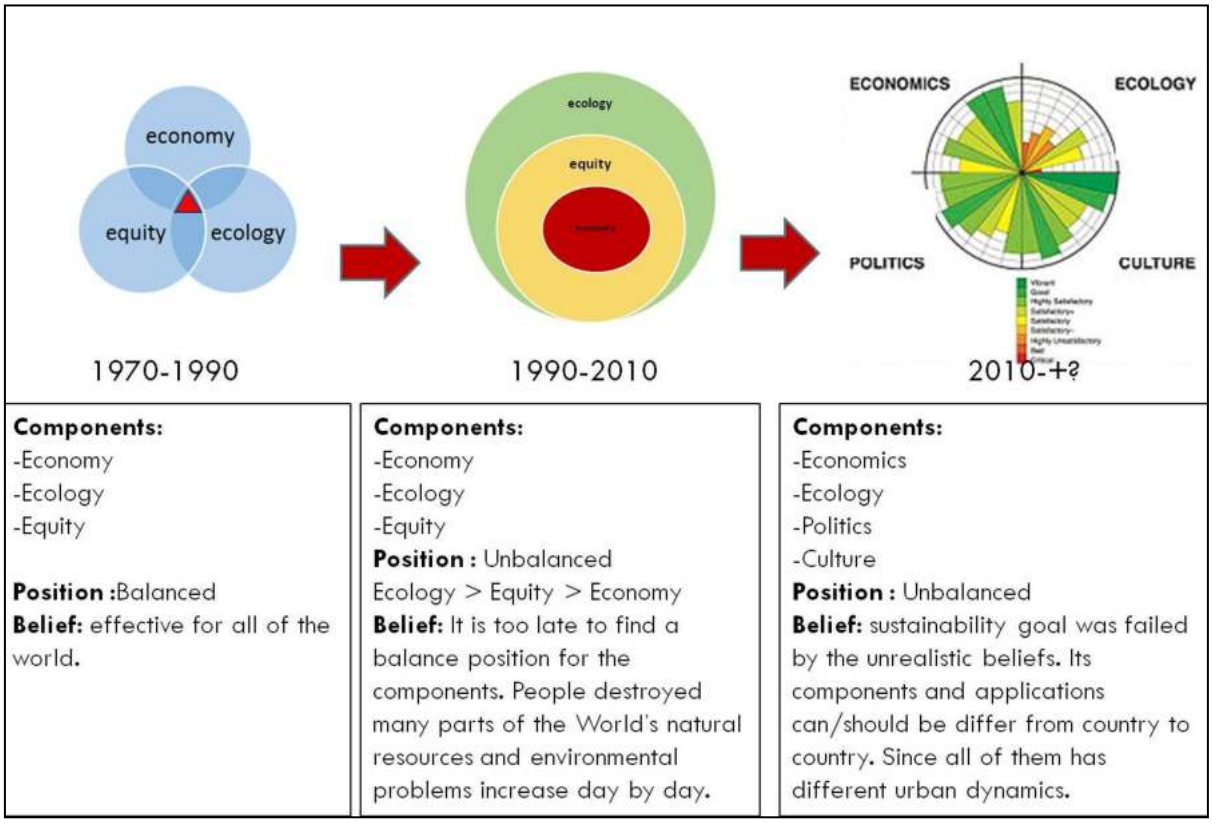

**Figure 2**: Components of Sustainability and their relations between each of them in history

But the global neo-liberal economic approach in the system, most of the economy is dominated by the left behind the sustainability approach, in theory, even a bona fide destination, can be applied in practice to the present day to get away from the semantic losses and is noted as the source.

In this context, the influence of modernism and the quest for the middle way approaches have changed in the scientific world, advanced, and "Environmental Economics" emerging stronger from the science academic with a workspace "ecological economy" kept on the agenda of the phenomenon (Stop& Başol,2007). "Ecological Economics" in general "sustainable development" as the main goal of classical economic theories set off with "environmental issues" with the title is moving. According to Sengupta (2014);ecological economics are considered interdisciplinary scientific field of study and in this workspace: Ecology, physical resource theory, institutional economics, neoclassical economics, the environment, politics, and sociology, psychology and business organizations, human ecology and

sustainable development is all about research fields. In this branch, environmental problems one-on-one is interested in theory, "the theory of externalities" (Stop& Başol,2007). This theory; Ecology and economy among the public is described as an approach to seeking solutions. Externality; Economics field, an asset for production and consumption goods to third parties other than vendors and buyers to install or to provide a benefit at a cost is called (Sengupta, 2014). In the opinion of the Mishan (1993) is another feature of the external behavior of an individual's impact on other individuals was a legitimate activity, and is not intended or earlier is that it is an extraordinary byproduct. According to the economist who created the first theory of externality Marshall(1920) reflected positive externalities to third parties to be questioned, while negative emphasis areas occured. Here is the next sub-research question can be mainstreamed into these externalities? Shaped. So, as a result of substances that are used in production and consumption activities, is it possible to leave no waste processes. At this point, the responses give clues to sustainable development are obtained. Today's manufacturing technologies and recycling efforts significantly advances over the last century to show that although waste-free production and consumption is still not possible (Sengupta,2014). This course of studies after the response given to people to reduce harm and tertiary media evolving. In this loss mitigation, environmental and personal losses in order to resolve different types of taxation and subsidies with persons, institutions or organizations, there are 2 different options on it. This chart outlining all systematic thought (see Fig3) is located below:

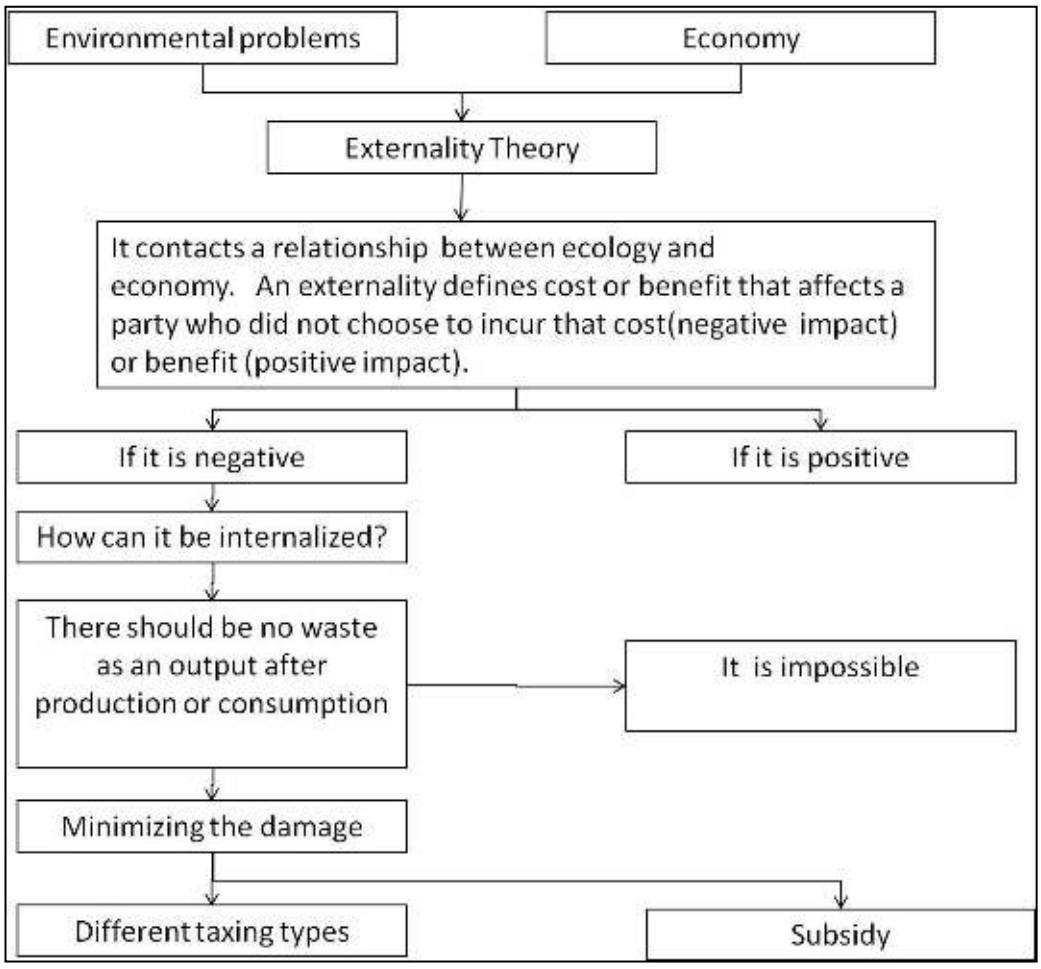

**Figure 3:** Summary of the relationship between environmental issues and the economy

Summary of the relationship between environmental issues and as a result of the economy, in order to be a new concept for sustainable development approach is the necessity arises. At this point, the "green economy" approach comes up. "Green economy" as found in the literature the term: The United Nations Environment program (UNEP, 2010) Although the concept of a framework proposed; production and consumption as the world's natural boundaries of thresholds can be expressed as an economic approach. Under the theme of ecological economy are separated from each other with the expression as one of several approaches to "green economy" approach among the ecological oriented economies (Hahn, 2013).. Sustainable development, green economy is the first to make the connection between the capital approach in the public interest that creates economic study, published in 1989 by Pearce (1993), Green has been named the blue book for the economy works. In this book, is failing because of sustainable development in today's economies tend to consume natural capital to sustain growth was suggested. 20 years later, in 2009, the UN General Assembly first Rio Earth Summit for 20.To celebrate the year 2012 (Rio + 20) in a Summit in Rio de Janeiro it was agreed to. Two of his agenda for Rio + 20; "The fight against poverty and sustainable development in the context of green economy" and "sustainable development" has been specified as the International Framework for the first time and "green economy" goal, global and officially adopted at this event. UNEP's definition of "green economy"; mankind's environmental risks and the likelihood of ecological scarcity, improve the quality of life and social justice wants to ensure he was born with. The green economy is simply low-carbon, resource efficiency and the thought of social inclusion can be expressed as. The main purpose here; sustainable development and quality of life and the economy is thought to be as a tool for it. "Green economy" of components and objectives with today's global world, the prevailing economic system on the path to sustainability, there are significant differences between (Hahn, 2013). These are conveyed in the following table (see: table1):

**Table1:** Today's global economy and "green economy", the differences between the approaches are, (adapted from Hahn,2013)

| **Today's Global Economy** | **Green Economy** |
|---|---|
| To maximize production (To increase GSMH), close to the targeted to maximize profits | Increasing the benefits of low consumption, long term increase in targeted income |
| quantitatively increasing economic growth | Both the quantitative and qualitative increase economic prosperity |
| By exploiting natural resources abuse | Planning and efficient use of natural resources |
| Investors will be focusing on their earnings;<br>-increase the external costs<br>-reduce workforce costs<br>-linear production model<br>-product selling | Focusing on the shareholders ' gains;<br>-external costs reduction<br>-versatile viral production reduction<br>-circular economy model<br>-services for selling |
| Efficiency is defined as the factor that reduces the consumption | Providing capacity to reach their goals of sustainability efficiency being defined as |
| Technology and innovation are accelerating the use of energy and natural resources, reduces the efficiency of work force | Energy-work force and natural resources in order to establish a balance between innovation, energy efficiency is the most important target |
| Based on your personal interests: saving status to persons of consumption<br>Contest | Based on the interests of a broad audience: the use of natural capital incentives for public goods<br>Business Association |

It is seen that the green economy approach, in theory, creating strategies that will serve the main goals of economic sustainability; at the same time, provides a positive contribution to the social and environmental components.

## 2.Rebound Effect in Green Economy: As a Result of Consumption Factor

The economic component of sustainable development in this part of the study with others is to be able to adapt more easily discusses whether there will be enough of the green economy approach. In this context questions also asked: to change the name and concept of the economic approach to sustainable development goal can produce a solution for it? Why rebound effect phenomenon is emerging? Quality of life based on purpose, mostly; low carbon, resource use efficiency, efficiency in energy consumption, focusing on the green economy approach in the rebound-effect phenomenon are encountered ( Lin&Liu,2015), (Hahn,2013). Why rebound-effect phenomenon is emerging? The question proposed to call this phenomenon is clearly described and the establishment of relationship with sustainability is required. The term "Rebound effect"; which is one of the most important goals of sustainability energy efficiency and reducing consumption phenomenon is noted as the consumed with (Aydın, 2014), (Lin & Liu, 2015). "A case of repeated consumption described over includes 2 different types of rebound effect (Aydın, 2014).

**Direct Way Rebound Effect:** To describe the phenomenon of the consumption is deirectly destroyed or where it reduces efficiency.
If there is to be transferred via a simple example of the general; Governments, corporations, etc. organizations by energy-efficient tools to produce a high budget diverged. The idea here; less energy consumption to reduce carbon dioxide emissions, provide as follows. Fuel savings of up to 50% of new vehicles developed provided the person making the 50 km per week with the old tool, this new vehicle less fuel consumption when the 200 km a week, thinking he was doing the main objective is deviated from. In this way gives rise to a further increase in energy consumption and emissions.

**Indirect Rebound Effect:** Income effect terms in the literature as the energy efficiency obtained with additional income to other energy sources consumption refers to the focus. Very often, to be expressed with a simple example, more for the extension of the practice of urban sustainability, these practices are also supported by both public administrations and the private sector that will contribute to achieving the purpose of the provision of Urban planning, it is believed.
With these facts in the literature as direct and indirect rebound effect, asked at the beginning of this chapter: “the economic approach can produce a solution for change the concept of sustainable development? Generally the answer to the question can be given. Changing methods and approaches do not produce a solution. The system as a whole should be viewed, in part, the problems faced, both within itself and in its entirety should be evaluated.
The rebound effect and negative effects on the sustainability brings forth the issue of “consumerism” in this context also the element of the next section is a phenomenon that needs to be addressed and re-produces the research question.

## 3.Understanding the non-sustainable consumption behavior with a game theory approach

In the previous chapter with an element of sustainable economic approach could not serve the purpose of consumption have been identified. Why, sustainable consumption is not done in this part of the study? The main question with "renewable energy, energy efficiency, and all technological

developments, political support, even if these components to consumer society enough?" an answer to sub-question is being sought.
While you're at it "dealing with the economic behavior of consumption, researching game theory" (Hanley&Former,1998) over a general review will be made. City planners perspective, game theory approach with only; city planning since the 1990s are concentrated in "sustainability", why can not reach the purpose, general idea, located under the economic behaviors, therefore the validity of the impact on society and the nature of the world being studied.

Game theory, which explains the uncertain situation that many decision makers are in, will affect planning discipline in a positive way. Nijkamp (1980) proposed negotiations between agents for solving externalities in environmental problems and he added that game-theoretic strategies could be used for negotiations. He indicates min-max models that the compromise solution for conflicting objectives is based on conflicting strategies from game theory.

Game theory approach to urban planning discipline it wants to achieve with the actual result; More for the extension of the practice of urban sustainability, these practices are also supported by both public administrations and the private sector that will contribute to achieving the purpose of the provision of Urban planning, it is believed.

Game theory, an individual's success is based on the selection of other choices covering strategic situations do mathematically behaviors has been working to catch up. While modeling environmental problems since the 1960s as the sole strategy of the country uses to produce theories accepted (Stevens, 1961). According to Hanley, friends and Folmer (1998) international environmental problems addressed to the main static game theory concepts: Pareto efficiency, market equilibrium and Nash equilibrium can be listed. Briefly the content of this concept is to be transferred (if Hanley, Folmer&et al.1998):

***Pareto Efficiency:*** Society producer, consumer and factor the status of one of the owners, without sacrificing one of them for improving the situation of someone else where it is not possible resource allocation status with the approach of this theory is expressed(Folmer&Musu,1992).. So, without reducing the welfare of at least one other of the individual in society the possibility of improving the welfare of society or the welfare of the opinion that it is defended optimum.

***Market Equilibrium:*** The amount of a certain price level in the market the quantity of presentations with the prompt is equal to each other, in other words an excess of involuntary or presentation and can be described as the absence of (Hanley, Former & Mibfeldt, 1998). Win-win situations that accept a system that works, in theory, the supply with the demand for both producer and consumer in the belief that it would always balance each other out.

***Nash Equilibrium:*** According to Hanley,Former (et al) (1998); each player select one of the actions within the game and all the players accepted that it is in the case of making such a choice. The selected action to a player, other players have chosen their action when given, which can be played (in the sense of return) is the best action for all players, and if this feature is provided ,these actions constitute a Nash equilibrium. Here players, they can choose simple actions, and multiple actions they can opt to play with a certain probability. According to the other theory approaches that appears more complex this theory; Hardin's(2000) book, descriptive of the subject in the literature, the most recognizable example is the (prisoner's Dilemma) can be read through the example. The prisoner's dilemma, which is known to be two criminals in the different interrogation rooms have been tried to be forced to confess their ensured crimes. Police is aiming the confession to be easier by making a deal with the suspects. According to the agreement, one of the suspects testifies against the other and the other remains silent, the one who testifies will be released and the other who remains silent will be

sentenced to10 years imprisonment. If they both do not testify against each other and remain silent, both 1 year imprisonment, if both testify against each other they will both be imprison for 5 years. At the end of the game both players have a short-term prison sentence to be preferred to the longer one, and each one will not gain any benefit from reducing the penalty of assuming that the other prisoner's dilemma, zero-sum games are considered as. However, prisoners that are expected from an environment of trust, based on individual interests rather than the decision to higher productivity in the long run, in the short term, low-efficiency, they continue with the decision to testify against each other. Game theory approaches to sustainable development and the players that are observed when the sole purpose of the bond is established independently from other players, to maximize their own profits. Here, environmental issues, therefore, according to the model of sustainable development to be adapted to the desired behavior; long-term investment, instead of the height of purposeful work and productivity; in the short term, a temporary solution, fast, efficient but low profit approach, represents human nature on the economic behavior. The belief that an individual is able to increase the welfare of other individuals due to the use of natural resources-waste, the use of distribution represents. It would balance out supply and demand balance of the market in accordance with their belief that no it's not the end of existence, emphasizing the consumption of like represents. Nash equilibrium in the approach of all societies, on the global level, and equal with interest in a holistic way, to move in the path of sustainable development strategies in an environment of insecurity produced concluded that would not be possible.

## 4.Discussion and Conclusion

Finally in the results section of the study, the questions are: non-sustainable consumption, How does that affect the concept of Urban planning? Urban planning tools in this context, How can they be re-editable? In fact, the content and scope of the questions; is not only the discipline of planning, covering all relevant disciplines, inter or trans-discipline is to describe a discussion of the environment. “The phenomenon of consumption, the economic system of the conscious and unconscious communities, particularly the media element is driven with a phenomena that” it is a fact that is publicly accepted (Baudrillard, 2013). However, the questions according to the response received from the literature in search of related topics; every creature, even though the yield is low in the close process that maximize profits in the long term high yield without general to observe the behavior can be specified.

First systematic thought in the ring; the relationship of the green economy and sustainable development and consumer relations in the cycle of the rebound effect of the subjects in this study have been analysed. Every one of the key words in the review has been questioned in connection with another theoretical. The result that is to be accessed; replacement of the current economic system in order to ensure sustainable development, or the economy in terms of being compatible with the other components to the understanding of sustainability has been on the introduction of naivety. Ecological economies, and which is an example of this approach, which is one of the most important components of the green economy with regard to energy efficiency that may not be serving the purpose is understood. Here intervenes and consumption habits or lifestyle questioning the necessity of the human factor has been identified. In this context, especially environmental issues within the scope of the study of economic behavior, game theory has been interpreted as a general topic.

In the latest systematic thought point; independently of each other, all living things on earth has been on wanting to maximize their own profits. For that reason they lived or attack the current global economic system is still supported. Instead of holistic and long-term mindset with contributing to sustainable development, focuses on understanding individual and collective consumption and

economic growth empoze. But the human can intervene and all creatures cycles for more destructive effects, hence it is more observable.

For this reason a human being who can think, should be trained in accordance with the behavior of consumption, should be directed behaviors. For the discipline of planning, at this point, the approach adopted on the basis of the objectives of sustainable development for the future of sustainable development in 3E or which they adopt all the components approach, on the components of consumption "element/pressure can be said for the importance. The components of sustainable development into a slippery floor is prepared, the element that creates conflict and tension between each other in this context, is an element of consumption. The components of sustainability in the planning studies, the present neo-liberal economic there is no requirement to be addressed by considering the plane again. While the planning tools that are adapted to 3E's also seen first have to consider the phenomenon of consumption, and how, by whom it should be directed. Sustainability approach away from its own logic and being applicable for this reason, a critique of the romantic approach. The main purpose of Urban planning since the 1970s, which is only due to the element of the sustainability of consumption, planning of scientific, social and economic, rather than supporting the validity puts you at risk. In this context, in order to increase the prosperity of the people of the individual and an increasingly science of existing planning, on the social process of participation and governance, especially in vehicles is expected to develop policies, arguments over consciousness. More for the extension of the practice of urban sustainability, these practices are also supported by both public administrations and the private sector that will contribute to achievement and the purpose of the provision of urban planning, it is believed.

# Solar heat strategies for Vienna: identifying regions with highly reliable and affordable potential

Julia Forster[1], Sara Fritz[2], Nikolaus Rab[2]

[1]A1 Vienna University of Technology, Department of Spatial Planning, Interdisciplinary Centre For Spatial Simulation And Modelling Vienna - SIMLAB, julia.forster@tuwien.ac.at;

[2]A2 & A3 Vienna University of Technology, Institute Of Energy Systems And Electrical Drives, Energy Economics Group, fritz@eeg.tuwien.ac.at; rab@eeg.tuwien.ac.at;

Keywords: solar heat, economic potential, 3D city model

**ABSTRACT**
A techno-economic heating energy system model for Vienna (Austria) is developed. Based on an existing solar potential map, different solar heat strategies can be evaluated economically and ecologically. The resulting share of installed solar heat units for every building is displayed in a 3D city model. This 3D model allows city planners to study the spatial impact of these strategies. Results are reported for three different scenarios, which differ in the assumptions regarding policy frameworks.

## 1. Introduction

### *1.1. Motivation*

The heat sector causes a huge share of a city's energy demand: in Vienna 41 % of the final energy demand is used for heat and domestic hot water demand (Stadtvermessung Wien (41), 2013). Actually, less than one percent of this demand is supplied by solar heat - a negligible share of the theoretical potential of 27.2 TWh (Haas et al., 2013). To exploit this theoretical potential for solar heat, investments in buildings heating technologies are necessary. These investments have to be done by the building owners and therefore subsidies and political strategies can be helpful to influence these decisions and the share of renewable heating technologies.

For a sustainable long-term planning of a city's energy system, the strategies have to be analyzed from an economic and social point of view too. The increase of decentralized solar heating technologies can worsen the economic feasibility of centralized supply by district heating due to a decrease in demand. The interdependencies between the centralized and decentralized heat supply as well as the interdependencies between the investment decision of the building owners, the government and strategies of district heating operator require an interdisciplinary analysis.
Such an interdisciplinary analysis aims to indicate the reduction of the total costs for heat supply, the reduction of the CO2 emissions and the share of each technology for different strategies. In addition, it is necessary to provide the results for scenarios differing in subsidies and strategies in a decision support tool to analyze the long-term effects.

This approach addresses the following research question:
"How do solar heat strategies influence the energy system and the spatial footprint of a city and which consequences arise for its total costs, the $CO_2$ emissions and the share of renewables?"

### *1.2. State of Art*

In recent years many different 3D city models have been developed for computing the theoretical potential for solar energy in urban areas (see for example (Hofierka and Kaňuk, 2009) and (Erdélyi et al., 2014)). However there has been little work on the economic viability for solar energy strategies that are trying to exploit these potentials. Up to now no simulation model exists for future heat demand and supply of all buildings in a city that includes an economic and ecological analysis of the impact of solar heat strategies, as well as the visualization spatial planning.

The well-established model Invert/EE-Lab considers the heating related investment decision of building owners due to legislatives, subsidies and obligations (for detailed description see (Müller, 2015), selection of projects and publications: (Kranzl et al., 2014a), (Müller and Kranzl, 2013), (Müller et al., 2010), (Kranzl et al., 2014b)),. It describes the future development of buildings heat demand and the share of the different heating technologies for the building stock. In particular it can be used for the analysis of the impact of solar heat strategies on the building owner's decisions. However when concerning the entire heating energy system the supply side sub-model for district heating, described in 2.2.2. Optimization model for district heating supply, is needed. Many other existing models like (Blesl, 2002), (Neuffer and Witterhold, 2001), (Hausladen and Hamacher, 2011), (Hensel, 2013) or (Nielsen and Möller, 2013) focus on the optimized expansion planning of existing district heating networks and also considers the heat supply. The development of the buildings' heat demand is not considered explicitly it's considered via endogenous scenarios.

3D city models in general support multilevel and procedural planning processes as cooperative planning instrument used in the "Model of Vienna" ((Freisitzer and Maurer, 1985)) or problem solving strategies in planning environments based on trainings formulated by Walther Schönwandt ((Schönwandt et al., 2011)). The aim to help city planners and policy makers is also included in a project of the ETH Zürich in collaboration with IBM, ESRI and the Imperial College London, named "Smart Urban Adapt". This project wants to support "european cities with next-generation decision tools, to design development paths for the 1-ton-CO2-society."(Weinstock, 2013, p.120-124) It comprises a scenario-based low carbon development path assessment. In 2011 Daniel Segraves and Adrian Smith dealt with the goal to reduce carbon too. They designed a "decarbonisation tool" for the city of Chicago. It is a comprehensive decision support tool within a 3D graphic environment, that incorporates carbon tracking, building energy analysis, design and planning optimization.(Weinstock, 2013, p.120-124).

### *1.3. Overview*

To evaluate solar heat strategies economically and ecologically we introduce a techno-economic model of the entire heating energy system of a city with three different sub–models, described in

section 2.2. However, it should be recognized that the areas of highest economic potential for solar heat is not necessarily the preferred optimal location. This is determined by the impact on the cityscape especially in the historic center. Thus simulations of visual axis for economic reliable solar heat units are needed for spatial planning. Therefore we build a 3D spatial simulation described in section *2.3 3D spatial simulation*.

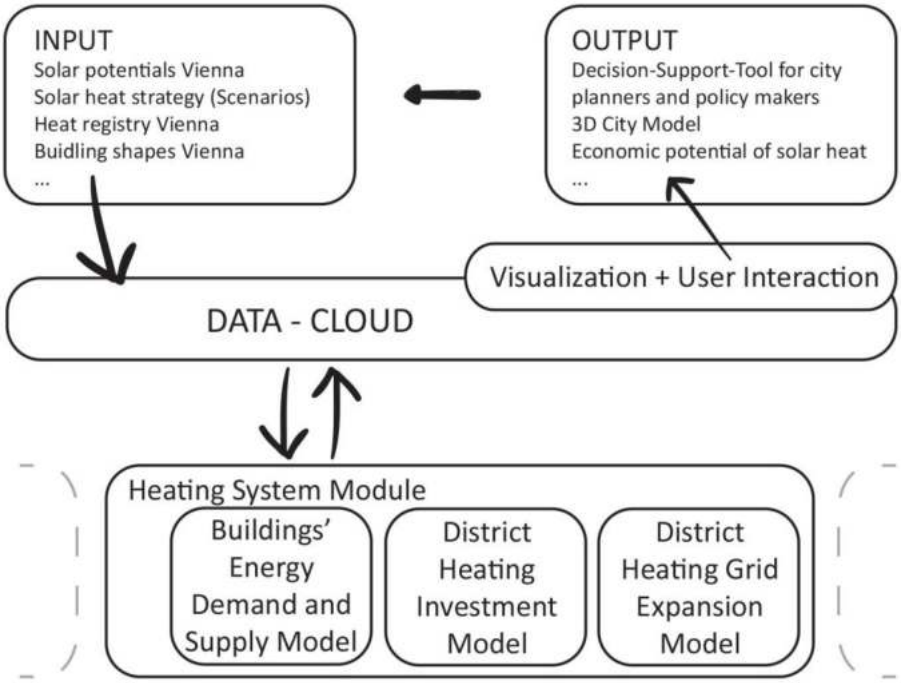

**Figure 1: Overview of the evaluation platform environment**

For our calculation we will use three different scenarios for subsidies until 2030, that can be found in section *3.2 Scenario Description and General Assumptions*. We will build our economic computations on the existing solar potentials computed by the Viennese municipal department 41 (Magistratsabteilung 41 der Stadt Wien), for an overview see *3.1 Data set* .The results of the economic and ecologic assessment can be found in section *4. Results* as well as in screenshots of the 3D spatial simulation.

## 2. Methodology

### *2.1 Methodological Framework*

We use a techno-economic model for a city's heating energy system and a 3D spatial simulation in order to evaluate different solar heat strategies based on economic, ecological and spatial planning criteria. Based on a data cloud, the involved sub-models of the heating energy system model (see *2.2.* ) are connected to this cloud enabling the data transfer. On top of the data cloud, a visualization environment is involved, displaying a 3D simulation of the installed solar heat and illustrating the

considered scenarios with the predefined parameters. The visualization environment also enables user interaction and predefined parameter control. Figure 2 shows an overview of the visualization framework, including the sub-models.

*2.2. Modelling heat demand, supply and related infrastructure*

For evaluation of solar heat strategies by economic and ecological criteria we set up a techno-economic model for the entire heating energy system. Modelling only the building owners' investment decisions for different solar heat strategies is insufficient for city planning: rising capacities of decentralized heating technologies have a strong influence on the economic viability of district heating and subsequently on the overall $CO_2$ balance of a city's heating energy system. Many district heating systems rely on combined heat and power plants that have a thermodynamically highly efficient use of fuel. Thus a substitution by solar thermal heating may be undesirable in the short-run. On the other hand extending the existing district heating grid causes additional costs that have to be taken into account for investment decisions. Thus the heating energy system model for Vienna for evaluation of solar heat strategies consists of three parts:

a. a simulation model for the future development of the buildings' heat demand and supply. It considers the economically based investment decisions for increasing energy efficiency as well as heating technologies including solar heating.
b. an optimization model for the investments in district heating plants based on the buildings' district heat demand computed in (a). It will give a cost-minimal investment strategy for district heating based on the future demand.
c. an optimization model for the district heating grid expansion. It maximizes the heating network operator's profit with possible new connections of building blocks to the existing grid.

The results of the heating energy system models comprise the investment costs in heating systems, the share of all technologies as well as the corresponding $CO_2$ emissions. Figure 2 shows an overview about the methodological framework. Moreover we provide a more detailed description of the mathematical foundation in the following sections.

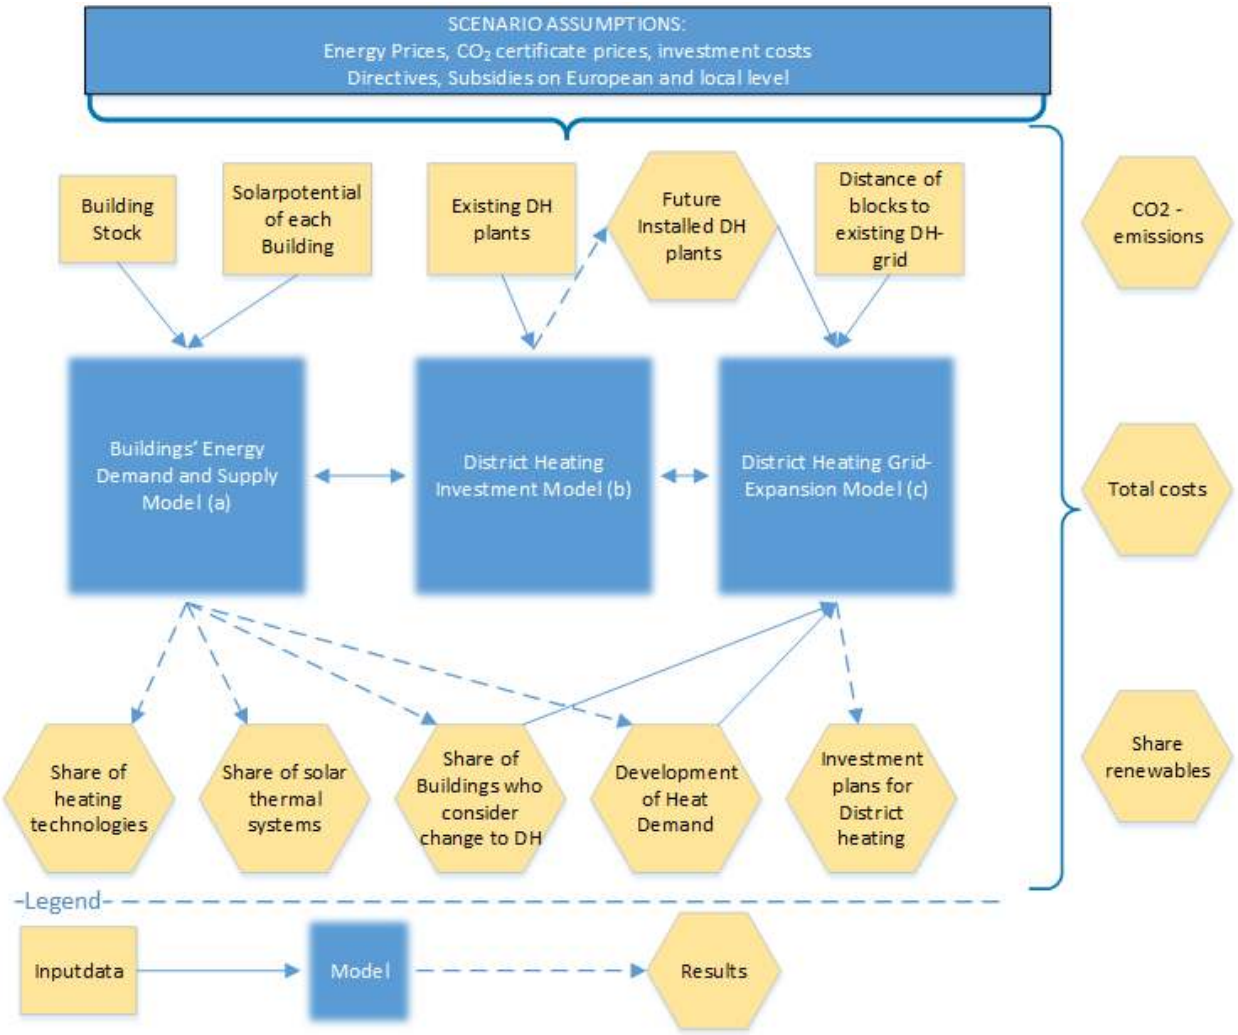

**Figure 2: Overview of the methodological framework**

*2.2.1. Simulation model for buildings' heat demand and supply*

For the simulation of the buildings' heating demand up to 2030, the share of solar heat, district heating and other heating technologies, the existing techno-socio-economic bottom-up modelling tool Invert/EE-Lab is used (for detailed description see (Müller, 2015)). The model uses a cost based logit approach to describe potential future paths assuming the consumer's decisions strongly depend on the costs of technology. These costs cover energy prices, connection costs for grid-bounded heating systems as well as obligations or subsidies. The buildings are grouped by their area of settlement, usage of building, building size, construction period, quality of thermal insulation and installed heating system. With the usage of areas of settlement the building can be located within the city and a distinction for different connection costs to the existing district heating network is possible.

*2.2.2. Optimization model for district heating supply*

The model for district heating plant investments assumes that investments are based on aiming minimal generation costs. The optimization program for the district heating system is based on a generation expansion planning model (GEP), a well-established linear program (De Jonghe et al., 2011). A simple model for short-term CHP planning of (Lahdelma and Hakonen, 2003) will be used to adapt the standard GEP formulation for district heating investments.

For every year $t \in T$ the district heating plants $i \in I$ are associated with fixed costs $F_i$ (in Euro/kW). Heat generation is optimized for every hour. For every plant $i \in I$ we consider the sets of extreme points of the (convex) feasible generation region $J_i$.For the $j_{th}$ extreme point then we have corresponding variable costs of cogeneration $V^h_{i,h,j}$ (in Euro) with generation of $g^h_{i,h,j}$ $kWh_{th}$ heat and $g^{el}_{i,h,j}$ $kWh_{el}$ electricity for every hour $h \in H_t$. The optimal generation can be displayed as convex combinations with weights $\lambda_{i,h,j}$ with $j \in J$. (see (Lahdelma and Hakonen, 2003) for details)

Investment decisions are modelled via the binary variables

$$n_{i,t} \coloneqq \begin{cases} 1 \; opening \; plant \; i \; in \; period \; t, \\ 0 \; else. \end{cases}$$

If the plant already exists $n_{i,t}$ can be set to 1, i.e. $n_{i,t} \coloneqq 1$ for all $t \in T$. Further we need to include the spot electricity market with spot price $s_h$ (in Euro/$kWh_{el}$) for every hour $h \in H_t$. Note that all monetary values are discounted and all decision variables are non-negative.

In such a two-stage formulation, $n_{i,t}$ are the first-stage decision variables, $\lambda_{i,h,j}$ the second stage decision variables. Thus we have the program:

$$\min_n \coloneqq \sum_{t \in T} \sum_{i \in I} \sum_{s=1}^{t} F_{i,t} \eta_{i,s} + \sum_{t \in T} \sum_{h} O_h(\eta_{i,t}),$$
$$O_{h(\eta_{i,t})} \coloneqq \min_{\lambda} \sum_{i \in I} \sum_{j \in J_i} V_{i,h,j} - g^{el}_{(i,h,j)} s_h \lambda_{i,h,j}$$

To ensure that heat and power generation is within the feasible operation region of every power plant and only proceeded in already built plants, suitable constraints are included. Moreover heat generation has to meet district heating demand for every hour. Additionally technical linear operation constraints for district heating plants can be added, e.g. temperature requirements for the district heating system.

*2.2.3. Optimization model for district heating grid expansion*

The investment optimization for the district heating grid expansion is based on the results of the module (a), shown in Figure 2, grouped by building blocks. The objective of the mixed-integer linear program model with several investment periods is to maximize the heating network operators profit $P_i$,

under consideration, that already connected blocks can't be disconnected as long as there is heat demand for district heating. The costs for the grid extension/expansion $c_{inv}$ and the costs for heat generation $c_g$ are considered, as well as the capital costs $c_{cap}$ and operation costs $c_{op}$. The revenues $R_{tot}$ respect the base price $p_{base}$ dependent on the blocks heat load in MW and the demand charge $p_{dc}$, which arise from the heat demand in MWh. The objective function is to maximize the profit Π, where $r$ is the interest rate, $T$ the considered horizon, $P_b$ the connected heating load in MW of the building block and $D_{b,t}$ the heat demand in MWh per block.

$$\max_{x_{b,t,}} \Pi = \sum_{t=1}^{T} \frac{R_{tot,t} - c_{tot,t}}{(1+r)^t}$$

$$R_{tot,t} = \sum_{b \in B} \left(p_{base,t} + p_{dc,t} D_{b,t} + p_{base,t} P_b\right) x_{b,t}$$

$$c_{tot,t} = c_{cap,t} + c_{op,t} + c_{Inv,t} + \sum_{m=1}^{12} c_{g,m,t}$$

Due to cost variations within the year for the heat generation costs $c_g$, these costs are calculated on monthly base. The decision, whether a block is connected to the district heating network or not is formulated as a binary variable $x_{b,t}$.

$$x_{b,t} := \begin{cases} 1 \; if \; block \; b \; is \; connected \; in \; period \; t, \\ 0 \; else. \end{cases}$$

This binary variable also indicates blocks, which are already connected to the existing heating network and influences the capital costs $c_{cap}$, the operation costs $c_{op}$ and the costs for the grid extension/expansion $c_{Inv}$.

*2.3 3D spatial simulation*

For further evaluation of the economically and ecologically reliable solar heat strategies by means of their spatial footprints, we propose a 3D spatial simulation. It serves as a decision support tool and is based on the output data of the heating energy system model, in particular the future installed solar heat units per building. It allows spatial analysis in a three-dimensional virtual space.

The computed installed solar heat units data is joined with the building shape data via an ID number defined by the GIS data source for buildings of Vienna. These GIS based data can include several parts of a building complex with the same ID. We dissolve all building complexes via their IDs and the maximum height of all parts will be assigned to the building complex. Thus a two dimensional map can be designed with the solar heat units for the considered scenarios in specific city quarters over time as well as the distribution of solar heat units in the whole city.

Based on this 2D city map, areas of particular interest, determined by the city planner can be displayed in bigger scale and transformed in a 3D city model with a rule based procedural 3D modeling software

(ESRI City Engine). The two dimensional building shapes are extruded to three dimensional objects, roofs and front buildings. A 3D city model is evolved which enables the possibility to change single object's appearance via defined color intervals corresponding to the data it represents. The underlying data determine the visual design of the spatial objects.

To enable interactive user control and multi-scalar viewing options, the use of a web viewer (ESRI) is beneficial. Especially the possibility of implemented features like sun altitude simulation within diurnal variations offers advantages for the user.

## 3. Data and Case Studies

### *3.1 Data set*

Two main data sets are used for this case study: the "Solar potential registry of Vienna" (Wiener Solarpotential Kataster) provided by the municipal department 41 and the "Heat registry of Vienna" (Wärmekataster Wien) provided by municipal department 39. The Solar potential registry of Vienna (GIS data set) is a land register for the solar potential in Vienna and includes the area suitable for solar thermal and photovoltaic potential for every single building. The Heat registry of Vienna (table data set) contains every single building from Vienna with the construction year, actual heat demand and its geometry like total gross floor area, ground area, number of floors, etc... The theoretical potential for solar thermal is the basis for the actual used potential up to 2030, determined with the simulation model.

To match the data structure for the used models (see chapter *2.2.1. Simulation model for buildings' heat demand and supply* for detailed description) some modifications and pre-calculations are necessary: In a first step, the data for the solar potential has to be matched to the building stock database and as the potential for the simulation model depends on the available roof area and the algorithm of simulation model is for segments and not for every single building, the roof area as well as the area for the theoretical potential has to be averaged. For visualization purposes GIS data sets representing streets, parks, etc. of the Open Government Data[1] Platform are used.

### *3.2 Scenario Description and General Assumptions*

Three exemplary scenarios, based on those described in (Müller and Kranzl, 2013), are considered. These scenarios are adapted for the situation in Vienna, since the scenarios in (Müller and Kranzl, 2013) represent the situation for policy instruments for whole Austria. It's necessary to mention here, that the considered scenarios don't represent the actual situation in Vienna, they just should point out potential developments dependent on different policy frameworks.

[1] https://open.wien.gv.at/site/open-data/

- Scenario 1 - WEM (With existing measures): This scenarios represent roughly the existing policy frameworks implemented in spring 2012 in Austria. The Scenario considers investment subsidies for heating systems and for refurbishments up to 2030. (see detailed description in (Müller and Kranzl, 2013))
- Scenario 2 - WEMpluSol (Additional Solar thermal subsidies): In addition to the policy frameworks from Scenario 1 the investment subsidies for solar thermal are increased.
- Scenario 3 - WAM (with advanced measures): In addition to the WEM Scenario additional budget for renovations is available and the renovation quality increases within the simulation horizon. (see detailed description in (Müller and Kranzl, 2013))

The focus of the analysis of all scenarios is on the actual building stock. New buildings due to the increase in population are neglected. However, buildings newly constructed due to demolition are included in the case study. In addition, the competition between photovoltaic and solar heat isn't the focus of this study either.

The yearly price increase varies in average during the simulation period between 1.02% for gas and 0.76 % for district heating, the two mainly used energy carriers for heating and domestic hot water in Vienna. (In 2013, share of gas in final energy consumption: 42.3 %, share of district heating: 40.6 % (Statistik Austria, 2014)) For climate data, the hourly averaged temperature values for the years 2012-2014 are used (Source: Wien Energie).
We assume constant losses for district heat distribution amounting to 7.5 %[2].

## 4. Results

To compare the results for the different scenarios, the following indicators are used:

- Average $CO_2$ Emissions (kg/GWh) for heat and domestic hot water supply.
- Cumulative costs for the building's heat and domestic hot water demand from 2015 until 2030. These costs include the annuity of investments in refurbishments, the annuity of constructions of new buildings and investments in heating systems as well as subsidies for refurbishments and heating systems and annual energy dependent consumption costs and operation and maintenance costs.
- Share of solar heat and district heating in the final heat consumption in 2030.
- Additional average generation costs for district heating in 2030. These costs include future annualized investment costs for new heat plants as well as fuel costs in 2030. They do not include investment costs for already existing plants.

[2] Source: http://www.nachhaltigkeit.wienerstadtwerke.at/oekologie/energieerzeugung-bereitstellung/energieeffizienz.html

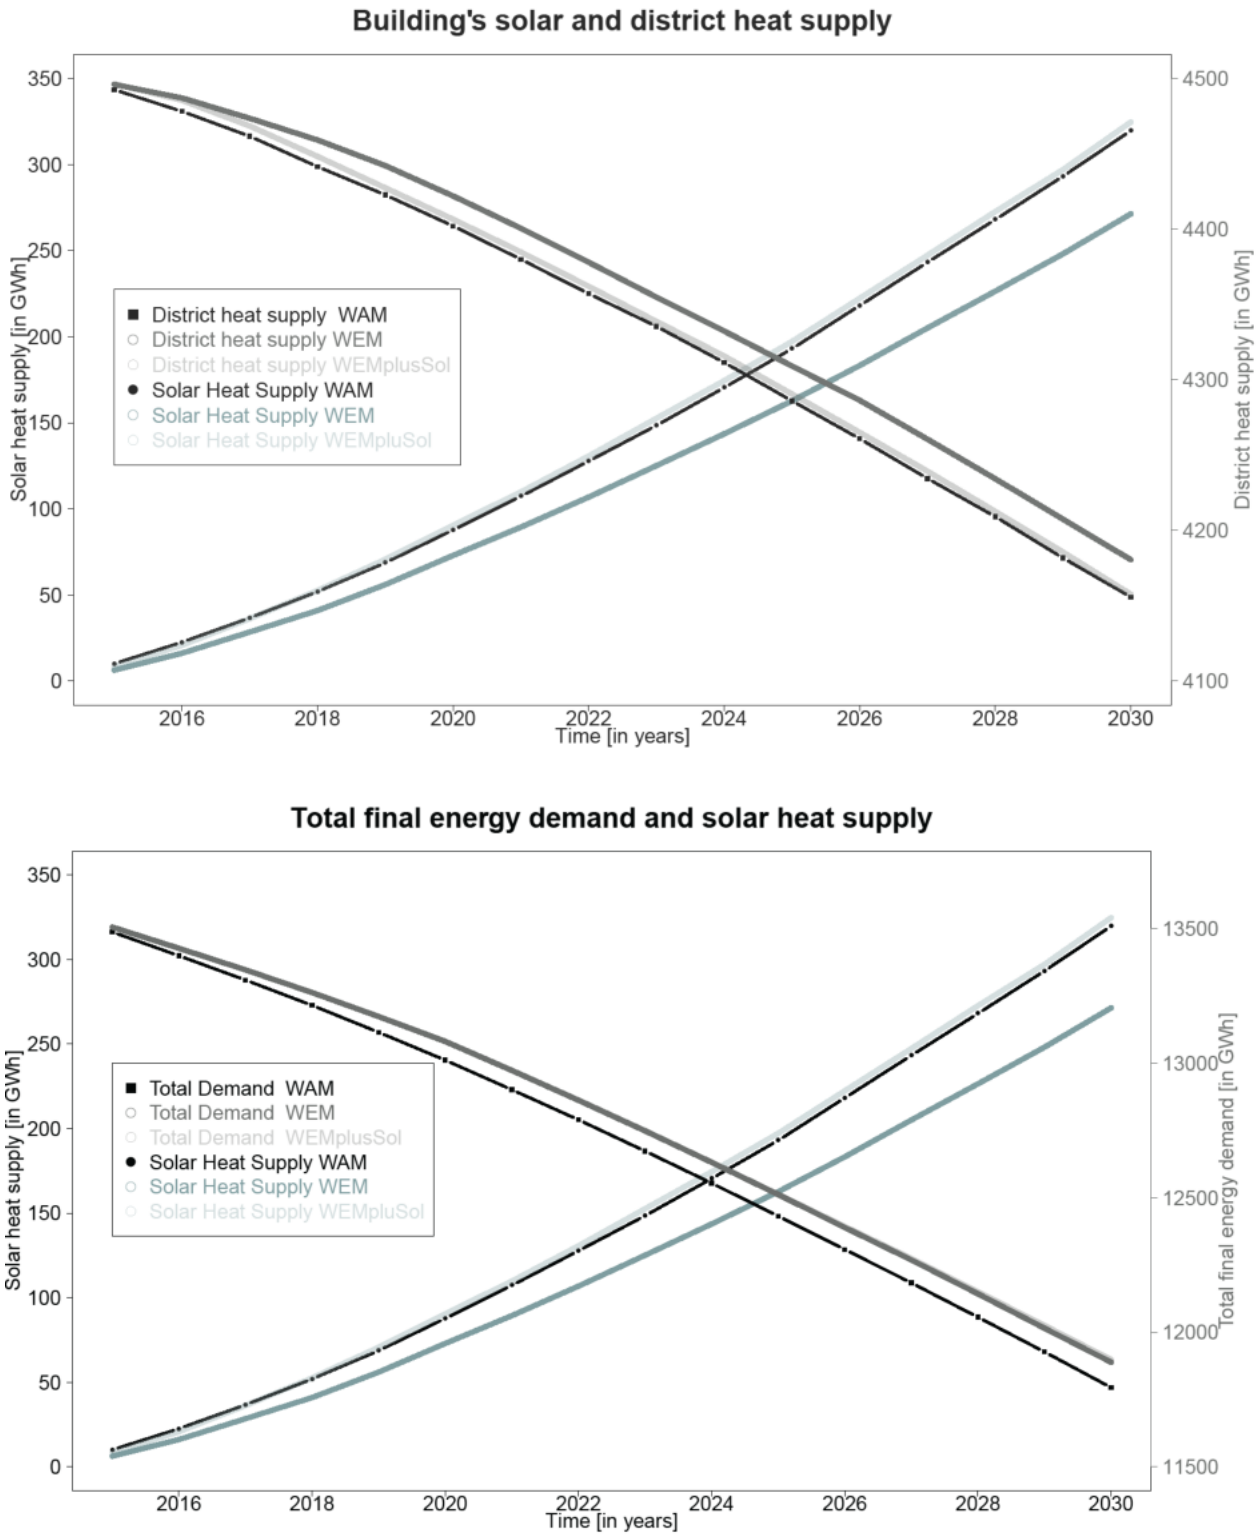

**Figure 3: Development of the building stock's (Residential and office buildings) final energy demand for space heating and domestic hot water**

In Figure 3 final energy demand (FED) for buildings in GWh in total and for district heating and solar heat is depicted from 2015 until 2030. The FED in total remains the same for the WEM and WEMpluSol scenario since the WEMpluSol scenario considers higher subsidies for solar heat with no additional incentives for the building owners to decrease their energy demand. The FED for the WAM scenarios decreases until 2030 by approximately 105 GWh. The impact of the additional solar heat subsidies is highlighted in the plot for the district heating demand and the solar demand: Here, the same change in demand for the WAM scenario and the WEMpluSol can be seen.

**Table 1: Overview economic and ecological assessment**

| Scenario | Avg. $CO_2$ emissions [$kgCO_2/kWh$][3] | Cumulative Costs demand side [Mio. €][4] | share solar in 2030 [%][5] | Share district heat in 2030 [%][5] | Generation Costs district heat 2030 [€/MWh][6] |
|---|---|---|---|---|---|
| WEM | 0.2248 | 3031.7 | 2.20 % | 35.16 % | 19.87 |
| WAM | 0.2239 | 3028.3 | 2.70 % | 35.23 % | 19.81 |
| WEMpluSol | 0.2236 | 3034.7 | 2.73 % | 34.94 % | 19.80 |

In Table 1 the indicators for all three scenarios are shown. Due to the lowest final energy demand in the WAM scenario and the same demand for solar heat and district heat as in the WEMpluSol scenario, WAM scenario has the lowest CO2 emissions. In addition, because of the reduction in the energy demand, the additional costs in the WAM scenario are balanced and the lowest average costs for the considered simulation horizon can be seen. As the building's energy demand and supply model gives a similar decline in demand for all three scenarios there will be no difference in district heat generation costs and investment decisions computed by the district heating investment model. In all three cases a modest change of the generation portfolio by installing 50 MW of heat pumps is cost-optimal. Thus the district heat generation in Vienna would still be mainly based in these scenarios on CHP plants with heat-only boiler station for peak load and incineration plants for based load. As the generation portfolio remains widely unchanged the additional generation costs can mainly attributed to fuel costs (gas) and the gains/losses of electricity generation by CHP plants.

- 3 Calculations based on the following values for CO2-emission: Gas: 0.252 kg/kWh, Oil 0.299 kg/kWh, Coal: 0.34 kg/kWh, electricity: 0.157 kg/kWh, district heating: 0.211 kg/kWh, Wood: 0.025 kg/kWh, wood pellet: 0.052 kg/kWh
- 4 The Cumulative costs of the demand side include the annuity of investments in refurbishments, the annuity of constructions of new buildings and investments in heating systems as well as subsidies for refurbishments and heating systems and annual energy dependent consumption costs and operation and maintenance costs.
- 5 The share is defined as the proportion of solar energy resp. district heating in the final energy consumption.
- 6 These costs include future annualized investment costs for new heat plants as well as fuel costs and gains/losses from electricity generation by CHP plants in 2030. They do not include investment costs for already existing plants.

Screen shots of the 3D spatial simulation are shown in Figure 4-Figure 6. In all three figures the probability of installing solar heat units until 2030 for different scenarios is displayed. In Figure 4, a 2D map of a city quartier in Vienna is displayed. This 2D map gives an overview of the impact of solar heat strategies. The City planner can choose some areas with particular interest that can be shown in a 3D partial simulation as shown in Figure 5. Here, two scenarios can be considered simultaneously. Moreover this 3D spatial simulation allows for more detailed street views too (see Figure 6).

**Figure 4: 2D city map with the share of installed solar heat units in comparison to the theoretical potential until 2030 for WAM scenario**

**Figure 5: 3D Spatial simulation with the share of installed solar heat units in comparison to the theoretical potential of installing solar heat units until 2030 for WAM (right) and WEM (left) scenario**

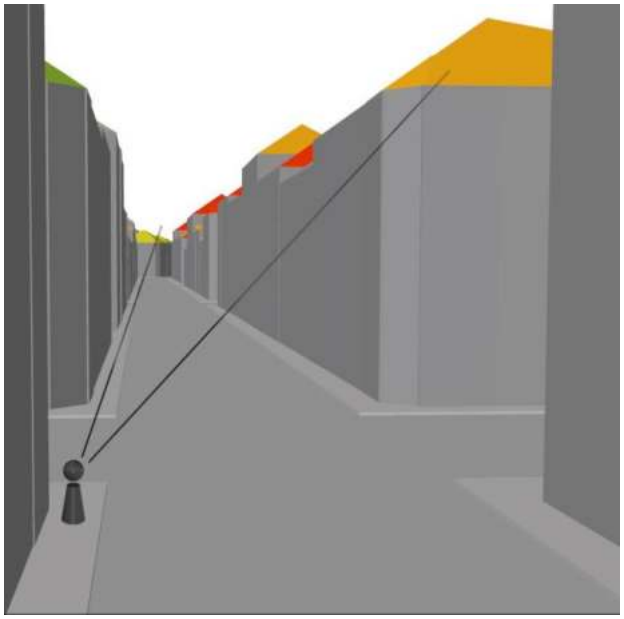

**Figure 6: Street view within the 3D spatial simulation**

The interactive (ESRI web viewer) version (see Figure 5) is available under: http://tinyurl.com/oebhcbl. It enables the comparison screen for two scenarios (WEM: Scenario 1; WEMpluSol: Scenario 2) for the year 2030. The Legend for the online tool is shown in Figure 4.

## 5. Conclusions

In this paper we developed a methodological framework for evaluating solar heat strategies based on economic and ecological indicators. Further we implemented a 3D spatial simulation of the probabilities of installing solar heat units for every building roof in Vienna. This allows an additional analysis of the possible spatial impact of economic and ecological reliable solar heat strategies. As seen in Figure 4 an economic assessment of theoretical solar heat potentials yields a quite different distribution of the most favored locations for solar heat. This can be attributed to the fact that many buildings with high theoretical solar heat potentials may already have economically or ecologically efficient heating systems installed. Thus we believe that such an analysis is essential for reliable city planning. Furthermore, we believe that using a 3D spatial simulation enhances city planning, since this is the easiest way for displaying spatial impacts.

Concerning the results for the city of Vienna, we want to raise several points: The theoretical solar heat potential differs severely from the economic potential. However solar heat subsidies don't have displacement effects on the usage of district heating in a city. In our computations mainly usage of gas for heat supply decreases by purely economic reasons. This is very satisfying from an ecological point of view and eases the implementation of solar heat strategies for city planners. Finally we have to emphasize that our 3D spatial simulation is designed as a decision support tool for city planners only. For detailed and reliable analysis, city planners need to define buildings, where installments of solar heat units (panels) are undesirable. Furthermore they have to define visual axes that have to be preserved due to historical or cultural reasons.

## 6. Acknowledgment

This project would have been impossible without the support of Wiener Stadtwerke Holding AG, Wien Energie and the PhD course URBEM. Further we would like to thank Stefan *Dürauer (MA 41) and Christian Pöhn* (MA 39) for providing us the data sets on building solar potential registry, GIS building data and heat registry.

# RENEWABLE ENERGY RESOURCES AND LOCAL POTENTIAL FOR A REAL "SUSTAINABLE" DEVELOPMENT: A MULTI-CRITERIA DECISION PROCESS. CASE STUDIES FROM TER.R.E. PROJECT

Elena Gissi[1], Giulia Lucertini[1], Vito Garramone[1], Francesco Musco[1] and Matelda Reho[1]

[1] Università Iuav di Venezia, Dipartimento di Progettazione e Pianificazione in Ambienti Complessi [DPPAC]; egissi@iuav.it

Keywords: renewable energy resources, sustainable development, multi-criteria decision analysis.

*Abstract*
*In the last decades, the discussion about Renewable Energy Sources (RES) has been involved and integrated in many fields of studies. However, the discussion and integration of RES has been considered without critics and context considerations, producing a wrong belief, namely that the implementation of RES project is positive by definition. In that way it is believed that the mere production of Renewable Energies automatically brings development, forgetting that "sustainable" development is based on environmental, social and economic factors, connected and calibrated on local territories and their potential in producing RES. Thus, considering the relationship between RES and local framework and potential must be a priority, before adopting and implementing some RES projects or policies. Despite, all this is recognized and supported by the scientific community and European Union, the awareness and capacity to adopt multiple integrated criteria is not fully understood by decision makers and stakeholders, who are in charge of translating the general concept of local sustainable development into praxis. This paper aims at discussing the multi-criteria decision model developed in TER.R.E. project (TERritory, eneRgy & Employment), built on the comparative analysis between 11 case study areas from 8 South East European Countries.*
*The model's indicators, selected by the decision makers involved in the process, are compared with those found in the literature and commonly used for sustainability assessment. Considering the decision makers' preferences, it emerges that the integrated and multiple vision on which sustainability is composed is not perceived by decision makers. On the contrary, their vision on sustainable development is anchored to pre-conceived pure economic perception on energy production.*

## 1. Introduction

In the last decades, sustainable development has been incorporated in many discussions on society and his future. The most common definition about sustainable development provided by Brundtland Commission, "to ensure that it meets the needs of the present without compromising the ability of future generation to meet their own needs" (WCED, 1987), is a starting point for any other definition of the concept. Sustainability research, which aims at better understanding the complex dynamic interactions between environmental, social and economic issues, and sustainability assessment, which aims at evaluating the progress toward sustainability, are based on the identification of criteria (and related indicators) (UN, 2007). Thus, the analysis of sustainable development means to develop a sustainable assessment, and in this paper it is presented one of these cases.
Renewable Energy Sources (RES) are generally considered to have a large potential, especially for local territories, in terms of achieving sustainable development. In fact, RES can provide a wide variety of socio-economic benefits, including diversification of energy supply, enhanced regional and rural development opportunities, creation of a domestic industry and employment opportunities (Del Rio and Burguillo, 2009). The European Directive 2009/28/EU on Renewable Energy (RED, EC, 2009a) recognises "the need to promote renewable energy sources as a priority measure given that

their exploitation contributes to sustainable development, create local employment and have a positive impact on social cohesion".

However, energy policies can produce local development benefits (Del Rio and Burguillo, 2009) but not automatically sustainable local development (Pflüger et al., 2005), which entails a process supported by local stakeholders built on local resources activation. All this produced a wrong belief, namely that the implementation of RES projects is always positive by definition. In that way, it is believed that the mere production of renewable energies automatically brings development, forgetting that "sustainable" development is based on environmental, social and economic criteria, connected and calibrated on local territories and their potential in producing RES. The aim of this paper is to demonstrate and discuss that this wrong belief about RES is widespread among decision makers and stakeholders, and it can lead to the selection of projects, which are not appropriate (i.e. sustainable) with is local context. The demonstration will be conducted using the case study of the project TER.R.E. (TERritory, eneRgy & Employment), under the South East Europe Programme of Territorial Cooperation 2007-2013. The study is based on the elaboration of a multi-criteria decision model and the analysis of its criteria and indicators. These criteria and indicators, selected by the decision makers and stakeholders, are compared with those found in the literature and commonly used for sustainability assessment.

Accordingly, the paper is structured as follow. Section (2) describe the TER.R.E. project as case study, its research objectives and its model. In section (3) the theoretical framework applied in the empirical study is summarize. Section (4) includes the methodology of the study, the decision model, its criteria and indicators. A discussion on the study results is made according to the comparison between the 11 case study areas across South East Europe is provided in section (5). The paper closes with some concluding remarks and policy implications in section (6).

## 2. Case study: the TER.R.E project

TER.R.E (TERritory, eneRgy & Employment) is a transnational project, involved 13 Partners (Figure 1) in 9 European South-East Countries (Italy, Hungary, Austria, Romania, Slovenia, Bulgaria, Croatia, Bosnia-Herzegovina, Albania).

Figure 1. TER.R.E Partners

Eleven case study areas are identified as "marginal rural areas", as small towns and villages located in less urbanized areas (or at the margin of metropolitan areas). They have, from an energy point of view, a greater competitive hedge compared to cities, as larger space and natural resources are available. These territories are characterized by hilly and mountain and are mainly rural, and are affected, although at different level, by similar problems: less or lack of service and less employment opportunities compared to urban agglomerations and competitive growth areas. Such problems cause (or could cause) a gradual depopulation of the less inhabited areas, with serious consequences in terms of new territorial disparities, risk of depopulation of more peripheral zones, risk of underproductive crops as well as loss of ecological safeguard and control of the territories.
TER.R.E. objective is to experiment and demonstrate that a wide and integrated exploitation of endogenous resources to produce renewable energy is an effective engine for a self-generated and sustainable local development in marginal and less developed zones. In such zones Private-Public Partnerships (PPP), between public institutions, private operators and local communities, can produce revenues and employment opportunities, and thus to promote tailored paths of growth and development based on a proper use of local resources. The project aims at path the way for long lasting positive effects on the local energy policies, which, if properly set, can overcame obstacles to energy plants investments across the civil society and can support policy-makers in elaborating RES programs and investments by adopting decision support models, based on a multi-sectorial approach.

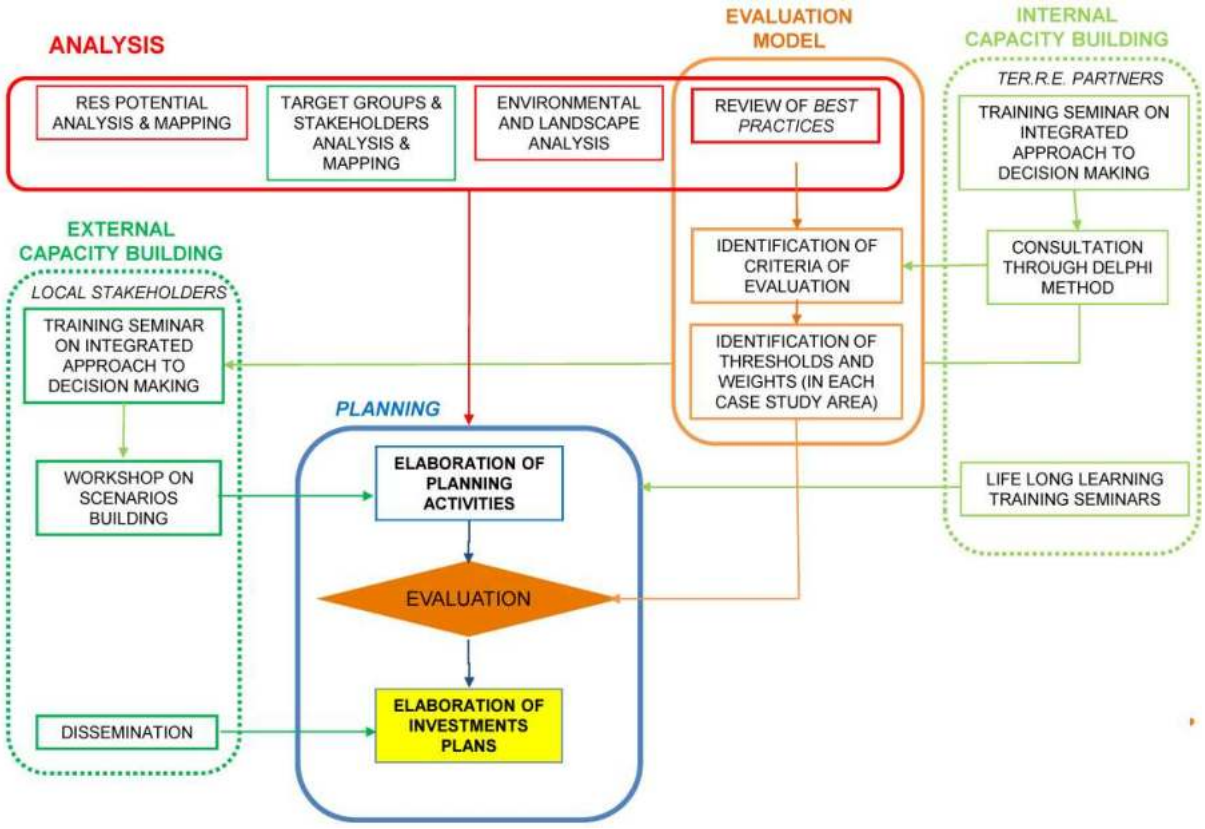

Figure 2. TER.R.E. rationale

The TER.R.E. approach (Gissi et al., 2014; Lucertini et al., 2014a; Lucertini et al., 2014b) was structured following different steps (Figure 2). The first step concerns the indications to support activities in mapping landscape capacity, and potential related to energy, and to build capacities for policy makers, stakeholders and target groups. In this way, in each case study area data are recollected

and stakeholders are informed about RES potential, as to make them part of the knowledge building process and to raise awareness about sustainability criteria (Analysis). The second step is related to the application of the Decision Support System (DSS) to elaborate investment plans. The evaluation model has been constructed through the involvement of all TER.R.E. Partners in an internal capacity building program. After the mapping phase, local actors are involved to discuss, in each area, about targets of local development and to elaborate strategies and actions, integrating human, natural and financial resources (external capacity building program). Planning alternatives are elaborated within a specific workshop in each case study area, and then evaluated according to the DSS. The third step concerns the capitalization of the results in relation to capacity building. Workshops for the promotion of investments (from different sources) are put in place, as well as specific actions towards target groups according to its interests, specificity and local contexts. In this way the outputs (investment plans) are supported in parallel by the construction of a networks of relevant actors (policy makers and stakeholders) and situated knowledge in all phases, two aspects that contribute to the implementation of the purposes and goals of the plans and public policies.

## 3. Theoretical framework

### *3.1. Multi-Criteria Decision Analysis*

Multi-Criteria Decision Analysis (MCDA) is a research area within the field of Decision Analysis (DA), which deal with the process of making decisions in the presence of multiple objectives. It develops methods and tools to assist with decision-making (DSS), in terms of the choice, ranking or sorting of options (i.e., alternatives, solutions, courses of action, etc.), when there are conflicting criteria (Figueira et al., 2005). These methods, which can handle both quantitative and qualitative criteria, share the common characteristics of conflict among criteria, incommensurable units, and difficulties in design/selection of alternatives (San Cristobal, 2011). This is one of the most used methods in environmental/ecologic science (Huang et al., 2011; Fontana et al., 2013), since MCDA give the possibility to combine environmental, social and economic information, and thus address interdisciplinary and complex issues. Moreover, MCDA, if a discrete number of alternatives is given, is a useful tool to structure the decision-making process, and supporting with evidence the decision-makers choices (Bouyssou et al., 2000). Decision-makers objectives are usually conflicting and therefore, the solution is highly dependent on the preferences of the decision-maker and must be a compromise. In most of the cases, different groups of decision-makers are involved in the process. Each group brings along different criteria and points of view, which must be resolved within a framework of understanding and mutual compromise.
Until now, MCDA has been mainly applied in a case studies with specific focus, like forest management (Ananda and Herath, 2009), river alteration projects (Oikonomou et al., 2011), or bioenergy solutions (Buchholz et al., 2009). Most of those studies apply specific criteria, so that the solutions to the environmental problems addressed are hardly comparable or transferable to similar cases. However, different land-use options, or land-use changes in a sustainability perspective have rarely been the focus of MCDA studies. Usually, sustainability criteria are general and about omnipresent phenomena, but they are disconnected to specific land-use resources. Thus, in this work we try to strictly link local resources, land-use, decision makers and stakeholders' preferences and expectations with the criteria, sub-criteria and indicators selected, used into the MCDA model. They are selected by stakeholders through a Delphi method.

### *3.2. Delphi method*

The Delphi Method is a systematic way to query and consult a panel of experts, through questionnaires in two or more rounds, that was developed by Norman Dalkey in a U.S. military project

of the RAND Corporation in the second half of XIX century (Dalkey and Olaf, 1963; Brown, 1968; Sackman, 1974; Linstone and Turoff, 1975, 2002; Skulmoski et al., 2007). Some authors (Thomas, 1972; Sackman, 1974; Rowe and Wright, 1999; Rowe and Wright, 2001; Green et al., 2007) define the Delphi Method an interactive and facilitated (assisted by a facilitator) process, used for the elicitation of opinions of experts and for the forecasting of the consequences of a specific issues. Delphi Method has been widely used in social, ecological and economic studies. For Rowe and Wright (1999), the principle features of the classical Delphi method were *i*) Anonymity of Delphi participants; *ii*) Iteration or information flows between participants through some rounds of discussion; *iii*) Interaction with controlled feedback through report of results, that inform the participants of the other participant's point of views; *iv*) Statistical aggregation of group response, for qualitative and quantitative results.
According to Linstone and Turoff (2002), the reasons to use this method are related to the undefined, unresolved and unclear issues that need to *i*) the subjective judgments on a collective basis; *ii*) the diverse backgrounds with respect to experience or expertise; *iii*) the preservation of the heterogeneity of the participants without domination of the positions; *iv*) an integration of efficiency, that a face-to-face meeting can't guarantee. Moreover, the Delphi Method reduces the time and cost of group meetings.

## 4. Methodology

The methodology proposed aims to identify a comprehensive list of criteria, sub-criteria and indicators, in order to construct a MCDA model able to assess the sustainability development produced by alternative options related to RES projects, considering that sustainable development "must aim to foster and preserve socio-ecological systems, from the family to the global levels, which are dynamic and adaptable, satisfying, resilient, and therefore durable" (Gibson, 2006a, p. 173). Thus, following the Gibson's (2006b, 2012) approach about sustainability assessment we identified the three main categories of sustainable development (environment, social and economic), plus one for the administrative and participation requirement, which have helped to underscore the mutual importance of the several sustainability aspects. In such perspective, we identify criteria and indicators through a process developed on four main steps (Figure 3).

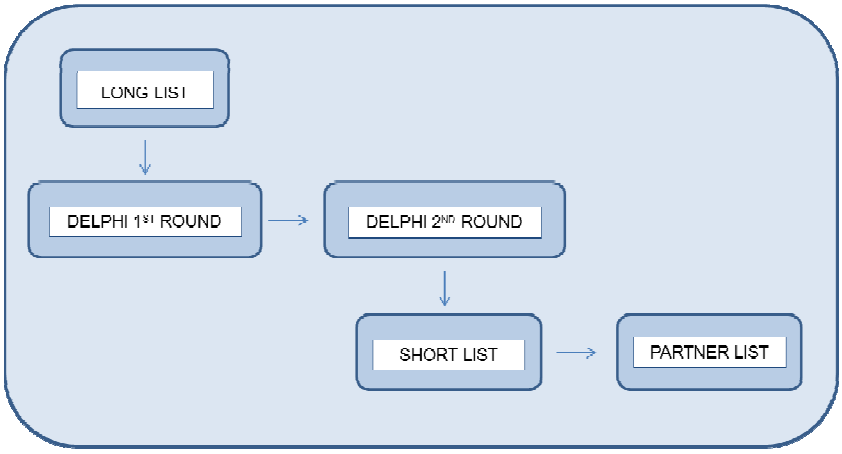

Figure 3. Delphi method, phases

A long list, of criteria, sub-critera and indicators, is completed by the involvement of experts from the Iuav research team, confirmed by European Union indicators and by the related scientific literature. The Delphi method is then applied starting from the long list. A facilitator coordinates a panel of informed and experienced actors through a series of questionnaires in a computer-assisted way. The

first questionnaire aims at acquiring preferences about each criterion, sub-criterion and indicator in their relevance in evaluating RES projects alternatives towards sustainable development. First round' results are elaborated through selection rules agreed with participants.
A second questionnaire is developed, in order to return at the Partners (PPs) the results of the 1st round, and to investigate on sub-criteria on which there is not perfect convergence of preferences. The indicators that will receive the absolute majority of preferences in 2nd round are included in the short list. Moreover, in this way, it is asked indirectly at the PPs to agree with the analysis, the selection rules and so with the short list emerging from the whole analysis process. The short list will be used to create the MCDA model.
In TER.R.E., 2 different groups of respondents were involved: an Experimental Group (EG) and a Control Group (CG). The EG was constituted from the panel of TER.R.E. project partners, 2 respondents for each partners, one decision maker and one professional (for the 12 partners of TERRE project, the panel consists of 24 respondents). The CG was composed of experts of the energy sector, technicians chosen by the Austrian partners (30 participants). In this case there was no anonymity, but the risk of mutual influence was very low and therefore negligible.

### *4.1 Criteria, sub-criteria and indicators*

In the definition of sustainability criteria, sub-criteria and indicators related to the RES system, sustainability was represented according to the 6 principles of Afgan et al. (2000), who include *i*) relevancy to the sustainability, *ii*) indicators should be measurable, in quantitative or qualitative way; *iii*) significance in the time of sustainability assessment; *iv*) reliable information; *v*) enhancing a strategic reflection; *vi*) significance in the optimization of the criteria of evaluation.
Considering that, the long list of 4 criteria, 18 sub-criteria and 114 indicators was completed, including sets of criteria and indicators from European Union (HM Government, 2013; EC, 2013; EC, 2011) and by the related scientific literature (for example, Del Rio and Burguillo, 2009; Neves and Leal, 2010; Gibson, 2012; Hak et al., 2012; Piorr, 2003; Shen et al., 2011; Milman and Short, 2008; Moussiopoulos et al., 2010; Lebre La Rovere et al. 2010.).
The four criteria considered are: *i*) environmental aspects, *ii*) social aspects, *iii*) economic aspects, *iv*) legal, institutional and perceptional aspects. The criteria aim at characterizing all the possible changes or impacts due to the strategies/actions/projects /plants implementation which occurs, respectively, on the environmental components, on social groups, on economic aspects, and on institutional framework and on stakeholders perception.

## 5. Results and Discussion

According to Lancker and Nijkamp (2000), "a given indicator does not say anything about sustainability, unless a reference value such as thresholds is given to it". However, considering the indicator selected by the project partners and decision-makers we can understand how they consider sustainability and RES.
In the TER.R.E. project 24 participants took part to the Delphi. From the complete list of 114 indicators, grouped in 18 criteria and 4 operational objectives, the participants have selected 43 indicators (but the short list contains 58 subcriteria).
With respect to the Operational objective related to the environmental aspects, almost half of the indicators were discarded (23 out of 47). Most of the maintained indicators were the ones related to natural resources in general, as "water", "habitats and biodiversity", followed by "soil". Surprisingly, the "available energy potential" was considered less important with respect to the precedents, even if the evaluation of sustainability is related to RES projects. The sub-criterion related to "greenhouse gas emissions" is in a lower position in the preference ranking, even if it is explicitly mentioned in RED (EC, 2009a). Finally, some criteria deriving from EU Directives, as the Directive 92/43/EEC

"Habitats" (EC, 1992) and Directive 2009/147/EC "Birds" (EC, 2009b), are excluded from the list as "habitats amount", "Protected areas", and "Habitats conservation". The least represented criterion is the one of "Landscape", interpreted only as "crops change (loss)". Landscape is widely considered as a resource for multiple purposes, as for rural tourism. This aspect might entail several problems in the evaluation of sustainability of local development from RES projects, reducing the possibility to consider synergies with other possible strategies in local development.

Table 1. Objectives, criteria and subcriteria (in number) in the short list and in the long list

| Operational objective | Criteria | Subcriteria of the Long List | Subcriteria of the Short List | Percentage of Subcriteria stability |
|---|---|---|---|---|
| A. Environmental aspects | A.1 Soil | 7 | 4 | 57% |
| | A.2 Water | 6 | 5 | 83% |
| | A.3 Air | 6 | 3 | 50% |
| | A.4 Landscape | 5 | 1 | 20% |
| | A.5 Habitat and Biodiversity | 10 | 5 | 50% |
| | A.6 Energy | 7 | 4 | 57% |
| | A.7 waste/residues | 6 | 2 | 33% |
| B. Social aspects | B.1 Population | 5 | 1 | 20% |
| | B.2 Services | 7 | 4 | 57% |
| | B.3 Job | 7 | 2 | 29% |
| | B.4 Poverty | 5 | 3 | 60% |
| | B.5 Settlement and Infrastructure | 8 | 3 | 38% |
| | B.6 Risks | 5 | 3 | 60% |
| C. Economic aspects | C.1 Costs and benefit | 7 | 4 | 57% |
| | C.2 Financing and Funds | 6 | 4 | 67% |
| | C.3 Productive investments, Research and Development | 7 | 3 | 43% |
| D. Legal, institutional and perceptional aspects | D.1 Legal and institutional | 5 | 4 | 80% |
| | D.2 Partecipation and acceptability | 5 | 3 | 60% |
| TOT. | 18 Criteria | 114 | 58 | 51% |

With respect to the operational objective related to the social aspects, they represent the second represented criteria among the 4 ones. Only 16 out of 37 criteria are accepted by the respondents. The most preferred criteria are related to "Services" to education and health, "Poverty" and "Risks". In contradiction with European social policies, Jobs and Gender issues are the least represented, as for the policies related to the construction of Smart Energy strategies. Social Inclusion and innovation strategies might risk to weigh less in the evaluation model.

With respect to the operational objective related to the economic aspects, some indicators were constrained by the authors, as required by the setting of the TER.R.E. project, as the criterion "Financing and Funds". They are at the basis for the elaboration of the investments plans related to RES. With respect to the others, 9 out of 20 indicators were discarded, confirming that market-related issues (as cost and benefits) are more relevant than issues related to innovation and research. It might result that classical economic approaches might weigh more than innovative and diversified approaches towards RES.

With respect to Legal, institutional and perceptional aspects, 7 out of 10 were constrained by TER.R.E. project, and only those indicators were maintained.

## 6. Conclusions

Besides the general agreement on the importance of considering significant criteria to assess sustainable local development, our analysis put in light that sustainable development is not completely understood in its complexity by decision makers and professionals in charge to support it. Beside the wide variety of objectives, criteria and subcriteria emerging from literature, experts and EU documents, still economic issues are perceived in quantitative terms, considering with higher rank the costs-benefits characteristics instead on including innovative aspects connected to investing in research and development. Moreover, criteria connected to PPP were not acknowledged for their importance to support local development, as to indicate that innovative practices might be difficult to be implemented.

Legal and institutional objectives as well as social acceptability – and related criteria and subcriteria – play a marginal role in the set of criteria selected by TER.R.E. partners. This aspect reinforces the fact that lifelong learning programs are needed to support decision makers and professionals in updating their understanding of problems. It is not sufficient to provide innovative criteria in a top-down manner, as issuing new laws or regulations.

The analysis has been replicated in a case study area in Austria, were RES have been considered as a source of local development till 30 years. From the comparison of the results it is evident that more advanced Austrian context and marginal rural areas from South Est Europe diverge with respect to the issues related to research and innovation, as well as on public-private partnership. To overcome this divide, it is necessary to accompany the process of elaboration of planning proposals related to RES with specific trainings and processes of capacity building, to support learning and understanding of innovative approaches.

Another important aspect is that landscape issues were considered negligible when evaluating local sustainable development through RES investments from the respondents. Landscape entails integration between ecological and social aspects, as well as the perception and preferences of local communities, as declared in the European Landscape Convention (Council of Europe, 2000). Landscape is considered as an asset in sustainable local development (Termorshuizen and Opdam, 2009), as it provides multiple services as, for example, flood prevention and recreational values (De Groot, 2006), besides the capacity to provide renewable energy sources. It would be worth to evaluate how sustainable local development can derive from different types of investments plans, without considering RES as a panacea for development (Del Rio and Burguillo, 2009). The risk is to disregard other possible paths, as for example, rural tourism based on landscape cultural services, or to underestimate possible impacts deriving from the implementation of RES projects with respect to multiple ecosystem services delivered by landscapes.

The analysis of RES investments plans according to a Multi-Criteria Decision Analysis (MCDA) model is meant to anticipate possible trade-offs between different alternatives. Objectives, criteria and sub-criteria are at the core of the model to interpret and to evaluate the performances of alternatives to achieve sustainable local development, as the result of multiple and integrated perspective able to include social, environmental and economic issues at once. The challenge is related to the perception and understanding of decision makers and stakeholders with respect to the interpretation of sustainability within DSS, as put in light in this paper.

## 7. Acknowledgements

We thank all experts, decision makers and stakeholders that took part in TER.R.E. project activities from the 11 case study areas. The TER.R.E. project, started in November 2012 and ended in November 2014, was financed by the European Union under the programme “South East Europe” (SEE), Transnational Cooperation Programme .

Keywords: urban structure, urban development, energy efficiency

**Abstract**

*Transforming cities' energy use to address the threats of climate change and resource scarcity is a main challenge in local governance. The EU-FP7 project PLEEC – "Planning for Energy Efficient Cities" – uses an integrative approach to elaborate pathways, considering diverse challenges and requirements, for energy efficient and sustainable urban development.*
*This paper addresses the challenges of urban energy policy from an urban structure related angle. The relationship of energy and urban structure is investigated by means of a literature review and in-depth knowledge from three case studies of medium-sized Northern European cities.*
*The study takes stock of the current state of energy in urban development and policy, and reveals current options and constraints of energy efficient urban development.*
*The case cities go in some ways ahead their national climate and energy policy and aim to establish urban planning as an instrument to regulate and influence the city's transformation process in a sustainable way. At the same time the cities are constantly facing goal conflicts which induce dilemmas in their strategic orientation and planning activities (e.g. regional enlargement and increased commuting vs. compact urban development). We conclude that applying a broader understanding of urban structure than usually encountered in the academic literature turns out as a suitable framework in order to address the challenges of energy efficient urban development.*

## 1 Introduction

In the backcloth of the EU's 2020 climate and energy package ("20-20-20 targets") energy is high on the agenda in current urban development issues. Energy is an important element in various urban visions including being a sustainable and climate-friendly city, being self-sufficient, regenerative (Girardet, 2015) and resilient or also in more general concepts a *Smart City*.

This paper approaches the challenges of urban energy policy from an urban structure related angle. Urban structure is part of the sphere of influence of the municipal planning authorities and can hence be operationalized through urban planning as competence. Municipalities can act within and affect urban structure which enables cities to contribute to the achievement of the 20-20-20 targets.

The chosen cases, Eskilstuna in Sweden, Turku in Finland and Tartu in Estonia, face similar challenges like tendencies of ongoing urban sprawl and regional commuting, strongly related to their position within the regional urban system; as well as partly comparable constraints towards energy efficient urban development. In this sense the cases can to some extend be considered as exemplary for the challenges many medium-sized European cities have to deal with today.

Urban structure is in the academic literature mainly related to *urban form* (morphology, configuration and compilation). This paper suggests a broader approach to urban structure, including *urban administration* (policy, planning and governance) and *urban functioning* (urban system, city-region and flows). This study reveals the interrelations between those three dimensions of urban structure and

shows that addressing urban form to increase energy efficiency requires accompanying policies that are likewise addressing urban administration and function as an integrated policy package.

The studied cities go in some ways ahead their national climate and energy policy and aim to establish urban planning as an instrument to regulate and influence the city's transformation process in a sustainable way. At the same time the cities are constantly facing goal conflicts which induce dilemmas and trade-offs in their strategic orientation and planning activities (e.g. regional enlargement and increased commuting vs. compact urban development). Consequently, the paper reveals current options and constraints of energy efficient urban development as well as potential contributions of cities to the achievement of the 20-20-20 targets.

## 2 Approach and methods

In 2008 the European Union (EU) set up a climate and energy package containing three key objectives for 2020: 20% reduction in EU *greenhouse gas emissions* from 1990 levels, raising the share of EU energy consumption produced from *renewable resources* to 20% and 20% improvement in the EU's *energy efficiency*. Transforming cities' energy use is a main pillar to reach these goals.

The research uses a twofold approach including a literature review on the relationship of energy and urban structure as well as in-depth knowledge from three case studies. The *literature review* examines the state-of-the-art of research on the relationship of energy and urban structure. The review includes conceptual and empirical work published in journal articles, conference papers, books and book chapters, as well as policy-oriented documents from the EU and other organisations. The literature search focused on energy use in urban areas, preferably in a Northern European context, but included further work from e.g. a Northern American and Australian context in case of specific relevance. This paper presents a summary of the outcome of the reviewed literature as baseline for the discussion on urban structure.

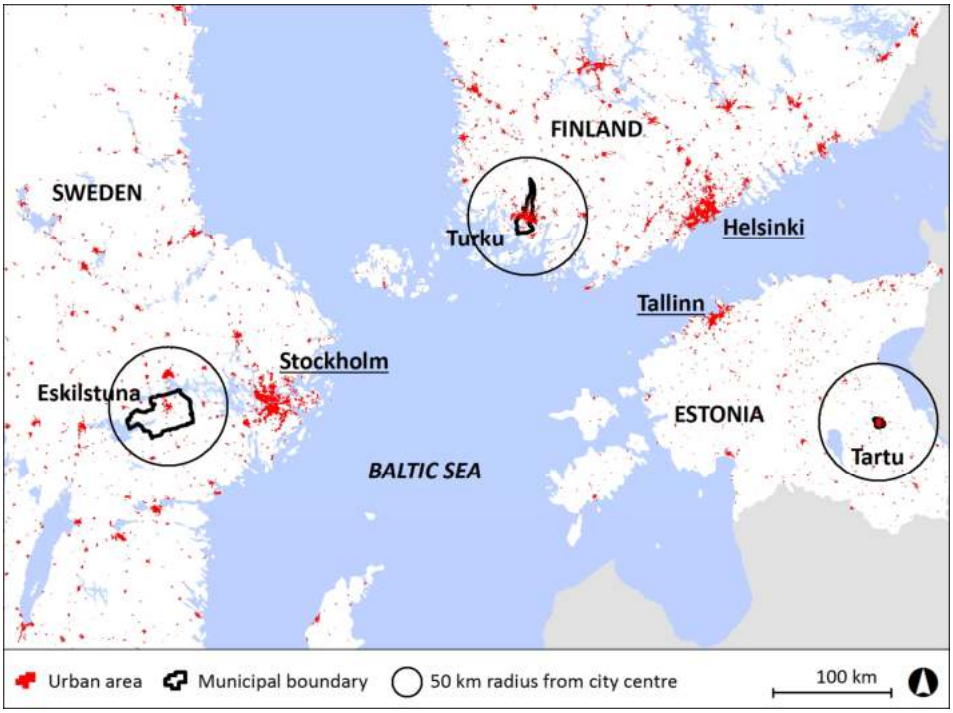

Figure 1. Urban areas in Northern Europe (European Environment Agency (EEA), 2014) and the three case study cities

Three in-depth *case studies* of medium-sized Northern European cities, Eskilstuna in Sweden, Tartu in Estonia and Turku in Finland, form the main part of this study. The case studies were conducted in 2014 as part of the European project PLEEC – "Planning for energy efficient Cities", funded by EU's Seventh Framework Programme (Fertner et al., 2015; Große et al., 2015; Groth et al., 2014).

The chosen cases are suitable for the intended investigation because they are both contrasting and similar. They are all medium-sized European cities (see Table 1), functioning as regional centres and striving to increase their energy efficiency. However, they face divergent urban dynamics and development challenges and act in different planning systems.

The investigation of the case studies is based on interviews with civil servants and stakeholders in urban development and energy planning, site surveys, scientific publications, planning and policy documents, maps and statistical data. The interviewees were asked about their perception of framing conditions and national energy regulation, the evolution of spatial planning, current transport planning as well as national and local energy policy and the role of regional planning.

The aim of the study is to investigate the relationship of urban structure and energy and examine urban structure as a suitable framework to address questions of urban energy efficiency. Subsequently, current options and constraints of energy efficient urban development and therefore potential contributions of cities to the achievement of the 20-20-20 targets will be elaborated.

## 3 The relationship of urban structure and energy

Since more than three decades researchers investigate the relationship between urban structure and energy use in cities. The approaches range from urban form related angles to approaches including for example socio-economic factors. Based on a comprehensive academic literature review on the relation of urban structure and energy use this paper provides a summary of main findings.

The reviewed literature proofs a relationship between urban structure and energy use. Næss and Jensen (2004, p. 37) summarize that "urban structure makes up a set of incentives facilitating some kinds of travel behaviour and discouraging other types of travel behaviour"; thus, the structural conditions have relevant potential to influence people's travel behaviour (Næss, 2006). Dense and concentrated cities are considered as contributing to reduce travel activities by car (Næss et al., 1996). Still, it is difficult to clearly verify this relationship between urban structure and travel behaviour; some approaches even consider it as 'weak' or 'uncertain', also due to the importance of socio-economic factors and people's attitudes (Næss and Jensen, 2004). Stead and Marshall (2001) identify effects of land use and socio-economic factors on travel patterns; consequently, policies aiming on influencing travel patterns have to assume "a set of interactions between land use, socio-economic characteristics and travel patterns" (Stead et al., 2000, p. 185), since land use characteristics explain only some of the variation in travel patterns. This relationship between the *parameters* or *structural variables* of urban structure and the final *energy implications* can be simplified as a causality chain (Figure 2), as comparably applied e.g. by Næss (2012, 2006), Næss and Jensen (2002) and Owens (1986):

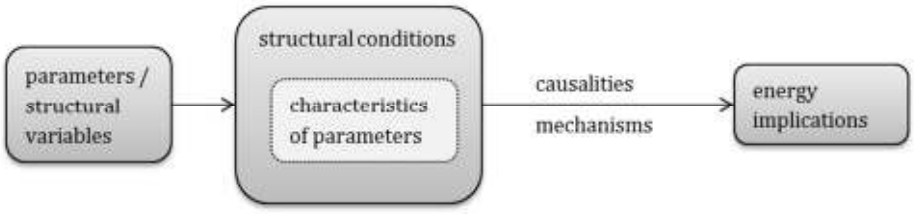

Figure 2. Causality chain between parameters of urban structure and energy implications

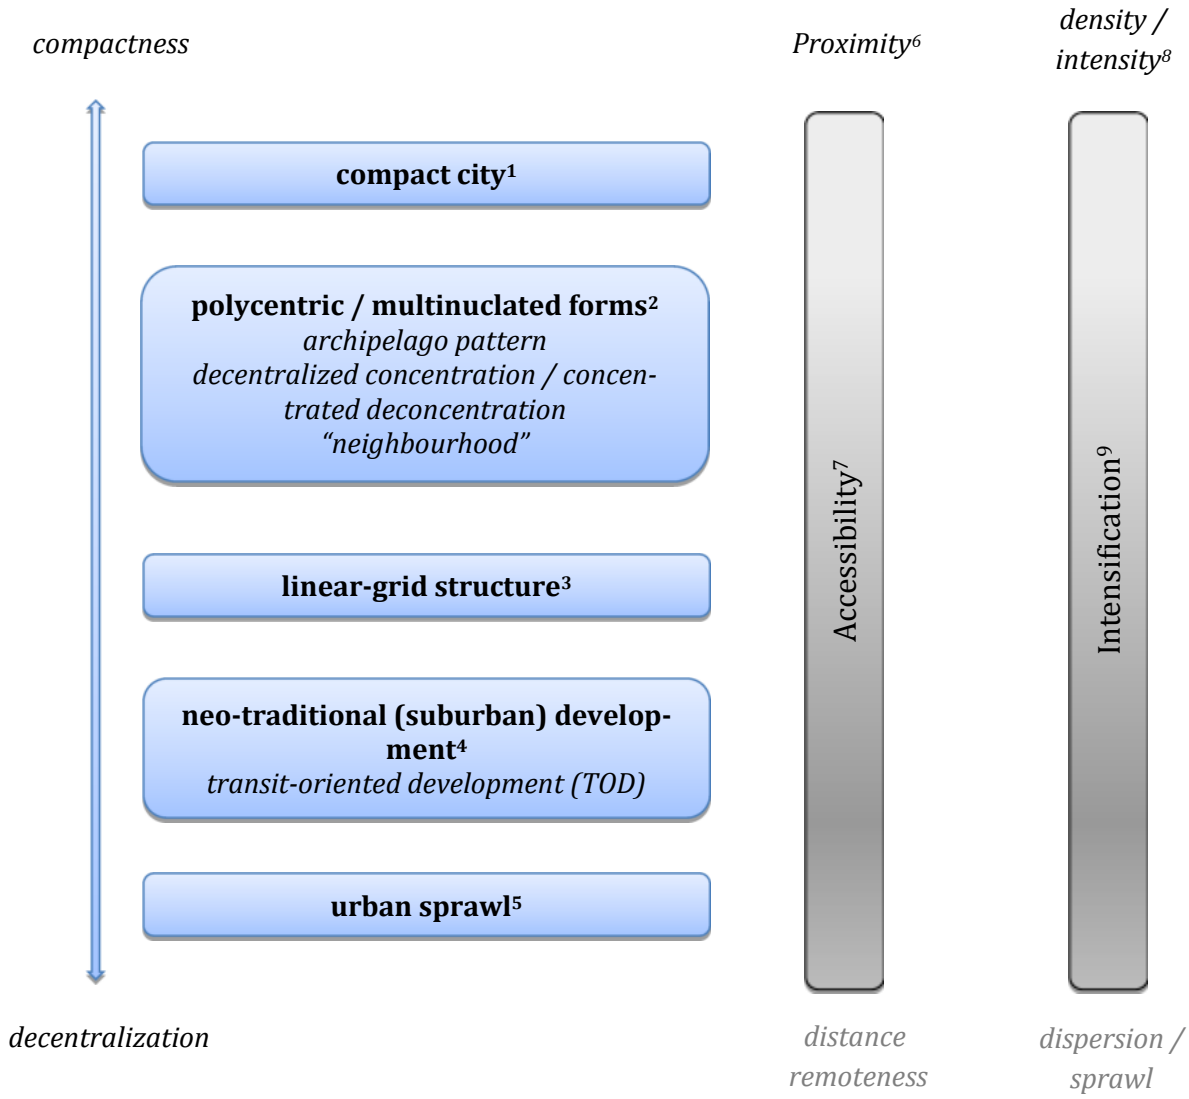
The *characteristics of the different parameters* (e.g. density, land use mix, settlement pattern) form *structural conditions* (e.g. accessibility, mix of facilities and services), which can be understood as "qualities" of a specific urban structure. Specific *structural conditions* induce then specific *causalities* or *mechanisms* that induce certain *energy implications*, e.g. a certain outcome of travel behaviour (modal split, journey frequency, travel distance etc.). The literature indicates that not only urban form parameters determine the relationship between the structural conditions and their energy implications, but a wider set of parameters needs to be included in order to sufficiently explain this relationship.

The identified causalities between urban structure (structural conditions) and energy use in cities are "translated" into concepts of urban structure which are supposed to facilitate efficient energy use. These theoretical concepts presented in the literature, that describe the relationship between urban form and energy use, range between the 'compact city' concept as summarizing term for towns and cities which "stress the merits of urban containment" (Breheny, 1995, p. 82) and 'decentralization' as referring "to all forms of population and industrial growth taking place away from existing urban centres" (Breheny, 1995, p. 87).

Figure 3 provides an overview of the different concepts of urban structure in the range between compactness and decentralization:



[1] Breheny, 1995; Christensen and Jensen-Butler, 1982; OECD, 2012; Owens, 1986; Rickaby and Steadman, 1992; Westerink et al., 2013
[2] Anderson et al., 1996; Breheny, 1995; Owens, 1986
[3] Owens, 1986
[4] Breheny, 1995; Calthorpe, 1993; Gordon and Richardson, 1997; Handy, 1992
[5] Breheny, 1995; European Environment Agency (EEA), 2006
[6] Anderson et al., 1996; Westerink et al., 2013
[7, 8] Westerink et al., 2013
[9] Jenks, 2000; Williams et al., 1996

Figure 3. Conceptualization of urban structure

Comparing the presented approaches it appears that compact urban structures and concentrated development at least facilitate and favour an efficient use of energy at the city level. In this sense, polycentric spatial structures (decentralized concentration) appear to provide an answer to the trade-offs arising from the pure compact city concept, since they are capable to diminish the disadvantages of a single compact city (e.g. too high densities) while keeping its advantages. Also they provide an alternative spatial principle for regions where compact city development is hardly feasible (e.g. sparsely populated regions).

The reasons for the divergence between (compact city) theory and planning practice are by Williams (1999) accounted also to policy implementation (process), as she questions the power of the (local) planning system to ensure intensification and also to manage its consequences. Complementary to this, Owens and Rickaby (1992, p. 251) consider "the absence of a supportive national policy framework" as one of the reasons that the "intellectual recognition of the links between settlement patterns, energy use and the environment has not yet been translated into real practical significance". Van Stigt et al. (2013) illustrate that the range of local options is determined by sectoral regulations from higher tiers of government when adopting the concept of environmental policy integration.

Furthermore we can conclude from the literature that changes in urban form can facilitate or affect, but not in itself constitute energy savings. Rickaby and Steadman (1992) found out that differences in urban form between different compact city models do not have significant implications on energy use; only competitive public transport systems and accompanying policies could induce reductions in energy use. Also Næss (2006) recognizes the necessity to complement transport reducing urban planning policies and measures with accompanying instruments in order to achieve significant changes. Mutually, public transport needs to be accompanied by land use and transport planning policies restricting car use and orienting development to transit nodes (Anderson et al., 1996).

In the backcloth of the main findings from the reviewed literature the relationship of urban structure and energy is further examined by using and applied approach, the investigation of three cases of medium-sized cities in Northern Europe.

## 4 Energy planning in three European cities

The investigated case cities contribute in different ways to the achievement of the "20-20-20 targets" [1] of the EU's climate and energy package. The cities' various efforts, current options and constraints towards increasing their energy efficiency will be discussed.

The following chapters are based on the results of the case studies that were conducted as part of the European project PLEEC (Fertner et al., 2015; Große et al., 2015; Groth et al., 2014).

Table 1. Key figures of Eskilstuna, Tartu and Turku (Giffinger et al., 2014)

| | **Eskilstuna** | **Turku** | **Tartu** |
|---|---|---|---|
| **Inhabitants in the municipality** | 99,804 | 180,225 | 97,847 |
| **Inhabitants in the larger urban region** | n/a | 316,634 | 150,528 |
| **administrative area of the municipality in km²** | 1,100 | 245 | 39 |
| **urban area of the municipality in km²** | 51 | 75 | 29 |
| **population density in inhabitants per km² urban area** | 1,945 | 2,403 | 3,396 |
| **Average number of persons per household** | 2.2 | 1.9 | 2.3 |
| **Final energy consumption per capita in MWh** | 26.5 | 35.3 | 13.0 |
| *share of transport in final energy consumption* | 16% | 9% | 20% |
| **Level of motorization - Registered cars per 1,000 inhabitants** | 450 | 420 | 250 |

[1] 20% reduction in EU *greenhouse gas emissions* from 1990 levels, raising the share of EU energy consumption produced from *renewable resources* to 20% and 20% improvement in the EU's *energy efficiency* until 2020

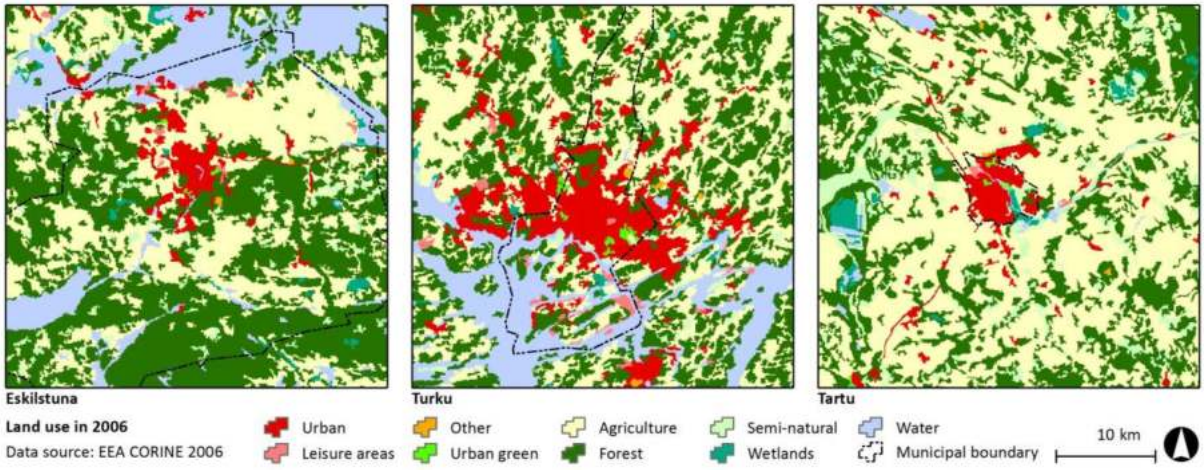


Figure 4. Land use and municipal borders of Eskilstuna, Turku and Tartu 2006

The key figures and the land use maps show the differences between the three cases in terms of their administrative boundaries and the actual urban area. While Eskilstuna municipality includes an area much bigger than the urban area, the urban area of Turku is significantly exceeding its municipal boundary. In Tartu the municipal boundary matches more or less the urban area, although tendencies of exceeding its boundaries are already visible.

Consequently, it is difficult to compare the cities' density or compactness only based on the key figures, they need to be related to the discussed area. Regarding the urban area, Tartu shows the highest population density, whereas Eskilstuna has the lowest density; Turku's density is amounted between Tartu and Eskilstuna, but it has to be considered that Turku urban area is much bigger than the municipal area which might result in a different overall density.

## 4.1 Eskilstuna

The Swedish municipality Eskilstuna, with almost 100,000 inhabitants (2013) [2] and a size of 1,250 km$^2$, is located around 100 km west of Stockholm and part of Stockholm's commuter belt. Eskilstuna is situated in the county Södermanland which is part of the Stockholm-Mälar Region, a polycentric region with about 3 million inhabitants. Eskilstuna marks a former major industrial location in Sweden; its population is since the 1970s rather stable between 90,000 and almost 100,000 inhabitants. Deindustrialization in the 1970s caused a pronounced decline in the number of jobs, making the city ripe for urban restructuring.

Comprehensive spatial planning is emphasized as a key instrument of sustainable development in Eskilstuna. Energy efficiency has become an almost omnipresent issue, integrated across sectors and between levels in the municipal organization and as such an issue of general commitment.

**Energy and urban development**

The biggest consumers of energy are households and transport. But their potentials for reducing the $CO_2$-emissions vary. With few exemptions transportation depends on fossil fuels, whereas energy consumption in households, mainly serviced by district heating, is composed by a number of energy sources, including an increasing amount of renewables operated by district heating plants as well as by individual house owners' initiatives. Only 25% of the electricity demand is provided by the local

[2] all eurostat (2014)

plants, thus, the main remaining part is imported from the national grid, i.e. produced by energy sources that are beyond the control of the municipality.

Regarding transport, the design of effective incentives to reduce fossil fuels remains the key challenge, also on the national level. Strong structural development trends that have increased transport both internationally and regionally exacerbate such efforts.

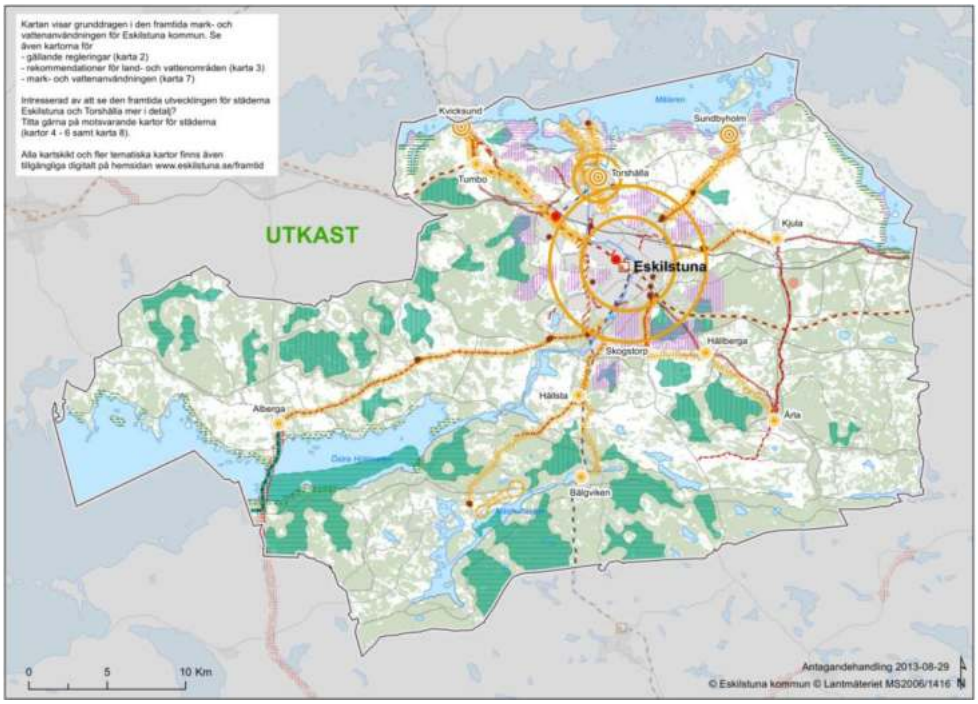

Figure 5. Development concept of Eskilstuna comprehensive plan (Eskilstuna kommun, 2013a)

Urban densification and urban connectivity to transport routes facilitated by public transport are generally acknowledged as the two main principles of energy efficient urban development in Eskilstuna. With the current comprehensive plan (Översiktsplan 2030, Eskilstuna kommun, 2013a) a radical decision was taken by abandoning former settlement planning in the attractive coastal area of the lake Mälaren. Furthermore, future urban development will be concentrated within or close to the existing urban cores as well as in connection with public transport links between these cores (Figure 5). Currently two thirds of the inhabitants live within 3 km of Eskilstuna city centre.

**Policy arenas**

Energy and climate policy is carried out at *two policy arenas*: The arena of the municipality acting as a concern ('planning') and the arena of the municipality acting as a stakeholder of energy initiatives ('strategy').

The municipal climate plans and projects are carried out with high level of effectiveness by the Eskilstuna municipal concern (municipal services, energy supply, public enterprises), which is in charge of all decisions concerning municipal planning, services and infrastructure. The climate strategies concerning the entire municipality have much larger potentials for e.g. $CO_2$-savings, but the development and implementation of such strategies relies upon partnerships to be established between the Eskilstuna municipal concern and e.g. private companies, organizations and the public, all of which operate outside the direct influence of the municipality.

The efficiency of the first is very high, due to an omnipresent 'sustainable thinking'. The total effect of the latter is, however, much larger, due to the size of the arena. For example, the concern's share of $CO_2$-emission reductions amounts only for 7% of the total reductions in Eskilstuna. The distinction between those two policy arenas is very relevant for the operational preparation of plans, projects and strategies.

**First- and second-order policies**

In Eskilstuna energy efficiency policies are developed subordinate to the basic drivers of economic development. Regional enlargement and entering Stockholm's labour market offered the municipality a way out of a long economic downturn from the mid-1970s to the late 1990s but is also facilitated by increased commuting. This development of the regional urban system is not questioned by the city authorities; it is taken as point of departure for policies that aim on compensating the effects of commuting; policies to enhance commuting by train rather than car and the development of a dense urban structure in hub-and-spoke patterns adjacent to public transport lines.

Although the municipality has a clear "climate oriented" strategy and a concrete orientation in planning within the municipal concern, two kinds of strategic planning are at play: first, matching trends in the outside world (e.g. 'threats' and 'opportunities') and second, setting up hierarchies of visions (strategy) and goals (plans and projects). In this sense, although the Transport Plan (Eskilstuna kommun, 2012) and the Climate Plan (Eskilstuna kommun, 2013b) contain concrete measures towards sustainable transport, these remain "mild answers to strong trends" as part of the latter strategy. Policies of energy efficiency are of *'second-order'* compared to the economically driven *'first-order'* development of the regional urban system coming along with increased transport.

## 4.2 Tartu

Tartu is with 98,000 inhabitants (2014) and a municipal area of roughly 40 km² the second largest city in Estonia after Tallinn, located about 180 km southeast of the capital and the centre of southeast Estonia. Tartu has no relevant big industries; the main employers are the municipality (incl. hospital) and the university. Energy related challenges occur from transport and residential (district) heating.

**Energy and urban development**

The highest share of emissions is allotted to energy production. In terms of energy sources Estonia is highly dependent on imports like oil and gas and the Estonian electricity production is to more than 90% based on Estonian oil shale. Due to Estonia's high dependency on resource imports, national efforts towards higher energy efficiency are rather driven by ambitions to decrease fuel dependency and secure energy supply than merely sustainability objectives.

Although, regional energy production and increasing the share of renewable and local fuels are considered as relevant measures, the above mentioned policy related goal conflicts are also reflected in the planning documents. Those lack concrete energy efficiency measures that affect urban energy policy. Municipal energy planning therefore has to deal with a different commitment to energy efficiency or sustainability than for example in Eskilstuna.

One major problem in Tartu is regional commuting, short distance commuting due to ongoing urban sprawl and far-distance commuting, e.g. to Tallinn. This is also caused by the orientation on the capital Tallinn, providing diverse employment possibilities. Thus, the modal split shows big differences between journeys within Tartu and journeys between Tartu and its surroundings. While the first shows a high share of public transport and walking, the latter includes a high share of car use, especially in work related travelling. A strong driver for this development is also the ongoing catch up with Euro-

pean standards of car ownership, the number of registered cars is constantly increasing in Tartu since 2008 (eurostat, 2014).

A development concept addressing those challenges is the concept of *"Low-density urbanized space"*, as implemented by the National Spatial Plan (NSP) "Estonia 2030+" (Ministry of the Interior, 2013). It is also transferred into the previous and current Master Plan of Tartu (City of Tartu, 2006). The concept aims to combine the concept of sustainable (compact) urban space with the low-density settlement characteristics in Estonia. By these means polycentric spatial structures (decentralized concentration) provide an alternative spatial principle for regions where compact city development is hardly feasible. Contrary, Tartu is facing ongoing *urban sprawl* and car-dependent commuting, also because planning documents assign new residential areas in the outskirts of the city.

**Scope of action**

The outlined challenges like regional commuting and urban sprawl require coordinated cross-municipal efforts on the regional level. However, the Estonian planning system allots the main responsibilities for planning activities to the local level, whereas the regional level (county) is rather weak. Estonia has 215 municipalities[3] and the municipal areas are quite narrowly confined. Thus, the local planning competences have a very limited scope of action, tied to the core municipal territory.

This implies a gap of cooperation on the regional level. Therefore, addressing problems that exceed the city scale is hardly feasible, which leads to dispersed urban development in suburban areas and contradicting interests and developments between neighbouring municipalities, since their interests reasonably exceed their municipal borders. In this sense also the Tartu City Transport Development Plan 2012-2020 (Tartu City Government, 2011) is limited to the municipal boundaries. Similarly demands of regional positioning and integrated planning within the functional urban area, as e.g. mentioned in the Development Strategy "Tartu 2030" (Tartu City Government, 2006), can be hardly addressed neither fulfilled. Hence, urban planning is 'locked-in' the framework of the local power relations and limited commitment to sustainability, not favouring efforts for urban energy efficiency.

## 4.3 Turku

Turku is with a population of about 180,000 inhabitants (2014) in the municipality and 316,000 inhabitants in the larger urban area the centre of the region Southwest Finland. Turku is situated at the southwest coast of Finland, about 150 km west of Helsinki. It is an important university town due to the presence of different universities and about 40,000 students living there.

Since industrialization Turku has also been an important industrial town. Today, after considerable restructuring of the industrial sector, 79% of the jobs in the city of Turku are within services. Besides its economic base, Turku is experiencing a change in the former prevalent urban sprawl, characterizing urban development since the 1950s. The city is densifying and promoting sustainable urban development, though, with several growth centres at a regional scale. Today, approximately one-third of the 150,000 jobs in Turku's urban region are located in the centre of Turku, while the rest are located elsewhere in the urban region.

**Compact city and polycentricity in a low density country and on a voluntary cooperative basis**

Turku has experienced extensive urban growth since the 1950s. While the municipality of Turku is stagnating since the 1970s, the city region has grown further, resulting in a large urban area and a dispersed settlement structure in the fringe. Thus, Turku is, as many Finnish cities, urbanizing but in parallel undergoing tendencies of urban sprawl, inducing regional and car-dependent commuting as far as

[3] Currently a reform to join local governments (municipalities) up to a minimum amount of inhabitants (e.g. 5,000) is in process.

to Helsinki. This urbanization trend needs to be operationalized as a chance towards more energy efficient urban structures.

The traditional low density settlement structure in Finland marks a key challenge; similar to Estonia, urban settlements are dispersed and long-commuting distances are usual. Furthermore, Finland is characterized by a fragmented municipal structure, especially in urban areas, and extensive municipal self-government competencies. Regional coordination is therefore dependent on voluntary collaboration of municipalities. Consequently, it is – despite ambitious targets in energy efficiency issues – very difficult to address problems crossing municipal borders, whereon – in terms of urban sprawl – the main effort should be directed.

In the beginning of the 1990s Finland underwent an "exceptionally deep" economic depression, which turned out to become a turning point in the Finnish planning. Municipalities started to review their relationship to the private sector and their administration and organization methods in favour of an incremental and project-based planning. This turned out to have a major impact on local land-use planning; "[t]he local plan is not made as a proactive regulative statement to guide future urban development, but rather as a reactive document whose primary function is to provide the judicial legitimation for development decisions made elsewhere" (Mäntysalo, 1999, p. 179).

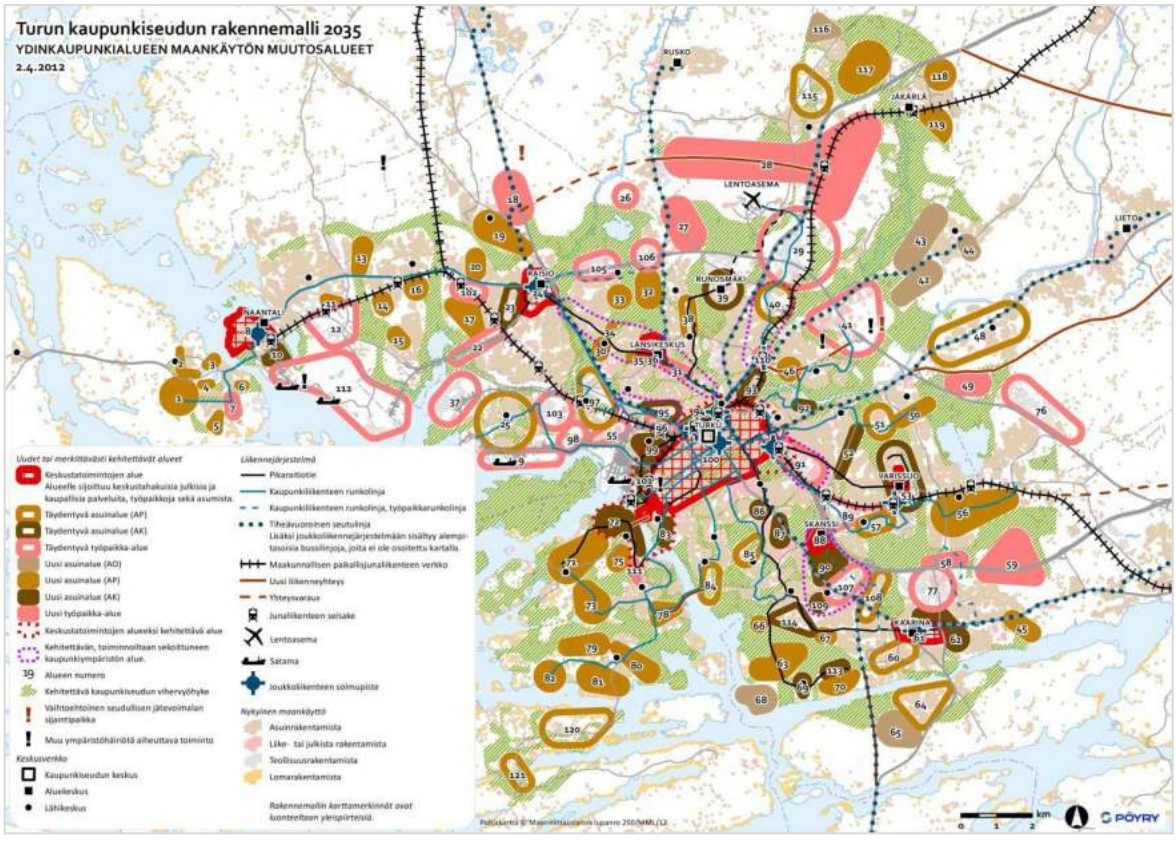

Figure 6. Regional structural model 2035 (City of Turku, 2012)

To coordinate urban development, Turku and 13 neighbouring municipalities have set up the "Regional structural model 2035" (City of Turku, 2012) as a common land use strategy, developed out of the national municipality reform. The Structural model 2035 aims on common objectives for all significant land use activities and focuses on more compact urban development along public transport corridors (Figure 6). It can be considered as a remarkable step towards policy and planning coordination on a regional level.

**Current urban development and energy supply**

Despite decreasing importance, industry is still an important sector for the city and not least for the wider region. From an energy perspective, industry is though important, e.g. as big customer of the district heating system, which makes district heating in some areas feasible. However, industrial development can also be seen as a hamper for the sustainability goals of the city.

The waste incineration plant in Turku was closed down, also because its old technology did not match with the general goals of an environmentally friendly city development. A sustainable industrial development has therefore also been seen in the light of new, renewable energy sources and how those are distributed.

Skanssi is a new urban development area in the southeast of the city centre of Turku. It is a pilot project for an integrated energy supply and demand system, mainly operating self-sufficiently.
Both, the lasting importance of industry and the development of a new urban area, reflect ongoing growth tendencies of Turku. Hence, Turku is facing the challenge to connect growth policies, by attracting population and industries, and energy efficiency policies.

## 5 Reconsidering urban structure

Energy consumption corresponds with urban development. Accordingly, principles of urban development, notably urban structure, are supposed as crucial for energy efficiency. This study provides evidence for the need to reconsider the understanding of urban structure when discussing energy efficiency.

The reviewed literature on the relationship of urban structure and energy addresses mainly parameters of *urban form* (morphology), such as settlement pattern and shape, density and land use mix, and their energy implications. Although some contributions add parameters related to *urban functioning* (e.g. communication, transportation system, location in the urban system) or acknowledge the relevance of *socio-economic factors*, the main focus sticks to a spatial perception (urban form) of urban structure; both terms are often used synonymously.

We argue, that the structural conditions, which have certain energy implications, are not only determined by *urban form* (morphology, configuration and compilation) related parameters, but include dimensions related to *urban functioning* (urban system, city-region and flows) and *urban administration* (policy, planning and governance) as well as that considerable interrelations and interdependencies between those dimensions exist. Hence, this paper suggests and applies an extended understanding of urban structure, including a *functional* and *administrative* dimension (Figure 7).

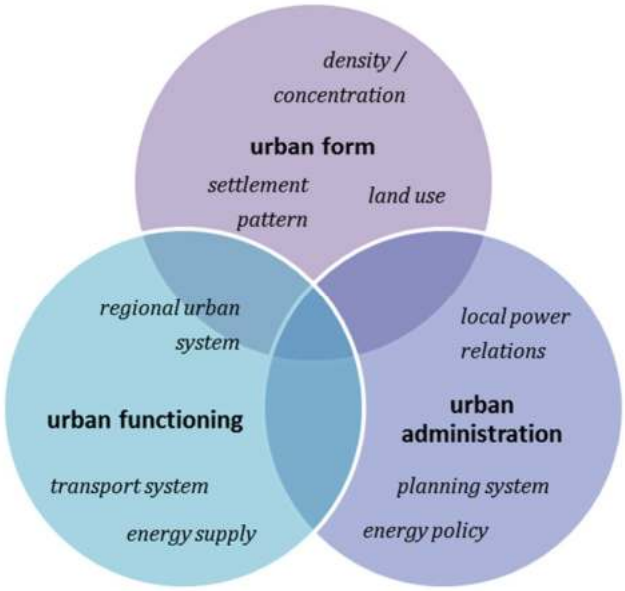

Figure 7. Dimensions of urban structure and exemplifying parameters

*Urban functioning* describes how the "system city" works; it includes all kinds of urban flows and interactions, like the transportation and energy system, as well as a city's position in the regional urban system. *Urban administration* describes the organization of the "system city" and includes the relevant organizing principles like the planning system, the local power relations and driving policies. We argue that addressing *urban form* to increase a city's energy performance requires considering *urban functioning* and *urban administration* in terms of providing adequate conditions to enable implementation as well as accompanying policies in order to exploit the potential of urban form. Urban functioning and administration inherit also additional potential to improve energy efficiency on a city level.

**Urban form – urban administration**

All three case studies exemplify how the actual scope of action of a municipality is determined:

- By the allocation of planning competences to the national, regional and local level,
- the territorial scope of a municipality, defined by the municipal boundaries or
- the coverage of a municipal concern, like in Eskilstuna.

Strong planning competencies at the local level combined with narrowly confined municipal boundaries, like in Estonia and Finland, imply a gap of cooperation on the regional level. Consequently, development challenges that cross municipal borders can only be addressed on voluntary effort between municipalities. But problems of regional and long-distance commuting in all three cases show that questions of energy efficient urban development are not tied to the core city level; they require a wider perspective taking into account the regional urban system ('functional urban area') and questions of regional positioning within that system. Also Jørgensen and Ærø (2007) recognize formal and cooperation based weaknesses on the regional level in the Nordic countries and thus, difficulties in handling problems exceeding municipal borders.

The scope of action for municipal urban planning (municipal planning authority) and options to include energy issues in urban development are framed by the organization of the planning system and the local power relations. The capability of urban planning to influence urban form, e.g. by land use

planning, is strongly related to the allocation of planning competencies as well as the interdependencies between the different planning authorities and stakeholders, namely urban administration.

**Urban administration – urban functioning**

Constraints in addressing energy efficiency in urban development can also originate from contradictions in leading principles in national or local policies as well as the need to react to trends in the outside world.

The case of Tartu illustrates that the actual commitment to sustainability or the driver behind energy efficiency in national and urban policies determines both the content and the total effect of set up objectives and measures – either energy efficiency is a subordinate or a leading principle. This is in line with Jørgensen and Ærø (2007) who attest the state a still strong role in urban policy ('national urban policy'). Solving urban problems on a local level requires backing from the state level; but likewise the state requires strong stakeholders on the local level in order to conceive and implement its urban policy (Uitermark, 2005).

In the case of Eskilstuna it is not a lack of commitment to sustainability but a twofold strategy in urban policies, following first-order economically driven policies and downgrading energy efficiency as a second-order policy. This twofold strategy is partly a reaction to trends from the outside world, but it is also taken for granted and negative effects of those are compensated by second-order 'sustainability' policies.

Both cases provide examples for policy trade-offs that originate from goal conflicts – either due to subordinate commitment to energy efficiency or ambiguities in the development strategy. These conflicts take place in the interplay between urban administration and urban functioning, as how energy efficiency is carried out in first- or second-order policies.

**Urban form – urban functioning**

The differences between the three cases regarding their municipal area in relation to their actual urban area exemplify the interrelation between urban form and urban functioning. Eskilstuna municipality comprises its urban region whereas Turku and Tartu municipality hardly comprise their urban area. Therefore, Eskilstuna municipal planning can address urban form, as related to the core urban area, and the surrounding regional urban system; Tartu and Turku municipal planning is, however, tied to the core urban area, or even less in Turku.

But, for example the way people travel is not sufficiently explained by the characteristics of urban form, as also the case studies show. Specific characteristics of urban form parameters can facilitate sustainable transport, but urban form alone does not determine specific energy consumption patterns. Travel patterns are for example strongly related to a city's positioning in the regional urban system, as the case of Eskilstuna in regional commuting to Stockholm shows.

Urban form, as related to the urban area of a city, is in some respects overlaid by the regional urban system.

**Three dimension of urban structure**

The cases reveal limitations and obstacles in urban development towards increasing energy efficiency. Thereby the cases illustrate also the interrelation and interdependency between urban form, functioning and administration and provide evidence that addressing energy efficiency from an urban structure related angle requires a broader understanding of urban structure than limiting it to urban form.

Limiting urban structure to urban form implies also to neglect factors besides urban form, like the traffic flows within the regional urban system (regional commuting) or the organization of public transport, which are crucial for the successful implementation of energy efficiency efforts.

The reviewed literature indicates and the case studies show clearly, that understanding and responding on the relationship of energy and urban structure requires taking e.g. organizing principles like local power relations, the planning system and energy policy as well as the embedment of a city in its regional urban system, the transport and energy system into consideration.

Furthermore changes in urban form are difficult and long-lasting processes. Urban functioning and administration, however, are likely more accessible to induced changes, within the scope of action of municipalities, than urban form.

## 6 Conclusions

The capacity and options of urban energy planning to influence urban energy efficiency are determined by the interplay between *urban form*, *urban administration* and *urban function*. Although the presented cases are quite different regarding the framing conditions, like the planning system, the economic situation and their positioning in the regional urban system, the constraints towards energy efficient urban development show similarities. Just as well face the cities similar challenges: tendencies of ongoing urban sprawl and regional commuting, strongly related to their position within the regional urban system. The outlined constraints mark as the same time aspects which can be affected in order to increase the capacity of urban energy planning. Addressing energy efficiency from a structure-related angle requires addressing urban form, administration and function as an integrated policy package. The study shows furthermore that applying this broader understanding of urban structure turns out as a suitable framework towards energy efficient urban development.

Urban structure is part of the sphere of influence of the municipal planning authorities and can hence (according to the framing national policy) be operationalized through urban planning as competence. Municipalities can act within and affect the three dimensions of urban structure which enables cities to contribute to the achievement of the 20-20-20 targets – decreasing $CO_2$-emissions by working on sustainable transport, increasing the share of renewable sources by local energy generation as well as increasing energy efficiency through building refurbishment, combined-heat-power generation and regional product cycles.

Nevertheless, the paper illustrates that addressing urban energy efficiency also requires an understanding of urban planning that is not restricted to municipal planning authorities. Urban planning needs to apply a cross-level and cross-sectoral form of policy integration, which exceeds public (municipal) boundaries and involves actors and stakeholders from outside the established public institutions and hierarchical decision-making chains, in order to enlarge its scope of action and respond to the actual local power relations.

The study shows that, with regard to increasing the use of renewable sources as well as urban resilience and self-sufficiency, the relevance of urban energy production as well as a city's heat energy and electricity consumption requires further discussion. Moreover, the policy trade-offs as a result of goal conflicts which take place in different stages and levels of national and urban governance and determine the policy outcome remarkably need to be further investigated in terms of their causes and how to handle those dilemmas.

## 7 Acknowledgements

We would like to thank all our PLEEC co-workers in the case studies who do not appear as co-authors in this paper. In addition, we are grateful to the civil servants and stakeholders that participated in the research project. The research was partly conducted in the frame of the project PLEEC (Planning for energy efficient cities), GA no. 314704, www.pleecproject.eu, funded by the European Commission's 7th Framework Programme.

[3]Shanghai Urban Planning and Research Institute, yinwei@supdri.com

*Since the 1980s, China has witnessed significant city growth, and the Chinese version of urban sprawl emerged all over the country. Within the last more than two decades, the non-agricultural land of Shanghai expanded quickly, more than doubled. Under the strict land quota system, Shanghai municipal government has to transform Greenfield development approach to land consolidation strategy. Under the policy of "Increase and Decrease Balance" land use policy, Shanghai government started to consolidate the rural construction land to acquire extra quota for the state land through transferring development rights from the collective land to state land, and established a three-level land consolidation planning system. This paper firstly examines the expansion of non-agricultural land in Shanghai since 1990, and explains the policy arrangements of land consolidation from the perspective of property rights configuration of state land and collective land. Taking Xinbang Township as an example, this paper examines the roles of various stakeholders, the municipal, district and township government, local villagers and entrepreneurs in the land consolidation and the impacts of land consolidation on them. It concludes with discussion and policy implications in the future land consolidation.*

Key words: Land consolidation; urban sprawl; property rights reconfiguration

## 1. Introduction

China has experienced drastic changes in land use since the initiation of economic reforms in 1978, and the loss of farmland has been primarily driven by urbanization and industrialization (Lin and Ho, 2003; Liu *et al.*, 2008; Long *et al.*, 2007; Long *et al.*, 2012). As the trends of urbanization and industrialization show no signs of abating, the pressure on farmland coming from both urban sprawl and uncontrolled expansion of rural constructive land has raised great concerns on food security (Huang *et al.*, 2011). In order to curb the sprawl of non-agricultural land, the Chinese Central Government has introduced the strict farmland protection policy through the land quota system, meanwhile, in order to alleviate the pressure of substantial demand for city growth, it adopted the "increasing vs. decreasing balance" (IDB) land use policy to transfer the development rights from collective land to urban state land. In 2014, the Ministry of Land Resources of China further claimed that "…cities with more than 5 million will not be allocated land quota except residential and infrastructure land"[1]. Under the more and more stringent land control policy, many cities, particularly the large cities, have to transfer the strategy of

[1] http://news.xinhuanet.com/house/sh/2014-02-20/c_119417080.htm, accessed on 02/03/2014.

Greenfield development to land consolidation in order to acquire the new space for growth.

Traditionally, land consolidation has been a favorable device for solving land fragmentation and has been applied in many countries around the world. As strategy of managing land use, land consolidation has been extensively discussed in the existing literature (Miranda *et al*, 2006; Sklenicka, 2006; Tang *et al*, 2012; Dijk, 2007; Demetriou *et al*, 2012; Wang *et al*, 2012). Recently, there has been some research on local land consolidation practice of China fuelled by the IDB policy (Long *et al*, 2011; Long *et al*, 2012; Wang *et al*, 2014). Nevertheless, little research has been conducted from the perspective of land property rights re-configuration, which plays a critical role in facilitating land consolidation and reshaping spatial structure. This research is thus an attempt to fill this gap by taking the land consolidation in the suburban Shanghai as a case and focuses on the following issues: (1) how has the land consolidation re-configured the land property rights of collective land and state land? (2) What are the costs and benefits of various stakeholders in the land consolidation process in the suburban Shanghai?

Using a case study approach, this paper is organized as follows: the next section examines the role of property rights in land consolidation, and the introduction of IDB land use policy and land consolidation practices in China. The third section introduces the background, the planning and policy framework of land consolidation in the suburban Shanghai. Then, the case of Xinbang township is analyzed to explore the costs and benefits of various stakeholders with the reconfiguration of land property rights. The last section concludes with future policy implications, involving consideration on flexibility of policy-design and social equity issue in the land consolidation.

## 2. Dual land ownership and land consolidation in China

### *2.1 Institutional arrangements behind the land consolidation in China*

Two types of land ownership coexist in the current land administration system of China, namely, state-owned land in the urban area and collective-owned land in the rural area. While the establishment of the Land Use Rights System in 1988 has allowed the lease, transfer and sale of urban land at different time limits, in rural areas collective ownership has allocated farmers plots of land that they can use for cultivation and for building their own houses, which has been called *Zhaijidi* in China. Collective land can be inherited, but it cannot be converted to urban use without going through state requisition. Through strictly drawing a line between urban land and collective land, the Chinese government has created a dual land management system (Tian, 2008).

The role of property rights in land development is a central issue in land consolidation. The reconfiguration of land property rights affects land development and economic performance (Besley, 1995; Field, 2005; Galiani, 2010; Goldstein & Udry, 2008). A property right is the exclusive authority to determine how a resource is used, whether that resource is owned by the government, by collective bodies, or by individuals (Alchian, 2008). Bromely (1991) further indicates that property is not an empirical possession but rather is a social relation that defines the property holder with respect to something of value against all others. Therefore, property rights are also a factor of production. Property rights can be altered among individuals and groups to accomplish certain desired ends.

In the realm of land policy-making, the relationship between the State and the property owner has always been an important and sensitive issue, politically and economically. In most cases, the property rights have been defined by the State through a series of tools such as land laws, land use regulations and land taxation. The state, however, is not free of restraints in defining property rights in land. On the one hand, the state has its own national planning aims and preferences in different development periods. Property rights over land as basic instruments of overall development policy, perform both an indirect, facilitating role and a direct and active one, and therefore exert a great impact on urban development, in terms of both efficiency and equity (Doebele, 1988; Payne, 2001); on the other hand, the state cannot go too far for its own interests or impede the security of tenure, for the security is essential to stimulate the individual initiative necessary for economic development. The state therefore has to strike a balance between efficiency and equity (Tian, 2014).

*2.2 Increasing vs. decreasing balance land-use policy under the land quota system and development rights transfer from collective land to state land*

In 2003, with the tightening national land policy, the central government of China strictly enforced a land quota system that restricts the maximum amount of newly added land used at the subnational level, but gives local governments enough autonomy to determine sectorial allocation of land quotas within their jurisdictions (Cai，2011). Meanwhile, the rural-urban migration has led to relative stagnation in China's rural sector, but the expansion of rural construction land has never stopped. While the rural population decreased by 98.6 million within the period of 1996-2007, the area of rural housing land increased by 1180 $km^2$（Qiu *et al*, 2010）. Therefore, the pressure of urban land demand generated by rapid city growth and the inefficient rural land use coexist in China.

Realizing that the consolidation of low-efficiency rural construction land can be a valuable source of farmland reclamation, the central government introduced the "increasing vs. decreasing balance" (IDB) land use policy in 2005, which seeks to balance increases in urban construction land with a reduction in rural construction land (Long *et al.*,2011). The key objective of the IDB policy is to achieve equilibrium in the supply of land in China by balancing increases in urban construction land (driven by urbanization) with decreases in rural construction land (facilitated by out-migration). Former rural construction land could consequently be reclaimed as agricultural land, thus supporting food security goals and broader socio-economic development in rural areas. The program is to be implemented at a county level, and the local government needs to bear all cost to acquire the land quota. In nature the IDB is top-down, focusing on spatial-territorial reorganization, administrative reorganization, and industrial reorganization (Liu *et al.*, 2009; Long *et al.*, 2012; Wang *et al.*, 2014).

The mechanism of IDB is similar to that of the Transferable Development Rights (TDRs) widely applied in the United States. TDRs have emerged based on the underlying principle that the development potential of privately held land is in part a community asset that government may allocate to enhance the general welfare. In concept, TDR serves the development potential from the land and treats it as a separately marketable item. It is viewed as a means of providing an equitable return on land investment to property owners whose returns otherwise would be lessened by regulatory activity (Tian, 2014). In the framework of

IDB, the development rights of rural construction land are transferred to other designated area where the same amount of land quota can be granted, and the original land owners can receive compensation in kind. The difference from TDRs is that the transferred development rights can only be sold to the government, and thus local government can capture the differential rent between the rural construction land and urban construction land.

### *2.3 Land consolidation under the IDB policy in China*

Land consolidation is a technique for carrying out the unified servicing and subdivision of separate landholdings for planned urban development (Farvacque and McAuslan, 1992). It is designed as a vehicle to be applicable in countries with rapid growth, rapid increasing land value, and insufficient funds to provide urban services. Unlike outright purchase, land consolidation returns to each owner a substantial portion of the land originally owned in a location as close as possible to the original site. Therefore it is more politically acceptable than outright purchase or expropriation, which requires reducing all land values to specific cash sums (Tian, 2014).

Since the promulgation of IDB land use policy, the land consolidation has been widely implemented in China. From 2005 to 2010, the land consolidation was carried out in 27 provinces (including municipalities directly under the central government), and the transferred land quota reached 450,000 mu (Wang *et al.*, 2012). With the application of IDB land-use policy, a number of successes, such as improvements to rural infrastructure and releasing the potential of rural land resources, have been achieved. However, the top-down nature of the programme has proved controversial, and generated conflicts and compromises to the scheme when local actors have refused to comply in the way anticipated (Long *et al*, 2012). Wang *et al.* (2012) argue that the local government has taken the advantage of the IDB to capture the land rent of collective land, and farmers have not been adequately compensated. Tu (2010) criticizes that the IDB policy was misinterpreted, and local governments withdrew villages to get in return the construction land quota. As a consequence, many farmers who lost their housing land were forced to live in high-rise building.

## 3. Land consolidation in the Suburban Shanghai: Rationale, objective and policy arrangements

### *3.1 Urban sprawl and its consequence in Shanghai*

Since the middle 1990s, Shanghai has been expanding at the fastest speed ever. From 1946 1996, the construction land of Shanghai grew by 1,228 $km^2$ within five decades, however, the construction land had rapidly expanded from 1,705 $km^2$ in 1996 to 3,073 $km^2$ by then end of 2014 with an increase of 1,368 $km^2$ during less than three decades. From 2000 to 2014, the permanent population in Shanghai increased from 16,096,000 to 24,257,000, up by 51% (Figure 1). During the same period of time, the construction land grew from 1996 $km^2$ to 3,073 $km^2$, by 54%, indicating a higher growth rate than that of the population (source: Shanghai Municipal Planning and Land Resources Bureau).

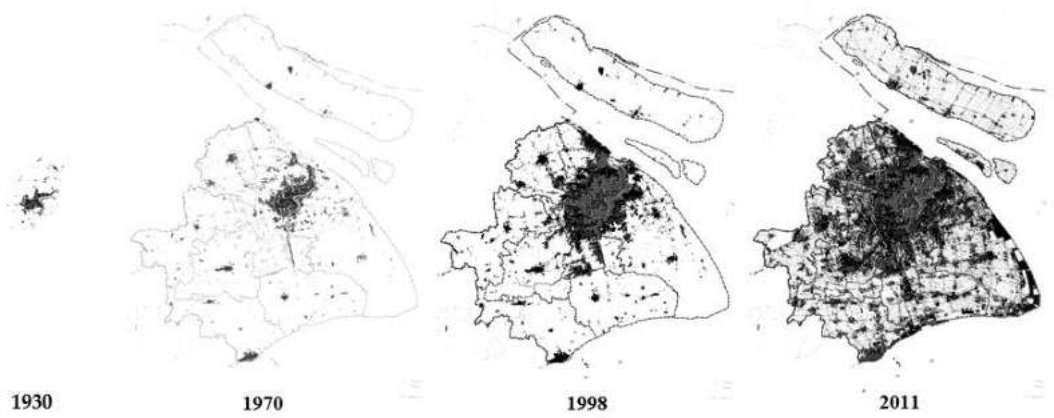

Figure 1 The expansion of non-agricultural land in Shanghai

In order to curb the urban sprawl, Shanghai municipal government designated the boundary of "Concentrated Construction Area (CCA)[2]" and a "Red Line of Eco-security" in 2008. However, there is a large amount of *status quo* construction land outside the CCA and above the eco-security red line, and most of that is industrial land. In 2012, the industrial land outside the CCA amounted to 188 km², accounting for 39% of all construction land outside the CCA and 25% of the total industrial land in Shanghai. Nevertheless, its contribution to Shanghai's total industrial output value was less than 10% in 2012. Generally speaking, this scattered industrial land share the same problems such as low production efficiency, highly energy-consuming, resulting in serious environmental problems.

The uncontrolled sprawl of non-agricultural land has led to many urban problems, such as air pollution and traffic jam. By the end of 2014, the share of construction land reached to 48% of the total land area in Shanghai, and the ecological space has been seriously squeezed. In recent years, environmental problems have been generating more and more adverse effects on people's daily life. For instance, in 2013, the haze days of Shanghai came at 61% (Source: Shang Meteorological Service). In addition, in order to curb the further sprawl of non-agricultural land, in 2011 the central government put a ceiling on the area of non-agricultural land in Shanghai: 3,226 $km^2$, yet this figure reached to 3,073 $km^2$ in 2014 (Source: Shanghai Urban Planning and Land Resources Bureau). In other words, only the land quota of 153 $km^2$ can be reserved for the future growth of Shanghai.

*3.2 Transition of growth strategy under the strict land quota system*

In the face of the urban land shortage, Shanghai municipal government has to reconsider and adjust the previous Greenland development strategy. In 2010, Shanghai government started to make the land consolidation plan outside the CCA. Based on this ambitious plan, 380 $km^2$ of rural construction land outside the CCA will be reclaimed as farmland. Under the IDB policy, the new quota for non-agricultural land can be created, and these quotas can be transferred to the CCA and sold as state-owned land. In other words, while the rural construction land is reclaimed as farmland outside the CCA, the same amount of urban

[2] CCA is similar to the Urban Growth Boundary in the United States, and any newly-added non-agricultural land has to be located within the boundary of CCA.

construction land can be added in the CCA on the grounds that the land use efficiency of rural construction land is fairly low but that of urban construction land is much higher.

### *3.3 Policy and planning framework of land consolidation*

#### 3.3.1 Targets of land consolidation

In the suburban Shanghai, construction land to be consolidated include the scattered, discarded, idle and low effective construction land outside the CCA. To be specific, it covers 5 types of land use: industrial land, *Zhaijidi* land, urban land, land for transportation facilities and water conservancy facilities land, and religious and military land. In view of the objective of environment pollution treatment, consolidation of industrial land outside the CCA has been on the primary agenda of Shanghai municipal government. The consolidation of the *Zhaijidi* land outside the CCA will be based on local situation and willingness of local residents. Since the *Zhaijidi* land is rather scattered, it is financially difficult to provide basic public service and supporting facilities to all rural residents. Promoting the compact *Zhaijidi* land use is also a key part of land consolidation strategy.

#### *3.3.2 Managing mechanism of land consolidation*

In the Shanghai suburban area, the development rights of rural construction land is transferred to other designated area, and the original land owners can receive compensation in kind. The differences from TDRs are as follows: (1) the transferred development rights can only be sold to the government under the IDB; (2) the compensation standard will not be based on the market value of the collective land rights (in theory, the collective land does not have a market value), but based on compensation standard made by the government. Therefore, the land consolidation is top-down by nature, and lacks a bottom-up facilitation procedure.

Realized that the CCA is not flexible enough to accommodate the new space, Shanghai government designates “semi-CCA” outside the CCA as the receiving area of transferred development rights. Semi-CCA has been used as the space for the relocation of *Zhaijidi* land owners and Economic Development Land (EDL) of rural collectives. For the sake of reserving enough space for improving industrial structure, no commodity property development is allowed in the semi CCA. In principle, the area of semi-CCA is 1/3 of the total area of reduced construction land. The other 2/3 land quota will be purchased by the district government at the average price of around RMB one million per mu. Figure 2 shows that the process of land consolidation.

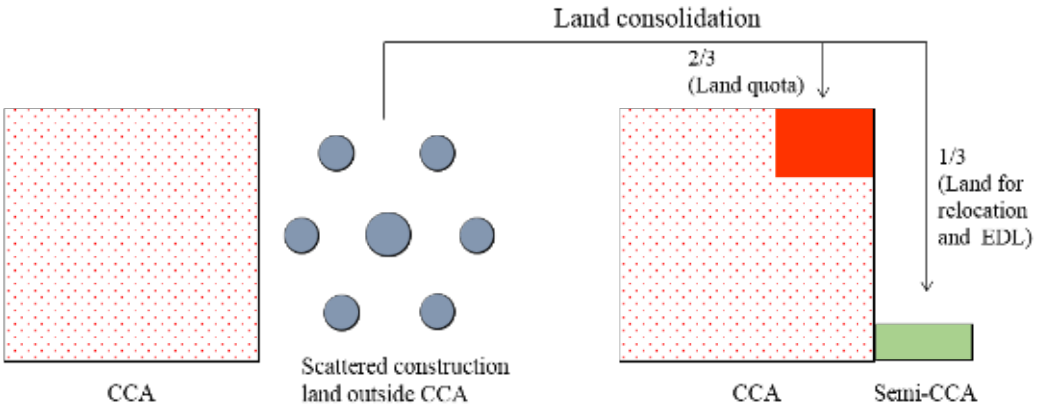

Figure 1 A schematic illustration of land consolidation process in the suburban Shanghai

*3.3.3 Financial support and compensation for the original land users*

Land consolidation involves clearing up existing settlements, reclamation of farmland and new construction in the semi-CCA, and it is rather costly and time-consuming. Taking the land consolidation of Xinbang Township, Songjiang District of Shanghai as an example, the local government estimated that the cost of land consolidation will be RMB 2.4 billion Yuan. If all of the 104 towns outside the CCA start land consolidation, the total cost may exceed RMB 250 billion Yuan. Therefore, Shanghai municipal government and district government have to set up special fund to support land consolidation.

Compensation for the relocated farmers varies from district to district. A typical way is that the *Zhaijidi* land where the villagers originally lived will be replaced by an apartment with equal floor space after the villagers move to semi-CCA from the village. The contracted farmland cultivated by the farmers still belongs to them. However, in reality most farmers of Shanghai are no longer engaged in farming, and they usually transfer the right of management to the cooperatives or professional companies and earn annual rent. Moreover, the collective economic organization can acquire EDL at fair price or free of charge in the semi-CCA, and villagers can obtain annual dividend from the rent of collective property. Cash compensation has been also applied in some areas.

The compensation for the relocated factories owners is based on the land area. There are two kinds of policies of compensation: it is generally RMB 900 Yuan/$m^2$ for the enterprises with legal land property right and lease contract, but only RMB 200 Yuan/$m^2$ for the industrial enterprises without legal property rights. In addition, compensation for the operating loss and relocation cost is also paid based on the assessment of the third party.

*3.3.4 Planning response to land consolidation in Shanghai*

In order to carry forward the progress of land consolidation, Shanghai government constructed a three-level land consolidation planning system comprising "metropolitan land consolidation plan (MLCP) → district and county-based land consolidation plan (DLCP) → township-based land consolidation plan

(TLCP)". While the former two are more strategic, the TLCP is the implementation plan. MLCP defines the task of Shanghai by 2020, quantifies the land area to be consolidated and allocate the task to district and county. Based on the MLCP, DLCP determines the key implementation area, further decomposes the land consolidation task to towns.

TLCP is a comprehensive planning involving land use, spatial layout of various facilities including infrastructure and ecological facilities. Meanwhile, it is a policy-oriented plan: it needs to identify the boundary of reduced land and newly built land, and make the cost analysis. In the suburban Shanghai, there have been 104 townships outside the CCA, and the TLCP of most of them have been made.

## 4. A Case of land consolidation: Xinbang Township

*4.1 Study area and research methods*

Xinbang Township, located in the southwest of Shanghai suburb, is about 60 km away from the downtown and it is affiliated with Songjiang District (Figure 3). It covers the land area of 4474.98ha, and its land use structure has been illustrated in 2010 based on the second national land survey (Table 1). Xinbang Township is situated at the water source protection area of Huangpu River, its expansion, particularly industrial land growth, has been restricted to a great extent.

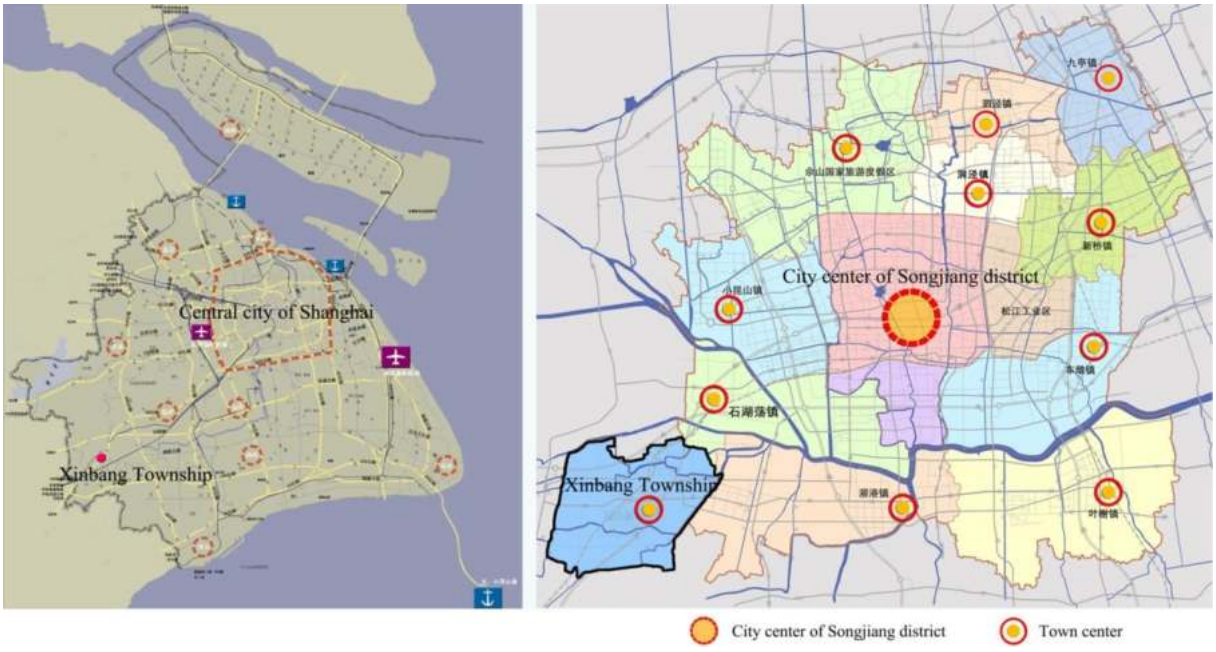

Figure 3 Location of Xinbang township in Shanghai and Songjiang

Table 1 Land use structure of Xinbang Township in 2010

| Land use type | Farmland | Construction land | | | Unutilized land | Total |
|---|---|---|---|---|---|---|
| | | Urban industrial and mining land | *Zhaijidi* land | Rural industrial land and others | | |
| Land area(ha) | 3163.96 | 345.17 | 270.21 | 401 | 294.89 | 4474.98 |
| Percentage in total | 70.70% | 7.71% | 6.04% | 8.96% | 6.59% | 100% |

In 2013, there were 11 administrative villages under Xinbang Township, and the township had the population of 37,527, among which 26,123 are residents with *Hukou*, and 11,405 are migrants, and its urbanization rate was 30%. The GDP of Xinbang Township reached RMB 2.135 billion Yuan, up 1.7% over 2012, and the local fiscal revenue were RMB 130 million Yuan. Table 2 presents the economic development of Xinbang Township and Shanghai municipal area, and we find that compared with that Shanghai municipal area, the economic development index of Xinbang township is much lower. The GDP per capita of Xinbang was 70.5% of that of Shanghai, and the disposable income per capita was only 51.8% of that of Shanghai.

In this research, we combine both qualitative and quantitative research. Firstly, the research team made extensive and intensive interviews on the stakeholders, including Shanghai municipal government, the Songjiang district government, Xinbang township government, village collectives, villagers and relocated factory owners, to understand the mechanism of land consolidation, and analyze the costs and benefits of various stakeholders in the land consolidation process. Moreover, we organized the villagers' meetings under the help of village leaders and heard about their voice. Then we distributed 120 questionnaires among the 3 administrative villages: Xinbang village which is closest to the town center, Linjian and Nanyang village which are several kilometers from the town center, and 106 effective ones were collected. The questionnaire covers the information such as age, income and job, *Zhaijidi* land, the attitude of local residents towards the relocation and expected compensation in the land consolidation. While replying the question on their attitude towards consolidation, more than 90% of villagers in Linjian and Nanyang expressed their support. In the Xinbang village, 81% of villagers said that they agree with the consolation, and the remaining 19% did not clarify their position, partly because that they expect higher compensation standard than that provided by the government. As for the relocated place, the majority of villagers expect to move to the city center and town center to use the public and service facilities. In Linjian and Nanyang village, more than 60% of villagers expect houses with floor space between 150 and 200$m^2$, but 56% of villagers in Xinbang expect higher compensation standard, more than 200$m^2$.

*4.2 Land consolidation planning and implementation in Xinbang Township*

Xinbang Township has been the first pilot town carrying out land consolidation in Shanghai due to the following reasons: (1) Xinbang is located in the outer suburban area of Shanghai and its land price is fairly low. Compared with the villagers of the towns in the inner suburban Shanghai, local villagers' expectation towards compensation is much lower. Under the policy of land consolidation, the land quota will be

purchased at the price of RMB one million Yuan per mu, and this has provided financial motivation for township government and village collectives. Secondly, since the early 2000s, the Shanghai government strictly prohibited the construction of new rural houses. In Xinbang, 86% of the rural houses that were built in the 1970s and 1980s have been aging and the quality is very poor (Xinbang township, 2014). Land consolidation provides a chance to replace the old house with the new apartment near the town center. Therefore, 92% of interviewees expressed their support towards the consolidation. Thirdly, based on the questionnaire survey, 83% of local resident are no longer engaged in farming, but working in factories or service industry. In average, they only charge the rent of 200 Yuan/month/person for the migrant workers. As the semi-CCA is close to the city center and the living environment can be much better, local residents expect the rent would be substantially increased. This is also one of the important reasons that they agree with land consolidation.

The land consolidation planning of Xinbang Township was approved in the late 2013 and the implementation started in 2014. According to the plan, the reduced construction land area shall be no less than 156.72 ha by 2016 and 496.2 ha by 2020, among which the reduced industrial area shall be no less than 61.62 ha by 2016 and 108ha by 2020. Semi-CCA is located near the town center. Targets of land consolidation include two types of land: one is the idle and low-efficiency industrial land outside the CCA, and the other is the *Zhaijidi* land. The reduced industrial land was mainly used for garbage collection, hardwires, and other small-scale manufacturing etc. These small enterprises usually sign rental contracts with the village collectives to lease land at a rent of 20,000-30,000Yuan per mu each year. Meanwhile, they generate heavy metal pollution and water pollution.

Figure 4 shows the *Zhaijidi* land consolidation process. In the first batch of village *Zhaijidi* land, agreement has been signed with all villagers. In the second batch of village *Zhaijidi* land, more than 90% of local residents have signed the relocation assignment with local government in most villages except the Xinbang village which is closest to the town center. Due to the advanced location, local villagers expect higher compensation, and only 60% signed the agreement (Source: Xianbang township, 2014). The new apartments for relocated residents have been completed in the semi-CCA.

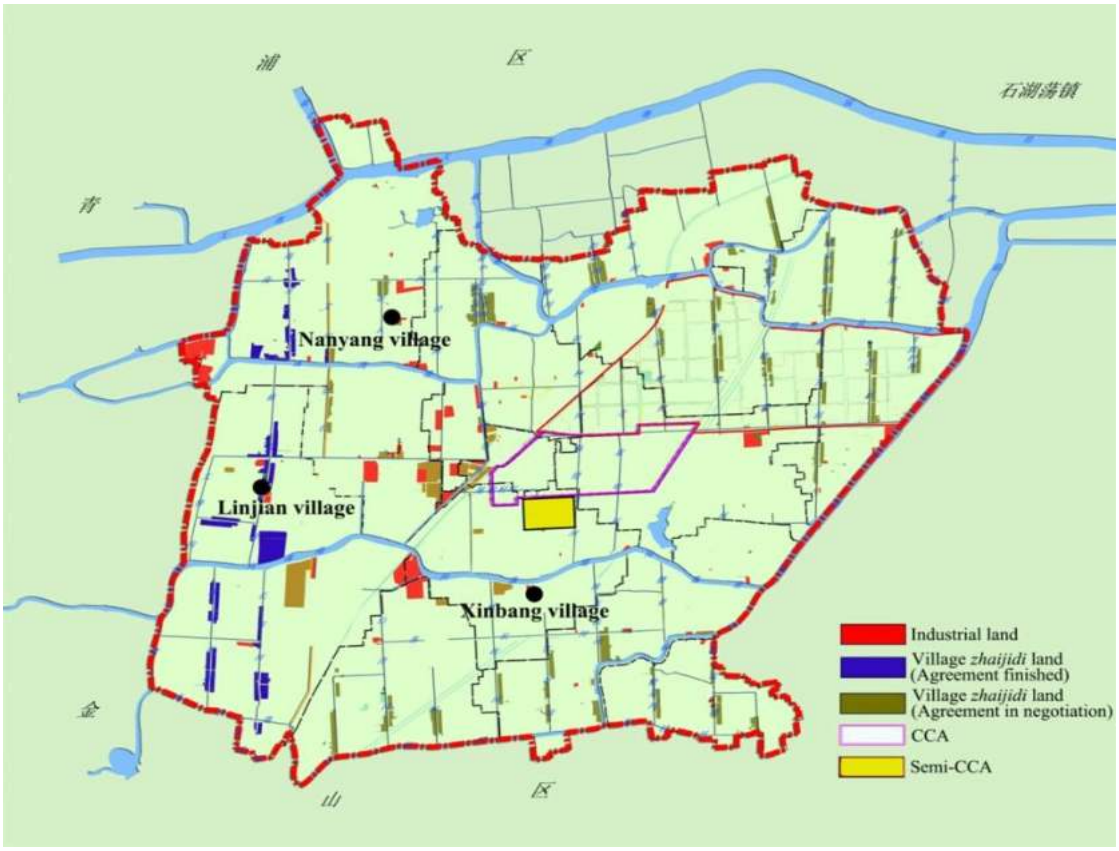

Figure 4 Land consolidation process of Xinbang township
(Source: Shanghai Urban Planning and Research Institute, 2014)

### *4.3 Property right reconfiguration and its impacts on stakeholders in land consolidation*

#### *4.3.1 Municipal and district government*

In the course of land consolidation, the municipal government has been playing the role of policy-making, and it provides local regulations to implement land consolidation. Under the strict land quota system, the municipal government can only make policies within the existent legal and policy framework and it is politically needed to obey with the central government (Zhou, 2004). Motivated by economic growth and demand for non-agricultural land, municipal government has great incentives to explore the new source of urban land. As a result, under the IDB policy, Shanghai municipal government promulgated regulations on land consolidation in the suburban Shanghai in June 2013 and the land consolidation has been officially launched since then.

In the case of Xinbang land consolidation, Shanghai municipal government has invested 788 million Yuan in land reclamation and compensation for the relocation of villagers. For the purpose of encouraging land consolidation, the municipal government will additionally provide a land consolidation award of 200,000 per mu of industrial land to township government, totally 466 million Yuan. Municipal government

needs to invest RMB 1,250 million Yuan in total (Source: Xinbang township land consolidation plans, Shanghai Urban Planning, Design and Research Institute, 2014 ).

Meanwhile, the Shanghai municipal government has achieved its multiple objectives through the land consolidation. Firstly, land consolidation is the optimal choice for Shanghai to deal with the performance evaluation of the central government, and the major source of future new space. Secondly, the low-end industries will be expelled, which creates opportunity for industry upgrading. Last but not least, municipal government can obtain certain amount of LURs transfer fees: 20% of the LURs fees from selling the 2/3 land quota. From 2014 to 2016, Xinbang Township will consolidate 2,330 mu of non-agricultural land, and the municipal government will receive 20% of LURs fees of 1553 mu. according to statistics of Shanghai Land Market Trading Center, the average LURs fees of Songjiang District was around RMB 12 million Yuan per mu in 2013, and the municipal government can expect the LURs fee of about 3.728 billion Yuan, among which the municipal government will return 129 million Yuan to Xinbang Township.

As a lower level government, the Songjiang district government has its political obligation to implement land consolidation according to the requirement of municipal government. Songjiang district government is the major party in charge of the implementation of land consolidation, and it bears most of the cost of land consolidation. It has to pay the land quota fee of RMB one million Yuan per mu, and thus needs to spend 2.33 billion Yuan in total, which covers expenses on houses displacement and resettlement, compensation for clearing-up of the industrial land, farmland reclamation, and the infrastructure investment in the semi-CCA. Meanwhile, while transferring the land quota to the developable land, the district government has to invest in the infrastructure to transfer the raw land into serviced land. Although the land consolidation is rather costly, the district government can benefit from it in many ways. Firstly, district government will gain 80% of the LURs fees from selling the 2/3 land quota, which is about RMB 14.9 billion Yuan in the Xinbang case. Secondly, the more compact land use, industry upgrading and improvement of environmental quality are the key objectives of land consolidation. Nevertheless, in the reality, district government has to assume the risks in the land market and social instabilities caused by the large-scale relocation.

### *4.3.2 Township government and village committee*

Township has been playing the key role in implementation of land consolidation planning, and it is responsible for the relocation of farmers and construction of new apartments. As a reward, the township can obtain some extra EDL in the semi-CCA at a fair price. In the semi-CCA, the Xinbang township government finally received the LURs of EDL of 397.19 mu. Other additional benefit includes the improvement of environmental quality, and more chances for attracting outside investors. While obtaining the LURs fee return of 129 million Yuan from the municipal government, the township government needs to pay about 358 million Yuan for the consolidation (Source: Xinbang township government).

Village collectives are mainly responsible for negotiating with local farmers and factory owners. As a return, they can get the LURs of a certain amount of the EDL in the semi-CCA and the award of RMB 100,000 Yuan for clearing-up of construction land per mu. In the semi-CCA, EDL of 174.17 mu land has been reserved for village collectives. In average, the 11 villages in Xinbang Township will get an award of

about 20 million Yuan per village, which will not be granted to villagers but reserved as for future development funds of collectives.

While the factories are closed, the village committee loses some rent revenue. Before the land consolidation, the village collective could acquire the rent at the annual price of 10,000 to 20,000 per mu. However, compared with the rent loss, the income from the reserved land in the semi-CCA has been anticipated much higher.

### *4.3.3 Local villagers*

During land consolidation, villagers have to give up their *Zhaijidi* land and move to the semi-CCA. After the *Zhaijidi* land is cleared up, villagers can move to new houses whose floor space is equal to the original *Zhaijidi* land in the resettlement area. Moreover, the new house has a state-owned property right, and thus can be sold or mortgaged in the open real estate market. Meanwhile, the Shanghai municipal government requires that the maximum floor space of each household shall be 176 $m^2$. Based on the questionnaire survey, the average floor space of farmer's original houses is 187 $m^2$, among which 155 $m^2$ has legal certificate. In the land consolidation, many households will obtain a new apartment of 176 $m^2$. Furthermore, the farmers can still own contracted farmland, although most of them are no longer engaged in farming. They can transfer their farmland to large landlord or cooperatives at the rent of about 800 Yuan per mu per year.

The villagers will receive no other cash compensation or subsidy except the new apartment. Based on our interview and questionnaire survey, more than 90% of the villagers have shown their willingness to give up *Zhaijidi* land. This is primarily because under the strict planning regulations and *Zhaijidi* land control policy, villagers have little chance for the expansion of their old houses or new construction. It is more favorable for them to obtain a new apartment and public services in the town area. However, the situation is different in Xinbang village adjacent to the town center. Due to the relatively good location, villagers can earn fairly high rent income from the migrant workers. Based on the interview, each household can earn annual rent of RMB 5,000~8,000 Yuan. Moreover, the floor space of some houses is far greater than 176 $m^2$, and the location of semi-CCA is not better than the original village. Therefore, some of them are reluctant to move to the semi-CCA. The over-simplified compensation standard without considering the location difference has been problematic.

### *4.3.4 Entrepreneurs*

In the process of land consolidation, 919.96 industrial land needs to be cleared up, which involves many micro and small enterprises engaging in machining, hardware and chemical industry. They are characterized by low output and serious environment pollution. Some of these enterprises lease land from the township or village collectives, and the lease will be terminated after paying compensation. However, there is a small amount of land owned by the enterprises, and the land consolidation will be more difficult. The compensation is 900 Yuan/$m^2$ for the enterprises with legal land property right and lease contract, and 200 Yuan/$m^2$ for the industrial enterprises without legal property rights. Besides, compensation for the operating loss and relocation cost is also paid.

In the land consolidation, these enterprises will be "expelled" out of Shanghai. In Xinbang Township, most of these enterprises are micro processing factories with 3-4 employees who can make profit of about 300,000 Yuan each year (Source: interview with village committee and local enterprises). After the industrial land is cleared up, the factory owners have to move to other regions or enter the industrial park in Shanghai. Nevertheless, the industrial park has its thresholds such as minimum input-output and high pollution control standard, and land price or rent is much higher than the collective land, thus it is rather difficult for factory owners to find new space in the industrial park. Land consolidation does not take their future development into account, and their voice is intentionally or unintentionally neglected in the land consolidation process.

## Discussions and conclusions

While the available non-agricultural land resource has become more and more scarce in China, many cities, particularly large cities in the developed region, have to transfer their strategy from urban sprawl to land consolidation. Under the strict land quota system and IDBP policy, Shanghai government put the land consolidation in the suburban Shanghai on the agenda in 2011. Through transferring the development rights from collective construction land to state land, the municipal and district government can acquire extra land quota for the growth of new space. Meanwhile, the multiple objectives such as more compact land use, industry upgrading, spatial structure reshaping and environmental pollution treatment can be anticipated.

The case study of Xinbang Township has enabled us to gain insights into stakeholders' perspectives in the land consolidation of the suburban Shanghai. The cost-benefit analysis shows that the municipal government might be the biggest winner. Through the provision of the policy framework and limited land consolidation fund, it can acquire the multiple goals including revenue from LURs fees. The district government has to bear the largest share of cost of consolidation, including villager's relocation and farmland reclamation, but the rewarding can be attractive, for instance, the largest share of LURs fees, the improved environmental quality and investment environment. The district government, however, has to take the risks such as real estate market downturn and social instability due to the large-scale relocation. The township government and village collectives are the party who is responsible detailed negotiation with villagers and entrepreneurs, and relocation of local villagers, and construction of new houses for villagers under the financial support of the district government. As a return, they can receive the bonus from the upper-level government. In the Xinbang case, most villagers expressed their support for the land consolidation, however, a small number of villagers have opposed the consolidation on the ground that the compensation standard is uniform without consideration of their *status quo*. Undoubtedly, the entrepreneurs are the biggest "losers" in the consolidation, and they are expelled out of Shanghai ruthlessly based on a limited compensation.

In general, the land consolidation of Xinbang township seems a "win-win situation". Nevertheless, equity issue emerged during the consolidation. In view of the complexity of local socio-economic condition, policy makers should provide flexibility in policy planning and implementation. Moreover, they should take the attitudes of those adversely affected by their policies into consideration, and compensation should be sufficient to cover their loss. Therefore, local governments are well-suited to tailoring solutions based on local conditions and are rightly the institutions that should play a lead role (Wang *et al.*, 2014). Policy makers should provide flexibility in policy planning and implementation. Institutional changes are capable of

increasing production efficiency, of distributing income in some socially more desirable manner, and of reallocating economic opportunity to achieve social efficiency in line with social objectives (Bromley.1991).

# Community Energy Enterprises in a polycentric society: new devices for local energy system

*Luca Tricarico*,[1] *Stefano Moroni*[2]

–

*New technologies for "local energy systems" have recently reached a degree of maturity that now allows for significant innovations and investments in community-based initiatives. As such, they could have a critical role in totally new polycentric development processes. While the issue of distributed energy is widely discussed in technological terms, a more articulate connection between distributed energy productions and local initiatives still needs to be elaborated and put into practice. The main objective of this paper is therefore to verify how the availability and advancement of certain current technologies – along with the potential of new forms of community organisations – can solve some of the economic and environmental problems that are becoming an increasingly critical and inexorable challenge in today's world. The principal issue here is that the crucial obstacle to innovating the utilities supplying statutory services to local communities today remains basically our outdated legislation and regulation. In many countries, the legal setup for the entire supply system was actually devised to secure and perpetuate the interests of the centralised, statutory energy sectors. This analysis therefore suggests ways in which certain elements of our legal framework might be revised and reformulated so as to allow greater leeway for the proliferation of bottom-up initiatives in energy production.*

*Keywords***:** local energy systems, community enterprises, community technology.

## 1. Introduction

An energy system is an "energy chain" that comprises energy production, conversion, transmission, distribution and consumption (Alanne and Saari, 2006).
The technologies currently available for creating "local energy systems" (e.g., small devices to product electricity on-site, two-way smart grids and micro-grids, etc.) have reached a promising level of advancement, and these new system are now in a good position to be integrated with renewable energy sources, and for reducing supply costs, streamlining consumption, creating new production chains, increasing local employment, and not least the empowerment of the local communities.
Any discussion of these new systems inevitably pivots on how they compare with the large energy systems, namely the traditional centralised models of energy production, and on the viability of local energy systems as an alternative in terms of efficiency and sustainability.
At present the debate on local energy production hinges mainly on questions of technology and engineering; at most, some reflections on economy are thrown in for good measure. What we believe is essential is to cast the net wider and include the organisational, social, and ethical-political issues involved (until now largely ignored: Alanne and Saari, 2006; Ribeiro et al., 2012). As Nele Friedrichsen et al. (2014, p.264) observe, "t*he institutional set-up of the smart system is still uncertain*". The crucial issue here is that in a distributed energy system "distribution" refers not only to energy generation units, but also to ownership, decision-making and responsibility as regards energy supply (Alanne and Saari, 2006). In short, distributed energy means more than merely situating smaller energy units close to consumers.

## 2. Available technological for local energy systems

Local energy systems have now become a workable reality thanks to new technologies that can guarantee local energy production and distribution, along with computerised systems for managing local demand and consumption, which include such vital devices known as the "smart grid", along with their parallels such as "micro-grids" (functioning in both on and off-grid modes), and the other experimental systems such as on-site utilities and user coalitions (Mendes et al, 2011; Chicco e Mancarella, 2009; Hiremath et al, 2007).
More specifically, the relevant technologies can be grouped into three main categories, as follows: first, technologies related to the production and utilisation of energy – namely, those that enable the on-site

1 Department of Architecture and Urban Studies, Politecnico di Milano, luca.tricarico@polimi.it

2 Department of Architecture and Urban Studies, Politecnico di Milano, stefano.moroni@polimi.it

production of the energy needed by the local system, and for ensuring that consumption is efficient; second, the technologies for the distribution and proper flow within local grids; third, management technologies that enable the remote control of the assets of production, distribution, storage, and consumption of energy.

*2.1. Production, storage, and usage of energy*

As far as the local production plants are concerned, the available technologies are based on four different types of renewable source: photovoltaic/solar thermal, wind farm, small-scale hydropower, and geothermal; but to some degree they also rely today on traditional sources, such as the use of heat pumps or co-generation/tri-generation systems.

Among the technologies in this first category are also those relating to accumulators and devices (electrochemical and others) for storing electrical and thermal energy; logically, these are critical for off-grid units, namely special systems that can run independently from the national power grid.

Similarly, the technologies affecting the end-use of energy can contribute to improving the local networks, such as more efficient lighting and heating, building automation, and the use of smart appliances.

A fair quota of technologies for energy production and consumption have achieved a high level of effectiveness and sophistication (Fig. 2), and boast an increasingly valid cost-efficiency ratio. The only area still lacking at present is storage technology, though a recent report published by UBS (2014) – in tandem with Tesla and Umicore – shows a vast market potential of storage technologies in the next twenty years, which will see an up to 50% reduction in energy storage costs by the year 2020 (Fig. 1).

*2.2. Distribution of energy*

By "technologies for energy flow" we mean local infrastructure for optimising the transfer of energy from the power units to the points of consumption.
This area of technology can be divided into two types.
The first is the physical distribution system itself, either for electrical energy (electricity network) or for thermal energy (remote heating network), which consists of pipes and/or pipelines created to connect the energy production plants to the storage depots, the end-users, and on occasion also the national grid (Rezaie and Rosen, 2012).
The second is the communications network or information exchange systems linking the various "nodes" of production and consumption. This virtual grid facilitates the exchange of data via cables (increasingly optic) or wireless data transmission (radio waves, or infrared). This technology was set up to ensure the efficiency of the physical network and deploys sophisticated smart-metering devices to maximise production/consumption ratios (Feng et al., 2013).

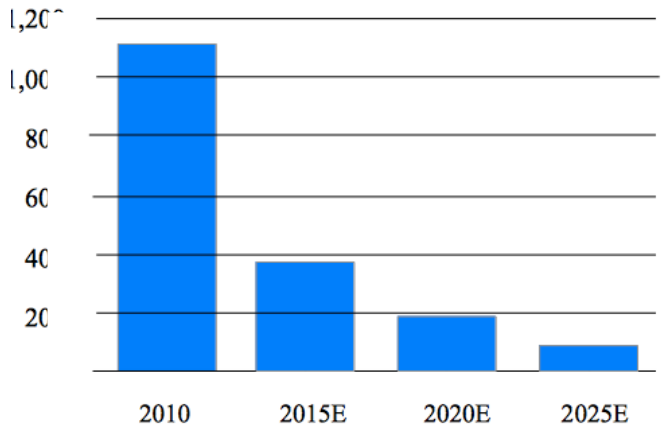

Figure 1. Graph of cost of energy saved on storage devices (€/kWh); re-elaborated by the authors from data estimated by Tesla, Umicore, and UBS (UBS, 2014).

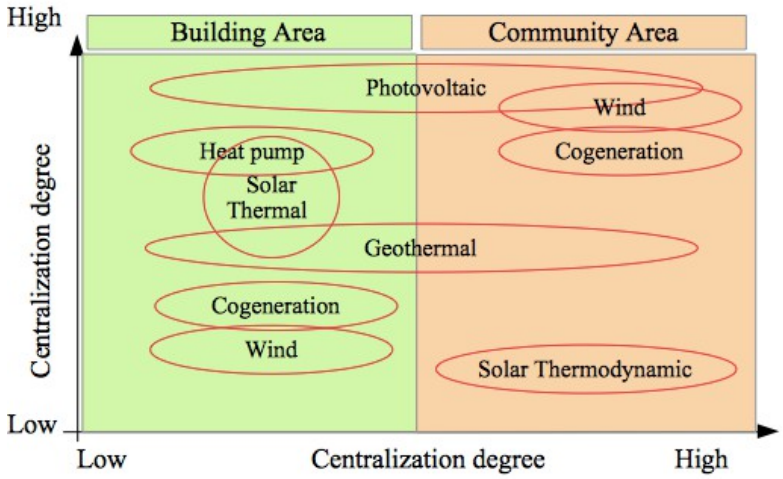

Figure 2. Degree of technological advancement and centralisation from building to system (from left to right) in energy production technology; re-elaborated by author from an evaluation done by the Energy and Strategy Group and the School of Management of the Politecnico di Milano (ESG, 2014)

*2.3. Management, control, and monitoring of energy flow*

The technologies involved in the control, management and monitoring of energy flow consist of two systems in particular.

First we have the software systems that can forecast energy consumption patterns and those for the production of plants powered by renewable sources; these systems include cloud computing energy efficiency (Berl et al.; 2010). Such predictive systems make it possible to optimise consumption and ensure the efficiency of the local energy grid.

Second come the hardware systems backing up the assets of production, storage, and consumption. These devices are the physical side of energy management (computer, sensors, meters, switches) that function at the local unit or network scale, automatically regulating the network flow to ensure the maximum efficiency in response to the fluctuating consumption quotas.

## 3. A potential system of decentralised energy units: aspects of infrastructure and organisation

The world's major energy networks continue to provide the backbone for most of human activity, and are hence essential for the proper functioning of today's societies. Thanks to them we have linkage between producers and consumers, the transmission of energy between different regions and states, energy for our offices and homes, and heating and air-conditioning according to the changing climatic conditions.
According to a recent study (Dobs et al., 2013), the value of a country's overall infrastructure stock (including energy, but also roads and waterways) on average amounts to 70% of its GDP – that is, an enormous amount of capital. Given such a massive employment of physical and financial assets, at first sight any alteration to this setup would seem impracticable.
When we think of the energy infrastructure, we invariably think primarily of the physical infrastructures needed for energy production, transformation, transmission, distribution, and storage. The current setup for electricity production is principally generated by large power plants, which are usually located at a considerable distance from the end-users, who receive it via long and complex networks of power lines. In Italy the current power grid is composed of 63,500 kilometres of cables (www.terna.it).
A possible alternative scenario centred on local energy systems would entail the creation of numerous smaller, modular plants located closer to the places where that energy is actually being consumed. At present, such a setup could come about by combining traditional power plants burning fossil fuels with other renewable sources. In future that energy production could rely entirely on the latter sources (photovoltaic, solar thermal, wind farm, small-scale, hydropower, geothermal). Basically, this local redistribution is the

only arrangement that would enable a extensive network of renewable energy sources to function (Scheer, 2010; Lowi & MacCallum, 2014).
If we embrace this idea of local energy systems, we need also to think about what kind of organisations would be appointed to manage these new initiatives. The concept opens up a whole new gamut of opportunities in collective energy production and management. The nodes of this new polycentric system of energy production will not be the individual homes, stores, or industries (as is often considered, also in terms of new legislative measures), but new forms of "intentional communities", and "voluntary communities" (Brunetta and Moroni, 2011).
We will adopt the expression "Community Energy Enterprises" to indicate this particular type of collective management unit (voluntary, self-regulating and self-financing); clearly, such units could easily form coalitions to create a wider grid of sorts.
To this end, the production of on-site energy would not only benefit domestic appliances and so forth (heating, lighting, etc.), but also could be used for recharging electric vehicles and the like (Newcomb, 2013).
The efficiency of a polycentric system of electricity generation of this type would be guaranteed by the introduction of the aforementioned smart grids, whereby the units are rendered interactive via smart software protocols. This contrasts with the standard type of power grid with its single source and passive distribution, and instead would involve users interactively with the grid (consumers and producers) connected to a network fed by multiple energy sources. As such, the smart network would be able to respond promptly to surges and dips in demand from the various end-users, thereby ensuring the optimal and immediate management of energy supply and demand (Butera, 2007; Dall'Ò and Galante, 2010; Enea, 2011; ESG, 2014; U.S. Department of Energy, 2014). Clearly, this smart grid does not need to pose as a public utility, nor need it be unique or universal. Such a scenario does away not only with the alleged intrinsic reasons for a "natural" monopoly of energy *production*, but also with the idea of "natural" *distribution* monopolies.
As Alvin Lowi and Wayne Crews write (2003, p.164): "*Historically …, electric utilities never achieved natural monopoly status before the advent of the state public utility commissions that arose to regulate them*". See also Geddes (1992, p.76): in the sector of electric utilities, "state regulation was instituted not to correct private market failures and to increase social welfare, but to provide firms with a way to insulate themselves from the discipline of competition". The issue is evidenced also by Fred Foldvary (2005, p. 28): "*Electricity provision has been regarded as a natural monopoly, a utility with a high fixed cost and low marginal cost. … Historical studies have shown that governments have helped to create a monopoly situation – there may not be a natural monopoly*".

## 4. Polycentric energy systems: the foreseeable implications

The advantages of a polycentric system composed of multiple local energy systems are twofold: it would have positive implications both in general terms (i.e., systemic benefits) and for the end-users (i.e., specific benefits).[3] Here we will look at six different forms of positive side-effects generated by a polycentric energy system.

### *4.1. Reduction in power transmission and distribution losses, and recovery of residual heat*

At present, local energy production could turn out more expensive, owing largely to the reduced size of these distributed energy production plants. This greater outlay would be immediately offset however by the lack of the notorious energy losses whenever electricity is transmitted over long distances. In Italy these electric power transmission and distribution losses amounted to 6.2% of the energy on the national grid in 2007, 6% in 2008 (www.terna.it) and 7% in 2011 (http://data.worldbank.org). Parallel figures for the United States showed similar trends. The U.S. Energy Information Administration estimates that national electricity transmission and distribution losses average about 6% of the electricity that is transmitted and distributed in the United States each year (average of losses from 1990 to 2012: www.eia.gov).[4]

3 One aspect omitted here (for methodological reasons) is the creation of new national production chains and employment from the expansion of the sector dealing with the production, installation, and maintenance of the proposed local energy systems; for more in this, see the specific literature (Sastresa et al, 2010; del Rio e Burguillo, 2008).

4 Compare electric power transmission and distribution losses (% of output) in other countries (2011): Denmark (7), Sweden (7), United Kingdom (8), Portugal (8), Spain (9%), Turkey (14%), Argentina (14),

Furthermore, a network of scattered systems could better handle the question of harnessing and recycling residual heat for other energy uses, as against the prohibitive costs of channelling the residual heat dispersed by large power stations over distances (Butera, 2007).

*4.2. Reduction of network overheads*

The self-contained energy within the local systems will mean less drain on the public univeral grid (lines and transformers), and consequently a reduction in overheads for the grid itself (ESG, 2014). In time, the local networks could gradually replace most of the public global grid.

*4.3. Reducing pollution*

The key feature of local energy systems is the opportunity they provide for harnessing renewable energy sources.
It is common knowledge that traditional power plants employing fossil fuels (in particular coal, natural gas, and oil) cause the emission of billions of tons of CO2 into the Earth's atmosphere per year: in the year 2012 that quota reached 34.5b (Oliver et al. 2013). Of the 14,000 billion Watts that the Earth's inhabitants consume every year, some 25% currently derives from coal, 20% from natural gas, 33% from oil, and 7% from nuclear; whereas from sunlight or other renewable sources, such as wind-power and geothermal, that quota stands at a meagre 0.5% (Kaku, 2011). Confirming the global intransigence in the use of fossil fuels is the fact that the percentage recorded forty years ago (1973) has remained the same: world 91%, and OECD countries 95% (Fig 3).
Also worth noting is that our cities use 80% of that energy (Butera, 2007). Furthermore in Italy and Europe, greenhouse gas emissions stem largely from urban areas and residential use (ISPRA, 2013; EEA, 2012). The reason for this is the continued poor implementation of the technological know-how for the use of on-site cogeneration plants and the continued use of old plants running on fossil fuels. As underlined by Akorede et al. (2010), it has been shown how the "*adoption of distributed generation technologies in power systems can play a key role in creating a clean, reliable energy with substantial environmental and other benefits. For example, a British analysis estimated a reduction of about 41% of CO2 emissions in 1999 when a combined heat and power (CHP) based distributed generation (DG) technology was adopted. In the same vein, a report on the Danish power system, observed a cut of 30% in greenhouse gas emissions from 1998 to 2001, with a widespread of DG technologies*."
Furthermore, distributed plants of this nature slot far more readily into the territory and landscape, with far less physical and visual impact on the environment.

*4.4. Reduction of electromagnetic radiation*

It is important moreover to take into account the other negative side-effects of large power transmission systems, such as electromagnetic pollution and the consequent risk to health. As noted by Akorede et al. (2010) *"the magnetic field directly underneath a transmission line is in the range of 300 and 600 mG, and has a field strength of between 10 and 100 mG at some 61 metres away"*. An investigation made by Draper et al. (2005) shows a 70% increase in childhood leukaemia for those living within 200 metres of an overhead transmission line, and a 23% increase for those living between 200 and 600 metres, both of which are statistically of crucial significance.
The health risks from electromagnetic radiation would be dramatically reduced with the introduction of a polycentric network based on local energy systems.

*4.5.Reduction of blackouts*

The presence of multiple local energy systems will also greatly reduce the risk of network power outages typical of the current unified grid system, which affects all users alike (with heavy economic consequences). In the case of distributed energy production units, the vulnerability of the entire system decreases because of the independence from the global electricity distribution grid.
It is worth noting also that the proposed distributed system would be far less vulnerable to possible acts of sabotage.

Brazil (16%) (http://data.worldbank.org).

*4.6. Increase in self-sufficiency for consumers, and differentiated and tailor-made solutions*

The distributed generation systems would promote the creation of non-hierarchical and competitive networks, with an increase in local self-reliance and a greater range of solutions (tailored to individual and small groups needs). Observe how this may also positively affect consumer awareness, and hence consumption behaviour patterns (Alanne and Saari, 2006). Furthermore, this type of system would be more flexible.

## 5. A framework for the diffusion of local energy systems: market, rules, and organisations

Infrastructure is only one part of a far-reaching system composed as follows:

- the economic sectors, such as transport and petrochemical;
- national and international markets;
- specific industries that produce energy plants running on traditional or renewable sources;
- institutional, regulative, and fiscal frameworks.

Recent research has shown that technologies co-evolve with the institutions, and the social and political, forming a socio-technological system, as it were (Goldthau, 2014; Geels, 2002).

The current institutional and regulative system has most certainly played in favour of the large technological systems, establishing a framework of rules that have fostered the emergence of a superstructure of giant energy providers cohering in a single global mega-network.

The traditional model of centralised technologies is so deeply embedded in the system of norms governing industry ad society that attempts to introduce changes of any kind – let alone radical ones – are strongly resisted. In the course of time this entrenched model has spawned mammoth sector monopolies and consolidated the mechanisms that preserve the status quo.[5] In the case of the energy grid, it largely functions as if it were a "natural" monopoly. The combination of economies of scale and subadditive firm costs prevents any new operators from gaining a foothold in the market, and their attempts trigger new preventive regulative barriers that favour the monopolistic powers (Gomez, 2013; Joskow, 2007). Here and there, efforts to support local energy production has threatened the profit margins of the incumbent giants (Crouch, 2014), unleashing waves of sector lobbying activity with the regulating bodies (as regards Germany for instance, see Vasagar, 2014).

In short, the major centralised energy plants using traditional technologies have created solid bonds with the socio-economic and geopolitical authorities. "Present regulation often does not allow nor gives the right incentives to the network operator to interact with generation, storage, flexible loads and aggregators in order to harvest the efficiency benefit they can provide" (Friedrichsen et al, p.266).

Italy for example, in 1980 still had 91% of energy production in traditional fields, falling to around 70% in 2013 (UP, 2010; IEA, 2014). In the first quarter of 2015 the country's renewable energy sources accounted for almost 31% of the net domestic energy production (Terna, 2015); given that almost half of this figure is owed to large hydro-electric plants, it becomes patently clear how far we still are from establishing a network of distributed small energy production units (based on renewable sources).

The current energy production framework with its entrenched reliance on traditional sources is drastically at odds with recent EU energy policies (in particular as regards the 2020 climate and energy package; EU, 2011; da Graça Carvalho, 2012), which are aimed at reducing CO2 emissions (reducing 20%) and at promoting a changeover to renewable energy sources (raising to 20% of the total) for the year 2020. Goals of this nature cannot be reached without somehow getting round the reigning monopolies, and without forming regulative frameworks that facilitate decentralisation and the creation of new legal arrangements for the transition from a *passive* energy society to an *active* one.

This transition is made possible by the continuous advances of technology, which now justify investing in

5 As shown by the reports of Transparency International on lobbying (Transparency International Italia, 2014), and by the overview proposed by Foldvary and Klein (2002).

polycentric units of energy production, in particular in solar-based systems (Farel, 2012). On this subject, there is a crucial need for the statutory energy utilities to reposition themselves on the market and in the production and distribution chain in light of the potential arrival of new competitors such as the Community Energy Enterprises (Vasagar, 2014).

The current regulatory framework in Italy and in most EU countries is focused on creating incentives for individual technological solutions, such as "Titoli di Efficienza Energetica" (Energy Efficiency Tokens) or "Conto Energia" (Energy Account) (ESG, 2014), by-passing the idea of collective solutions.

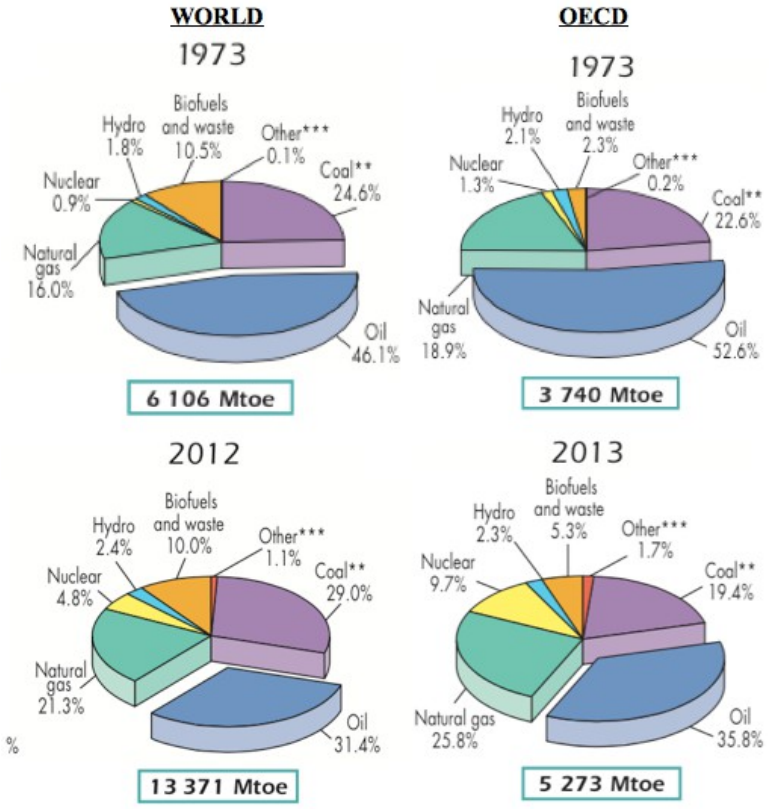

Figure 3. World and OECD area energy primary production supply sources percentage after 40 years (IEA, 2014).

In terms of public decisions and governance, the diffusion of local energy systems poses something of a challenge. Despite the steady fall in investment costs, it is essential that incentives and tax cuts are applied for the creation of local energy production networks, which will also guarantee solar grid parity (SGP), whereby the cost of on-site energy production through renewable sources (e.g., solar) is lower or compares favourably to the average costs currently available on the traditional utilities market.[6]

Among the policies for promoting a widespread access to energy self-sufficiency, some of the most important are new forms of ownership of the installation themselves. For example, third-party ownership (sometimes referred to as "solar leasing") is a long-term contract between individuals and a third party that installs, owns, and operates the solar electric system on your property. "The third-party ownership is able to

6 This approach aims to foster new arrangements or incentives in order to create the conditions for affordable and efficient local energy systems. It has been tested out by several local American municipal councils in tandem with the Institute of Local Self-Reliance, a research body for local energy systems advocacy. The policy changes proposed in the document entitled "Rooftop Revolution" (Farel, 2012) cover several important features of the approach: "*Rooftop solar transforms Americans from energy consumers into producers. Each house with a solar rooftop has (on average) two voters who will strongly support smart solar policies. When half of Americans can install solar for less than the cost of grid electricity (in 12 years), it makes a political majority that favors local ownership of localized energy production long before solar power becomes a significant portion of total electric generation*."

capture the federal tax incentives (including depreciation, otherwise not available to individual residential users) and therefore can compete favourably with those making cash purchases of solar power for their homes" (Farel, 2013; an example of this kind is described below in chapter 6).

In general, it is important to note that the cost of photovoltaic modules dropped about 80% between 2007 and 2012, and prices are continuing to fall (Newcomb et al., 2013). So called "soft-cost" (namely, all other costs beyond the module itself: installation, and permission and inspection procedures) can be significantly lowered by streamlining public procedures (ibid.).

## 6. Community Energy Enterprises: two types and examples

The composition of Community Energy Enterprises can vary as follows:

- a coalition of local public authorities/governments;
- a coalition of private individuals/groups forming an innovative unit that offer an alternative to local authorities for proposing new formulas of urban growth and energy supply (Bailey, 2012; Brunetta e Moroni, 2011; Tricarico, 2014).

### *6.1. First case: local energy systems as local government coalitions – the Cogeser Group*

*Cogeser* was set up in 1986 as a Consortium between the municipalities of Melzo and Vignate (near Milan) to manage the supply of domestic gas (Lombardia Region, Italy). Since the year of its foundation up until 2001, a total of seven separate municipalities adhered to the consortium.
Some time later the consortium became a quoted company, Cogeser Spa, and an offshoot of the new company took over handling the distribution (Cogeser servizi Srl).
Since 2007 the company has consisted of three operational branches:

- *Cogeser vendite srl*: for the sale of gas and electricity;
- *Cogeser servizi srl*: for the management of street-lighting, the gas distribution network, and the management of new energy production services through renewable sources (photovoltaic and solar thermal), along with the co-generation of remote heating for a segment of the member municipalities (Fig. 5);
- *Cogeser servizi idrici srl:* water mains services and distribution utility.

The utility's ownership of the distribution and production system, together with the sales network, has enabled Cogeser to optimise its management performance: +11.8% profits in 2013, entirely redistributed among the member municipalities (Turati, 2013). At the same time, the cost of utility bills has dropped significantly, and Cogeser has guaranteed utmost transparency to the user community, along with all information regarding management policies and production (publishing its annual report). In addition, special local policies are put forward such as "gas bonus", namely a discount on utility bills for large low-income families, a perk that in 2013 alone benefited some 1,164 clients, to the tune of around 30 thousand euros (*ibid*.). Moreover, the group effects numerous special initiatives in its catchment area, such as sponsoring cultural events, or raising awareness in schools on environmental issues, and internships within the company for students from the area's high schools.

Figure 4. Maps showing the member municipalities of the Cogeser utility network (http://www.cogeser.it)

The success of the investments completed on the local dominion stems from the astute formula of integration between service management and ownership of the distribution network, which has enabled investment in cogeneration and district heating systems, along with photovoltaic plants in schools and other public buildings in the member districts. Recent years have also witnessed the outlay of interest-free loans for upgrading heating plants in the individual homes and condominiums (Lojola, 2008).

*6.2. Second case: local energy systems as private community coalitions – the Melpignano "Comunità Cooperativa"*

Among the examples on Italian context, the CC (community cooperative) of Melpignano near the southern city of Lecce (Puglia) has provided a significant yardstick for of collaboration, in this case between the Legacoop (a nationwide network of cooperatives) and the local municipal councils. As a working concept, the CC was created to handle a network of solar energy production via photovoltaic panels mounted on public and private buildings across the city; endorsing this was a third-party ownership scheme in the form of a community cooperative, namely an experimental form of organisation entrusted with managing the local council assets and services (Bartocci and Picciaia, 2014; Tricarico, 2014; Legacoop, 2011). According to the CC's statute (art. 5), this organ was appointed to install the plants and see to their upkeep, managing the production of energy via smart metering tailored to the needs of the end-users, and selling any excess energy back to the market. In truth, the company offers a potential multi-utility structure, inasmuch as its activities include the distribution and supply of combustible gas and water resources, along with the management of the services offered by the energy grid. From a legislative viewpoint, the setup could be reconfigured as a normal mixed cooperative (which would comprise production and consumption at the same time).

The participation of the various members of the cooperative is discretionary, depending on the duties they perform: autonomous worker members who supply technical know-how and actually build the plants; user members who are grouped into "host" members (i.e., citizens who host photovoltaic panels on their roof), and "simple" members who subscribe to the project via a fee in order to benefit from energy discounts; and subsidising?? members, namely those opt to invest in the project by contributing capital for its completion.

Thanks to the joint efforts of three partners, a unit was set up to run operations through a signed agreement, comprising the municipal administration of Melpignano (which oversaw the general scheme), the Officina Creativa of Lecce (which coordinates activities), and Salento university (which drew up a feasibility study for installing banks of photovoltaic cells on rooftops in Melpignano – identifying around 180 households with a suitable roof – and a schedule for implementing the project).

The successful realisation of the CC plants in Melpignano was feasible thanks to the detached single-unit housing typology, with accessible roofs (each of which ceded the use of their roof to the cooperative for a period of 20 years, whereby they receive free energy in return).

As for the financial resources needed, these came from the "Copfond" (one of the Legacoop's ventures), the "Banca Etica", a third-party owner (the cooperative itself), and partly through a subscription fee paid by members. Through these funds the cooperative has managed to repay the interest on the initial outlay, and also create its own savings fund. How the earnings from investment are employed is decided by the members, and so far goes toward urban requalification, such as improving greenspace, resurfacing roads, school bus services, and school cafeterias.

## 7. Closing remarks

A look at the situation in Italy shows that in the last twenty years there was been a steady increase in utility costs (NE, 2013), largely due to a dependency on imported raw materials, the lack of market liberalisation, a thorough overhaul of the national energy grid (Bitetti and Rocca, 2014), and not least to the government's resorting to energy taxation as a way of harvesting public money. This situation could lead to a worsening of the what is know as "energy poverty" (Faiella and Lavecchia, 2014; Oldfield, 2011), whereby some members of the population are not able to purchase the necessary minimum of energy assets and services.

For this reason it is critical that we question the present framework of state control over the energy grids and

infrastructure, which is currently configured on a centralised model of production and distribution.[7] As Nele Friedrichsen et al. (2014, p.273) write: "*Decentralization is changing the structure and operation of electricity distribution. Consumers, generators and other stakeholders become more active participants in the electricity supply system and thus challenge the traditional responsibility and scope of action of the network operator*."

It goes without saying that a distributed energy system must likewise establish a set of safety and security standards. In this case, the principal "infrastructure" that the State can offer is the guarantee of universal legal safety and security standards, stable and impartial, that will guarantee equal access to new options and a "framework for utopias" (Nozick, 1974).

# UNPACKING THE GOVERNANCE OF ENERGY TRANSITION. A CONCEPTUAL FRAMEWORK.

Govert Valkenburg[1] and Giancarlo Cotella[2]

## Abstract

*There is a deep relationship between energy transition and the governance of contemporary societies. However, while existing governance literature has gone a long way to accommodate complex and heterogeneous problems, it has so far fallen short of entirely dealing with the human, social and cultural challenges that this topic incurs. In particular, the deep relationship between energy transition and political dynamics at large has important connections to social, cultural and personal issues that remain underattended in theories of energy transition governance. As a matter of fact, in more or less direct ways, any event moving in the direction of energy transition requires sophisticated levels of coordination among the many actors involved in governance, and mobilizing a wide range of interests that are likely to produce conflicts, tension and resistance. Building on the interim results of the MILESECURE-2050 FP7 project, the authors reflects upon constitutive elements of energy transition regimes, i.e. more or less stable clusters of individual and collective actors, institutional or not, that can develop plans of action, activate social norms and standards and mobilize resources to encourage, manage, anticipate or direct the dynamics associated with energy transition. Theseelements are presented against existing, more abstract and generic approaches to governance of complex problems, in order to position them as potential operationalisations. Overall, the proposed contribution aims to derive general principles for the governance of Energy transition and Energy security, using both empirical material and existing scholarship on governance of complex problems.*

## Keywords

Governance, low-carbon transition, energy security

## 1 Introduction

This contribution aims at a problematisation of the governance of energy transition and the multiple challenges surrounding the latter. It does so by putting together a conceptual framework that integrates multiple modes of governance into an organized toolbox, from which some of those may be selected and mobilized jointly towards a successful governance of energy transition. In particular, it shows how the clustering of modes of governance may help devising strategies to attain energy security as well as an increased use of renewable energy sources, while at the same time stimulating a much stronger mobilization of the general audience with its social-cultural capital that most often still remains elusive to grasp and address.

In the following sections, we first present our understanding of energy transition, as developed within the activities of the MILESECURE-2050 FP7 project[3]. Then, we discuss in more detail how

[1] Maastricht University programme in Science, Technology and Society (MUSTS), Faculty of Arts and Social Sciences, Grote Gracht 92, 6211 SZ Maastricht (Netherlands). Ph: +31-6-53224463; E-mail: g.valkenburg@maastrichtuniversity.nl

[3] The present paper is indeed based on the interim results of the FP7 Project MILESECURE-2050: Multidimensional Impact of the Low-carbon European Strategy on Energy Security, and Socio-Economic Dimension up to 2050 perspective (www.milesecure2050.eu). Overall aim of the project is to understand and overcome the political, economical and behavioral traits and trends that led Europe to its difficulties in reducing fossil fuel consumption, and in diversifying its energy balance at rates which guarantee European energy security in the next years (more specifically at the horizon 2050), reduce the threat of climate change, and diminish the risk of an energy gap in the coming decades. The MILESECURE-2050 consortium is led by Politecnico di Torino (Italy), and composed by ten project partners: Instytut Energetyki IEn (Poland) EnergSys (Poland);

complexity arises in energy transition and how this complexity stretches beyond the epistemological ambiguities that have been observed already in policy studies. The third section focuses on how approaches to governance of complex problems still offer some ground work for dealing with these particular issues. More specifically, we offer an inventory of modes of governance that bring out qualities of specific modes that serve the mobilization of citizens in different ways. In the penultimate section, a brief outlook will be given of how such governance could work in practice. Finally, a conclusive section rounds off the contribution, reflecting onthe possible implication that the propose discussion may have for further research in both the fields of energy transition and governance.

## 2 Socializing energy transition: knowledge, politics and the 'human factor'

Energy transition is the result of a set of complex, heterogeneous, long-term and reflexive processes. Governance studies have produced sophisticated perspectives on the societal management of such processes. These have addressed challenges such as value pluralism, uncertainty, contested expertise, and the changing role of the state (Enroth 2014, Bressers and Kuks 2003, Florini and Sovacool 2009, Guston 2013, Termeer et al. 2013). Yet, the resulting governance frameworks are not per se apt to address the issues that come about when energy security and low-carbontransition are implemented in a social context, and in particular the mobilization of citizens who are the ones supposed to enact the eventual changes.

In this contribution, energy transition is understood at a conceptual level as a set of structural changes in the energy system, with the aim of both achieving energy security as well as of moving towards an increased use of renewable energy sources.This usage is adopted from the conceptual framework developed in the context of the MILESECURE2050 FP7 project. As the changes constituting energy transition concern the structure of the energy system, they are highly consequential: subsystems may become obsolete as they become poorly aligned with new system standards (they become 'reverse salients', see Hughes 1987). Insofar as incumbents depend on these particular subsystems, their competitive position will change. This is one important reason for changes to breed resistance.

Changes also protrude into the private life of citizens: modern life is inextricably connected to energy consumption, and effectuating changes in private lives requires a high degree of willingness for it to happen in the first place. The connection between changes in the energy system and the lives of citizens are manifold. The most radical change seems to be that the role of citizenschanges from mere energy consumers to potential energy producers, since their small scale photovoltaic (PV) installations and the energy buffer offered by the accumulator of their electric car will at times have a surplus rather than a shortage of energy. Moreover, in a less radical sense, citizens' approach to energy consumption is required to change: either as a consequence of legal enforcement, of economic conditionality mechanisms, or by means of 'fun' applications that render energy frugality a competition, decisions on when to use energy and how much will change. This 'human factor' (cf. Caiati et al. 2014) of energy transitions is in the centre court of this paper.

While important challenges in the governance of energy transition still stand, governance studies have already gone a long way in dealing with complexities in a more generic sense. In particular, attention has been paid to the mobilization of science and expertise to abate policy problems. The traditional notion of scientific knowledge and evidence informing political decision making in a neutral way, as 'speaking truth to power', has long been refuted (Brown 2009). The most important arguments are that it would be naïve to believe that scientists and experts do not have political interests or at least a particular, value-ladenperspective, and it would be equally naïve to believe that politicians have no

ENEA (Italy); Laboratorio di Scienze della Cittadinanza LSC (Italy); Maastricht University MUSTS(The Netherlands); The University of Salford USAL (United Kingdom); Paris-Lodron Universitat Salzburg – PLUS (Austria); EU Joint Research Centre JRC (EU); Ecologic Institute (Germany); Société de Mathématiques Appliqués et de Sciences Humaines – SMASH (France)

access to knowledge without help (Brown 2009, Palmer 2012, Adams et al. 2011). Additionally, the whole idea of science informing political power from a neutral ground presumes that such political power is available in a single site such that it is receptive to the sayings of science.This is clearly a questionable presumption to the backdrop of modern, democratic societies.

A first move in the direction of a more sophisticated connection between knowledge production and decision making has been the introduction of the very notion of 'governance'. For one thing, it holds a refutation of the presumption that politics in clearly defined and limited sites, and instead presumes that power is distributed over many formal and informal institutions throughout society (Barben et al. 2006, Rip 2010, Peters 2004). This entails that decisions are made at numerous places. Also, with this vastly expanded space (compared to conventional notions of politics) in which governance takes place, both the range and heterogeneity of relevant bodies of knowledge proliferate. Not least, it becomes to include the knowledge otherwise confined to private life just explained[4].

Yet, it has been observed that even in its distributed and democratized forms, explicated notions of governance and the way these notions mobilize knowledge still seem to be modelled after scientific ideals of qualified knowledge. That is to say, the more knowledge resembles in content and method the kinds of knowledge produced by (chiefly natural) sciences, the higher its chances to find entrance to governance decisions (Schomberg 2011). Knowledge production aimed at informing governance and modelled this way may make highly valuable contributions to governance, but it is hard to see how it deals with the issue of enrolling citizens.

In addition to the enrolment of citizens, also the problems themselves with which governance is confronted, sometimes resist the simple structure of scientifically informing politics and then taking a decision. In identifying such complex problems, one categorization has been influential. Uncertainty can occur on two dimensions. On the one hand, there can be uncertainty with respect to the facts. In this case, expertise could be consulted so as to reduce this uncertainty. On the other hand, uncertainty can be situated at the normative level, if there is no clear position on which value should be realized. In that case, political and moral debate could possibly be conducted to come closer to a consensus. If neither dimension is particularly ambiguous, we could speak of 'puzzles': these problems are sufficiently structured and can be approached as implementation problems of which the solution is principally within reach. Quite the contrary, especially difficult or 'wicked' problems occur if uncertainty exists on both dimensions.[5] In that case, normative uncertainty renders controversial or ambiguous what kind of expertise should be enrolled, and the factual uncertainty renders unclear what the political debate should be conducted about(Hoppe 2002, Ezrahi 1980). These problems are unstructured, and resist strategies that approach them as puzzles.

[4] For a further discussion of the relation between knowledge and power, check the 'Territorial knowledge channels' framework developed by Adams et al. 2011 Adams, N., Cotella, G. and Nunes, R. J., 2011. Territorial knowledge channels in a multi-jurisdictional policy environment: a theoretical framework. *In:* Adams, N., Cotella, G. and Nunes, R. Dilemmas in a General Theory of Planning. *Policy Sciences,* 4, 155-169, Termeer, C., Dewulf, A. and Breeman, G. 2013. Governance of Wicked Climate Adaptation Problems. 27-39. use different specifications, but the overall characteristics of the current class of problems are much alike.

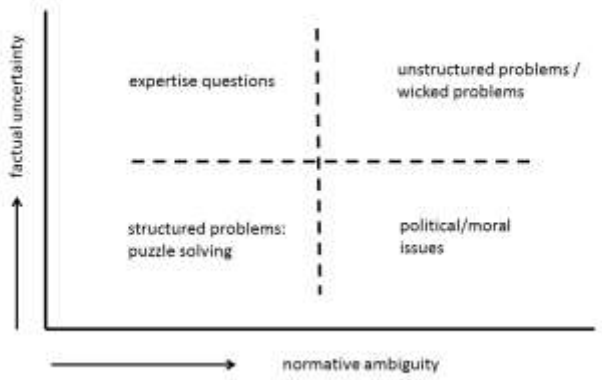

Figure 1: the structure of policy problems (modified from Hoppe and Hisschemöller 1996)

In the upper right quadrant of Figure 1, many problems have been identified over the past decades that are subject to strong controversy and contestation while uncertainties cannot as yet be reduced by scientific research. This is often the case of uncertainties linked to energy security and transition, where the weakness of scientific evidence over long-term issues such as peak oil and climate change impacts hampers the reconciliation of opposite political positionson various matters. For such problems, new modes of knowledge-intensive governance have been devised. On the one hand, it is certainly valuable to bring in many different perspectives, including the perspectives of citizens who are in the end important actors in the effectuation of transitions. On the other hand, as will be developed at length in this paper, to actually transform their positions and mobilize them is entirely another kettle of fish.

Many of the challenges that concern energy transition can be classified along theaforementioned epistemological lines. However, some difficulties remain anomalous in face of this classification. Notably, the fact that energy transition renders the private lives of citizens part of the object space of governance raises ambiguities that are not simply resolved by either conducting further debate, nor by conducting further research. After such epistemic endeavours, considerable ambiguity remains. Most importantly, considerable effort is still to be spent on actually mobilizing citizens, on committing them in the transformations needed. This is not an epistemic affair, but a matter of empowerment, enrolment, activation, and engagement. These dimensions defy the classification of problemsin terms of normative and empirical uncertainty, andremain anomalous, because the classification is chiefly epistemic.In order to shed some light on the matter, the following sectiondiscusses first in more detail how the complexity that arises in energy transition stretches beyond the epistemological ambiguities that have already been observed in policy studies.

## 3 The complexity of energy security and energytransition

Thus, energy transition derives complexity from three kinds of sources. First, energy transition is complex because of the heterogeneity of relevant values. This concerns both conflation of notions of energy security with notions of sustainability, and a broader range of social goods such as freedom of movement, security of subsistence, and the exercise of democratic rights. These may each entail different and conflicting demands for the energy infrastructure. This is the aforementioned normative ambiguity. Second, energy transition is complex because of factual uncertainties. It is as yet unknown what kind of energy technologies will be successful in the future, how energy needs will exactly be shaped, etc. Also, the influence of carbon emission on climate change remains swayed by large margins of uncertainty, which determines part of the urgency of energy transition. This is the factual uncertainty mentioned earlier. The third kind of complexity is of an entirely different nature though:

the difficulty of societal mobilization. It is different because it is not a knowledge-driven problem in the sense that it can be solved by either moral-political or techno-scientific intellectual effort. It needs something to be 'done'.

An example of a difficulty brought about by a failure in efficiently enrolling citizens in a specific initiative, that is difficult to solve by merely acquiring additional knowledge, could run as follows.It could happen that producers of consumer appliances that have some sustainable energy aspects have wrongly estimated the impact of a particular technology on the private life. They have devised a new laundry machine that directly communicates with real-time energy markets, and takes its own decision as to when the laundry is to be done. It strikes a balance between determining the cheapest moment and meeting some basic level of convenience. However, making use of the machine requires that people may have to wait up to 48 hours until their laundry is finished. Even though this was considered a reasonable 'operational cost' by the developers, it turns out in practice that people after a short while start overruling the energy trading mechanism and tell the machine to do the laundry immediately after loading.

This example tells that the designers had wrongly assumed that people will simply reschedule their laundry during the week, if this yields a financial benefit. To some extent, of course, this is exactly a knowledge deficit in the sense mentioned before. Methods of bringing in user perspectives into the innovation process could indeed help prevent part of such misfits between everyday life practices and novel technologies.The introduction of such new technologies can be supported by roping in relevant expertise and by allowing the public involved to generate relevant perspectives on how things are likely to operate when implemented in the social practices they know so well. But it is hard to see how such perspectives relate to actually 'doing' the work of enrolment – getting citizens to 'do' something – and engagement – getting citizens to care about something and voice their concerns.

It was already pointed out above that transitions involve a reprioritization of values that each on their own have a legitimate claim to realization; that is to say: even if we know what the goods are that deserve our pursuit, we clearly cannot pursue them all at the same time (Caiati et al. 2014). In a governance perspective, such value conflicts would be delegated to the domain of political debate (of whatever sort), in which consensus can be tried to achieve. However, in the case of the laundry machine with sensitivity for the energy market, it is unclear what kind of political question is to be put on the agenda, and in which sort of political or ethical forum. The value prioritization is in the first place a private affair, and it requires specific mechanisms to connect in any democratically legitimate way between such public and private spheres. Such connections can be technologically mediated (Marres 2009), but this in itself not a direct resolution of the problems of enrolment and engagement (for the implementation of those technical connections would themselves face exactly the same challenges of engagement and enrolment).

An additional complexity derives from the reflexivity of the entire system that, in turn, generates additional uncertainty. In other words: we don't know how the future system will behave, since we cannot be entirely sure what system we will build for the future.This is especially true for transitions with their upheaving changes: given the fundamental levels at which changes take place, we are gradually *de facto* building a new sociotechnical system, which means that it is not entirely known how the future system will behave. This holds *a fortiori* for the human factor. In practice, this means that we cannot easily predict the exact social situation in which future technologies will be embedded. This is not only about social and institutional arrangements, but also about the whole axiological scale of private moral concerns, habits and life-style related norms, political ideologies, etc.

This reflexivity holds for all the uncertainties mentioned so far, which adds to the difficulty of challenges being not clearly of an epistemic kind. In general, the reflexivity of transitions and their management has been recognized, and taken to call for an iterative and learning way of management (Kemp and Loorbach 2006, Stirling 2014, Rotmans and Kemp 2008). At the same time, it has been argued that hitherto, important normative questions have been neglected, including the question of

how to 'live' under sustainable transitions, and how the inclusion of this private sphere can be shaped in any democratically sensible way (Shove and Walker 2007).

In the following section, we will explain how governance theory has approached complex problems. The complexity is of a different kind there, and we will thus show how these approaches offer a misfit with the problems of transitions. These misfits will then in the next section be explored proactively, reflecting on how different modes of governance can be mobilized in a way that fills in part of the lacunae.

## 4 Governance of complex problems

The intricate balance between maintaining (central) public control over matters or delegating decision and policy making powers and competences toagents distributed at the different territorial scales and in and outside the public sectors has long been recognized and captured through the concept of 'governance'. Where the traditional notion of 'government' referred to the control exercised from within a polity's institutions, 'governance' generalizes this control and also includes all the forms of control that take place outside those formal institutions. Thus, forms of citizen participation, production and mobilization of expertise, and self-organization within professional and commercial sectors, to name only some, come to be recognized as important elements not only of the management of a society, but of the evolution of the various institutional mechanisms that shape the latter.

However, the meaning of governance is not univocal and evolved through timein many different, more or less normative understandings. In its broadest, more neutral sense, governance includes all structuring that has consequences and legitimacy (cf. Rip 2010). In a general way, governance is presented as a bottom-up alternative to top-down modes of command and control, that complements the latter without replacing them by any mean (Barben et al. 2006).Some authors often presents it as adding democratic quality to governing a society (Le Gales 2002), while others contest these claims as uncritical, by opposing the blurred features of legitimacy and accountability that the new governance beyond the state often brings along with it (Smismans 2006, Swyngedouw 2000, Swyngedouw 2005).

Whatever conception of governance we adopt, it is likely for there to be problems that are too difficult to resolve. As explained above, Hoppe (2002) has identified two dimensions along which problems can be 'difficult': their normative and factual ambiguities, respectively (see also Hoppe and Hisschemöller 1996). These two dimensions together determine the degree of 'structure' of problems, or the extent to which they can be approached as puzzles to be solved. If problems score high on both axes, they are unstructured, which means they cannot be approached as puzzles. They are likely to be wicked problems: the definition of the problem itself may be ambiguous, there is no clear point at which the problem can be seen as solved, there is no test-site in which a manageable version of the problem can be tried to solve, there are no clearly good or bad answers, etc. (Rittel and Webber 1973).

An approach such as *post-normal science* (PNS, Funtowicz and Ravetz 1993) has prescribed how such wicked problems necessitate the expansion of practices of knowledge production beyond traditional forms of expertise. This 'extended peer community' needs to include a broad range of stakeholders, which are needed to bring a sufficiently wide range of perspectives to bear on a particular problem. While this approach, together with many other approaches to governance of complex problems, has accomplished a democratization of some sort, it has not explicitly engaged with the 'engagement' part of dealing with energy issues.

It is vital to recognize that both the axiological and empirical dimensions of wicked problems are epistemic:[6] they relate to particular forms of knowledge about the world. Even though the distinction

[6] 'Epistemic' is used here as referring to 'knowledge', in particular knowledge of any sort. Thus, it includes normative knowledge. This is different than how Funtowicz and Ravetz Funtowicz, S. O. and Ravetz, J. R. 1993. Science for the post-normal age. *Futures,* 25(7), 739-755. use it. They oppose 'epistemic' with 'axiological',

between these two realms seems fundamental, the categorization is incomplete as, as problems are not always possible to reduce to a knowledge deficit (whether axiological or empirical). Also the PNS approach is ultimately directed at the expansion of knowledge. But knowledgeis only part of what makes this class of problems complex. Complexities of geopolitics and marketsare neither reduced by expertise nor by debate. Also, as Guston (2013) has noted, seeking resolution within a mere epistemic realm would arrogating to (social) scientists the ability to determine what is good, as they will always be in a prioritized position when it comes to adducing knowledge.

True enough, inclusion understood as the inclusion of a sufficiently broad range of perspectives on a problem, what could be called *epistemic inclusion*, is important both from the perspective of democratizing decisions and from the perspective of capacitating actors to cope with complex problems. An approach such as PNS is indeed in principle open to any sort of knowledge, including the human aspects of energy transitions. But exactly because of this fundamental openness, the approach is less capable of identifying problems that are outside the epistemic realm. Also, not all sorts of knowledge can be expected to be equally able to 'speak truth to power' and get their particular truth over the footlight. As Adams et al. (2011) pointed out, when aiming at influencing policy and decision making through the production of knowledge, individuals are more likely to be successful when clustering more or less formally in knowledge communities (may their nature be epistemic, linked to a specific practice or set of values).

At a more philosophical level it can be argued that governance as an alternative to government offers a reversal of the primacy, from a top-down central government to a bottom-up approach (Van Zeijl-Rozema et al. 2008). This changes the subject of governance – who does it – but it does not significantly alter the *object* of governance – what needs to be governed. This is, though, exactly what becomes destabilized in the context of energy transition. Perhaps, additional insight on the modes through which governance actually operates may contribute to unravel the conundrum, and this is what the following paragraph tries to do.

## 5 How governance operates: modes and regimes

We speak of governance as all those activities that are consequential for how life in the polity is organized. Straightforward examples of modes of governance are political debate, public debate, the installation of market incentives, public education, and self-regulation of professional groups.In a general way, governance is presented as a generalized alternative to classical notions politics and government, which is able to accommodate more of what actually matters in the management of a society. It thus has an inherent promise of democratization, even though Smismans (2006) as convincingly argued that such promises are often made too uncritically.

Classifications of modes of (conventional understandings of) governance have been suggested along various dimensions. As Treib et al. (2005) review, modes of governance can be classified to their degree of coercion, the degree of openness of implementation of decisions, the presence of sanctions, their involvement of actors, their dependence on market mechanisms, and some more. Such classifications are typically one-dimensional and, due to their nature, often sacrifice complexity to the altar of clarity. In this light, it may be worth to put together, on the basis of existing studies, a classification of modes of governance along two dimensions instead: the level of inclusion, and the level of coercion.

The first dimension captures the extent to which modes of governance are socio-spatially distributed and mobilize agency of a broad variety of actors. This *level of inclusion* is low if only institutional and political actors matter, and high if the general audience and market players etc. matter as well. Political debate in parliament is a fairly exclusive, centralized affair. So are taxes, since there is only one authority that executes them. In contrast, grass-root initiatives, interest groups, and public information

---

where the latter is exactly the realm of values. Thus, epistemic uncertainty with them is only empirical uncertainty.

are much more distributed and inclusive. They are accessible to many or all citizens, and their execution or effectuation is importantly done by many. This dimension conflates several aspects of what may, in certain conceptualisations, count as 'democratic'. It includes the enrolment of citizens in effectuation of a policy. It includes citizens' access to the institutions where the policy is created and implemented. It includes the extent to which something pertains to all members of society. And it includes the degree to which things are physically distributed and pervaded through society. Thus, this distribution is comparably intuitive, and leaves intact some underlying heterogeneities and ambiguities. However, a further analytic specification of the concept is not needed for the argument of this paper.

The second dimension captures the extent to which propositions are open to negotiation, or instead have closed down and become inevitable. This *level of coercion* is high if things are settled and/or institutionalized and decisions are binding, and low if they are still debated and contested, and decisions dependent on voluntary action. Political debate, conducted within the confines of political institutions that eventually produce laws and other authoritative policies is ultimately capable of coercively taking decisions. In contrast, public debate as such is not. It may generate new ideas and perspective, it may generate support for a particular case, and it may in the end breed acceptance for laws to be adopted, but in itself it is not able to issue binding rules. Yet, the fact that public debate can have important consequences for how life in the polity is organized, makes that it clearly belongs to the sphere of governance.

Following distinctions along these two lines, a collection of modes of governance – by no means meant to be complete – can be arranged in Figure 2.

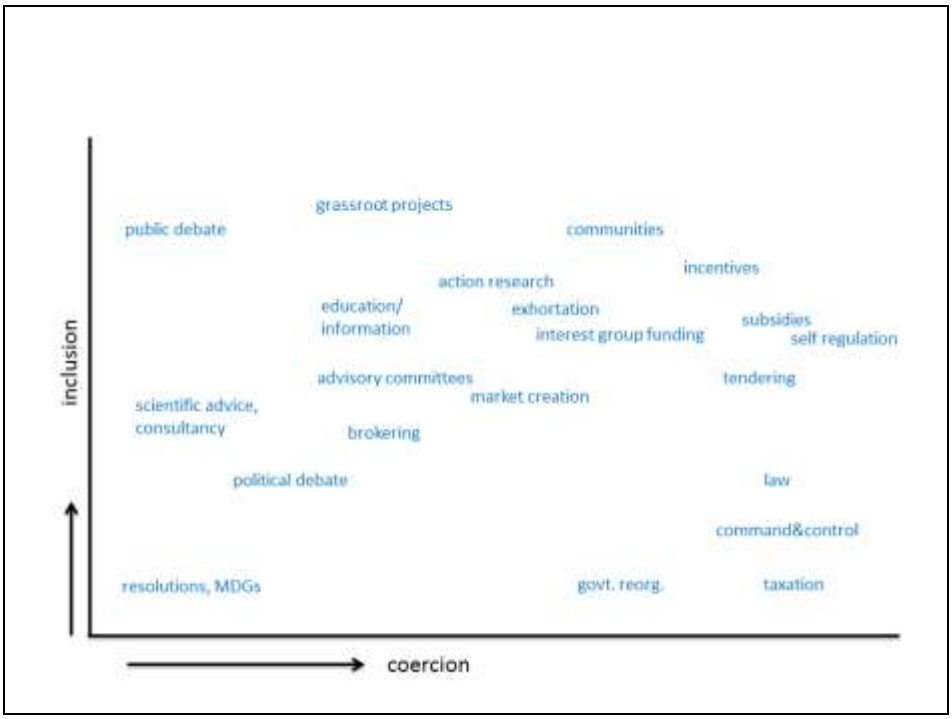

Figure 2: A two-dimensional classification of conventional modes of governance (original)

The combination of these two dimensions produces a field in which the complete range of modes of governance can be charted. At the same time, the field carries a gradient towards both engagement and enrolment of the general public. This is a democratic enrichment, and one that offers more substantial specification than the naïve hopes debunked by Smismans (2006). As will become clear onwards, this classification explicitly engages with the agency of individual actors and how this is arranged, whereas existing approaches often see agency as a systemic feature (Lockwood et al. 2013).

However, in modern, technological life, choices between technological options can be very consequential and binding for the citizens living with them. Therefore, notions of governance should importantly include all those decisions that are consolidated into the techno-scientific infrastructures upon which we live our lives. This holds maybe even more strongly when it comes to energy security and transition towards a low-carbon society, processes that are very much influenced by variable linked to technology. In this light, it is worth to include in the classification more technology-based forms of governance, as the setting of standards, the implementation of infrastructures, the installation of research and development incentives, but also the mere development of new technologies and the abolition of obsolete ones. Thus, innovation and technological design are important forms of governance, even if they are not typically reckoned as such in governance studies.

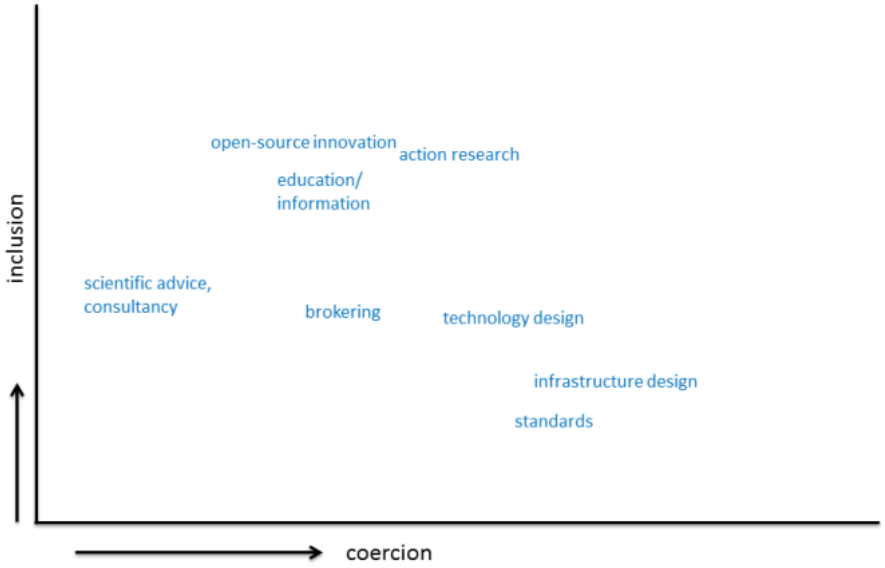

Figure 3: Techno-scientific modes of governance (original)

Principally, governance is about making decisions, the effects of which are imposed on society at large. This is not only done through formal, binding decisions, but also through breeding particular commitments and voluntary behaviour. This entails that the field of modes of governance harbours a general gradient towards the upper right corner. In the end, decisions should produce an impact on everyone (or at least on a high share of the chosen target), and decisiveness requires that the openness to negotiation is ultimately reduced.

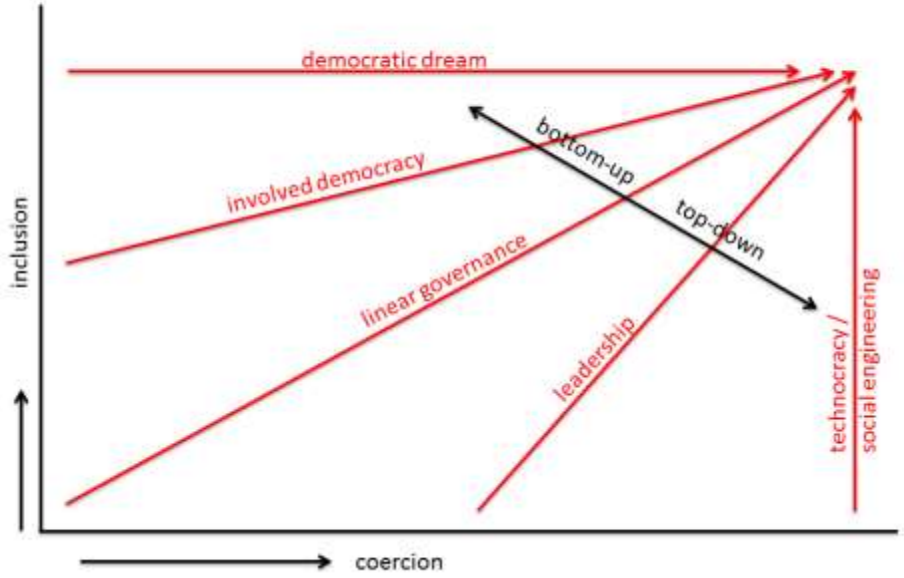

Figure 4: Regimes as gradients in the field of governance (original)

Given this gradient, different 'governance regimes' can be discerned,and represented as stylized trajectories through the field of modes of governance (figure 4).The three trajectories at the centre seem most legitimate and realistic. The most straightforward form of governance, termed 'linear governance' here, starts from a political situation, increasingly enrols and engages more parties so as to include more distributed forms of agency, and eventually ends up in a situation where a policy is well-developed, and generally accepted and applied. What we have termed 'leadership' and 'involved democracy' principally do the same, yet they importantly differ in their starting position. Leadership starts from a position that is stronger on authority while building participation from scratch, whereas involved democracy starts from a position that is stronger on involvement but has no a-priori authority. The extremes of 'democratic dream' and 'technocracy', while theoretically possible, are left out of the following analysis, because they are unrealistic or morally undesirable, respectively.

While the above subdivision of policy problems into the classes of political/moral issues, expertise questions, puzzles, and wicked or unstructured problems remained largely epistemic, the classification of modes and regimes of governance as exposed above adds to this the dimension of process: how issues are circulated, how actors show agency, how actors are positioned in power relations, and how outcomes are never merely determined by knowledge positions. Only through this expansion of the scope can it be possible for the human factor in energy transitions to be incorporated and mobilized. The trajectories towards the upper right corner of the inventory of modes of governance show exactly the enrolment of forces outside institutional politics, and moreover in a way that pays tribute to the fact that such processes are more than an epistemic affair. As a matter of fact, the presented trajectories, but also the many other trajectories that may be drawn in the diagram as linking various modes of governance towards the reach of a specific achievement, when carefully thought, may actually provide a preliminary representation of the involvementof more or less stable clusters of individual and collective actors, institutional or not, that jointly develop plans of action, activate social norms and standards and mobilize resources to encourage, manage, anticipate or direct the dynamics associated with energy transition.

At this point, the important question can be raised of why developments typically start somewhere in the lower left quadrant: with a small degree of participation and a small degree of enforcement. One simple answer is that sustainable transition is an imperative, and institutional politics is a good place to

start implementing such an imperative. A more complex answer is that even if considerable support of the programme exists outside institutional politics, and even if the actual initiative for sustainable transition is taken elsewhere than in parliaments, then still coordination of some sort is needed. For sustainable ideas to be implemented, it is necessary to pass them through political institutions to make sure they become authoritative. De facto, institutional politics will thus always be involved, and pivotal at that.

## 6 Governing energy transition

As empirical work in the MILESECURE2050 project shows (Caiati et al. 2014), the enrolment and engagement of citizens is most important throughout the whole trajectory of a transition. The empirical material consists of pilot-scale projects. While most of them show characteristics of radical innovation, they are too much limited in scale to count as systemic changes (even though at the level of local perception, they may appear so). Nevertheless, the material clearly shows the value of the gradient-field grouping of the modes of governance. First, it serves as a heuristic to increase our understanding of energy transition and how their governance unfolds. Second, it provides advice on how such governance could be arranged, provided that indeed the gradient as explicated is appreciated.

First, using the framework as a heuristic, the following becomes clear. On the one hand, the empirical material seems to suggest that transition succeeds best if social dimensions are mobilized first, then to be followed by technical and economic arrangements. However, such a conclusion would suggest that the whole transition starts somewhere in the upper half of the field. This is unlikely from the perspective of the field itself, and indeed it should be expected that transitions in reality do not start from scratch. They are typically prepared 'backstage' in policy rooms, political forums, or even spontaneously in public debate. The gradient field suggests that some more centralized form of governance is required upstream, so as to provide some stability and legitimacy to the very direction of the transition. While the gradient field is merely speculative (i.e. based on conceptual ideas, not meant to constitute an empirical or ontological claim), it offers a perfect heuristic reason to look for such more centralized modes of governance. And indeed, at closer look, such modes of governance are actually found in the empirical material. For example (p. 99) [7], it is observed across a variety of case studies that think tanks often play a role in preparing the activation.

Second, the framework seems to make sense as a tentative guideline for selecting relevant modes of governance. For instance, it is observed in many pilots that acceptance of lifestyle changes (p. 46) strongly depends on cultural backgrounds, and how valuations of specific forms of behaviour are made. In many situations, owning a car has a value beyond the mere economic. Owning a car is also about status, comfort, and about a seemingly self-evident conception of 'normal'. Similarly, changing behaviour in heating, for example if an innovative system uses lower reference temperatures than conventional heating systems, is difficult if the whole perception of what a proper reference temperature is, and how this perception is to be changed, are not taken into account. The regimes that were identified in the gradient-field already show which modes of governance are likely to be mobilized if we want those social-cultural aspects to be changed. If an informed guess is made that trading the car for public transit is likely to meet resistance, then it might be naïve to hope for strong participative governance in the initial phase. Instead, the 'leadership' regime might be the trajectory of choice, building on modes such as infrastructure and technology design and the creation of markets. Conversely, if it is expected for any substantial reason that revision of heating behaviour will meet with great initial public support, the 'involved democracy' regime is likely to be successful. This means that scientific advice can easily be consulted, to be followed by public information campaigns and incentives – to mention of course only a few of the many available options.

## 7 Conclusions

[7] Page numbers in this section refer to the MILESECURE2050 deliverable by Caiati et al. (2014).

The gradient field of modes of governance helps operationalizing the idea that the solution of complex problems requires that multiple perspectives are brought to bear on the very problem. In particular, to existing approaches to complex problems, which engage with epistemic lacunae of normative and empirical nature, it adds sensitivity towards diverse ways of mobilizing and engaging citizens.

Through the three regimes of leadership, linear governance and involved democracy it offers three ways of giving a particular direction to transitions. Clearly, these three regimes are only stylized trajectories, and in practice there is no limitation on the combination of modes of governance. Yet they offer, as shown in the examples in the previous section, some guidance on which modes are likely to be effective. Regardless of the exact choice of modes, the trajectories also reflect that building legitimacy is at least as important as is building engagement. Such legitimacy is built in the left half of the field, and requires argumentation of why a particular transition is needed. This point is vital: as earlier critique has pointed out, many approaches to transition take too easily for granted that the direction of transitions will be a good or benevolent one (Shove and Walker 2007). The current approach highlights what it takes to add democratic legitimacy to such directions. That is why the lower left corner of the field plays an important role in any evolution of a transition.

It is to be hoped that this approach, of arranging modes of governance in the field spanned by the level of inclusion and the level of coercion, can be developed further. Given that the regimes move in the upper right direction, which is a direction of increasing legitimacy, one follow-up question would be how each mode of governance contributes to the further production of legitimacy. A second line of research would be a more substantive specification than could be given here of how modes of governance actively contribute to the engagement and enrolment of citizens. Currently, in fact only a match is made between such levels of engagement and the seemingly appropriate mode of governance, but this requires more specification.

Finally, this production of engagement and legitimacy must be connected more explicitly to the ideas of learning that are central to existing approaches to transition (see sections 2 and 3), which in turn are strongly connected to the notion that transitions, as are contemporary societies at large, are highly reflexive processes. Feedback loops render the prediction of future behaviour of systems (whether technical or social) unpredictable. The production of engagement and legitimacy are themselves interventions in the sociotechnical system, and reflexive at that. The current contribution helps mobilizing learning processes to deal with this reflexivity.

## Acknowledgements

The authors would like to express their gratitude to all the partners of the transnational consortium that is responsible for thedevelopment of the FP7 Project MILESECURE-2050. Moreover, additional gratitude goes to the colleagues of Maastricht University and Politecnico di Torino involved in the project, namely Wiebe Bijker, Tsjalling Swierstra, Patrizia Lombardi, Jacopo Toniolo and Federica Borio, for the continuous proactive collaboration during the research work.

# TRACK 10

# Planning in Weak Institutional Environment

## Track description

Co-chairs: **Jose-Miguel Fernandez Guell**, **Pantelis Skayanis**

Many countries and regions struggle with weak institutional environment. In some countries, institutional planning effectively controls only a fraction of development. In other countries, shrinking public budgets negatively affect the operation capacity of planning. Under those circumstances, questions arise about the opportunities and limitations for undertaking urban planning. Congress participants are encouraged to explore some of the following questions.

- What kind of contexts characterizes a weak institutional environment? Assess the importance of political system, legal framework, economic model or social capital among other contexts.
- Are there differentiated weak institutional environments so as to establish diverse typologies? If so, can we segment urban planning policies and methods according to those typologies?
- Is acceptance of informal planning processes a sound solution for those cases? Would a trend towards informal planning be another feature of governance? How would be the responsibility for planning and development distributed in these cases?
- What kind of governance model would be appropriate for countries with weak public institutions? Discuss the role of political leadership and technocracy, stakeholders' involvement, citizen participation, inter-governmental coordination, public-private partnership and Third Sector involvement.
- Are the responsibilities and commitments of actors in the weak institutional context different from a "standard" institutional environment?
- Can "smart technologies" reinforce weak institutions or build institutional capacity?

Phd candidate, Dept. of Planning, Design, Technology of Architecture
Facoltà di Architettura, Università "La Sapienza" Roma_Sapienza University Rome (Italy)

Keywords: Public Private Partnership, Urban Regeneration, Italy

*Since the 90's, urban projects based on partnerships between different kinds of stakeholders, both market or public-oriented, were spreading in the European Countries in order to face EU policies. In the current economic and financial context, these experiences are becoming more relevant than ever with their complexity, fuzziness and multiple-player nature. Therefore it seems now crucial to understand limits and possibilities of PPP's projects (notably about urban regeneration) and the issue of balancing contraction of public finances and private stakeholders' involvement.*
*In this framework, the paper presents investigations about the nature of each "P" involved in the process by the analysis of a case study in urban regeneration in Italy which has shown negatives features, especially considering the role played by the public administration. Particular attention has been paid to understand how the allocation of risks and responsibilities and the definition of the final purpose affected the final outputs and outcomes. The paper argues that PPPs need to be analysed beyond biased literature and useless generalization, setting up a sort of database of practical experiences, examined and classified also through the point of view of practitioners, in order to relate outcomes with institutional environment, typology of partnership, role of each stakeholder, relationship between public interest and private benefits.*

## 1.What can't be cured must be endured? Observations about Public Private Partnership

Summary of the section

The term Public Private Partnership refers to a general approach to urban transformation, involving several policies, tools and devices. In the current frame defined by social and economic crisis, PPP's gain a leas role both in governance mechanism review and in the production of new paradigms and operational tools in order to study, manage and intervene on urban transformations.

The urban transformations' background came under deep change, in the last decades, in Europe as in Italy, considering social, political and economics aspect.

It's possible to number among the expressions of change the spreading of policies and practices of urban regeneration based on a PPP's approach (Sagalyn, 2011, EC 2004). Nowadays more than ever is important to consider the occasion that drove, since the early 90's, the migration and diffusion of PPP's procedure, also linked to European policies aimed to reach stability of states through a limit in use of public assets.

The whole spectrum of PPP's practices is a new market up to, virtually; find a balance between the reduction of public finance, the need to renew collective services and of urban renewal and the incentives to private stakeholders. In a context of scarcity, both in public and private sector, PPP's could be read as a laboratory to investigate and change links and connections among different stakeholder with different interests and aims. In the meantime, there are several cases with negative outputs dued to the lack of dialogue between actors or to the unclear purposes. Therefore it's crucial to understand if and how they could be successful and beget urban transformation and regeneration, towards a just city.

PPPs stay as a problematic topic, often analyzed from biased points of view, mostly because economic and financial issue. Is PPP only a way to extract money from the community or is it a way of reallocating risks and responsibilities? (Hildyard, 2014) Discussion on this tools has to be observed by different perspectives: on the one side we have PPP's as symbol of neoliberal city (allocating resources to private actors, privatization, selling-off of public goods), in a sort of ideologization of critical analysis upon an approach strongly interconnected with debate on economic and social aspect of contemporary cities (Le Galès, 1995; Sagalyn, 2011, Swingedow Moulaert Rodriguez, 2002, Miraftab2004). On the other side there are also several studies and handbooks describing PPP's as a

miracle cure for infrastructures, services and urban transformations urbane (Hodge, Greve & Boardman 2010.)
PPP can be the place for dialogue as it can be the place of conflict; that's why; biased approach is confusing in the reading of such practices and, thereby, frustrates the improving of best practices in Public Private Partnership.

**2. Research questions**
Summary of the section
The first question of this research is about who takes the risks and for whose benefit, beyond the ideological position, in order to read the relationship between public and private interest without the lens of a supposed necessary dualism (Alexander 2001).
In a wider point of view, the interaction between public and private actors in urban transformation starts a lively and open debate, since it involve different discipline. The research of a new paradigm in the definition of PPP tools has to be supported by the research on the evolution of economic and politic paradigm, nowadays in the spotlight.
The power of each actor and stakeholder involved in Public Private Partnership is a crucial guideline to investigate how the process develops in planning and design phases in order to build different kinds of approach and definitions of public interest (which is supposed to be, anyway, the final aim of PPP's introduction)
In the current times, PPP tools, mainly in Italy, are in crisis, both considering the number and the value, because of the credit crunch after 2008 crisis, bad communication with local communities, and fuzzy definition of the final aims.
This work is part of a bigger research aimed to understand whether PPP could be a real opportunity for cooperation to create a synergy and more inclusive processes for urban regeneration, to be an exchange between different stakeholder, or, on the other side, if it's only a financial device to sell commons and public goods to private developers and investors.

**3.European institutional environment and PPP regulations**
Summary of the section:
Before taking into consideration concrete experiences that can put in evidence possible virtuous uses of the PPP, it is essential to consider either the directives and the community recommendation that favored the diffusion of the collaboration between public and private subjects from countries where that approach was already strengthened (such as United Kingdom and France) towards the other countries of EU.
In the past 25 years we observe a trend of reorganization of the public sector in various parts of the world. This phenomenon affects particularly the european countries, where, starting from Maastricht, the use of private and financial resources to optimize the realization or the management of infrastructure and supply of services have been made necessary.
Since the green book of PPP until the newer European directives, the European Union, supported the diffusion of subsidiarity in urban transformation. But at the same time, the isn't an unique definition and procedure for the Public Private Partnership in all the European countries; the role of the public stakeholder and the kind of private stakeholders differs from a country to another. So it's important to describe the institutional environment in which the investigated PPP take place.
Description of laws and procedure of PPP in Italy and comparison with other countries' laws and institutions which regulate and improve partnership between different actors

**4.Urban transformation in Naples, an attempt of urban renaissance**
Summary of the section
Short description of urban policies, urban marketing and urban transformation of Naples, related to the change in institutional framing (new role of the major and of local administration in Italy in the early 90's). Good and bad experiences
Large urban regeneration, new public transport and the network of intervention in the east of the city (Naplest).

**5.The case of the "Centro direzionale" completion**

Summary of the section.
Centro Direzionale is a district in Naples mainly devoted to business and services, planned at first in 1964 and designed by the Japanese architect Kenzo Tange in the early 80'. The construction of the huge district, with some of the tallest building in the south of Italy, was interrupted half way. While a part of the project is completed and working, there is an empty or under-used area at the east, in a marginal and peripheric area of the urban conglomeration.
Description of the Project Financing proposed to fill the empty area, with a new project and new function (streets, park, schools, social and private housing, leisure and tourism infrastructures).
History of the project, since the early public proposals in 1999 until the starting of Project Finance initiative in 2004, which lasted until the final approval of project in 2011. At the end of this process, also dued to long and difficult procedures (not fully regulated by the Italian Law at the time) and to critical partnership between public and private stakeholder, the construction of the new urban development haven't yet started, even if it's not officially abandoned.
In this part, the evolution of the agreements between public and private promoter of the whole operation is descripted also following the evolution of the urban design and of the actual project.

**6.From synergy to compromise**
Summary of the section
The development of the project financing, which was carried out during more than a decade, perverted and twisted the procedure of the public private partnerships. The core of the proposal had some point of interests : the private developer wanted to build private residential building to payback the costs of public works in the same area, so there was a gain in both part from the achievement of public interests (even for the economic purposes of the private stakeholder)
In this section we describe the causes of the deep changes in the project, connected to the weak leading role of the public administration (which changed during the year) and the role of the private stakeholder who was no more interested in creating a real reallocation of responsibilities and risk, but looked for the most convenient way to finalize the works.

**7.Consideration about the role of public administration in PPP**
Summary of the section
The output and outcomes of PPP operations, mainly in the urban regeneration program such as the one we are talking about, depend on the cooperation and togetherness of all the actors involved. While the role played by the private developer is to pursue its own interests (except for the third sector actor, whose role in PPP will be briefly investigated), it's up to the public administration and to the institutional stakeholder to coordinate the sum of the private interests and drive them through urban transformation. It's up to the public actors to go beyond the dichotomy between public and private. That's why it's important to investigate the role of public entities in the building of PPP in different countries, and short comparison between other experience of PPP in Italy (Civic Center of Scandicci, Florence, designed by Sir Richard Rogers) in France (Caserne de Bonne, Grenoble) and in Spain (Renewal project Ciutat Vella district), with a special focus on the role of public actors in the good quality of the physical outcome.

**8.Conclusions**
Summary of the section
The accountability and the strength of public administration is the key to read the urban transformation through Public Private Partnership. This section is going to explain how a weak institutional environment, also on the side of the law and of regulation, affect the output (or the lack of implementation) of PPP project. The lack of vision and of legal device to coordinate complex programs between the main reason why the public stakeholders lose the opportunity to create an innovative urban transformation.

# STRATEGIC LEADERSHIP AND PLANNING IN A LOCALIST AGENDA: LESSONS FROM THE NORTH WEST OF ENGLAND

**Mark Baker,** Centre for Urban Policy Studies (CUPS), School of Environment, Education and Development, University of Manchester, UK, mark.baker@manchester.ac.uk
**Abbas Ziafati Bafarasat,** CUPS, School of Environment, Education and Development, University of Manchester, UK abbas.ziafatibafarasat@postgrad.manchester.ac.uk

## Abstract

Following the 2010 election, the new Coalition government in the UK abolished the English regional (planning and development) institutions and their strategies, establishing business-led bodies of Local Enterprise Partnerships (LEPs) at the city regional scale, and a cross-local authority 'Duty-to-Cooperate' to feed in informal strategies and deliver projects around cross-boundary issues such as housing, transport, the environment, and strategic sites. Given the non-statutory status of the LEPs and the loose framework for the Duty to Cooperate, this paper draws on empirical case study research undertaken by the authors in three city-regions of North West England to investigate whether strategic spatial priorities can be effectively planned and delivered under this highly neo-liberalised and localised system. In other words, it asks whether strategic thinking can still take place in a weak strategic / sub-regional environment. In examining the inclination and ability of LEPs for spatial governance, we identified three typologies of their roles in the city-regions studied: *'expedient leader'*, *'ambitious mediator'*, and '*political and functional rival'*. These findings, along with those of the Duty-to-Cooperate in cross-local consensus building and delivery, result in lessons about building corporatist institutions of strategic governance as well as the institutional and legislative contexts of 'bottom-up' strategic planning.

**keywords**: Localism; City-Regional Leadership; Strategic Planning; LEPs, Duty-to-Cooperate

## Introduction

Given the traditional lack of a directly electoral tier, the story of English regionalism is a recurring roll-in and roll-out of state apparatus (Roberts and Baker, 2002). The most recent wave of regional planning and institution-building was arguably the strongest and lasted for two decades from 1990 (Pearce and Ayres, 2006; Swain, et al., 2013). The peak of this wave involved the creation of a formal regional planning body, called the Regional Assembly (RA), which comprised 70% local authority members and 30% regional representatives of the voluntary and business sectors (Cullingworth and Nadin, 2006). They were subsequently put in charge of preparing statutory Regional Spatial Strategies (RSS) involving a cross-cutting and inclusive agenda (Riddell, 2013). The Government's National Planning Policy Statement (PPS) 11: RSS (ODOM, 2004) required local authorities' Development Plan Documents (DPDs), including Core Strategies, to be in conformity with RSS, thus establishing a cascading hierarchy of spatial planning policy from the centre to the locality.

Although generally known as regional planning bodies, Regional Assemblies were not the only organisations preparing regional plans. Regional Development Agencies (RDAs) were another institutional innovation whose business led and centrally appointed Boards were tasked with producing Regional Economic Strategies (RESs) (Shaw and Lloyd, 2000). In addition, the Government Offices for the Regions (GOs), which had been created in 1994 to act as integrated branches of central government (Pearce, et al., 2008; Sandford, 2013), played coordinative and mediation roles between RAs, RDAs, local authorities and other stakeholders whilst trying to empower the grassroots in regional decision makings (Baker, 2002; Pearce, et al, 2008). However, there were still issues around power relations, authentic consensus building and involvement of weaker parties in regional planning which surfaced in some regions such as the more prosperous South East and East of England (Hager, 2012; Allmendinger and Haughton, 2012).

Helped by the dissatisfaction of some local authorities with the so-called 'democratic deficit' of the top-down apparatus and the associated regional imposition of housing numbers, the 2010-elected Conservative / Liberal Democrat Coalition government embarked on the abolition of regional plans and institutions in England (House of Commons, 2011, Haughton and Hincks, 2013). The new government's institutional alternative was city-regional and informal; the *Local Growth* White Paper (2010) introduced Local Enterprise Partnerships (LEPs) of business and civic leaders to undertake the strategic steering of transport, housing and planning (HM Government, 2010). It was announced in the White Paper that these LEPs would be expected to fund their own day-to-day running costs, but they now receive core funding from the government (HM Government, 2010; DBIS, 2012).

While the abolition of the regional planning apparatus was not surprising, the Coalition government also abolished the GOs and all this created another strategic vacuum to be filled by central and local governments. In 2012, the Coalition's *National Planning Policy Framework* (NPPF) was published, replacing the former series of detailed PPSs with just one document. The NPPF requires local authorities to work collaboratively, especially with their neighbours, on strategic planning priorities such as housing, infrastructure and the environment. Local authorities are expected to demonstrate they have fulfilled this *'Duty to Cooperate'* when their Local Plans are submitted to the government's executive agency, the Planning Inspectorate, for public examination. This could, for example, be via a joint policy making / planning committee, a memorandum of understanding, or a joint strategy (DCLG, 2012). In contrast to New Labour's enthusiasm for spatial strategies as visionary, broad-ranging and integrative frameworks (Nadin, 2006; Haughton, et al., 2010), the NPPF uses the term '*spatial*' only once in connection with Local Plans and this comes with an emphatic '*realistic*' (DCLG, 2012: 37). So the basic form, and probably the most practical expression, of a joint strategy, as envisaged by the new Coalition government, would be some kind of supra-local land-use plan involving neighbouring authorities working together. Under these reforms, the Local Plan is thus expected to engage in a range of contentious decisions which used to be made at the regional level through RSS procedures. These include, for example, the scale and distribution of new housing, strategic transport and provision for gypsies and travellers (ODPM, 2004; DCLG, 2012).

A raft of experiments has subsequently unfolded in the context of the Government's quick establishment of the localism project, particularly in the two core areas of city-regional leadership and 'bottom up' strategic planning. These initiatives have received mixed but mainly negative scores in subsequent evaluation studies. For example, Lowndes and Pratchett (2012) argue that the Coalition's reforms show traces of an ideological commitment to localism which has the potential to deliver a radically different form of local governance. Putting forward a socially and geographically expansive alternative called 'progressive localism'. However, Featherstone et al. (2012) are less optimistic and suggest the current austerity localism can have pernicious consequences. Lowndes and Pratchett (2012) see austerity as a political expediency of Government, while Haughton and Hincks (2013) talk about austerity politics. Nonetheless, these studies are unanimous about the potentially detrimental impacts of austerity on territorial management at the local and supra-local scales, especially for less affluent areas. Similarly to Gallent et al. (2013), Boddy and Hickman (2013) raise concerns about the loss of strategic planning objectives, for example in housing policy and delivery, under the new localist arrangements. The former authors (Gallent et al, 2013) observe a need to embed localist arrangements into a more vibrant local democracy to counter the loss of the 'stick' of regional planning by reshaping the relationship between communities and development. Meanwhile, Boddy and Hickman (2013) argue the Duty to Cooperate represents a problematic and reductionist view to the functions of the abolished regional strategies. Some shortcomings, they suggest, include: the need for a phenomenal political leadership to reproduce the inter-local housing exchanges of RSS; a lack of meaningful collaboration at the city-regional level despite the existence of LEPs and a range of other voluntary partnerships amongst localities; limited scrutiny of the Duty to Cooperate; and its inadequacy when there is no appetite for collaboration.

This paper therefore aims to contribute to this emerging literature by presenting empirically-based insights from one of the biggest regions in England (the North West) in which regionalist

arrangements have been replaced with localist alternatives. It is intended to examine (a) the extent to which the new architecture of city-regional governance, primarily based around the newly created LEPS, appears capable of exerting proactive territorial leadership at the sub-regional scale and (b) in terms of cross-authority cooperation and collaboration, whether the statutory 'Duty to Cooperate' is helping to reconcile the '*strategic*' with the '*grass-roots*'. In terms of case study selection, it was recognized that the chosen region and the local case examples needed ideally to exhibit a degree diversity in their socio-economic, institutional and political circumstances to increase the validity of the findings whilst, on the other hand, the chosen localities should be reflect similar governance arrangements to those in place in other English regions to provide transferrable lessons from the empirical findings.

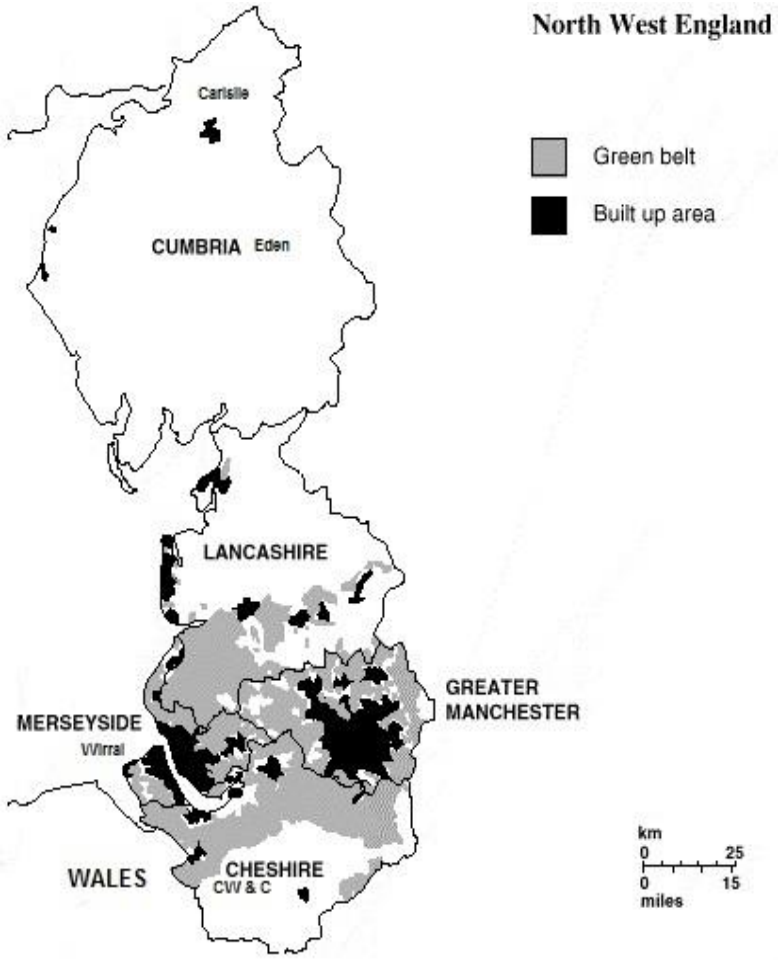

Figure 1: The North West Region (Source: House of Commons, 1998)

The North West region of England has a population of 6.9 million - the highest after London and the South East - of which around three-fifths live in the major conurbations of Greater Manchester and Merseyside or Liverpool City Region (see Figure 1) (Wilson and Baker, 2006;Young and Sly, 2011). Three of the five sub-regions of the North West are located on the national borders: Cumbria, which is largely rural with sluggish growth, borders Scotland to the north; Cheshire, which accommodates some of the region's wealthiest wards, neighbours Wales to the west; and the Liverpool City Region borders Wales by water to the south. Administratively, the region comprises two counties (Cumbria and Lancashire), six unitary authorities, and 15 metropolitan districts within Greater Manchester and Merseyside (Young and Sly, 2011). In order to examine strategic leadership within the sub-regional geography of Cumbria, and to gain a bigger-than-sub-regional insight, Cheshire and Merseyside were chosen for more in-depth study. Cumbria has a two tier local authority system (county council and

district councils) and is located in the more isolated and self-contained northern parts of the region whilst Cheshire and Merseyside are made of one tier authorities and form two of the region's political and economic heartlands in proximity. These areas represent two extremes of political attitudes towards regionalism and localism. While in the regional planning process '*Cumbria in particular felt excluded and were "seeking equal status".'* (EiP Panel, 2007: 40), Merseyside was steering the decision making process and Cheshire were at the centre of the previous regionalism era's cross-border experimentations under which it signed up to a deal with North East Wales (see Cheshire County Council, 2006). However, these areas represent similar governance arrangements to many other English city-regions. Unlike Greater Manchester, which since 1986 and the abolition of metropolitan county councils has been partly governed by a powerful voluntary body called the Association of Greater Manchester Authorities (AGMA) (Leach and Game, 1991), the selected city regions have had less of a tradition of collaborative governance and it was felt could thus reveal more traceable impacts of post-Coalition central institutional innovation.

Based on 28 in-depth interviews with a wide range of policy actors, complemented by textual analysis of key policy documents, the next sections of this paper discuss developments in sub-regional governance and the role of the new Duty to Cooperate in two chosen case study areas: firstly, Cheshire and Merseyside and, secondly, Cumbria. At the more local scale, four neighbouring local authorities were selected in order to examine the effectiveness of the 'Duty to Cooperate' in more detail; one was in Cheshire (Cheshire West and Chester), one in Merseyside (Wirral), and two were in Cumbria (Carlisle and Eden).

## Case Study Area One: Cheshire and Merseyside

Cheshire West and Chester is a unitary authority area that was established in 2009 from the amalgamation of some of the districts of the former county of Cheshire (Young and Sly, 2010). Bordering the Welsh local authorities of Wrexham and Flintshire to the west, Cheshire West and Chester constitutes the main English part of the West Cheshire / North East Wales sub-regional geography of housing and employment (see Figure 2). In order to address the policy-making and governance implications of this functional area, a non-statutory spatial strategy was published in 2006 as a result of cooperation between both Welsh and English local authorities, sponsored by the North West Regional Assembly and Welsh Development Agency / Welsh Assembly Government (Cheshire County Council, 2006; Wrexham Council, 2009). Among the wider referenced areas of this strategy in England is the metropolitan district of Wirral which is part of the Liverpool City Region. Wirral is a peninsula bordering Cheshire West and Chester by land, and other local authorities of the Liverpool City Region, as well as parts of north east Wales, by water.

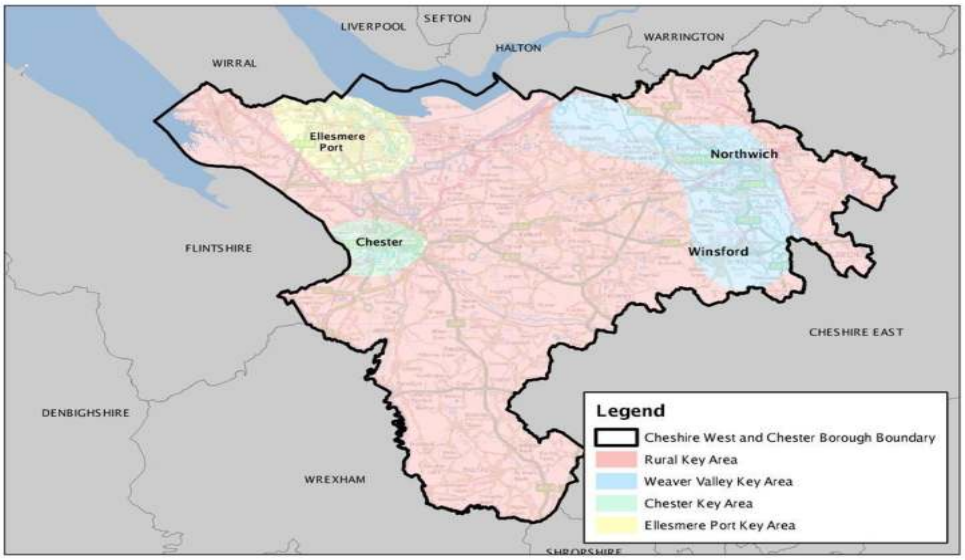

Figure 2: Cheshire West and Chester

***Sub-Regional Governance***

The process of preparing the West Cheshire / North East Wales Sub Regional Spatial Strategy is arguably at least as important as the final document itself, since it involved innovative consensus building that, for example, required Welsh authorities to provide for some of the housing demands of the English side. Indeed, despite initial tensions, it was the significant 'relation-brokering' aspect of the process that turned the initial cross-national study into an emerging spatial plan. As one interviewee commented:

> *"At the start of the process … it was that fractious the relationships, and that was between Welsh authorities, between English and Welsh authorities, and between English authorities … At the end of the process we got a lot of agreement on the high level principles, the way forward, and they were enabled to embed that into local development plans, LDFs and so on. I think that was a success and the fact that a piece of … research evidence-gathering project turned into a strategy-making project probably shows the progress that was made there in those relationships."* (Interview R8, regional body, 2012).

Although the scrapping of the West Cheshire / North East Wales Sub Regional Spatial Strategy in 2011 (Bangall, 2011) meant the end of its lifespan as a decision framework, its institutional legacy, namely the Mersey Dee Alliance (MDA), is still active. The original MDA was a cross-local authority organisation covering parts of Cheshire and Merseyside (Wrexham Council, 2009). The cross-national *'4 Counties Partnership'* (the core local authority alliance engaged in the strategy making process) merged with the original MDA in 2007 to create a more powerful organisation to deliver the published strategy and act as an influential lobby at the regional and national levels (Wrexham Council, 2009; Celtic League, 2011). The recent tough political and financial circumstances have hindered the MDA's visionary territorial leadership but it has nevertheless continued to act as a cross-national facilitator for officer-level meetings, as observed by a planning officer from Wirral: *" that is one of our main means of engaging with Wales … it probably struggles from the lack of resources in terms of being able to do much, other than have meetings."* (Interview L12, 2012).

Since the LEP and the Duty to Cooperate do not include Welsh territories, the MDA is the only governance arrangement covering the whole area, but it currently has a more sectoral focus and is not dealing with unresolved issues around the imbalanced distribution of development costs and benefits between the Welsh and English neighbouring authorities (see MDA, 2012a: 4): *"it is increasingly important to focus available resources (people and money) in support of a limited number of deliverable projects"*. However, this is not the only barrier to adopting a more proactive leadership approach to this dynamic area as the political mood in Wales has become even less favourable. The West Cheshire / North East Wales Sub Regional Spatial Strategy has thus been seen by some Welsh community organizations and politicians as a means of making parts of North East Wales a suburb of Cheshire and Merseyside (see Celtic League, 2011; Deffro'r Ddraig, 2012).The Deffro'r Ddraig campaign, run by the People's Council for North Wales - which ultimately managed to get the strategy scrapped (Bangall, 2011) - is now becoming even more assertive. The second phase of the campaign wants to eradicate the housing policy legacy of the strategy from existing Welsh local plans. Indeed, their aim is to recall all Local Development Plans across Wales and to scrap the use of the housing formula applied by the Welsh government which would supply for more than local needs (Deffro'r Ddraig, 2012).

The MDA is now a locally funded, cross-national, partnership whose political and financial fortunes has been decided by the same reforms that established LEPs and put them under the policy direction of the state. Considering the structural role of government in creating sub-regional divisions through its funding and political apparatus, it is tricky for the MDA and the two LEPs operating in parts of the same geographical area, to build any joint partnership. The Cheshire and Warrington LEP, which has been established in a relatively more open institutional culture than has been the case with other LEPs,

has managed to take a step beyond its initial institutional engineering by giving a board seat to a social partner. The aim is to: *"Develop an strategic alliance with other LEPs and North Wales via Mersey Dee Alliance."* (Cheshire and Warrington LEP, 2012: 8). But there are few signs of a welcoming reaction by the MDA. Despite the new emphasis on acting as a network for business, employment and skill actors, the MDA's Business Plan 2012- 2015 (MDA, 2012a) is silent as to how common concerns can feed into partnerships with the LEP.

Subsequently, in this highly connected functional area, the Cheshire and Warrington LEP has not developed ties with its counterpart in the Liverpool City Region or with neighbouring Welsh authorities. This inter-LEP governance failure is also related to their economic-output design; indeed, the LEP's non-statutory status and central expectations (see HM Government, 2010) seem to have contributed to the effects of their core business membership so that: *"What they have promoted is greater competition between local authority areas and between Local Enterprise Partnerships,[but] far less incentive to cooperate"* (Interview E6, environmental leader, 2012). The Cheshire and Warrington LEP has so far failed to use the potential of the MDA to resolve its frictions with local authorities. For example, a partnership between the Cheshire and Warrington Enterprise Commission and the three local authorities of Cheshire West and Chester, Warrington and Cheshire East published a sub regional strategy in 2010: *'Unleashing the Potential of Cheshire and Warrington'* (Cheshire East Council, et al., 2010). This growth strategy is now the key reference point for the LEP in their housing and employment policies (Cheshire West and Chester Council, 2011) and the strategy has acted as a point of difference between the LEP and the accountable body for the MDA, namely Cheshire West and Chester Council (MDA, 2012b).

The LEP would like Cheshire West and Chester to be more ambitious in its housing targets but the council is looking at 1050 dwellings per annum in its emerging Local Plan (Cheshire West and Chester Council, 2012a), which is nearly a third lower than the target of the sub regional strategy (Cheshire East Council, et al., 2010):

> *"One of the challenges we've got is that … organisations like the Local Enterprise Partnership… private sector interests like Peel Holdings who obviously have quite a key interest around this part of the world, there are sort of competing strategies… 'Unleashing The Potential' was very much the sort of economic strategy and it's still being used as a sort of driver to say 'well, this should be our ambition for housing, this should be our ambition for economic development', which currently, in terms of what we consulted upon with regards to local plan policy in Cheshire West, they don't match… There might be aspiration for higher numbers but the delivery is going to be tricky."* (Interview R11, local government, 2012).

The situation in the neighbouring Liverpool City Region is complicated; the only significant sub regional body when the LEP was being introduced was The Mersey Partnership, a business network which subsequently merged with the LEP (Bartlett, 2012). This void was less tangible than in the previous era as the Liverpool City Region, along with Greater Manchester, were the main actors in the regional planning body which also had an explicit sub-regional mandate (see ODOM, 2004):

> *"I think what we have really seen is a Balkanization of local government and strategic government from which a strong sense of direction is yet to emerge… the institutions we have … are quite incapable of giving the integration and strategic leadership which is needed especially as the regional tier has been abolished."* (Interview R7, regional body, 2012).

Some stakeholders we interviewed were excited about the LEP and believed it would provide the answer to the affliction of strategic leadership: *"there's a real prospect of let's say in three, four, five years time people saying 'well the Local Enterprise Partnership made all the difference to the Liverpool City Region'."* (Interview B2, business stakeholder, 2012). Others, however, suggested LEPs do not have the powers and resources to function in this way. On the other hand, any increase in

the LEP's strength could fuel further divisions and objection as some argue that: *"in the main, they consist of ad hoc groupings of business people who happened to be around in the right place at the right time."* (Interview V2, voluntary sector, 2012). There is also the question of whether the governance vacuum in which the Liverpool City Region LEP was created could gradually lead it to gain a territorially assertive position; amongst the challenges are that such position would require the LEP to open its Board composition to socio-environmental partners and to adopt a broad-ranging framework to guide partners' activities. However, these are clearly in conflict with the government's intention in putting forward, and funding, LEPs as primarily growth promotion partnerships (see HM Government, 2010).

The second challenge to an assertive leadership by the Liverpool City Region LEP comes from within its own Board. On 7 February 2012, it was confirmed that Liverpool City would receive new money and powers following its *City Deal* with Government. On the same day, the city council voted to have an elected mayor to lead the changes. Amongst the incentives is an Enterprise Zone for North Liverpool and the Central Business District (Liverpool City Council, 2012). However, the Enterprise Zone's prospectus (DCLG, 2011) says Enterprise Zones will be geographically defined areas, agreed between the "Local Enterprise Partnership" and government. This example of bypassing of the LEP, along with the city's distinctive growth arrangements such as Liverpool Vision, alarmed other localities and even the business actors of the LEP for a stronger governance arrangement.

Reporting on an independent study to address similar issues, Lord Heseltine and Sir Terry Leahy (2011: 13) argued: *"A metro Mayor is the best single solution to the leadership gap that currently afflicts the city region and constrains its growth."* But a Liverpool Mayor leading the entire metropolitan area was not the type of strategic compromise to which other localities were prepared to sign up and this recommendation was therefore shelved (Liverpool City Council, 2012). However, the idea of a combined authority, the Government's second favourite alternative (see HM Government, 2012), gained the support of some local authorities and major business stakeholders of the LEP, leading to the submission of a recent proposal to Government for the establishment of a combined authority responsible for transport, regeneration and economic development (see DCLG, 2013b) . The director of the Mersey Gateway project, which is the largest private-led development in North England, for example, suggested: *"A combined authority could attract that investment more so than an individual local authority."* (InvestSefton, 2013). Liverpool City, which has lost the opportunity to represent the whole metropolitan area, seems to have been on the compromising side of this deal which is supported by the government and business partners. The initiative would harness the city's economic and political maneuvering space since a combined authority means any decisions would have to be approved by a simple majority of the members (Wiggins, 2013). This could be well understood by the following statements of the Liverpool City Mayor:

> *"The government are clear that this is a model of governance that will put regions ahead of the game in the race for funding. For me it is an absolute no-brainer and merely lays down the existing positive, informal, arrangements that already exist."* (BBC, 2013).

Given the core interests of the Liverpool City Region LEP and the proposed combined authority are similar, especially in regeneration and economic development (see Liverpool City Region LEP, 2012; DCLG, 2013b) and because the businesses and central forces have been crucial in overcoming local political differences, it appears the LEP will exert significant influence over its indirect institutional product, namely the combined authority. A combined authority could adopt stronger positions, on behalf of its peer LEP, without facing the opposition of socio-environmental partners, especially as the Greater Manchester Combined Authority has provided an economic success story in which issues around governance representation have been overshadowed.

***The Duty to Cooperate***

The preparation of a *Core Strategy* for the Wirral started in 2005 in response to the then PPS documents and the RSS. Nine years on, the final draft was expected to be published for public comment in early 2014 before being submitted to the Secretary of State for public examination (Wirral Council, 2013). Despite starting later than Wirral in 2009, Cheshire West and Chester has now finished consultation on its final draft and was anticipating the examination stage in mid-2014 (Cheshire West and Chester Council, 2013). In the interviews held in Wirral, local planning officers believed that the emphasis of the Inspector would be on the outcomes of the increased frequency of meetings following the introduction of the Duty to Cooperate. Such an expectation could not be fulfilled in the political geography of Liverpool City Region by the introduction of general memorandums of co-operation as these would be regarded as a step back from what has already been achieved:

> *"we have a sort of structure of meetings set up as what's called the District Planning Officers Group, which is all the local authorities of Liverpool City Region…our main political links are really with the Liverpool City Region but, because of where we sit, we do have links with Cheshire West and Chester, and we share a border with Wales so we have to be aware of what's going on there as well."* (Interview L12, local government, 2012).

However, all the partnerships and planning initiatives that the Wirral officers mentioned as evidence of their fulfillment of the Duty to Cooperate with the rest of the metropolitan area were established under the previous era of government and were usually initially sponsored by the former regional institutions. One example which indicates how a third party influence provided a context to extend networks beyond traditional political partners was a 'needs-and-supply' study of housing and employment land. The study was based on an innovative partnership between the districts of Liverpool City Region, Cheshire West and Chester, and West Lancashire, called *'Liverpool City Region Partners'* (GVA, 2010; Liverpool City Region Partners, 2011). Similar to the West Cheshire / North East Wales initiative, the support of regional institutions was pivotal; the regional Leaders Board for the North West (4NW) and the GO supported the partners to commission the consulting company in 2010 (GVA, 2010). The *Liverpool City Region Overview Study*, which was published in 2011, forms part of the evidence base for subsequent local development plans (Liverpool City Region Partners, 2011; Sefton Council, 2012). Planning officers at Wirral Council considered the study as a demonstration of cross-boundary cooperation. However, the NPPF does not mention either study networks or a jointly prepared evidence base as fulfilment of the Duty to Cooperate. This opens a wide gap for discretion and might distract local planning authorities from more fundamental cross-border studies which could have lasting political, institutional and planning yields similar to that of the West Cheshire / North East Wales study which turned into a strategy with lasting governance impacts: *"we are now looking over our shoulders and saying what we need to do [is] to avoid being challenged, rather than [saying] what we need to do[is] to work together effectively."*(Interview R9, local government, 2012). Wirral MBC has some other joint initiatives with its political and economic partners in the Liverpool City Region which again started before the Duty to Cooperate was introduced. In this context, a big ticket item for its *Core Strategy* examination will be the *Joint Merseyside and Halton Waste Local Plan* which began much earlier in 2006 (Halton Borough Council, et al., 2013).

Beyond the Liverpool City Region, Wirral will probably find it more difficult to demonstrate two of the three NPPF-envisaged outcomes of the Duty to Cooperate: namely, a joint planning committee and a joint strategy (see DCLG, 2012). Wirral planners have struggled to produce noticeable outcomes from their more frequent meetings, but when it comes to links with Cheshire West and Chester, "*there is more liaison than joint working*" (Interview L13, local government, 2013). Facilitated by good officer-level relationships, the two planning departments engage in regular communications regarding the evidence base and policies with cross border impacts, particularly on

housing, transport and out-of-centre retail. Nevertheless, as the following examples suggest, it has proved difficult to take these discussions to the level of strategic cooperation. Local authorities are not directly responsible for some of the strategic issues they commonly grapple with and therefore need to act in a lobbying capacity, for instance, concerning the future capacity of the M53 motorway and improvements to the rail lines from North Wales, through the north of Cheshire West, into the Wirral and to Liverpool. This needs close cooperation at the political (Councillors) level as planning officers do not have the means to lobby the Department for Transport. Since even such non- controversial alliances have not formed outside the MDA arrangements, it was not surprising to hear from a Wirral planning officer about their refusal to take up the housing burden of their neighbour: *"We have also formally responded to a request to make up a short term shortfall in housing land supply in Cheshire West and Chester to say that we could not help."* (Interview L13, 2012).

The Duty to Cooperate-induced consultations of Cheshire West and Chester are, however, not likely to progress to more serious stages as, in any case, the Welsh side is not covered by the Duty. The Welsh local councils have no reason to move against the core values of nationalist parties that are getting more vocal in the Welsh Assembly (see National Assembly for Wales, 2011). Since transport policies which can encourage population movements into Wales have been shelved, it is hard to imagine discussions of planned settlements:

> "*They see themselves very much part of the Welsh scene and want to work with their Welsh counterparts but not necessarily their English counterparts, particularly on transportation. One of the focuses that the Welsh authorities and the Welsh members have is north-south links within Wales itself rather than east-west links into England."* (Interview L7, local government, 2012).

So Cheshire West and Chester is proposing to release land for up to 2000 new homes from the green belt around Chester in its emerging Local Plan (Cheshire West and Chester Council, 2012b) - a decision in which the NPPF pressure to identify sites for five years' housing supply (see DCLG, 2012) was critical. The halting of cross-national governance and the pro-development national planning policy therefore seem to have displaced conflicts to the English side where there is no longer the necessary funding and institutional arrangements to help with conflict resolution:

> *"they [Welsh opponents] were kind of trying to force Chester down the green belt release route but obviously that is a very contentious route and is being very heavily challenged at the moment from groups like CPRE."* (Interview L7, local government, 2012).

The strong language used by many commentators against green belt revisions around Chester (see, for example, the consultation document: *Green Belt Background Paper* by Cheshire West and Chester Council, 2012c) as well as campaigns by some residents, voluntary groups and politicians such as the Member of Parliament for Chester suggest the plan and politics behind it might be challenged through non-planning routes after the green belt release appears in the adopted plan.

Similarly to Wirral, planning officers in Cheshire West and Chester believed the Inspector would look at things beyond just officer meetings. However, the latter had a more vivid and ambitious vision of central expectations, helped by a meeting they had with the Planning Inspectorate and Planning Advisory Service:

> *"there was a lot of emphasis there on it's not just about having a few face-to-face officer meetings, it's if there are particular issues that need dealing with, you have got to demonstrate if there are political decisions to be made, that you've got your various politicians together, so in other words, our senior politicians to meet senior politicians in the Welsh authorities and, if needs be, to thrash out agreements about 'well, this is what we're doing, you're happy with it and vice versa'. Or if there are actual joint initiatives, that those are set down in proper terms"* (Interview R11, local government, 2012).

Whilst the Government is alert to the need for engaging local politicians if genuine and practical consensus building is to come out of the Duty to Cooperate, it appears less realistic to expect planning officers to convince politicians to talk, let alone sign off agreements on highly contentious issues, especially when officers have a more pragmatic interpretation of their role under the '*localist*' arrangements: *"so yes, you've got to keep your head down and get that plan produced."* (Interview L10, local government, 2012). Besides, not even a single department at, or between, the local councils studied has been established to embed the Duty to Cooperate; neither has an officer been designated to broker relations, especially at the political level: *"There's not a specific officer who's being given responsibility for undertaking this cooperation work and there's no new institutions being created."* (Interview L12, local government, 2012).

## Case Study Area Two: Cumbria

Cumbria is a non-metropolitan county comprising six districts. The District of Carlisle incorporates the largest settlement in the county - the City of Carlisle - with its wider urban and rural areas. The District borders Scotland to the north via two unitary council areas: Dumfries and Galloway, and the Scottish Borders. Carlisle's Cumbrian neighbour to the south, Eden, is the district in which the first Neighbourhood Plan in the country was adopted; this plan, for the upper Eden valley, was approved by 90 percent of voters and was commended by the Communities Secretary (DCLG, 2013a). Carlisle and Eden have many common strategic grounds on which to work – these include the impact of the M6 motorway, especially in terms of transport and employment sites, rural affairs and the function of Carlisle as a service hub for the area. In the wider context, the isolation and relative deprivation of Cumbria made its relationship with the Regional Assembly and the RSS procedures problematic. Local politicians interviewed believed these arrangements worked to the benefit of stronger localities, most notably the metropolitan ones: *"Cumbria, because it is so large and so sparsely populated…we found we were not being listened to"* (Interview L9, local politician, 2012). This section examines how the 'usual suspects' of regionalism are now responding to the ostensibly opposite localist paradigm of the Coalition government.

### *Sub-Regional Governance*

In the *Local Government Act* (2000), local authorities were given the duty to prepare community strategies, in consultation with other stakeholders and the community, as an agreed basis on which to join up partners' activities (Jones and Stewart, 2009; Geddes, Davies and Fuller, 2007). This was a responsibility which they often undertook through a Local Strategic Partnership (LSP) (FoE, 2005). These non-statutory LSPs were promoted by the GOs to provide an umbrella for a variety of partnership structures and to bring together different elements of the public, private and voluntary sectors (Pearce, et al., 2008; Jones and Stewart, 2009). In Cumbria, this was a remit in which the North West GO was considered by some of the interviewees to be particularly effective:

> *"we got a lot of help from the Government Office when that was in Manchester, we got an awful lot of help from them – more from them than we did from the regional government [Regional Assembly]; the Government Office were very good to us. It tailed off towards the end. We built up this Cumbria Strategic Partnership, we had a number of other offshoots – JoPO, one was called, which was Cumbria Joint Planning Officers Group"* (Interview L9, local politician, 2012).

The Cumbria Strategic Partnership (CSP), which basically depended on the GO and Cumbria County Council, published its community strategy in 2008 (CSP, 2008a) simultaneously with a spatial strategy to deliver it: the *Cumbria Sub Regional Spatial Strategy* (CSP, 2008b). In other areas, where there was a better relationship with the Regional Assembly, the sub regional dimension of the RSS (see ODOM, 2004) was taken forward by the regional planning body (see, for example, Cheshire County Council, 2006). Although the *Cumbria Sub Regional Spatial Strategy* replicates its main policies from the RSS (for example in setting out locations for major, moderate and small scale

development), it appears to distance itself from that of a sub-regional stem of the regional plan; indeed, there is only one mention of the RSS in the document (see CSP, 2008b).

After the 2010 election, and with the termination of the grants and functions of LSPs, the CSP underwent a period of inactivity. It was then re-launched in 2012 as a consultative network called the Cumbria Partnership Forum (CPF). With the GO no longer in place, the county council reached out to new partners, most importantly the LEP. The CPF also includes social partners such as the Third Sector Network (CPF, 2012a). Despite major changes, the CPF has maintained Cumbria's strategies as its mobilizing vision: "Membership of the Full Forum is open to any organisation entity or body which is actively supporting the delivery of outcomes in the *Cumbria Community Strategy*." (CPF, 2012b).

Theoretically, membership of the LEP in the Cumbria Partnership Forum could help secure the weight of the business sector alongside other partners to deliver Cumbria's strategies but there are indications of an opposite move. Rather than putting forward a more inclusive and sustainable alternative for sub-regional governance, agreed by partners through consensus building, the dominance of the LEP and its growth discourse is mainly driven by a sense of economic urgency as well as a reaction to the marginalization of the former collaborative regional procedures. The LEP has understandably adopted a business plan (see Cumbria LEP, 2013) which verifies the argument of a planning officer that:

> *"if the Cumbria example is typical, then LEPs are focused on particular things, putting money into business development, skills development, things like that, and they haven't really got to grips with strategic spatial planning."* (Interview R6, 2012).

While the interviews in Carlisle and Eden suggest a low profile for Cumbria's strategies, the pursuit of the LEP's priorities is facilitated by the expertise and connections that sub-regional networks provide. Some of these networks were developed in reaction to the dominance of the metropolitan authorities (especially Greater Manchester and Merseyside) in the former regional planning body. For example, an institutional legacy of the CSP, called the Cumbria Strategic Planning Partnership (CSPP) and comprising the county council, district councils and the Lake District National Park Authority, is still to be seen in the LEP's Planning and Housing Expert Group. CSPP is engaged in brokering cross-border agreements to relax planning and boost development. A CSPP representative, for example, suggested:

> *"the Chairman of what they call the Expert Group is a very large developer … he says 106 Agreements are stopping him building to the extent he would like. He would like to see 106 Agreements throughout the whole of Cumbria which says these are the things that you can ask for, I would agree with him… The [Cumbria] Strategic [Planning] Partnership at the moment is looking at having a pro forma [setting out what] you could ask for in a development on a 106 Agreement"* (Interview L9, local politician, 2012).

***The Duty to Cooperate***

The *Draft Carlisle District Local Plan (2015-2030)* has now passed the consultation stage and, at the time of the research, was due for submission to the Secretary of State in mid- 2014 (Carlisle City Council, 2013). Being in the production stage of the Core Strategy at the time of the interviews, the main concern of the Council was how the independent Inspector would assess the soundness of the document and its compliance with the newly introduced Duty to Cooperate. Carlisle has held officer-level meetings with Dumfries and Galloway and the Scottish Borders to discuss cross-boundary issues as part of its Duty to Cooperate. Whilst these meetings were a response to the new procedures, planning consultations with neighbouring Scottish community councils had been running for some time. Surprisingly, despite the positive signs of Carlisle's cross-national policy communication, the District's relationship with Eden has been negatively affected by financial and political factors since 2010. Eden has placed most of its services that used to be executed by Carlisle (such as waste

services, transport and highways services) out to contract and previous cooperation on environmental issues has also stopped. Also, since the political balance in Carlisle Council changed in the May 2012 election from a Conservative / Liberal Democrat majority to Labour, cooperation between Carlisle and Eden - which has a Conservative / Liberal Democrat majority - has reduced and Carlisle is currently working more closely with Allerdale and Copeland than with Eden. These interview findings were later verified by the Carlisle statement of the Duty to Cooperate; the statement involves three counts of joint policy development (conservation and land-use agreements) but Eden is not present (Carlisle City Council, 2013).

When interviewed, a local politician from Carlisle responded to the question of whether the Duty to Cooperate is making real impacts on the level of strategic cooperation with Eden: *"The short answer is no. Eden is more rural and we have quite a lot of rural areas within Carlisle, but I don't think it will, and I don't think it will for political reasons rather than anything else."* (Interview L9, 2012). Although there has been an agreement between Carlisle, Eden and South Lakeland to support growth on employment sites along the M6 Corridor (Eden District Council, 2012), there is a long way from ad-hoc to more holistic partnerships and from land-use to spatial deals.

The Core Strategy of Eden District was adopted in 2010. The Inspector's report at that time argued that the '*encouragement to cooperate*' had been fulfilled:

> "In line with the encouragement given in PPS12 towards joint working and addressing cross boundary issues, I consider that such shared interests have been satisfactorily addressed by the Council through various mechanisms including; reciprocal consultation on DPDs, regular meetings of Cumbria-wide officers' groups…and through the joint production of key aspects of the evidence base" (Bussey, 2010, p.9).

This is similar to the cooperation evidence that Carlisle has produced in the absence of regional arrangements (see Carlisle City Council, 2013). One exception appears to be the preparation of a joint evidence base with other Cumbrian districts for travellers' accommodation needs. However, the county council will have the main role in the proposition of indicative allocations across different districts. While other contentious, but territorially essential, debates around housing policy / number exchanges, provision for a manageable number of inward investment sites and alike remain untouched, even in raised subjects such as traveller sites, the Duty to Cooperate:

> *"doesn't solve the problem of where people don't want to cooperate … I want you to take my housing [numbers]; you're going to tell me you can't for very good infrastructure and sustainable development reasons. It's not a duty to agree and as a result of which you can pass through the Duty to Cooperate without confronting strategic planning issues."* (Interview P7, professional body representative, 2012).

A 'duty to agree' was considered a strategic necessity by some planners, but it was also accepted that this would create political, and even judicial, complexities around 'who needs to agree with whom' and the limits and interests conflicts in such a duty. Regardless of how this duty would apply to local authorities on national borders, there would be a danger of sub-urbanizing some localities to the benefit of economically growing districts instead of moving activities to less advantaged areas. Without having a supra-local spatial plan and its governance context, a heavy handed approach might actually lead to the opposite of what it is designed for. Holistic agreements could set a proper consensus building context in which the losses of local authorities hosting unwanted development are balanced out with a range of incentives, whereas an unsystematic duty with an agreement obligation is bound to steer backlashes against strategic thinking.

## Conclusion

This paper started with two core questions about the Coalition Governments' recent changes to the regional and sub-regional policy landscape in England: firstly, the extent to which the centrally re-

designed city-regional governance structures in the case study areas, primarily based around the introduction of LEPS, appear capable of territorial leadership and, secondly, whether the statutory 'Duty to Cooperate' appears capable of reconciling the '*strategic*' with the '*grass-roots*' at the local authority scale? Based on the empirical findings of the case study areas in North West England, this concluding section of the paper thus aims to address these questions and reflect on some more general points about institution building and 'bottom-up' territorial management.

***Territorial leadership and the role of LEPs***

The three LEPs in the case study areas that were investigated in the research are not currently involved in strategic planning as a broadly conceived 'place making' tool. Given they are in an evolving state and primarily designed to serve an explicit growth leadership agenda, this is perhaps not that surprising. However, in more broadly examining their capability in providing territorial governance at the sub-regional scale, one interesting aspect was that the three LEPs appeared to differ in their approaches to engagement and interaction with the wider governance context in the three sub-regions studied. This may sometimes have been based on the political reception given to the newcomers in the existing governance context, but it also appeared to reflect the level of leadership ambition and/or interest in longer-term strategic planning by the LEPs themselves. In summary, three typologies appear to emerge from the case studies:

***(a) Expedient leadership.*** At the top of the hierarchy in terms of leadership roles is the LEP for Cumbria. Here, the evidence suggests a relatively high degree of receptiveness of the existing local authorities and sub-regional networks to the potential steering role of the LEP, particularly in the absence of any other obvious alternatives or rival sub-regional institutions. In this sub-region, support for the LEP comes from the County Council but also appears to originate from the remnants of the former local-central institution building in the pre-2010 Labour Government era as a local alternative to the earlier Regional Assembly-centred regionalism which was perceived as marginalizing the Cumbrian sub-region in favour of the metropolitan cores of Merseyside and Greater Manchester. The LEP appears to be taking on the role of an 'expedient leader' in this sub-region. Rather than seeking unified political ties with the new central Government vision, the main incentives for alliance building with the LEP, and the provision of expertise and relation brokering support for its agendas, include a common sense of regional marginalization under the previous administration and the need to address the current economic urgency. Since this typology is essentially based on responses to economic crisis and feelings of peripherality and exclusion, the ability of the LEP in taking on a sub-regional leadership role relies on extensive dialogue and consensus building with the other local stakeholders. At present, there appears to be much local support and the LEP might therefore be expected to further consolidate its leadership position. However this could, of course, still be challenged if the LEP is not ultimately seen to be delivering the desired economic growth on behalf of Cumbria.

***(b) Ambitious mediation***. In contrast to the picture of generally shared consensus in Cumbria, there is evidence from our empirical research that the Liverpool City Region, which used to be amongst the main regional policy actors in the RSS era, has descended somewhat into a number of internal conflicts post-regionalism. The introduction of the LEP as the only city regional network of localities has, however, potential support from some of the metropolitan authorities who were concerned with the stance that Liverpool City Council was seeking through its individualistic growth approach. While the socio-environmental profile of the LEP appear low, and the City Council seemed initially less inclined to play by the LEP rules, the wider government and business stakeholders retain vested interests in a stronger city-regional (rather than City Council) leadership. So, following an initial role in networking localities and business partners, the LEP has arguably performed a mobilizing and mediating role for more formal institution building and, mirroring earlier moves in Greater Manchester, the latest moves have been towards the establishment of a formal combined authority as a potentially

more effective way to create collective commitment to strategic decision-making and business certainty than would otherwise be the case if the only institutional development at the city-region scale was the creation of the LEP.

(c) ***Political and functional rivalry.*** Despite the tendency of Cheshire and Warrington LEP to extend its network and play a stronger leadership role, the concurrent existence of the Mersey Dee Alliance (MDC) provides a rival sub-regional governance architecture and the MDA's lack of vocal support to the creation of the LEP further suggests their coexistence is not necessarily going to be a reciprocal and supportive one. Since both the LEP and MDC arguably owe their fortunes and misfortune to the same localist reforms, the LEP has not been able to take advantage of the extensive consensus building skills of the MDA and has struggled to exert a strong sense of direction within its boundaries and resolve its differences with some key local authorities. Nor is there yet evidence of much success in establishing cross-LEP ties with the Liverpool City Region or in building networks with its Welsh neighbours. Given the MDA's recent move towards the adoption of similar priorities to the LEP, it is likely that the governance landscape will be characterized by more rivalry in the future. Even if some kind of consensus-building deal is brokered to resolve political divisions through the central recognition and sponsorship of the MDA, functional rivalries will still be dominant, thus leaving the LEP in the role of a political and functional rival to alternative governance arrangements.

***Cross-authority collaboration and the 'Duty-to-Cooperate'***

Especially in cross-border areas, the introduction of more regular planning consultations, and more frequent dialogue between the various authorities, are important initial achievements as they open institutional gates for the gradual building of more holistic networks and higher levels of engagement. But our two cross-border cases in which such links were initiated by the Duty to Cooperate do not show such promising signs. The establishment of planning consultations between Carlisle and its Scottish counterparts was facilitated by a relatively neutral political context, but functional relations do not seem to be substantial enough to provide incentives for more ambitious steps. On the other hand, although there are more significant employment, housing and infrastructure ties between Cheshire West and Chester and its Welsh neighbours, these currently suffer from divisive cultural and political agendas either side of the English-Welsh territorial borders.

With an inability to provide incentives for, and overcome fundamental barriers to, building supra-local alliances and strategies, so far the main outcome of the statutory 'Duty to Cooperate' in the four local authorities studied has been the coordination of planning policies for the avoidance of conflictual decision-making. Beyond its limited performance to date, there are however reasons to argue the 'Duty to Cooperate' is proving to be an insufficiently comprehensive piece of legislation which is prone to 'lowest common denominator' outcomes. It represents a static and simplistic understanding of how planning polity and networks develop. Ignoring the fact that *"political accountability is demanding different things for different parts of a joint committee"* (Interview P7, professional society, 2012). All this is exacerbated by a decline in localities' access to the required level of cross-local negotiation skills, for example, through job cuts under public sector austerity programmes. There are also political forces at the community and central levels putting pressure on local planning authorities to be less outward looking.

Nevertheless, there is an increasing local need for the consensus building and conflict resolution skills of strategic planners for several reasons. One of these concerns the rescaling of decision making on inter-territorially contentious policy areas (such as future housing figures and locations, inward investment sites, and provision for gypsies / travelers) from the regional to local level. Secondly, central funding is being reduced and local authorities are having to tighten their belts, be more competitive and explore new sources of revenue all of which might trigger cross-border friction more readily. Thirdly, the bidding mechanism of some major funding schemes, especially in employment,

such as Enterprise Zones (see DCLG, 2011) and the Regional Growth Fund (see DBIS, 2013), as opposed to the formulaic approach, creates a difficult context for relationship building between local authority groupings: *"we have to speak direct to central government as part of a number of often competing consortia from across the country for a scarcer pot of funding"* (Interview L13, local government, 2012).

However, despite this context of increasing demand for skills, local authorities will have lost a third of their budget by 2015, slashing as much as 58% from their planning budgets between 2012 and 2014 (Taylor, Murdoch and Butler, 2013; Booth, 2013). So in probability:

> *"at the end of this process, which has only just started, the councils will be severely disabled because they will have had to lose an awful lot of capable staff so they won't be able to play the kind of leadership role in the future that they have done in the past"* (Interview R7, regional body, 2012).

It is hard to imagine that a possible shift of strategic planners to the private sector will deliver the same quality of relation brokering services which would have been rooted in their daily engagement in planning politics within and across local authorities.

In a Ministerial Statement in 2013, the Secretary of State once more highlighted the government's discourse around transferring powers to local people and making the planning process more accessible to local communities (DCLG, 2013c). Although the government appears to be getting more wary of its wording, local authorities have now started grappling with the consequences of what they consider as unrealistic community expectations regarding planning freedoms under localism. Concerns were even evident in the interviews with Conservative councillors who tended to see this phenomenon as a result of ill-managed localism and hasty announcements:

> *"we've had quite a few announcements from the Coalition government which seem to be saying communities can basically do what they wish... the Coalition government make announcements ... but they didn't tell you how in the planning context you could come to that... there is a danger that people will feel they have more freedom than they actually do have... that is a difficulty in itself, because people think 'oh, just put a planning application in, it'll be granted', and then, when it isn't granted, it has to come to the Development Services Committee or whatever, they want to know why.* " (Interview L9, 2012).

It is not only developers and land owners that have been pitched against local authorities; had those putting forward their abstract ideas in Whitehall conducted detailed discussions with experienced local politicians and planning officers, they would have probably faced the unfortunate fact that: *"people tend to make representations opposing or objecting to development rather than supporting it"* (Interview L8, Conservative local politician, 2012). But, the *'muscular localism'* (see Wintour, 2012) of the Secretary of State wants local government to move against the wishes of communities by accelerating decision making on planning applications with a pro-development approach. Those councils that show a '*poor-quality*' or slow decision making record will have their planning powers handed over to the central Planning Inspectorate (Wintour, 2012).

On the other hand, community expectations from the three-way pressure on local authorities (central government, developers and landowners, and local nimbyism) to focus on internal priorities make it a political gamble for them to adopt a strategic approach in a time of economic hardship. So there is not much that local authorities can contribute in city-regional leadership or can offer in the fulfilment of the Duty to Cooperate, especially when some of their resources are engaged at the neighbourhhood level to make sure *local* strategic priorities are taken on board:

> *"I know the people that I'm dealing with who are trying to do Neighbourhood Plans, they're not interested in strategic issues… the people in [neighbourhood A] are not even going to think about the people in [neighbourhood B] - two Neighbourhood Plans in our*

*district - because they want a Neighbourhood Plan because they want to say what they want to happen in their parish." (*Interview R6, local government, 2012).

Ultimately, the wider lessons of this paper could be considered in relation to the two basic tenets of the localism project: 'bottom-up' territorial management and city-regional leadership. Our empirical research highlights the very fact that, paradoxically, a genuine bottom-up management of space cannot be achieved through a purely self-help approach. Indeed it is, arguably even more than top-down system, dependent on public spending and, therefore, the comprehensive sponsorship of the state. The downscaling of strategic decisions to the local and neighbourhood levels increases the need for institutional, financial and intellectual resources at these levels. Even more planning freedoms would require stronger incentives to establish a community mandate for supra-local considerations. So, in order to prevent a crisis of strategic territorial management, it is inevitable to have an element of centralism in the context of 'austere localism'. But even this combination has proved largely ineffective in the case studies, leading to a tick box and lowest common denominator attitude by some localities to the 'Duty to Cooperate' and discouraging them from genuine involvement in supra-local affairs. As regards city-regional leadership, it is argued that building new institutions of governance, such as seen with the LEPS, might be effective in areas where established arrangements are failing to secure local prosperity, or local political rivalries and differences thwart the exercise of strategic governance. Otherwise, it will almost certainly be more appropriate, and cost effective, to persuade and better equip the existing networks to double their efforts in relation to addressing new priorities, rather than usher in further institutional churn and uncertainty in an attempt to build new alliances from scratch.

# CENTRAL TRAIN STATION AREA DEVELOPMENT PROJECTS AND THEIR STRATEGIC POTENTIAL, REFLECTED IN STRATEGIC DOCUMENTS. CASE STUDY OF PRAGUE.

Kateřina Čechová MSc.Arch.
Faculty of Architecture, Czech Technical University in Prague
katerina.cechova@fa.cvut.cz

Key words: strategic urban project, central train station area development project, strategic documents

## 1. Introduction

In my previous work I have explored the specific nature of central train station area development projects as projects of strategic potential (Čechová, 2014). Based on the findings, this paper first gives a brief overview of what a strategic urban project is, what its specifics when realized on a centrally located railway brownfield are and what kind of strategic potential these projects have. The following section presents these findings in the context of urban development of Prague in the past twenty five years with focus on three specific sites within Prague. The core part of this paper looks into the strategic documents, issued by the government of Prague, and explores how the documents reflect the previously identified levels of strategic potential of central train station area development projects in Prague. Its aim is to identify the attitude of the city representation towards the active policy of strategic urban projects and outline the chances that the strategic potential of these projects will actually be fulfilled. The methodological approach taken in this study is a mixed methodology based on existing literature research and qualitative content analysis of the strategic documents. This paper constitutes part of my dissertation thesis, which is dedicated to potential of central train station development projects.

## 2. Strategic urban project – theoretical framework

There is an important recent phenomenon creating a base for the transformation of cities throughout urban Europe: The emerging autonomy of urban regions on the central state power. (Salet and Gualini, 2004). Within newly established global economic networks, it has been cities rather than states looking for new strategies to increase their competitiveness, most recently through smart, more sustainable and inclusive economy, as promoted by the EU (European Commission, 2012).

Strategic urban projects, or large-scale urban projects, are increasingly regarded as vehicle of urban transformation in metropolitan regions across Europe. There is apparent shift from master-planning to strategic planning, realized through (among other tools of operation) strategic urban projects (Carmona, 2008). According to Salet and Gualini (2007), large urban projects are strategic in their nature, because beside the impact of their own mass there is also an impact on symbolic level, since the projects also manifest "...the commitment of a local society to invest deliberately in a certain direction for the future" (2007, p.4). The authors succeed in framing the „strategic" dimension of the projects, claiming that the "strategic devices (…) attempt to settle or stimulate certain joint courses in individual actions. (…) The strategic dimension lies in the transcendence of individual horizons in scope and time – i.e. in exceeding the reach of single actors, single-purpose behaviours,..." (2007, p.3).

Numerous studies have attempted to often critically explain increasing expectations of strategic urban projects on the background of principles of neoliberal capitalism (Carmona, 2008, Swyngedouw, Moulaert and Rodriguez, 2002, and Fainstein 2009). The essential difference from both the welfare-state in western Europe as well as socialist-state driven projects in the countries of central and eastern Europe is the new role of fundamental actors involved: local governments, producers, the knowledge-industry and community (Carmona, 2008) Especially high demands lie on local governments and their institutional framework, expected to foster collaboration between stakeholders rather than to hold a central control over the whole process. This paper explores this particular niche when focusing on the perspective of local governments through the research of strategic documents they issue.

## 3. Central train station area development projects

### **3.1.** *Theoretical background*

As I argued in my previous research (Čechová, 2014), Central Train Station Area Development Project is a special kind of strategic urban project, defined by three distinct features:

- the location of the development site within the urban core of an European metropolis
- current and usually well-established node of public transportation
- railway station building as a unique typology

This classification is based on the work of Peters and Novy (2012), describing strategic integrated mega-projects of train station area development projects as "…projects that combine the (re)development of station facilities with significant urban development and transportation infrastructure investments, most notably national-level investments in new high-speed rail nodes and networks. They are strategic in nature in that they typically form part of wider planning initiatives at different policy levels and aim at triggering multidimensional changes far beyond the geographic confines of the projects themselves" (2012, p.17).

Another important perspective offered Bertolini and Spit (1998) through the concept of "node and place," combining the transport development perspective and the perspective of property development. According to their research, any significant transport node in the city should ideally be a significant place as well, and they demonstrate this principle on several case studies.

These two studies remain up-to-date the only comprehensive and systematic researches, dealing with specifics of train station area development projects and with their strategic dimension. Their scope is limited to selection of highly visible projects in the west European metropolises, which are generally well covered by partial case study researches (Wolff, 2012, Edwards, 2010). However, very little is known about the development of train station area development projects in central and eastern Europe.

### **3.2.** *Central train station area development projects, their strategic potential and key actors*

The strategic dimension, as defined by Salet and Gualini (2007) and indirectly, without calling it so, confirmed by Peters and Novy (2012) and Bertolini and Spit (1998), consists in the „transcendence of individual horizon in scope and time" (Salet  Gualini, 2007). Based on this finding, in the farther work

I refer to strategic potential as to unrealized ability that goes beyond horizon of single action and that is inherent in central train station area development project due to size, number, scale, cumulation, concentration and intensity of single aspects of the project. The inevitable interactions of single aspects might be in vain when unrecognised, or they might be faced actively: through the support of the beneficial mutual effects the synergies might evolve and the potential conflicts might be prevented.

Building-up the site of central train station area does not only mean there are more offices, residences and facilities close to the infrastructural node, it also means the urban pattern on the regional level is shifting, the society is sending a signal about its values and commitments, it also means new participatory partnerships are being established and the local environment is being enriched with new layers. On the other hand, the same under-pressure cumulation of effects causes massive gentrification and social division, conflicts of scale of the new and old constructions or poses a threat to public as well as private budgets.

In next section I identify crucial strategic potentials, coming out of the specifics of central train station area development projects and general features of strategic urban projects. The identification is based on case study research, conducted at the Faculty of Architecture, CTU (Fialová and Čechová, 2015). Farther on, the key players with capacity to recognize and fulfil the strategic potential on single levels are identified.

3.2.1. Strategic potential realized on the symbolical level

I identify three general ways, in which society manifests the will to invest in certain directions for the future:

- through the functions important on the city-scale
  such as objects for representation, culture or sports
- through architectural design
  which serves as a vehicle of place-marketing and image delivery, yet the image it delivers can still be quite diverse: from iconic cultural objects to super-modern corporate international architecture, symbolizing the connection to the global network of business, and hence competitiveness
- another way
  for example through conveying the image of sensitive reuse of the railway past and historical heritage or through sustainable development

The strategy of place-marketing is embraced by both, the public as well as private sector, yet each of them in a specific way. Typically, the public sector´s action would rather target the objects of important functions with additional symbolism of iconic design, or an alternative way of representing the general values, while private sector would use a strategy of capitalization on an unique architectural design.

3.2.2. Strategic potential realized on the transport-functional level

On the transit-related level, there are two general ways to realize the strategic potential:

- through an efficient multi-modal node of transportation
  with convenient transfer between single modes and incorporation of facilities for pedestrians and cyclists. The node would combine infrastructure of global reach, typically connected with airport or other metropolises via high-speed rail, and with local flexibility
- through transferium
  constituting enormously commercially attractive location, incorporating besides the transit also additional functions, travel-related as well as unexpected ones (Klokočka, 2013).

In continental Europe, the construction and mostly also operation of various modes of public transportation is the responsibility of various institutions of public sector. On the other hand, the

reconstruction of the railway station with its constant flow of passengers is commercially attractive for private investors.

3.2.3. Strategic potential realized on the spatial-functional level

On the spatial-related level, there are two general ways to realize the strategic potential:

- through active policy of urban development
  giving chance to the city centre to regain a leading role within the urban region, chance to counter the sprawling residential areas or development of edge cities
- through realization of good quality environment
  according to the principles of good urban design, regarding scale, capacities, landmarks, spatial integration and materials, and contributing to the genius loci; enter the existing rich environment with a layer of contemporary architecture while creating a dialogue of past and present

The only types of real-estate development, generating significant profit, are large-footprint offices, shopping malls, high-end hotels and housing. Any development aiming at going beyond that calls for establishment of a direct partnership of private and public actors, or setting up clear development conditions. The development of partnerships as well as regulation establishment lays mainly in the hands of local government: the regulations concerning capacity, functions and spatial design, given by the local plan, but also housing policy and real-estate policy based on demographic predictions.

3.2.4. Strategic potential realized on the level of partnerships

- institutional partnerships and establishment of efficient platforms for collaboration of stakeholders
  ability to create functional partnerships and learn through the process of making the development project happen increases the institutional capacity and in a long-term period contributes to city´s competitiveness; partnerships of public and private sector combine the advantages of stability of the former and flexibility of the latter and helps to finance innovative solutions
- participation of community and establishment of mutual trust
  apart from being a keystone of successful project, public involvement in decision-making process helps to build a mutual trust between community and public representation and as such builds the capacity to deliver complex projects in the future

3.2.5. Strategic potential realized through the prevention of conflicting situations

The most obvious dichotomy lies in the immediate proximity and intense contact of global and local, of mobile and immobile, of existing and new. The same effect of synergy might become a conflicting situation for different actors or even for the same actors in different roles. The anticipation and prevention of potential conflicts is a domain of public sector.

- symbolic expression misrepresenting local society
- unattractive symbolical expression
- railway stations becoming more of a shopping mall, loosing the sense of public space
- increasing social gap – gentrification, missing facilities for local inhabitants, character of public space
- conflict of old and new environment – tabula rasa, conflict of scales
- financial impact on public sector

## 4. Post-socialist Prague and the socio-political conditions of strategic urban projects

After 1989, the whole society was going through major political and economical transformation and at

the same time through the process of internationalization and globalization. Regarding the urban development, new institutions, rules and key players came into being. The processes of democratization and decentralization of the decision-making processes, dissolution of the state and its monopolistic corporations´ control over the land and housing sector, privatization and restitution, emergence of market-oriented actors and establishment of the new role of municipal governments in the development took shape.

Parallel to that, post-socialist cities started to re-emerge on the international scene. After forty years of isolation from the western world there were foreign investors and developers, enterprises and their employees, students and tourists present in the everyday activities. Capitalising on the beauty of historical centre of Prague, tourism, congress industry and related business became soon one of the main economic activities and one of the most prominent signs of globalization taking place in the city. Rapid internationalization exposed the will of Prague to learn about urban development from the experience of cities abroad: foreign experts were engaged for the preparatory phase of strategic and planning documents, international conferences and design workshops were taking place.

New spatial patterns started to emerge as a result of rapid social, economic and political changes. According to Tosics (2005, p.64), the newly built shopping centres became one of the most visible signs of the market-oriented development of the post-socialist cities. Shopping centres were followed by office development in spatially limited zones – either in the very centre of the city or in the green-field areas in the so-called edge cities. The establishment of residential real-estate market took relatively long time, despite the great demand of early 1990s, and in general took form of suburban residential sprawl. The development of shopping malls, green-field offices and suburban residences considerably accelerated the city´s reorientation towards individual transportation and raised the concerns about negative consequences of suburban sprawl.

In the first years of democracy, there was the highest pressure put on the historical city centre. After decades of socialism the historical centre of Prague was severely neglected, resembling ghettos, yet well preserved in its urban structure (Musil, 2005a). Its reconstruction went hand in hand with strong commercialization, reduction of residential function and increase of individual transportation. At the end of 1990s, the development in the city centre was virtually saturated, and the attention of developers has turned to traditional 19$^{th}$ century districts with their industrial and railway brownfields as well as to the edge cities. While green-field commercial and office development were relatively easier to develop, the central brownfields, including central train station area development sites, remain derelict with an exception of Anděl development in Smíchov.

During the socialist period, housing and construction policy was completely subordinated to a centralized, party-ruled, planned economic system. State interventions in housing and construction served as a tool to achieve political objectives, planning was attached to power and as such regarded as a source of regime legitimization. Post-socialist transformation brought about the need of new efficient and less direct planning tools, more of a framework-type regulations, limiting density or excluding specific effects. New planning system had to take into consideration the decreasing share of public finance and significantly increasing share of foreign direct investments, domestic entrepreneurs and private investors on the investments in the urban areas.

## 5. Central train station area development projects in Prague

There are three central train station development areas in Prague, conforming to the distinct features defined in the previous sections: Masaryk Station, Smíchov Station and Holešovice-Bubny Station.

Each of them consists of a potentially important multi-modal transit hub with railway as a superior mode of transportation, and the transformation site of the size of tens of hectares, situated in the vicinity of the historic centre of Prague, within the buffer zone of the world heritage property. Due to the topography of Prague and railway´s limitation concerning ascent and radius, these sites occupy rare plains within the Prague basin and they are surrounded by the traditional and increasingly popular mixed-use quarters (Figure 1).

For last ten to fifteen years, the developers have been seeking to abolish the building closure, an institutional mechanism restricting construction on the large development sites in Prague. Since two of them have recently succeeded and the third one is on the way, the process of development of these sites is open to transformation, which brings up the question: will their transformation reflect their strategic potential?

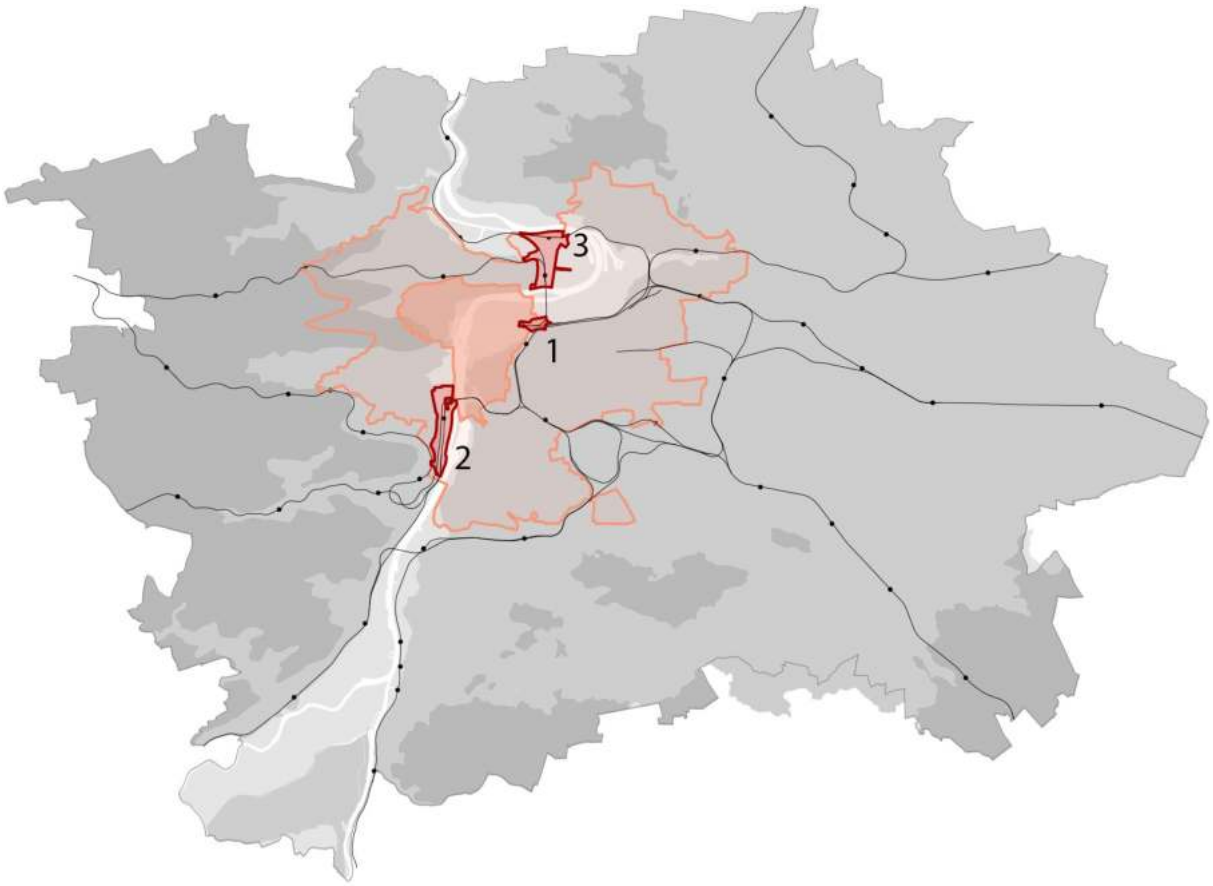

Figure 1: Central train station development areas in Prague – (1) Masaryk station, (2) Smíchov station and (3) Holešovice-Bubny station in relation to world heritage property zone of Prague, buffer zone of the historical city centre, railway network and overall topography. Source: Author

**5.1.** *Masaryk Station*

The first train station in Prague was opened in 1845 as a terminal for the railway connecting Prague with Vienna, the capital of the empire at the time. The terminal, nowadays called Masaryk Station, was built in a unique position: station building with platforms was within the city fortification, in the

immediate vicinity of important facilities such as post office and customs office, while the marshalling yard and facilities ground remained in the scarcely populated area outside the walls. Both parts were connected through six new gates constructed in the city walls. Soon there was another line constructed, connecting Masaryk station with North Bohemia and Dresden. This line crossed the Vltava river to Holešovice-Bubny on a 1 110 m long Negrelli´s viaduct, a great achievement of engineering of mid-nineteenth century. The fortification was demolished thirty years later and the technical facilities of the railway operations were transferred over the river to Holešovice-Bubny, yet the three surrounding quarters – historical quarter "Nové město," industrial-residential Karlín and residential Žižkov – have never been connected. By contrast, new barrier in the form of elevated highway crossing the twenty-hectares site from north to south in the trace of former fortification was constructed in 1970s.

There are two objects declared as state cultural heritage: The neo-renaissance building of the terminal, the only original one of the first generation of grand terminals in Prague, as well as the former railway workshop and locomotive shed are objects. While the station building serves its original purpose, the workshop and locomotive shed are intended to become the Railway museum of the National Technical Museum.

The location of the train station has certain limits and opportunities: It is situated right in the centre of the city, with major historical sights and various work opportunities within the walking distance. The station as such is a minor hub, but it is in the walking distance to the Main station Prague with the distant train connections and to Florenc, important metro lines crossing and bus terminal. The train station serves the regional transit, and it is currently considered to become a terminal for connections to Václav Havel Airport. Nevertheless, it´s location only makes the transit suitable for two lines – northern and eastern – and impossible for the through transit, therefore in the long-term there is an option of transfer of railway operations from Masaryk station to a single railway node at the Main station Prague (Masaryk Station Development, undated).

The story of transformation started in 2004, when the association of Masaryk Station Development (MSD) was established in order to develop the land not necessarily needed for the railway operations. This association consists of Czech Railways (ČD), a public limited company, and Masaryk Station Investment (MSI), a join-stock company of private investors, whose property shares have been changing since 2004. Since 2011 the majority owner of MSI as well as MSD is Penta investment group. The majority land-owner, ČD, is nevertheless legally bound to certain procedures, concerning the sale and development of the property.

In 2004, the building closure was declared on the Masaryk station, restricting construction on the site. The local plan change, allowing development, was finally approved in 2013, after several unsuccessful attempts based on various urban studies. The final study, as well as most of the previous ones, was worked out by the FNA studio. Due to the change of the local plan, the site does not have a status of large development area any more, and as such is developable in the parts dispensable for the railway operations. Due to unclear future of the railway transit and the character of urban study, a piecemeal development rather than an overall transformation is being realized. The transformation of the area already started with the construction of Florentinum, 50 000 sqm office complex completed in 2013, standing right opposite of the station and developed by the main investor of the property, the Penta investment group.

**5.2.** *Smíchov Station*

In Smíchov, rapidly developing industrial quarter at the southern left bank edge of the city, the second

railway station in Prague was constructed in 1862, serving as a terminal for western railway connecting Prague with Pilsen and further with Bavaria. In 1870s the importance of the station increased when two freight railway companies built their premises nearby and the original railway line was extended to what is nowadays the Prague main railway station. Over the following century the station has remained important point of traffic, serving regional as well as long-distance trains to the south-west of Prague, neighbouring to important bus station for local and long-distance buses Na Knížecí. According to plans, the original line to Pilsen is about to become one of the future high-speed railways of Prague.

Due to attractive location in the vicinity of the Prague city centre and already dilapidating industrial grounds, Smíchov was one of the first locations subjected to the interest of international developers in the early 1990s. Several urban design projects were worked out for Smíchov, nevertheless, the focal point of following urban transformation was at the former Tatra Smíchov plant in Anděl, an area north of the Smíchov station. At the turn of millennium, the construction of commercial and entertainment centre Nový Smíchov and building of the iconic office building Zlatý Anděl (Golden Angel) designed by architect Jean Nouvel represented a strong statement about the urban development in Prague. The development only concentrated around Anděl, while the south part of Smíchov, adjacent to the train station, has remained neglected, even more so in the contrast to the booming urbanity of Anděl.

A public-private partnership company Smíchov Station Development, similar to that of Masaryk station and connecting Czech Railways and a Sekyra Group development company was established in 2005 in order to jointly develop the site. Nevertheless, the construction on the site was restricted since 2002, when the building closure was declared. As was the case of Masaryk station, several urban design studies followed, but non of them succeeded in getting approval. Finally the Smíchov City project, designed by A69 architects served as a basis for the change of local plan and hence for the cancellation of the building closure in the mid-2014.

The current transformation site of the size of 106 hectares has been divided into two parts: easily developable rectangular area on the north of the site, adjacent to Anděl, and the southern part, squeezed on a narrow strip between Vltava river and city highway, overwhelmed with traffic. Whereas the urban design of the northern part has been a subject of an invited architectural competition in late 2014, in the southern part it seems to be hard to imagine its potential beyond its traffic use. In recent past a construction of multi-modal transit shed of city-logistics was considered for the Smíchov station.

**5.3.** *Holešovice – Bubny Station*

Holešovice, the almost perfect geographical centre of Prague, marked by the meander of Vltava river, was cut by three different railway lines in the past 150 years. Two historical lines connecting Prague Masaryk station with Kladno and northern cities (Ústí nad Labem, Dresden and Berlin) and the late 20th century relocation forming the Holešovice Station at the very north of Holešovice meander. They created a no-man´s land, separating two 19th century districts: traditionally industrial yet rapidly gentrifying Holešovice and traditional high-end residential quarter of Letná.

The vast railway yards with numerous railway sidings served as a technical background of the Masaryk station and related industry of Holešovice, including the city-wide facilities such as slaughterhouse, power plant and port. For decades, the railway station of Holešovice-Bubny was important due to great amount of commuting workers, nevertheless in the late 20th century affected by massive industry decline its importance has diminished. However, its potential for the future has been revived through the reconstruction plans of Kladno railway line and its prospective extension to

Václav Havel Airport, the only major airport in Europe not connected with the city centre via rail transport (CEDOP, 2011). This transformation would give the whole 78 hectares large transformation site a new perspective: The now-divided quarters of Holešovice and Letná would get a new common centre with mutual connections and the size and position of the new quarter within the city would allow for significant city-wide functions, while the existing multi-modal nodes of Vltavská and Holešovice station would get a significant upgrade through new railway and tram lines. Holešovice-Bubny has a chance to become the most attractive development location in Prague due to the vicinity of the city centre and direct connection to international airport.

The land of the transformation site is currently divided among tens of property owners. The former majority owner, state organization Railway Infrastructure Administration (SŽDC), sold about 25 ha of developable land to private company Orco Property Development group in 2006. The new owner has been fighting to overcome two major complications: the building closure declared in 2000 and a cultural heritage status for the complex of railway station buildings, pronounced in 2004. Considering the latter, the administration revised the decision and despite the protests of public as well as professional organizations cancelled the heritage protection in 2008. As in previous case studies, a variety of urban design projects followed, aiming at change of the local plan, and hence abolition of the building closure. The last such project is an urban study designed by CMC architects in 2013, currently seeking approval.

Meanwhile Orco Property Developer established a joint-venture with commercial property company Unibail Rodamco in order to develop 3,7 hectares of their site as a shopping mall. Parallel to feasibility study of the rail connection to the airport, a non profit organization Memorial Shoah Prague currently transforms the railway station Bubny into a memorial, an exhibition and event place dedicated to tens of thousands of Jewish residents, transported from this station to concentration camps during the second world war (Památník Šoa Praha, 2015).

## 6. Planning documents

The essential document studied was the Strategic plan of Prague, updated version approved in 2008 (Hlavní město Praha, 2009) and its predecessors: First the preparation phase "Praha 2010" (EcoTerra, 1994a,b), concluding the collaboration of hundreds of experts and identifying the complex issues of early post-socialist city, followed by the second stage of preparation which resulted in 1996 under the title Praha budoucnosti – Cesta ke strategii (Útvar rozvoje hlavního města Prahy, 1996). This document was based on series of workshops and conducted by professional body in charge of strategic planning, newly established under the Department of City Development. The first Strategic plan of Prague was approved in 2000 (Hlavní město Praha, 2000) and updated in 2008. The latter included the Programme of implementation of the Strategic plan for 2009-2015 (Hlavní město Praha, 2009), which was also surveyed. Since 2013 the strategic plan has been thoroughly updated, the works still going on. The basic aim of the Strategic plan is to set a framework that enables all actors to achieve synergic effects and as such represents an agreement on midlle- and long- term goals for the development of Prague (Institut plánování a rozvoje hlavního města Prahy, 2013). Another essential document, the local plan (Útvar rozvoje hlavního města Prahy, 1999), is among important tools serving to implement the strategic concept, as the Strategic plan states (Hlavní město Praha, 2009, p.10). Its main function is to set the development goals, determine land-use regulations, basic spatial regulations, delineate the technical and traffic infrastructure and publicly beneficial constructions (Institut plánování a rozvoje hlavního města Prahy, 2013). Its temporary predecessor, in 1994 approved Land-use plan of stabilized areas only depicted the land-use of the stabilized areas with indisputable current use, while other areas (such as the three inspected areas) were included in the white spots of the city, referring to future

solutions. Currently, new local plan under the title "Metropolitan plan" is being prepared. There has been additional documents under scrutiny, though in limited extent, such as the agenda of city council (Magistrát hlavního města Prahy, 2015) or The annual report of technical administration of communications (Technická správa komunikací hlavního města Prahy, 2014).

**6.1.** *Strategic plans*

Across the strategic plans, there are several issues that could be considered to be related to the problems of central train station area development projects, yet there is no comprehensive section focused on them.

Since the the preparation phase of the strategic plan (EcoTerra, 1994a,b) there has been a focus on the potential development of polycentric urban structure. In the following material the location of the potential alternative centres was specified: besides the peripheral housing estates, the crucial type of alternative centres was defined as an extension of historic city centre, namely in Smíchov, Holešovice and Karlín. These locations were not explicitly related to the train station areas but due to the transformation sites available in these locations, they were most likely meant to be (Útvar rozvoje hlavního města Prahy, 1996, p.V). The main argument for development of secondary centres at that time was the prevailing perspective of overloaded historic city centre through commercialization, tourism and individual traffic, whereas the importance of city centre extensions for the regeneration of affected quarters as well as its relation and potential synergy to redevelopment of railway lines was rather overlooked.

From the first Strategic plan on, the transformation of Anděl was mentioned as an example of how the city centre could expand. In the following update of Strategic plan however, the southern transformation site adjacent to the actual railway station Smíchov ceased to be considered for city-wide functions expansion (Hlavní město Praha, 2009, p.135), which is an odd fact given the acknowledged success of Anděl development.

The overall good will of the city representatives concerning the development of strategic urban projects is clearly stated in the first Strategic plan (Hlavní město Praha, 2000, p.76): The city will use its authority and public investments to give a direction to development of the above mentioned centres (Smíchov, Karlín, Holešovice and Pankrác). The city will actively support the realization of these projects, place the municipal and state institutions, headquarters of international institutions, banks and commercial headquarters, commercial functions, cultural, social and educational centres, suitable sport facilities and so on. The municipality will set up the phases and prioritize the development, regulate the limits of development in terms of capacity, based on market analysis and impact of construction on existing public services.

Another issue tackled by strategic plan was the formation of partnerships, whether among single bodies of public sector or among public and private actors. The city representation is aware of the necessity to launch the transformation of the sites in collaboration with private sector, since the public sector as such has withdrawn from the actual construction. In order to become a reliable partner, the city found necessary to create a real-estate property policy, prepare a stocktaking of the city´s property and set the basic strategic directions of property management (Hlavní město Praha, 2009, pp.51-55). Whereas the strategy has not been worked out yet, city´s property is continuously being sold out. As we saw on the examples of single central train station areas development projects, the strategic partnerships are formed among the Czech Railways company and private developers, without engagement of the local authorities.

Another key topic, declared in the strategic plans, is the development of public transportation, which is seen as a solution to negative side-effect of the individual transportation, such as alarming quality of air or frequent congestions. Despite the pressure on development of public transportation, at the same time the strategic documents insist on individual traffic regulation only when the ring roads are completed. According to Duchoňová (2014), the inability to prioritize the public transportation over the roads construction drains the financial resources from the public transportation. In addition, the effect of induced demand makes the public transportation uncompetitive.

The issues of public traffic support and establishment of partnerships meet in the concept of multi-modality. Greater integration of single transportation systems has started in 1993 with establishment of Prague integrated transport (PID) and its manager ROPID in 1996 (ROPID, 2013). Since then, the railway traffic shows highest deficiency of integration from all modes of traffic. Both strategic plans declared necessity to increase the share of railway transportation on the overall volume of public traffic, to offer attractive headways in the regional transportation in the open mode (fares through the city, without terminals in the city centre), to integrate the high-speed trains or combined freight traffic. Despite no major interventions in the railway network have been achieved, the number of passengers slowly increases. In the absolute numbers, the overall railway passengers´ volume is hardly comparable to tramway, whereas its actual capacity is multiple (Figure 2). Larger integration of railway is a prerequisite for the full use of strategic potential of the adjacent transformation sites.

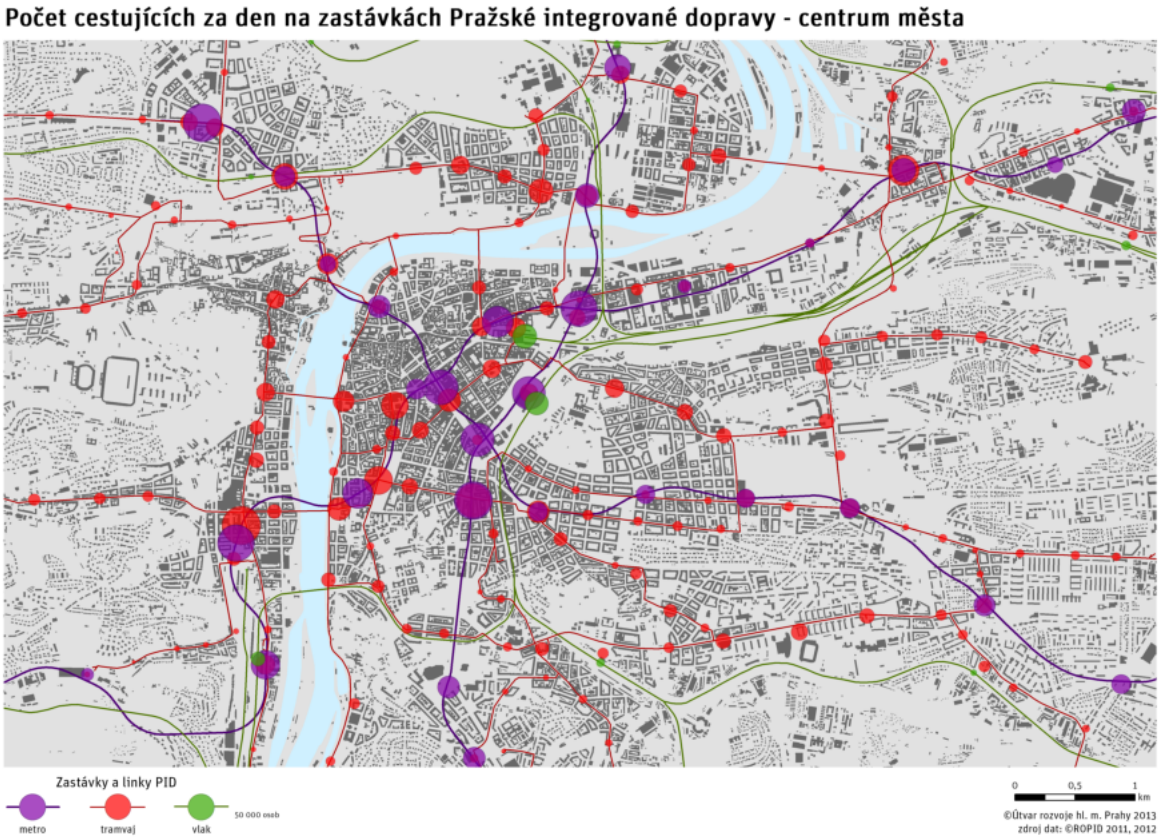

Figure 2: The number of passengers per day on single stations in the frame of Prague integrated transport: violet – metro, red – tramway, green – railway. www.geoportalpraha.cz

Since the issue of railways is primarily in the agenda of Ministry of Transport, transmitted to the Railway Infrastructure Administration, state organization (SŽDC), greater integration of railways into the public transportation in Prague would require close collaboration of Prague with these organizations. The necessity of this collaboration is declared in a memorandum of future cooperation, signed by Prague mayor and the minister of transport and in a commitment of the Prague council to work out the metropolitan strategy of multi-modal mobility (Rada hlavního města Prahy, 2013), nevertheless, the latter has not been accomplished. In this case, it seems that Prague reached the limits of partnerships it is able to initiate.

**6.2.** *Land-use plans*

The first temporary land-use plan of stabilized areas from 1994 indicated "white spots" on the sites of yet unclear land-use. The first local plan, approved five years later, classified stabilized areas, development and transformation areas and un-development areas. In the local plan, the prevailing poly-functional use (residence, mixed-use, production or services) or mono-functional use (public facilities, technical facilities, mining, water surfaces, landscape and agricultural land) is ordered by delimitation of the land-use zones. Within the development and transformation areas, the spatial regulation is represented by the code of land-use. This code limits the maximum capacity of the new development through the maximum of build-up areas and minimum of green-land areas. The local plan also limits the height of new buildings through the delimitation of a zone in the proximity of Prague heritage zone, where the prohibition of high-rise construction is declared. Both Smíchov and Masaryk station, as well as the southern tip of the Holešovice-Bubny station, are within this zone, whereas most of the Holešovice-Bubny area is in the zone, requiring detail inspection of a prospective high-rise building in relation to various vistas. More detail spatial regulation is a question of urban studies or other detail planning material. The local plan also introduced the concept of large development areas, where the building closure was declared until a more detailed planning documents will be worked out. This arrangement aimed for maintaining the city´s control over these important sites, nevertheless there has never been a mechanism within the local plan, that would encourage the local authorities to actively shape this control.

In the proclamations contained in the strategic plans, there is clearly an intention to give the transformation sites a symbolical meaning through an important function. Nevertheless the local plan only shows preference in positioning of specific functions by indication of special complexes within the poly-functional land-use zones. In the past experience from discussions about new national library or a new concert hall, an important building with an effect on the scale of the whole city can fetch up virtually anywhere, without any relation to the transformation sites.

As in the case of strategic plans, the systematic approach to transformation and development sites is missing. In these terms a change is expected based on the updated spatial-analytical materials (IPR Praha, 2014), where the transformation and development sites are classified according to their potential to be developed. This material should serve as data for farther work on the strategic and local plans.

**6.3.** *Capacity of strategic documents to reflect strategic potential of central train station areas*

What is the capacity of strategic plan and local plan to fulfil the strategic potential of the Prague´s central train station area development projects on single levels?

6.3.1. Symbolical

The values indicated by the strategic plan are too little specific and not related to single development

projects. The strategic plan declares the will to place important buildings on the development sites, and the local plan opens-up the opportunity for local authorities to do so, but in reality, the missing capacity to build partnerships and initiate activity prevents it from happening.

6.3.2. Transport-functional

There is a good will declared to support public transport and multi-modality, yet the follow-up phases lack behind, since no strategic partnerships with the presence of local authorities have been formed. In the local plan the development sites are divided between single owners along the line of transportation land-use and other land-use and developed piecemeal, which prevents the integrated multi-modal node – a transferium - from being developed.

6.3.3. Spatial-functional level

The strategic plan defines locations, where the development should happen and a will to play an active role in the development, but in reality, the city´s role is passive. Good quality of urban design is a question for single urban design studies, which have not been reviewed in this paper.

6.3.4. Partnerships

The strategic plan promises establishment of partnerships, leading to realization of the development projects, yet it failed to establish the property management policy as well as engage in any of the partnerships formed on the basis of strategic urban projects.

6.3.5. Conflicting situations

The strategic plan acknowledges a social conflict in the city centre, but it does not anticipate the future conflicts in the large development areas.

**Conclusion**

On one hand, the local authority clearly declares the will to become an active leader of urban transformation. Most of the strategic potentials of the central train station area development projects identified in this paper are at least partly reflected in single goals set up by the strategic plan or in the tools incorporated in the local plan.

Yet, there is a wide gap between the long-declared goals and the actual deeds. In the strategic documents there is a general lack of concentrated systematic focus on the issue of strategic urban projects and their development potential for the city. The chance to actively enter the process of realization partially ceased to exist when the central train station areas were removed from the poll of large development areas and the building closure was cancelled.

There is an implementation problem, and exploration of its roots lies beyond the scope of this paper. Possible explanation could lie in the process in which the strategic documents are worked out and approved: There is no general consensus on the goals stated in the strategic plans, and hence there is no will to work-out implementation strategy, to follow up and regularly revise the results. Another contextual explanations could be offered by related literature: Duchoňová (2014) in her analysis of transport-related strategic documents in Prague identifies strong implementation deficiency based on conflicting criteria and contradicting instructions. Horák (2014) explained that the unstable and institutionally incoherent environment of early post-socialist Prague prevented the city representatives from taking strategic long-term decisions about important issues of urban development, and how this institutional environment made the patterns of behaviour deeply rooted. Tosics (2005) and Musil (2005b) described the general reluctance of the new Czech democracy to any state control mechanisms, including spatial planning and regulations, and the existence of the negative liberty

concept, that allowed to conceive the democratic system as a freedom from the state control and its implications, rather than a freedom to fulfil its potential.

Keywords: Fuzzy Governance, Industrial Land Conversion, Weak Institutional Environment

## Abstract

Currently, the maximum tenure of industrial land use in China is 50 years, which far exceeds the manufacturing life cycle. In the absence of an effective exit mechanism and serious supervision, a large number of manufactories are waiting for land value-added income or illegal sublease for commercial use rather than returning the land-use rights for urban redevelopment. As one of the urban central areas in Shanghai, Hongkou District is facing a serious challenge on land scarcity and impending speculative inflows during the critical period of rapid transition.

The objective of this research is to explore fuzzy approach to industrial land conversion in weak institutional environment, eventually strengthening the initiative of land-use cycling of the governments for a better adaption to the changing demand in the future. So the research mainly consists of two parts. (1) Find bottlenecks. After deep investigation and analysis on the causes which restrict land users' access to land transfer, the findings reveal that profit mechanism, no alternative policy for land-use change, low compensation, low costs of illegal behaviour and high rate of planned non-profitable land on these industrial land blocks are the main bottlenecks. (2) Break bottlenecks. The following fuzzy governance approaches are discussed: fuzzy profit distribution mechanism, fuzzy exit mode, priority compensation, trans-regional land supply and combination of regular review and public supervision, as well as their application value and feasibilities.

## 1. Introduction

With the rapid economic development in China, the gap that system reform lags behind economic development has seriously hampered China's sustainable development. Taking land system for example, the maximum tenure of industrial land use in China is 50 years now, much shorter than the life cycle of most manufactories. As a result, a large number of manufactories are waiting for land value-added income or illegal sublease for commercial use rather than returning the land-use rights for urban redevelopment. This phenomenon forms obstacles to the government for the regulation of industry and space planning, which leads to low efficiency of land use. This is also against government's original intention of providing land as one of enterprise's essential productive factors.

Since the development stage of every city varies a lot, Shanghai as one of the representative of the Chinese first-tier cities is the first to face the issues that are specific to the transition period. One of them is how to make full use of limited land resources, look for further space stock possibilities and provide necessary space for development. But the situation that industrial land-use rights cannot be returned easily aggravates the shortage of land resource objectively and restricts the space supply for building industrial system of the service economy in Shanghai. As one of the central districts with good economic foundation and historical cultural resources, Hongkou District is facing high land prices, which increases land value-added income and illegal sublease for commercial use. This situation also leads to an even more serious challenge on exit strategy of industrial land.

## 2. Development overview of industrial land in Hongkou district

Based on industrial land and factory survey table of Hongkou District (2006) and author's added research in 2013, the status of Industrial land development in Hongkou District is as follows (statistical units in accordance with the streets administrative divisions of Hongkou District in 2009).

*2.1Spatial distribution*

There are 170 blocks of industrial land with 111 hectares in Hongkou District. Its main distribution trends are: in the southern area, smaller block of industrial land scattered layout. While in the northern area, industrial land appears relative agglomeration. In addition, around the boundary of Hongkou and Zhabei Districts, it has linear distribution trends.(Figure 1)

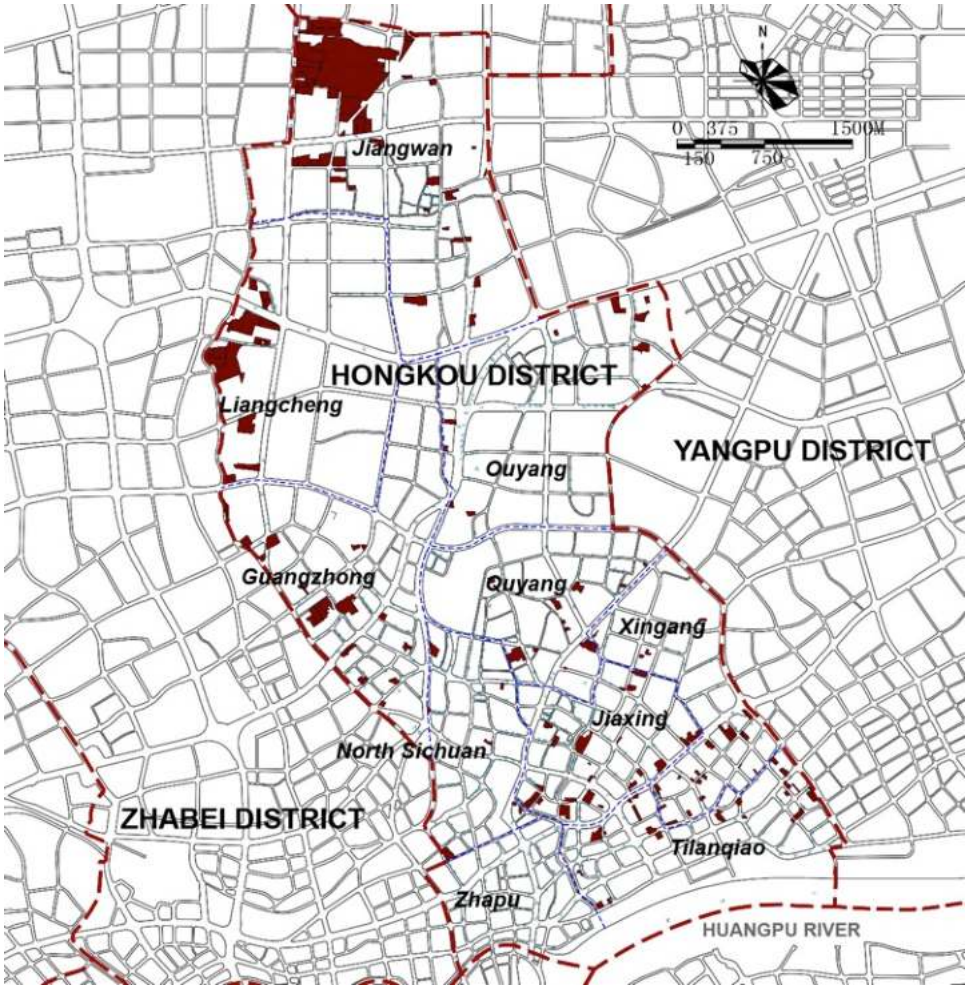

Figure 1. Spatial distribution of industrial land in Hongkou District
Source: Shanghai Tongji Urban Planning & Design Institute

*2.2 Functional analysis*

In weak institutional environment, from functional perspective, only 25.8% of industrial land blocks in Hongkou District are still used for production activities and 5.3% of them are idle, while up to 68.8% are used for other purposes, such as commercial uses and business, which contains a high rate of illegal sublease. (Figure 2)

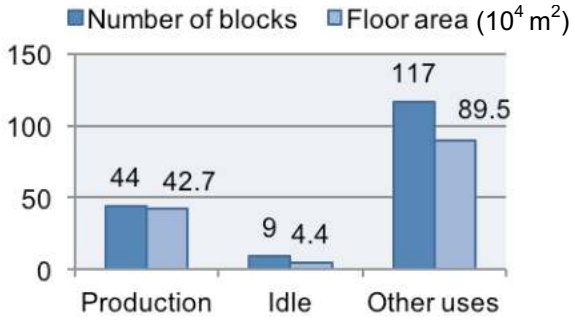

Figure 2. Functional analysis of industrial land in Hongkou District
Source: Hongkou District Government

*2.3 FAR*

To most of the industrial land in Hongkou District, economic feasibility of redevelopment is quite positive (FAR<2.0). Effective use of these redevelopment resources may relieve the critical situation of lack of commercial land and create good conditions for the restructuring and redevelopment.(Figure 3)

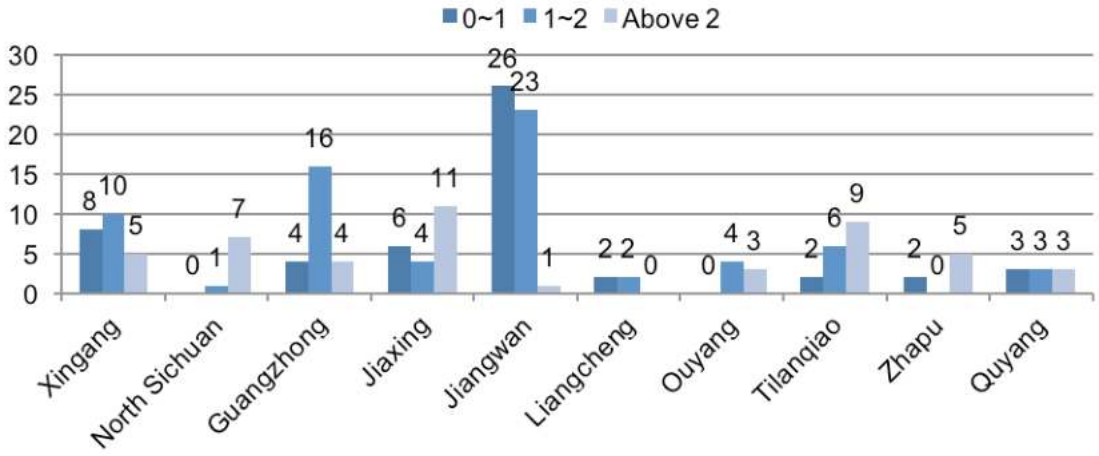

Figure 3. FAR of industrial land in Hongkou District
Source: Hongkou District Government

*2.4 Possibility of land transfer*

According to official statistics and forecasts, only 31% of the industrial land in Hongkou District may exit in the next five years. While this critical situation does not match the planning intention: master plan of downtown Shanghai (2010 combing Edition) mentioned about the replacement of industrial land in Hongkou District for other kind of land uses. (Figure 4)

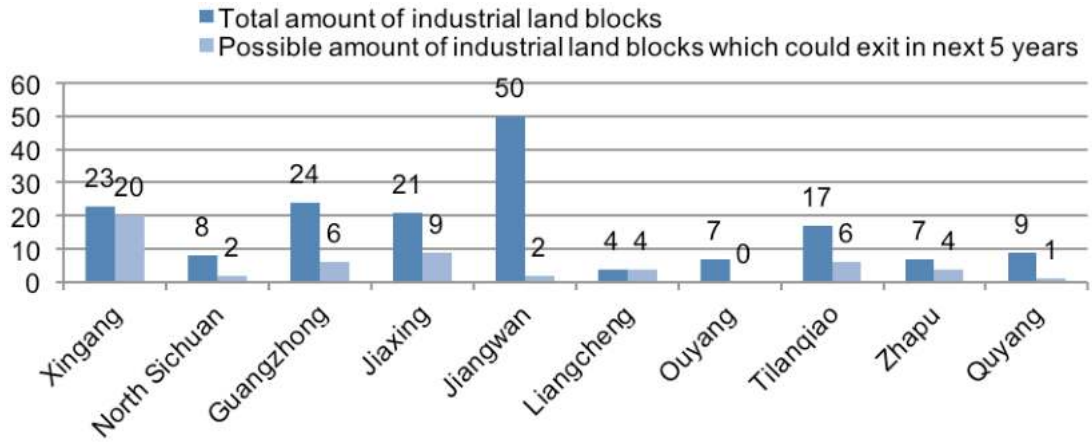

Figure 4. Possible land transfer of industrial land in Hongkou District
Source: Hongkou District Government

## 3. Bottleneck and constraints of industrial land conversion in Hongkou district

### *3.1 Huge speculative arbitrage*

68.8% of the industrial land in Hongkou District is used for commerce rather than industrial production. The most important reason is that with land price continuously rising in Hongkou District and differential land benefits increasing, it makes bigger profits from value-added income or illegal sublease for commerce.

### *3.2 Low compensation of land requisition*

The current land requisition compensation standard is primarily based on the provisions of Article 47, Land Administration Law of the People 's Republic of China (2004 revised version): land requisition and compensation refers to the original land use. Because industrial land price is usually not high enough, this means that the land-use right owner may not be satisfied with the price government departments could offer, which also cannot help break the existing solid interest group.

### *3.3 Low illegal cost*

As to such private rental behaviour, the relevant regulatory authorities have difficulties in ascertaining rights and executing the law. In addition, policy easing during the rapid transition period indirectly contributes to such speculation.

### *3.4 Rigid procedure of land-use change with no alternatives*

Normal procedure of changing land use of the existing industrial land needs public bidding, auction or listing. As a result, the land-use right owner who has demand to upgrade their industries will face three “Uncertainty”: Uncertain about the future land cost, uncertain about the possibility of getting the land, and uncertain about the time the project could get started. So, it will take high risks to change industrial land to commercial land through official procedure on the practical level.

### *3.5 High ratio of planned non-profitable land*

Around 40% of the industrial land in the regulatory detailed plan is all or part of non-commercial land (including park, public service facilities, etc.). Therefore, the economic motivation of the government and developers is limited. So is the land requisition compensation.

## 4. Fuzzy Approaches to Industrial Land Conversion in Weak Institutional Environment

*4.1 Government-dominated profit distribution mechanism*

The distribution of benefits and gap between huge speculative arbitrage and low compensation of land requisition are the critical problems to be solved when we talk about exit strategy of industrial land. As to the belonging of the value-added part of land, there are usually three arguments: private benefits, government's benefits or sharing benefits.

On one hand, unauthorized renting by the enterprise itself can be recognized as private benefits, but this doesnot match the land property and business scope. In addition to the existing low FAR, outmoded of buildings and unfit space for commercial needs, the land value has not been fully realized. On the other hand, if we expropriate and redevelop the industrial land with the low price in terms of the Land Management Law, which can be recognized as public benefits，it seems unfair and the land-use right owner will not endorse at all. Therefore, the simple distribution of land value to the private or the public is unfair, inefficient and hard to operate. As a result, only through reasonable benefits balance and promoting efficiency of land use, could our land-use right owners have the initiative and intrinsic motivation to return the land-use right.

Considering the benefit-sharing thoughts (benefits conclude economic, social and cultural value increment), it is advised to take the following two fuzzy compensation models in order to embody the original owner's right of sharing the fruits of redevelopment.

*4.1.1 After-compensation mechanism (for planned land property of the profitable uses)*

In addition to the land compensation in accordance with the standard, the District Government could withdraw an appropriate proportion from land-transferring fees and return it to the original land-use right owner or establish a special fund to encourage reinvestment in Hongkou District.

*4.1.2 Transfer payments (for planned land property of the non-profitable uses)*

In the regulatory detailed plan, a lot of land for public service facilities, green spaces and municipal facilities is planned on these industrial land blocks, resulting in great economic pressure on the implementation level. Hence, it is encouraged to have transfer payments or package sell with planned land of the profitable uses at the district level.

*4.2 Fuzzy exit modes*

*4.2.1 Traditional mode (current mode)*

Take changing land-use property from industrial land to commercial land for example (Weiwei Yu 2008). First, changing land property for commercial use must comply with the master plan, and have the approval of the planning authority. Second, if the changing for commercial use complies with the urban planning, according to the provisions of the current approach to land transfer, the transfer should be open to the public by bid, auction or listing. And the original owner and the buyer will not be allowed to conduct this trade by their own. Third, usual practice is that industrial land user contacts with the local land authority and land-reserving institution makes the reserve, according to the annual purchase and reserve plan.

4.2.2 *Fuzzy modes*

For the various needs of industrial land exit, especially for the enterprises which have a strong willing of self-update, industrial transformation or temporary land-use change, the existing changing process is too rigid with no alternatives, which restricts the initiatives of industrial land exit through a legal channel. Thus it is advised to have multiple fuzzy exit modes for enterprises to choose under fuzzy

policy framework, eventually achieving a win-win situation of the government and enterprises.(Table 1)

Table 1. Comparison of exit modes of industrial land

| | | **Traditional mode** (Bid, auction or listing) | **Fuzzy mode 1** (Enterprise self-update agreements) | **Fuzzy mode 2** (Temporary change of land-use property) |
|---|---|---|---|---|
| **Applicable target** | | -Strong willing to transfer the land | -Self-update demand<br>-No willing to transfer the land by bid, auction or listing | -High historical and cultural value<br>-Strong temporality of land use<br>-No willing to transfer the land |
| **Common character** | | Functional exit of industrial land | | |
| **Difference** | | -Have initiative to transfer land by bid, auction or listing | -Self-update demand<br>-Conditional agreements | -Functional update by utilizing original plant |
| **Land property** | | Change | Change | No change |
| **Building property** | | Change | Change | Change |
| **Structure** | | Change | Change | No change |
| **Property relations** | | Change | No change | No change |
| **Rights of Spiting, transferring and Conducting warrants** | | Yes | No | No |
| **Benefits distribution** | **GOVERNMENT (Land owner)** | -Land transfer fees under new land use by bid, auction or listing.<br>- Subsequent land tax. | -One-time land transfer fees for price difference in according with remaining years.<br>-Subsequent land tax. | -An annual portion of the land fees for temporary change of land-use property in according with land price difference.<br>-Subsequent land tax. |
| | **ENTERPRISE (Land-use right owner)** | Compensation of land, buildings and other fixtures | Income after renovation or reconstruction | Income after renovation |
| **Typical case** | | | China Publishing Blue Bridge Creative Industry Park | 1933 SHANGHAI |

Case 1: China Publishing Blue Bridge Creative Industry Park (enterprise self-update agreements)

The owner of the park is China Book Import and Export Company, one branch of the China Publishing Group in Shanghai. It used its own land and planned a Creative Industry Park oriented by content industry and new media, featured by digital publishing. Formerly known as Shanghai Jing Cheng printing factory, it was primarily used for rental before the transformation. The total area of the park is 31,000 square meters. The occupancy rate of the park was 100% with over 70% industry concentration. Its 2011 annual park operating income was CNY37.85 million, while cultural enterprises' total income was CNY22.19 million.(Figure 5)

Figure 5. Design sketch of China Publishing Blue Bridge Creative Industry Park
Source: http://finance.eastday.com/hdqxb/lq/index.html

Case 2:1933 SHANGHAI (temporary change of land-use property)

Built in 1933, the main building was originally used for slaughter for the Municipal Council with land area of about 15,000 square meters and construction area of 26,300 square meters. It was known as the most modern Far East slaughter field at that time, which was selected as one of the outstanding historical buildings in Shanghai.

The property of the building belongs to the Shanghai Great Wall Biochemical Pharmaceutical Factory. However, the building could only be on lease as a general warehouse before renovation. The total rental income was only about CNY2 million per year. Shanghai Creative Industry Investment Company rented the building with overall CNY10 million yuan a year for 15 years and invested more than CNY70million for renovation, which finally made this unique historic site reborn as a landmark of creative and fashion industry in Shanghai. Economic benefits of the project are quite significant - rental in 2007 reached CNY5yuan per day per square meter, higher than the overall rental level of the North Sichuan Road office area. In the recent years, only the round show site on the third floor of the main building charges more than CNY20million yuan.(Figure 6)

Figure 6. 1933 SHANGHAI and its round show site

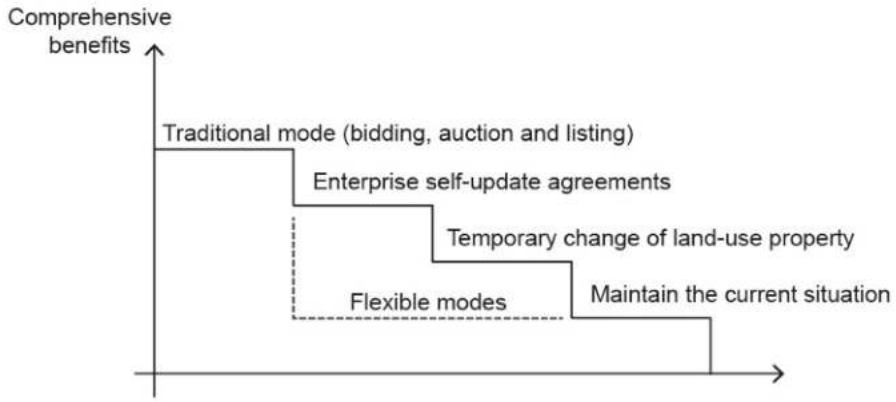

Figure 7. Comprehensive benefits comparison of exit modes

Regardless of the transaction costs and property rights system, the comprehensive benefits of traditional bid, auction and listing is the highest under market mechanism. But in such case, enterprise self-update agreement and temporary change of land-use property are more feasible options than maintaining the current situation. Therefore for Hongkou District, the long-term goal is to abolish the industrial land and accomplish industrial land exit completely. In addition, the short-term goal is to encourage traditional bid, auction or listing by preferential policies or subsidy. In case any difficulties exist, it should be considered toconduct guide according to applicable condition of enterprise self-update agreement and temporary change of land-use property.(Figure 7)

*4.3 Six Priorities*

Due to limited local funds and realistic conditions, Hongkou District is suggested to take exit strategy in turn. Based on industrial land and factory survey table of Hongkou District (2006) and the Twelfth Five-year Plan, the following six types of industrial land should be encouraged to exit by priority compensation.

*4.3.1 Exit priority of Industrial land near key development areas*

Main content about spatial planning of the Twelfth Five-year Plan of the Hongkou District is “one region, one street, one circle" development model: North Bund Shipping Service area achieves major breakthroughs； Sichuan Road business, travel, culture & leisure Street makes new achievements; Dabaishu knowledge innovation and service trade circles developes rapidly. Therefore the industrial land relevant to these three areas should be encouraged to exit first. From the research investigation, the removal process of industrial land in Dabaishu area is at a fast pace and those in radiation circle can be removed step by step; industrial land around North Sichuan Road is relatively less and small but hard to be removed due to high FAR. Considering surrounding traditional urban context and texture, it is suggested to conduct fuzzy mode 2 (temporary change of land-use property); industrial land in North Bund is extensive with high FAR. But considering the long-term income of the North Bund development and high cost of land acquisition compensation in the future, the recent land acquisition seems to be a sensible choice in the medium or long term.(Figure 8)

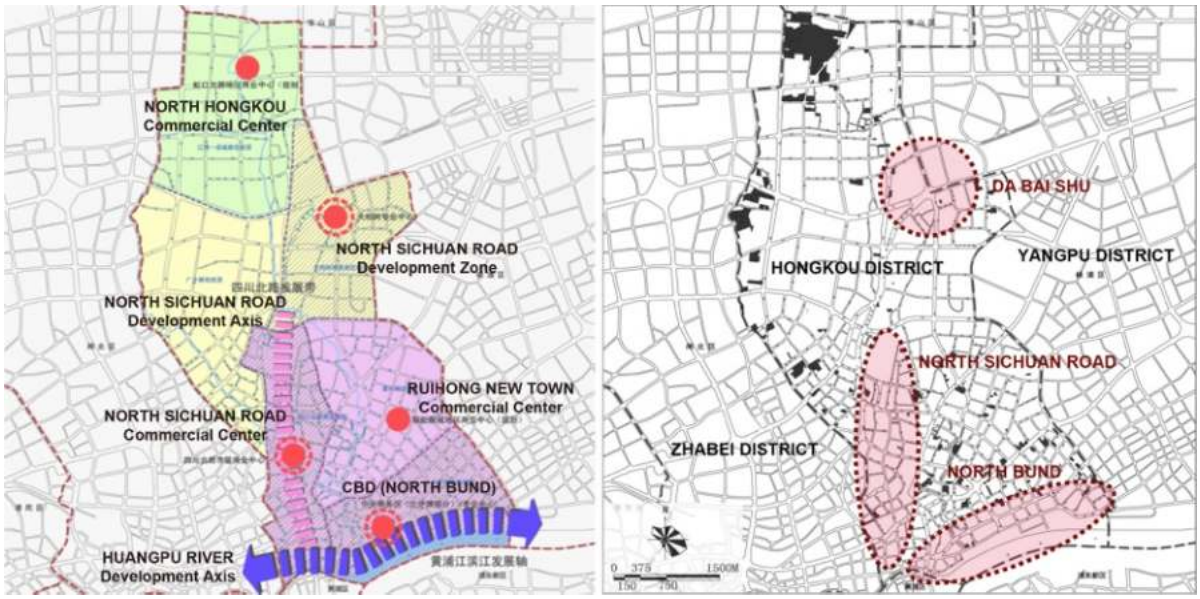

Figure 8. Key development areas and relevant industrial land in Hongkou District
Source: Shanghai Tongji Urban Planning & Design Institute

*4.3.2 Exit priority of larger industrial land*

Due to historical reasons, industrial land property rights in Hongkou District are dispersed and the size of industrial land varies significantly. In addition, from previous experience, small acquired industrial land can not form industrial agglomeration. Thus, from the view of redevelopment, regardless of the demolition or the update of the original plant, a certain land area is the threshold of highly efficient re-use. Priority should be given to large block or a certain land scale after joint land transfer with adjacent block, which may eventually form a tiered compensation system and encourage exit strategy of industrial land along with old residential district renovation (Figure 9 Left) and the municipal facilities relocation (Figure 9 Right) simultaneously.

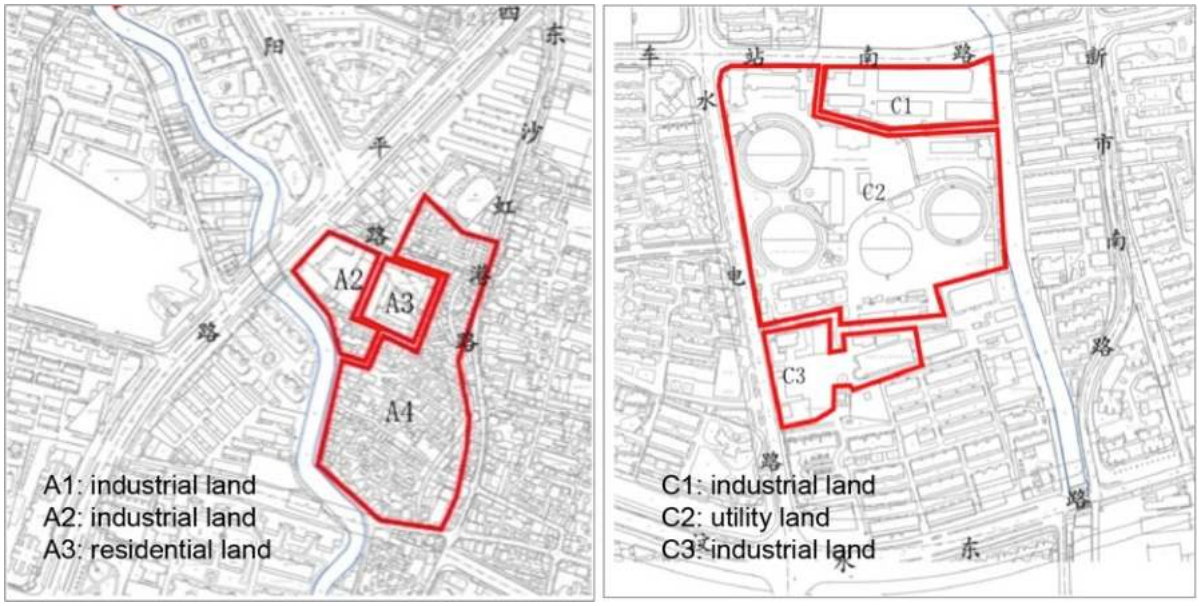

Figure 9. Joint land transfer

*4.3.3 Exit priority of industrial land with poor building quality*

The building ages, initial investments and maintenance managements all make the differences of building quality. Taking economic costs into account, owners of dilapidated flats are generally more willing to transfer the industrial land. In addition, the early-built flats are always with dirty and messy characteristics, which have a big impact on the living environment of residents nearby. Taking Shanghai Huaguang Instrument Factory (Figure 10) for example, after the production ceased, it was used for accommodation and bathing, which had a negative impact on the lives of residents. Later on, it was planned to conduct removal after negotiation by Hongkou District government.

Figure 10. Shanghai Huaguang Instrument Factory

*4.3.4 Exit priority of industrial land with low FAR*

Considering economic feasibility for redevelopment, those industrial land blocksof which original FAR is more than 2 are of low redevelopment economy, so priority should be given to those with lower FAR. The amount of industrial land in Hongkou District with FAR from 0 to1 and 1 to 2 is 53 (31%) and 69 (41%) respectively. Among them, FAR in Jiangwan, Xingang, Guangzhong is generally less than 2, so it is should be prioritized to exit in these areas.

*4.3.5 Exit priority of industrial land controlled by the easy-negotiators*

During the process of the Game and negotiation between government and enterprises, the existing relationship of government level structure makes it difficult or even impossible for the government to negotiate with enterprises with higher or lateral background level. The transaction cost is relatively high in this situation. On the contrary, when government negotiates with enterprises with lower background level, the transaction cost is lower and acquisition is normally easy to conduct. (Figure 11)

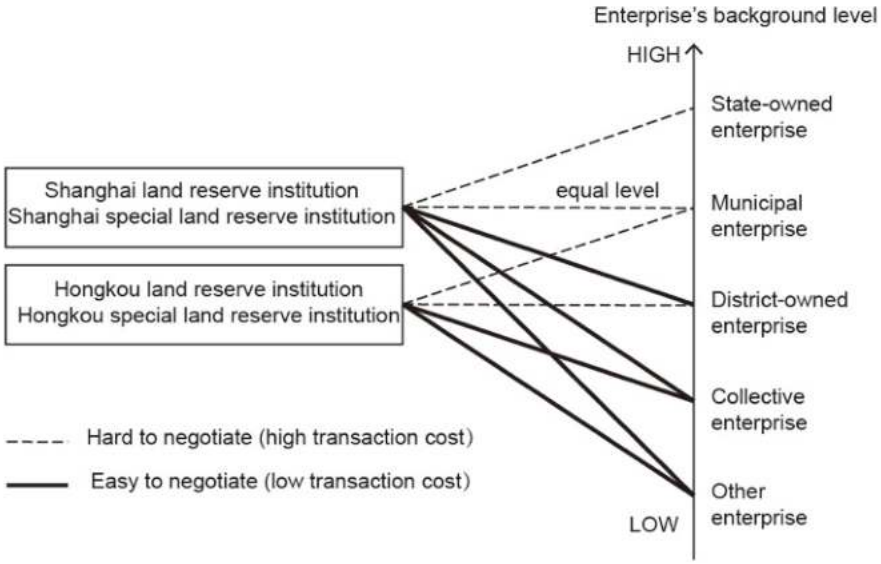

Figure 11. Government-enterprise relations Game from the perspective of administration level

*4.3.6 Exit priority of industrial land with planned commercial projects*

Based on the planned land property from industrial land and factory survey table of Hongkou District (2006) and relevant supporting list, related industrial land is suggested to be transferred first under the principle of "industry development priority and social driving effect priority". In addition, compared with planned non-profitable land, land acquisition compensation of industrial land with planned commercial intention or profitable project is considerable and exit strategy is easy to implement.

*4.4 Regional coordination and cross-district transfers of land*

For enterprise's owners who are willing to reproduce and conduct gradient transfer of industrial land, it has not been relevant preferential policies in Hongkou District to encourage industrial enterprises to be removed from the central area to industrial park. By comparison, some of the suburbs of Shanghai have more abundant land stock and more willingness to import "high, new, top" industrial projects into the industrial park. So, if region coordination and cross-district transfers of land are implemented, huge difference of land stock, land composition and facing problem in every district will be planned as a whole. Meanwhile, for Hongkou District government, this behavior also benefits the negotiation between government and enterprise's owner. Besides, the specific transfer destination should be included 104 industrial blocks mentioned in 2009 Shanghai "two planning in one". (Figure 12)

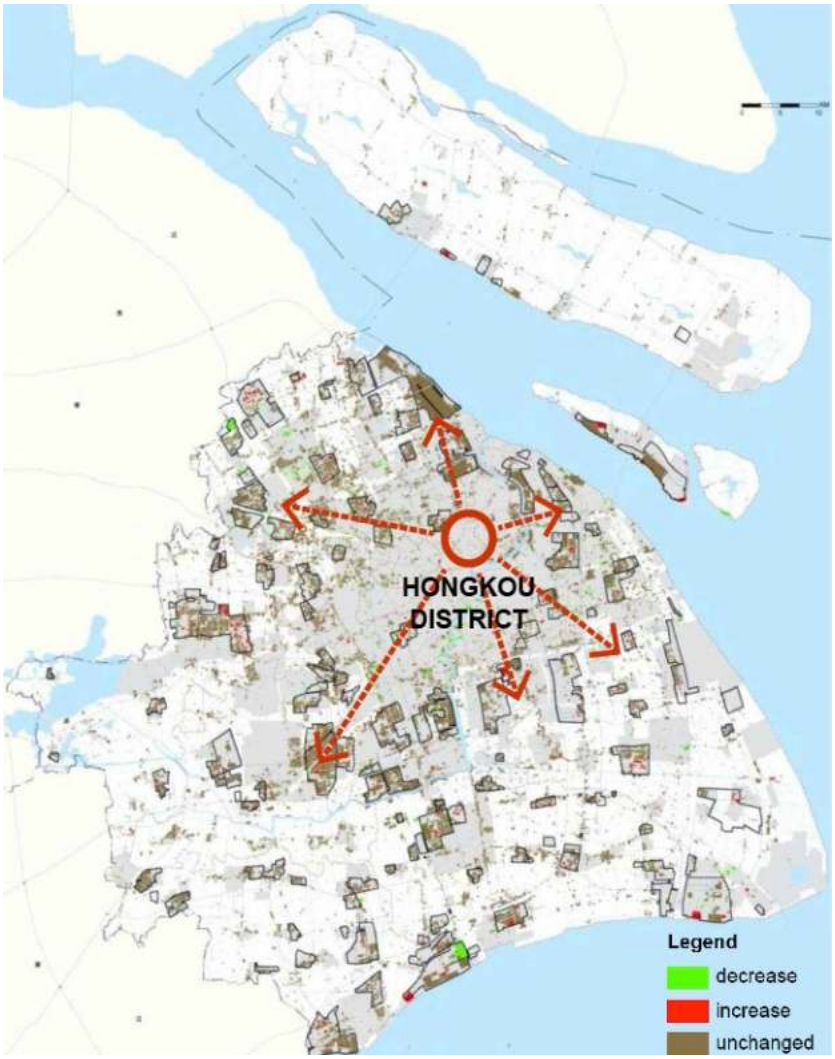

Figure 12. Gradient transfer of industrial land in Hongkou District

4.5 *Regular inspection and public supervision*

*4.5.1 Regular land inspection*

For unauthorized plant rental and lack of supervision, the relevant department of the district government should strengthen the regular land inspection. One is to check whether the enterprise has privately changed land-use property and do business out of the authorized business range. The second is to check whether the enterprise breaks the rules of environmental, safety, health or fire-fighting requirements.

*4.5.2 Public supervision*

The introduction of public report and media exposure should be encouraged to enlarge the channels of supervision in order to reduce the cost of government enforcement and increase the enterprise illegal cost. Since industrial land rental is normally accompanied by a large number of floating population and instability, residents will have enthusiasm and initiative to report illegal rental, which may force residents to be active stakeholders on exit issue of industrial land.

**5. Conclusion**

During the critical period of innovation drive and transition development, whether we can make full use of the limited land resources and explore efficient fuzzy policies, concerning exit strategy of 111

hectares industrial land, is a prerequisite for the future space development in Hongkou District. Only by innovative system and policies, could we break the passive situation of the government nowadays, turning from the passive to the initiative.

Firstly, it is proposed that under the government-dominated profit distribution mechanism, after-compensation and transfer payments should be implemented to promote benefits balance of industrial land exit among the various stakeholders and to ensure initiative of returning the land-use right and intrinsic motivation of cooperation. Secondly, instead of rigid exit mode with no alternatives (only by bid, auction and listing), it is suggested to encourage Fuzzy policies such as enterprise self-update agreement and temporary change of land-use property for various demands of different enterprises. Thirdly, "six priority" strategy should be implemented to ensure Hongkou District to make full use of limited resources and give priority to the development of the most potential industrial land. Fourthly, regional coordination and cross-district transfers of land should be implemented to guarantee the productive land demand of enterprises for further production. Last but not least, it is proposed to combine with regular land inspection and public supervision, in order to restrict enterprise's illegal arbitrage and add government's chips for negotiation.

*Abstract*

*The State contraction is a process that was felt in the 90s of the last century through the modalities of concession and public-private partnerships in response to the deep financial constraints of public institutions either for investments either for the maintenance and operation of their services and equipment. However, the context of serious financial crisis we are experiencing since 2008, particularly in southern European countries, allowed to accelerate the reduction of the State's role without resistance than in previous years had yet been offered.*
*At the local level, this narrative has more precise and deeper aspects, and even areas considered untouchable as urban planning, because it considered that the conditioning of rights and the imposition of responsibilities on owners could only arrive from an entity with democratic legitimacy to eliminate or, at least, make arbitrary decisions an exception, maintaining all the time the public interest over private interest.*
*This communication aims to illustrate, in Portugal, the extent, forms and consequences of outsourcing multifaceted process of urban planning, which now escapes from the democratic legitimacy, which before was considered essential, making it more difficult to discern the separation between private interest and the public interest.*
*The Communication also contributes to the discussion of this process effects on the reduction of costs and public employment, the civic participation, the decision's legitimacy in urban management and the term effects of this change in the future of the territories.*

Keywords: Neoliberalism, urban planning, legitimacy, urban management, Portugal

## 1. Introduction: "Neoliberalisms"

The finding that justifies this communication is that much has been changing in spatial planning policies but the economic, social and political consequences have not, in our view, sufficiently debated. The aim of this paper is, thus, contributing to feed this debate beyond to make a ranking of modalities in Portugal have been taken to dismantle the architecture of adopted planning system until a few years ago.

However, before changes in urban planning occurred other changes had already existed questioning the welfare state and the keynesianist state, removing them gradually from the economy and invading areas traditionally not "commodified". That instrument for the new capitalist relation in society is called "neoliberalism". Harvey (2005) said that "neoliberalism is the intensification of the influence and dominance of capital; it is the elevation of capitalism, as a mode of production, into an ethic, a set of political imperatives, and a cultural logic. It is also a project: a project to strengthen, restore, or, in some cases, constitute anew the power of economic elites" .

It was between 1978 and 1980 which triggered the change with the convergence of events that took epicenter in different parts of the world:

- In 1978, China began its singular path of liberalization of the economy within a totalitarian regime, bringing the country a few decades after the impressive growth rates;
- In 1979, the US began a battle against inflation, regardless of the social costs that this would entail;
- In the same year was elected Prime Minister of UK Margaret Thatcher, with one of its principals objectives curb trade union power (especially miners);
- The following year it was the turn of Ronald Reagan was elected US president, and, with the president of the Federal Reserve, begin an intense process of reducing labor's power, deregulation of economic activity and increase the financial power.

Thios is why "Neoliberalism is, in the first instance, a theory of political economic practices that proposes that human well-being can best be advanced by liberating individual entrepreneurial freedoms and skills within an institutional framework characterized by strong private property rights, free markets, and free trade. The role of the state is to create and preserve an institutional framework appropriate to such practices" (Harvey, 2005, pp. 2).

Deregulation, privatization, and withdrawal of the state from many areas of social provision have been all too common.

And it was in this way that neoliberalism came to the territorial planning.

## 2. The local government as laboratory

The logic of "Less State, Best state" relations between the sphere of public and private are central to the strategy followed in public administration in general and the municipal urban management in particular. The range of possibilities of these relationships is, however, tapered by convergence, both in form and content, the organization of the economic system and the need to compete in a global capitalist market (Jessop, 1997).

Therefore, and starting from this convergence, there is a double link:

- Among the validity of neoliberalism and the consequent need to implement a local administration "minimal", managing more than provisora;
- Among private management as a solution to the problems of municipal urban management and the abdication of the "dictatorship" of public administration.

Neoliberalism thus appears as a viable, seductive and widely accepted solution to the "failure" of the welfare state and the contract of modernist city.
Against this background, and looking recognize the passivity and the slowness of the public administration, this seems bent on copying based business management models now in the 2008 "crisis" hangover are systematically undermined by the economic operators themselves . Some of the recent corporate failures and procedural - detected and disclosed - warn of the risks associated with breakneck attempt firms - such as municipalities - in being globally competitive.

Incidentally, one of the processes by which the Central State is planning to migrate to the minimal state is through the transfer of competencies to the local level. It is not, until now, to have a real business outsourcing is actually a change that could end up there. The program "Aproximar" (Approximate, in english), recently approved, plans to achieve this goal by promoting the extension of decentralization of powers of the Central Government to Local Government.

Local authorities are widely covered in the Portuguese Constitution. Therefore, there is the difficulty in analyzing through a quantitative perspective the effect of minimal state at the local level because the changes that are taking place, and will predictably occur, do not allow serious temporal comparisons when generate-systematic changes in skills that authorities have to meet. The evolution of functions (powers and tasks) based on successive powers of delimitation laws have been made mainly through transfers to the state-owned enterprises; transfers to the private sector (out of the public sphere); and transfers from central to local level.

Figure 1 only want to portray the alternatives that have been studied and tested, at least since the end of nationalization.

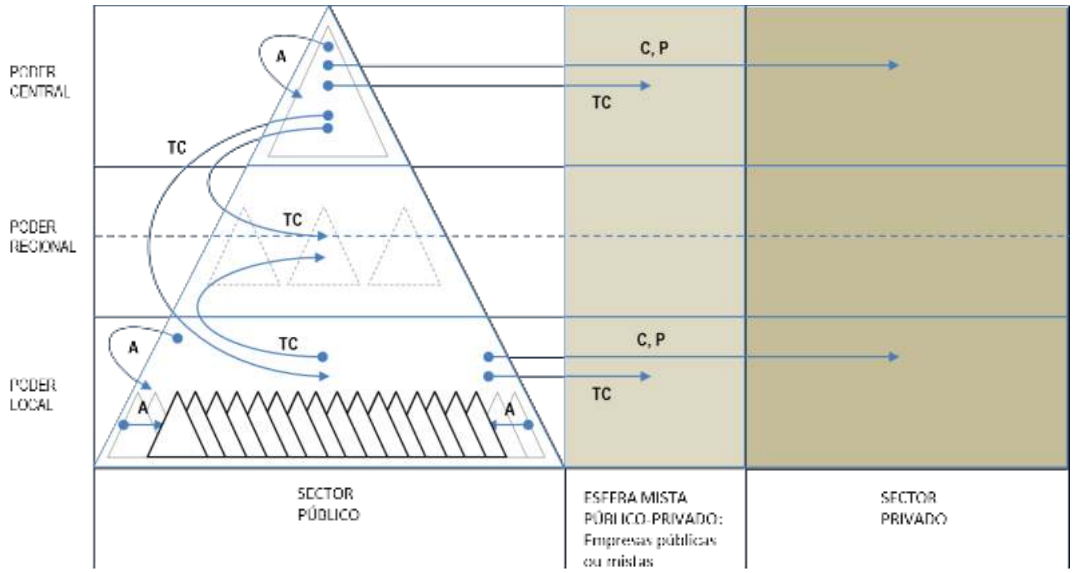

Figure 1. Types of Reconfiguration of the Public Administration

Legend: TC- Transfer of Competences; P- Privatisation; C- concession to private sector;
A- Joining services and / or local authorities or, in the complementary sense, creating new and subdividing.

The rescaling, ie, the adjustment of the state machine with their real capacity, this process can happen both at the administrative level, the applied levels of local government, as the sectoral spreading to more and more areas of activity once secured exclusively the public sector. The basic principle is, maintaining the statutory task, finding less expensive ways to provide the same social responses.

Ferrão et al. (2014) referring most matured process, as with the Big Society in UK, confirm that exists, in the short term, public expenditure decreases when transferring state level services to the private sphere but in the medium term "the transfer of responsibilities to local authorities, communities and individuals, who in most cases lack the financial and human resources and faced with a framework of strong reduction of public support, puts them the burden of having to look for new sources of financing "(p. 175).

Another indelible mark of neoliberalism is trying to make this invisible administrative process for participation and discussion where the deconcentration and decentralization are imposed and justified by the imperative of fiscal restraint: "Started a new municipal cycle, the government should not let isolated reform of parishes, and should open a dialogue with the National Association of Municipalities, aiming at: the institution, preferably with as

much as possible cross-party consensus, a process of reform of open and continuous municipalities, which facilitates and promotes its aggregation; prepare new Central Administration skills transfer process for municipalities and intermunicipal entities: "(...) The program"Approximate", in progress, will help consolidate this ambitious decentralization process. Without prejudice to other areas to be identified by that program should be able to be considered transfers in areas such as education, still under central responsibility, local health services, development contracts and social inclusion, culture, participation in public service network services the State, transport and traffic policing (...) " (Governo de Portugal, 2013).

Incidentally, this imposition occurs not only between different levels of government and between horizontal levels between the various ministries, as can be seen in the ongoing process of rationalization of the supply of equipment, where everyone acted so completely oblivious to what others were cuts also do. It is the effectiveness and economic efficiency to command the transformation of the territory, which can not be denied their relevance would have to be combined first with the various players and later in their relationship with "justice, cohesion and social and territorial development" (Ferrão, 2013, pp. 185).

Analyzing the different laws that defined the reconfiguration skills of Local Government, we can see there has been a cycle of about 15 years on relocation and refinement assignments over time to lower levels of the hierarchy of power going against the satisfaction of the subsidiarity principle. However, the transition of responsibilities to the municipalities no match in funds raises the aggravation of the problem of local finances and correlative strategies to address it.

In the Portuguese case, for now, are 29 municipalities that have a debt higher to three times the average of the current net revenue in the last three years and, therefore, are forced to use the Municipal Support Fund approved in 2014. For the 23 municipalities whose debt is between 225% and 300% the feature is optional required getting the same to adopt a financial recovery plan. It is understood, so the temptation to look at the municipal level to outsource services traditionally offered by the public sector but with the risk that, over time, to check the worsening financial situation because they were not evaluated all the consequences of those decisions. It is, moreover, why Peck (2004) states "the financial crisis of 2008 and the wave of municipal insolvencies que have occurred in its wake have thrust a new generation of 'model cities' into the spotlight" (p. 36). Emerged already emblematic cases of cities where there is an almost complete privatization of municipal services.

## 3. Spatial planning in a dangerous times

Spatial and land use planning are the answer to “the problem of coordination or integration of the spatial dimension of sectoral policies through a territorially-based strategy” (Cullingworth and Nadin, 2006:91). But spatial planning is also the result of the application to the territory of a wide-ranging set of values of a specific society in a specific moment in time, as many authors have shown, both from a positive perspective (Alexander et al., 2012; Friedmann, 2011; Davidoff, 1965; Harper and Stein, 2006) and from a more critical viewpoint (Fainstein 2010; Yiftachel 1998).

In this historical and social trajectory between the definition of rules and the perception of the difficulties involved, awareness of the need for change does not emerge during the tendentially conservative planning process (Alexander et al., 2012; Santos, 1998; Moroni, 2010), but in the moment in which the inefficiencies, perversities and inadequacies generated by the process become intolerable (McClymont 2011). Spatial planning thus reveals itself as the imposition of a socio-spatial order that is continually challenged by the tensions it creates for the various stakeholders involved.

But these questions on the principles and processes of spatial planning have not emerged out of the blue. The world has been marked, albeit unequally, in recent decades by the passage from a regulated economic and financial system to a different form that is highly flexible and in which the states' power of control over financial processes is greatly reduced. These financial processes in turn take on the role of influencers of policies (and politics), society and the economy (Harvey 2000, 2010; Jessop 2008; McCarthy and Prudham 2004).

This generalized change has manifested itself in various areas and spatial planning has not been an exception. The linear and pre-determined future proposed by the rationalist paradigm has lost credibility and, with it, the spatial planning that was associated with it, understood as a process that was continuous (development, execution and assessment) and cyclical (restarting at the end of the period of validity or due to structural changes in the objectives or the context) (Pereira, 2009).

The shift away from a Keynesian social model to a Neoliberal model that has been abundantly characterized elsewhere (Harvey, 2013; Waley, 2013; Kamel, 2012; Albrechts, 1992) is reflected, in spatial planning terms, in the changes in terms of the content, methodology and objectives of planning instruments (Sager, 2011; Prato, 2007).

Thus, it is common to find references to the current weaknesses of the public regulated spatial planning system and the emergence of trends that seek to reformulate it. Lovering (2010) very clearly stresses that the "'Neoliberal turn' was reflected in, and in turn encouraged by, the reinvention of planning as a service to special interests, especially property owners and boosterist politicians. Discursively, this led to a new orthodoxy focused on the vacuous (but politically useful) concept of 'competitiveness'" (Lovering, 2010:1).

There would thus seem to be no doubts that land use management that once derived from rationalist, technocratic and regulatory planning (McLoughlin, 1969; Faludi, 1973) is today subject to enormous pressure as a result of the diminished role of the State in relation to the power of employment and competitiveness that is only guaranteed, in the Neoliberal view of things, by the market and the private sector (Pereira, 2009).

This increased competitiveness is essentially achieved by bypassing the traditional planning processes, which are considered too rigid and formal, in order to achieve better capital turnover rates (Peck, Theodore, and Brenner 2010). There thus begin to merge more clearly the principles of change, first and foremost the idea that planning should be a circular (continuous), participative (open) and prospective process (the future as uncertainty and construction) (Fernandez-Guell, 2006).

In the following the three principal sets of strategies that have been developed to achieve this are identified:

i. due to limited resources, there is an openness on the part of the public system to the possibility of developing some planning instruments with the active participation of the stakeholders, both in terms of financing the processes and conducting them (Moroni, 2010; Waley, 2013; Lovering, 2010), whilst requiring compliance with all the legally imposed rules and, in particular, the monitoring, appraisal and approval by the relevant public authorities;
ii. the development of instruments for spatial and sectorial planning that are not regulated by any legal framework. They are therefore not subject to any rules other than those defined by the developers and partners. Given these characteristics, it has become common to refer to his trend as alternative planning (Ferrão 2011; Gonçalves 2010). Indeed, the restrictions applied by the classic spatial planning process, which is very much marked by the capacity for leadership and realization

by the public sector, has rendered it necessary to come up with alternatives expeditely and, at the same time, to bring to this new context the stakeholders that can conduct it and, more importantly, implement it. Strategic plans are perhaps the instrument that best illustrate this form of "tailor-made" planning by the partners involved in their development, but several others can also be identified (De la Espriella, 2007; Todes, 2012). In this process usually exists, beyond stakeholder's involvement, an intense citizen participation to inform, validate and legitimize the Plan. Throughout its implementation by stakeholders the community should be informed of the degree of implementation of the Plan and there are regular public sessions for Strategic Plan monitoring and evaluation.

iii. the increased incorporation of the strategic component in spatial planning carried out by public authorities, which now also has increased legitimacy by means of a process of consultation and participation of the agents of change in diverse areas of local life (Albrechts, 1992, 2006, 2012). This is a hybrid spatial planning model in which the general principles of the development of strategic spatial planning instruments (particularly with regards to their methodology for defining targets and the discussion and perfecting of them together with the local private, associative and public stakeholders) are retained. Citizen participation in spatial plans is usually confined to special moments (before the beginning and end of the plan) although there are cases where municipalities lead the discussion of the strategy to the inhabitants. It announces the transition from a hard planning process (one that is very regulated and centralized) to a soft planning process (i.e. consensus-based and agilized).

We must call attention to that between ii. and iii. there are very important differences that can never be undone. Firstly, because the strategic plans are indicative only, depending on its implementation mainly on the willingness of its promoters. In the case of spatial planning their rules have to be strictly respected because it is binding. Secondly, strategic planning can only be achieved over a wide time scale (15, 20 or more years) through a good and sectorial integration (social, environmental, territorial and economic) supported by local and sometimes regional and national stakeholders. In spatial planning we can not see this dynamic because it is traditionally a more passive process. Finally, a very important difference relates to the obligation to draw up the special plan unlike the strategic plan that is optional. Therefore, in the absence of a strategic plan to support the spatial plan is very important to strengthen this strategy.

The tensions that generate change, the principles that characterise that change and the forms it takes seem to configure the emergence, in Healey's (1997) view, of a systemic institutional design for collaborative planning where it is possible to integrate the role of the stakeholders (soft dimension) into the already existing formal planning system (hard dimension).

For this reason it is likewise necessary to take into consideration the practice and legitimacy of governance, which is understood as a set of mechanisms and relationships between public and private entities and associations capable of generating and managing policies and actions for the territorial context (Asher, 1995). It is evident that the openness of the public bodies and the level of development and commitment of civil society will have an effect as to the difficulty or ease of applying this more cooperative system.

With the affirmation of neoliberalism being reflected in the growing commercialisation of all aspects of daily life (Luxton & Braedley, 2010), a trends that goes hand in hand with a corresponding reduction of the State's role and its influence and decision-making role, matters related to the involvement of citizens in the decision-making process have also undergone change.

However, problems began to merge in organising the pillars of participatory democracy, given that civil society had become apathetic over the lengthy period in which the role of the State was dominant. When participatory democracy finally developed, it ended up not generating the desired effects (Swyngedouw, 2010 and Swyngedouw, 2011). In the case of the collaborative planning paradigm the literature has highlighted how Neoliberalism has made use of this situation to "maintain existing power relations, protect market-centric state agenda, annul possibilities of counter-hegemonic developments and therefore consolidate the current post-political condition of neoliberal governance" (Roy, 2015:59).

A weakened and pliable State and easily manipulable public participation, even if the latter maintains the outward appearance of a credible instrument, are the perfect context for guaranteeing maintenance and even strengthening the hegemonic power held by Neoliberal entities, both public and private (Swyngedouw, 2009).

Things such as public-private partnerships, urban governance and involvement of residents have come to dominate spatial planning processes, becoming a way of agilising the realisation of investment and spatial transformation plans, leading to the emergence of the romantic idea of a side-by-side approach instead of bottom-up processes (the interest-free and collaborative convergence of all stakeholders). This has enabled large-scale urban projects to effectively circumvent the formal planning system frequently and escape the tight control over spatial planning and the public and political scrutiny that the planning process would require (Swyngedouw et al. 2002). The problem has been that the methodology applied for the involvement of the public has steered towards assuming deliberative capacity. Cases of participatory budgets would seem to indicate a move in this direction (Fung, 2006).

This situation demonstrates that collaborative planning and its new rules, by partly replacing representative powers derived from the electoral process, only appears to empower people to make decision on their everyday spaces. In reality, however, it has proven to "not only [be] incapable of resisting neoliberal hegemony, but can potentially help reinforce it" (Roy, 2015:60).

These trends have been accompanied by other trends taking us in the same direction. The growing importance of informal planning (Gonçalves, 2003; Ferrão, 2011), which includes, by way of example, strategic plans for cities and municipalities, is explained by an also growing difficulty on the part of spatial planning to respond to the galloping demands of investors seeking to accelerate their capital turnover, which so frequently gets stuck in the red tape and constraints of the formal process.

This is a time of the assertion of financial might and the weakening of public powers. This is a time of a shift from a Keynesian economic model to a Neoliberal model (Kamel, 2012; Albrechts, 1992, Harvey, 2013; Waley, 2013), with the corresponding impacts on the contents, methods and objectives of planning (Sager, 2011; Prato, 2007).

This development manifests the current deficiencies of the planning system and the emergence of forces aimed at reformulating it. Lovering argues that Neoliberalism has brought about a reinvention of planning in the service of special interests – in particular those of investors and politicians. The focus has more or less always been on the private sector, but the new Neoliberal wave has also affected the public sector, which is reflected in the multiplication of municipal companies and other corporate forms to carry out, with supposedly greater efficiency, what was once public or state responsibilities, the main consequence of which has been the loss of public control of spatial transformation.

In the public discourse, this reinvention has led to the emergence of a new orthodoxy focused on the politically useful concept of "competitiveness" (Lovering, 2010).

There would seem to be no doubt that traditional rationalistic, technocratic and regulatory land use management (McLoughlin, 1969; Faludi, 1973) is today subject to a great amount of pressure as a result of the diminution of the role of the State vis-à-vis the power of job creation and competitiveness, which can only be guaranteed, according to the Neoliberal point of view, by the market and the private sector (Pereira, 2009).

This competitiveness requirement is met by circumventing the traditional planning processes, which are deemed too rigid and formal (Peck et al., 2010). The signs of change then emerge more clearly in the form of the idea that planning should be continuous, participatory and prospective (Fernandez-Guell, 2006).

We are thus heading towards a post-political or post-democratic scenario, where collective interests can be better protected through new forms of urban governance (Mouffe, 2005). For this reason one can easily argue that whilst "debate and disagreement is possible within these post-political/post-democratic governance arrangements, they operate (without questioning) within the given hegemonic socio-political and economic context" (Roy, 2015:61).

This consensus around the much celebrated economic growth, supported by a growing number of local governments oriented towards entrepreneurism, job creation and competitiveness, has led to this paradigm of post-political urban citizens being able to establish itself without much resistance (MacLeod, 2011).

## 4. Urban planning at a local scale

### 4.1. General framework

Both in Portugal and in the European Union the local expenditure weight in relation to total public expenditure keeps on average virtually unchanged in the last five / six years being the difference between the weight of this expenditure in Portugal (around 15 %) and the EU (around 24%) also keeps unchanged since 2007. This measure, not telling us anything about the transformation process at local stresses, however, the degree of departure from the Portuguese reality in the face of European and, in particular, the difficulty of national authorities cope with assignments that do not walk away from that exist in Europe but with far fewer resources.

One way we tried to organize the municipal action was by externalization via local business sector. After a huge boom in structures of this nature, the weight of services and/or given competencies to municipal services and/or municipal/intermunicipal services companies has decreased very significantly in the last five years.

In late 2014, the number of these entities will be substantially 30% lower than in 2009 (less 100 entities). The most significant reduction there is in local companies of which were dissolved in 2013 and in dissolution process 67 entities. The lack of profitability of these entities and the proliferation of cases where not treated more than financial engineering processes to subtract the control of municipal assemblies surveillance of some investments and expenditures led to the bankruptcy of this idea.

In fact, the difficulty of adjustment is evident in Figure 2 where the sharp fall in employment in the central public sector has not matched pattern identical on site sector where the decrease is very slight or when we focus on the amounts (Table 1). The multiplication of municipal companies and other bodies not served to shrink, in fact, local governments being many of these workers on mobility schemes.

| 2006 | 4 223 433 | 2 029 672 | 1 421 601 | 129 395 | 103 432 | 2 385 211 | 1 993 444 | 118 955 | 236 308 |
| 2007 | 4 595 746 | 2 075 006 | 1 626 900 | 182 481 | 116 268 | 2 393 495 | 1 990 876 | 124 315 | 256 170 |
| 2008 | 4 932 136 | 2 154 478 | 1 782 719 | 224 735 | 127 292 | 2 558 468 | 2 089 509 | 147 316 | 277 857 |
| 2009 | 5 260 870 | 2 397 839 | 1 859 620 | 189 195 | 135 397 | 2 598 602 | 2 065 336 | 182 872 | 250 408 |
| 2010 | 5 037 017 | 2 451 019 | 1 731 123 | 104 681 | 132 176 | 2 227 304 | 1 782 319 | 129 674 | 247 425 |
| **2011** | **5 032 643** | **2 365 017** | **1 789 426** | **141 517** | **135 274** | **2 042 387** | **1 670 162** | **115 234** | **219 944** |

Source: INE, 2013

The fact is that the delay in implementing the reduction in public employment has not made impossible the contraction in spending (by imposing new limits on municipal debt and a reduction of the wage bill) and the increase in revenues from new taxes, new values to existing rates and even the very slight decrease in revenue from existing taxes and that accrue to the local authorities. It is noteworthy that since 2008 (the year associated with the beginning of the "crisis"), and despite a marked decrease in urban dynamics (urbanization processes, licensing of buildings and real estate transactions) taxes derived from real estate (property taxes (IMI) and Council Tax Transactions (IMT)) hardly decreased. The justification for this apparent contradiction lies largely in the recent review process of these taxes has meant a gradual increase in their nominal value.

This indicates the distance between two processes in the Portuguese Municipalities: the reconfiguration of the skills intended to be accelerated and the reconfiguration of the funding

system that remains unchanged since it is evident, even in a deep period of low activity related the universe of "construction", which own revenues continue to strongly result from this universe. This growth in expenditure on goods and services in the municipalities in financial contraction period can prove lack of resources and internal expertise to perform some of the tasks. Clearly the universe well beyond the urban field but this will also be one of the net contributors.

## 4.2. Outsourcing in territorial Planning: Causes and modalities

If so far only sought to establish a global framework for transformation of the state to the local level, is justified at this point a similar breath of reflection for urban planning. And in fact, dismantling the structure of the municipal urban and regional planning has undergone a remarkable set of loose but usually convergent strategies in its effects:

**Human resources structure.** The structure of municipal human resources and especially their poor qualification in the field of urban planning does not allow them to start properly carrying out studies and territorial plans and even assess and monitor their performance. Even in the case of larger municipalities is often this be done by outsourcing this kind of specialized work;

**Outsourcing services.** It occurs for the reasons stated above and for other reasons specific times. This hiring plans and projects to outside entities is a practice that does not expand the staff but implies gains and losses: can be achieved effectiveness in achieving and external incorporation of knowledge but at the same time does not contribute to the development internal skills and not allow a sufficient degree of monitoring of the work of external teams;

**Development of instruments and studies by stakeholders.** The law allows individuals, interested in urban development in a given area (or even in urban regeneration processes), producing, in compliance with the current regulations and under monitoring by the competent authorities, the IGT and necessary studies. This question incorporates large areas still poorly defined because the respect for the rules does not mean immediate respect for the collective interest and the monitoring of consistency is very dependent on the available resources;

**Preparation of informal planning studies.** The preparation of studies and tools that do not directly affect the materials of urban management but have on it a significant effect determines the creation of an informal system of planning and management. And these effects are mainly one-way, ie, urban planning is only designed to conform with the strategic, economic and political guidelines, stripping it of the role it once had in municipal management. These non-formal documents for its specificity, importance to the sound advice of private investment and to ensure compliance with planning tools (often supporting applications to obtain EU funds) are often acquired externally to ensure more experienced teams and better results. May have the consequence of not internalize an important competence with direct influence on the efficient execution of plans especially when it is intended to guide private action;

**Urban Management Companies.** These municipal enterprises were created locally to accelerate the model of economic growth and social development, considering that when undertaken directly by the local administration did not provide the best answer to the needs of urban management (urban cleaning service, public green spaces maintenance, etc.). A major problem is their type of management that has so far generated, in general, huge financial problems even using the human and material resources of the municipality.

# Primeira falência de uma empresa municipal abre porta a novos casos

LÍGIA SIMÕES E PAULA CRAVINA DE SOUSA
13 Mar 2015

**Tribunal de Amarante decretou a primeira falência de uma empresa municipal. A Câmara de Paços de Ferreira, que detinha a PFR a 100%, não vai assumir a dívida.**

Está em curso o primeiro processo de insolvência de uma empresa municipal, abrindo um precedente no que toca à

Figure 3. Recent news (March 13, 2015) about the bankruptcy of an urban management company Paços de Ferreira

**Society of Urban rehabilitation Companies (SRU).**
When a company of the local business sector has as exclusive purpose the urban rehabilitation operations management adopts this designation. The DL 104/2004 of 7 May and the Law 32/2012, of August 14 makes it clear transfers of municipal competencies for a business entity of the local sector of the urban licensing processes in areas subject to urban renewal and even enforcement of the obligation to rehabilitate and enforcement works, among others.

The transfer of powers of this type and in this way could then move on to a different scale city which can not in itself negative. The role of SRU turns out to still exceed the legal texts to take, as stated Silva (2007), that "urban renewal is an urban policy that seeks the rehabilitation of the existing city, developing multiple intervention strategies, which give rise to a set coherent actions and programmatically, aimed at maximizing the socio-economic, environmental and functional values of certain urban areas, in order to raise the quality of life of local residents, improving the physical conditions of their building stock, habitability levels and endowment in community facilities, infrastructure, facilities and public spaces. "For this works by using Base studies that are not foreseen in the legal framework and eventually justify the delimitation of areas of priority intervention, the methodology and the means to be called for that purpose.

They are therefore both diagnostic instruments and norms. The depth of this diagnosis ends up legitimizing "intervention strategies that can encompass several aspects from the definition of housing types to develop, to identify potential partners, through the definition of target markets and the level of infrastructure needs. These studies base takes different forms and is sometimes the responsibility of the SRU's own, sometimes from outside entities hired for this purpose "(Floret, 2009).

Remind also that these entities can hire the procurement of goods and services will therefore be to admit that the licensing process can be awarded to private entities.

**Intermunicipal communities (CIM).**
The article 81 of Law No. 75/2013 of 12 September establishes the tasks of the Intermunicipal Communities. Its objectives also make clear its relevance in these matters addressed here: "The intermunicipal communities are for the pursuit of the following public purposes:

a) Promoting the planning and management of economic development strategy, social and environmental dimensions of territory covered
b) Articulation of municipal investment intermunicipal interest;
c) Participation in the management of support for regional development programs, particularly in the context of the NSRF;
d) Planning of actions of public authorities, in supra-municipal character"

Almost all assignments have a direct or indirect involvement in territorial matter and urban as it is for the intermunicipal communities ensure coordination of actions between municipalities and government departments in the following areas:

a) public supply networks, sanitation facilities basic treatment of waste waters and municipal waste;
b) Network health equipment;
c) Network educational and vocational training;
d) land use, conservation of nature and natural resources;
e) Security and civil protection;
f) Mobility and transport;
g) equipment procurement networks;
h) promotion of economic, social and cultural;
i) Network of cultural facilities, sports and leisure.

**POLIS Societies**
The Polis Programme - Programme of Urban Rehabilitation and Environmental Improvement of Cities - was created by the Ministry of Environment and Spatial Planning in 2001. Its main objective is to improve the quality of life in cities, by performing a set of urban redevelopment and environmental enhancement operations, developed based on partnerships between local authorities and central government.
The idea was fundamentally expedite rehabilitation interventions and rehabilitation of public spaces in various aspects including the riverfront, which typically involve different types of actors, negotiation, different degrees of commitment and fundamentally urban redevelopment projects.

It is recognized the diversity and persistence of the program (taking up various legal settings) watch out immediately in the design of purpose: "The Polis Program aims requalify Portuguese cities ... on partnerships between city councils and the state. Not intended to be an instrument to solve all environmental and urban problems, Polis has been designed to have a demonstration effect of what you need to change and simultaneously provide a local and regional development engine, consolidating and strengthening the National Urban System ".

Assuming the goodness of the Programme purpose is nonetheless symptomatic that they are framed in a specific way and confined to specific territorial areas and not common denominator to all the urban territory. Moreover, the fact has become necessary to achieve these purposes, the application of a set of exceptional regimes thus making it clear that there, at that time, two urban management schemes, "the Polis territories" and "others. "

These "territories Polis" were constituted a set of enforcement tools based mainly on two vectors: the public-public partnerships and the empowerment of territorial planning and urban management of these "territories" from the rest municipality:

Urban Intervention Instrument - it was decided that the urban redevelopment would be preceded by a Strategic Plan, and made through Urbanization Plans, or Detailed Plans.

Business Instruments - generally were created entities with legal, constituted with the majority interest of the State and the participation of local authorities involved.

filing Instruments with the municipalities - essential in order to substantiate the relationship between local authorities and central government MAOT.

structure and management tools - creating a dynamic structure and monitoring of the Polis Program, known as Office Coordinator of the Polis Programme and working in parallel to the internal services of municipalities.

legal instruments - were created a set of documents necessary for the smooth implementation of the program and thus created an exceptional regime.

**Potential projects of National Interest (PIN).**

As the Polis program, also called PIN initiative on (national interest projects) laid the design and implementation in structuring a regime that has a direct impact both on territorial planning and urban management at the local level.

the PIN of the case is a special case where the Central Administration avoca to you, (instead of Local Government) the power to assess and authorize a certain private initiative investment, for obvious national interest, which runs out to the materialization investment. Although outsourcing to private projects of interest to which it is also recognized an alleged national interest has limited duration territorial consequences at the local level can have on very long-lasting rule;

Given this analysis and survey it is legitimate to consider that we can find three types of outsourcing situations of central government services (Figure 3):

**i. Timely Outsourcing services**

The production / delivery of the good or service is outsourced planning for the private sector or other levels of administration for a short period or too short by contracting it can, however, be renewed; PIN is a special case where the Central Administration avoca to you, (instead of Local Government) the power to assess and authorize a certain private initiative investment, for obvious national interest, which runs out to the materialization investment. Although outsourcing to private projects of interest to which it is also recognized an alleged national interest has limited duration territorial consequences at the local level can have on very long-lasting rule;

**ii. outsourcing extended**

Outsourcing skills for mixed entities, whose justification is based on the complexity of the project and the need for agility. It can be prolonged, depending on the nature of the projects in question, but it is not permanent (POLIS, SRU);

**iii. permanent outsourcing**

It is an externalization of responsibilities to public bodies, municipal or possibly supra-local for the purpose of more operational management (in the case of Municipal Services) or articulation of actions and investment, lasting which is expected very prolonged or even permanent (CIM) and is equivalent in practice to an effective transfer of skills.

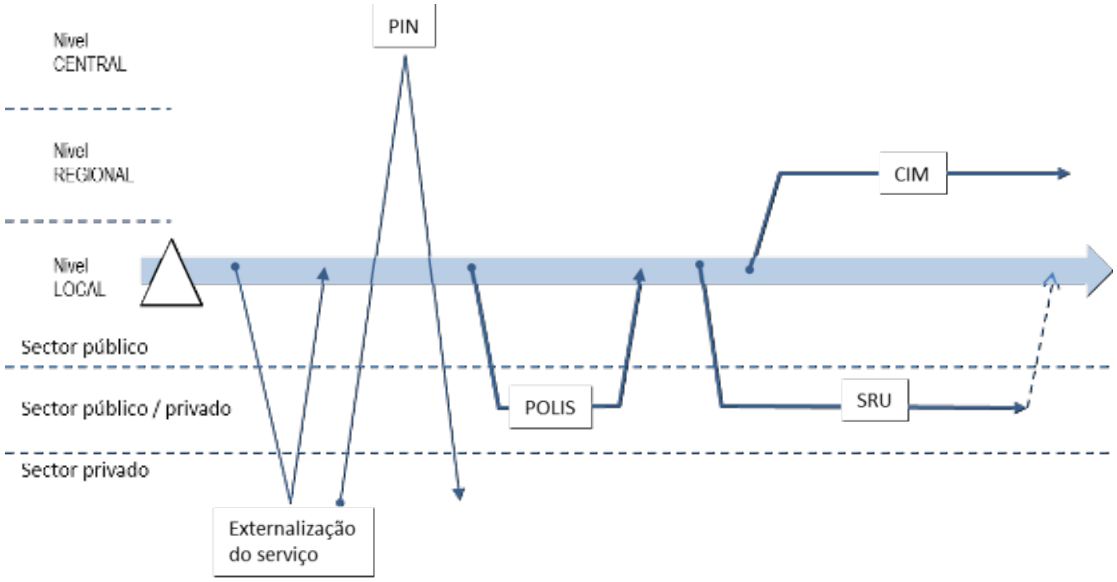

Figure 3. Outsourcing arrangements and respective territorial levels

## 5. Conclusions

Outsourcing is here seen as the key brand of neoliberalism presence in territorial planning. Its justification under the general principle that almost everything can be commodified and thus commodified. Not only expand the economic opportunities for domains before sealed as promotes another fundamental principle that is the diminuiçãoo the power of intervençãoo public administration, reducing her skills and resources.

This exit, slow but progressive, raises other questions and in particular on: the quality of territorial management; the fulfillment of the objective of reducing the state machine; the regulatory role of the state; the renewed role of public involvement.

We could not, of course, discuss all these materials, or for those who were selcionadas the intensity was similar but this is a work in progress for what we believe to have given very assertive and important steps for the future.

Thus it was confirmed from the Portuguese experience, the existence of a wide range of modalities followed by central and local government to subtract urban planning to bureaucratic control but legitimized techniques and machines to traditional policies. The justifications can spend or lack of agility (which can can carry risks of private investment losses) or the limited financial and technical resources (which justifies the adoption of private solutions or at least external).

All these transformations have come up with a repeated political and economic argument but it's been hard to counter and that is the lack of an alternative to the imperative of economic rationality and freedom of markets. This lack of alternatives continues to sow the neoliberal practices in land management has nevertheless effects far more funds coming to question the democratic system itself. If this is based on the idea that there are alternatives that ultimately are not credible or are even absent then the sitema can collapse. So the idea is gaining breath the city post-polítca or post-democratic, that is, the city one way: the neoliberalism.

Keywords: Metropolitan Planning, Transport Planning, Institutional decision- making

*Our paper examines the differences between institutional bases and metropolitan scale transportation planning in Helsinki, Finland and Melbourne, Australia. The starting point of the exploration is two transportation studies on opposite sides of the world in the late 1960's by Wilbur Smith & Associates. The Helsinki Metropolitan Transportation Study (1968) and the Melbourne Transportation Study (1969) were produced simultaneously from an almost identical value base. Not only the starting point of the studies, but also their structures, were strikingly similar. All modes of transportation (Cars and Trucks, Heavy Rail, and Buses and Trams) were analysed as a part of a metropolitan long-term development plan and even the proposed freeway/highway system follows the same, more elongated grid-like pattern rather than the currently popular orbital pattern. Differences can be found in the emphases of the work carried out. The Helsinki study is characterized by major restructuring of the highway system, while the Melbourne study appears to focus more clearly on the parking and public transportation side. Since this time the development of these cities has taken different courses. We take a closer look at the key points of decision-making, the institutional characteristics of the planning system and important differences in the starting points. By so doing we seek to understand the uncertainties, dynamics and path-dependency which evidently form the gaps in rational planning studies and systems.*

## 1. Introduction

What stimulated this research was our understanding of public transport accessibility in Helsinki and Melbourne in 2014. We discovered that Helsinki was a leader in delivering a world class public transport system, whereas Melbourne truly the poor cousin. Helsinki provides a public transport network coverage that serves 83% of its population, compared to 46.8% in Melbourne (Curtis and Scheurer – see www.snamuts.com). This prompted us to question how metropolitan transport planning, and its associated institutional base, had influenced this outcome. The starting point of our research is the finding that both cities were subjects of major transportation studies conducted in the late 1960s by Wilbur Smith and Associates, the American consultants. Our questions were – how similar were these studies in character, value base and with regard to existing spatial plans and configuration. How influential was the transportation approach alien to both countries, at that time and now? While this sets us a large research agenda, in this paper we focus only on an examination of the two transportation studies.

There are, and have been, differences in the sheer sizes of the two metropolitan regions and the geographical boundary conditions. The Helsinki study covered some 300 km and the Melbourne study some 500 km of freeway structures across the respective areas (in Melbourne 464 km of other arterial roads were proposed in addition to the freeways). Melbourne is roughly three times the size of Helsinki in terms of population. In the mid 1960s Helsinki had 640 thousand and Melbourne 2 million inhabitants (WSPP 1968, 131). Today the cities are twice as big, but the proportion is roughly the same: the Helsinki study area contains about 1.1 million and Melbourne some 4 million inhabitants. Despite the fact that the Helsinki CBD is located on a peninsula and Melbourne in the centre of a bay, both study areas are roughly semi-circular in shape. The extent of each city's urban development area in the 1960s plans was 77,021 ha in Helsinki and 116,550 ha in Melbourne (MTC 1969). Despite many similarities, in the late 1960s transportation planning in these metropolitan regions developed quite differently.

**Figure 1. Urban structure of present-day Helsinki and Melbourne** (Modified from Google Maps)

Despite quite obvious differences in the size of the cities, the transportation studies contain striking similarities – likely the result of having been accomplished at around the same time. Both of the proposed transportation plans are formed of a large scale grid of motor and expressways of roughly 5-8 km net size. It is also noteworthy that both studies included an extensive public transportation plan, by far more ambitious than what seems to have been implemented. In the Helsinki study the public transportation plans reflect the work of the Helsinki Metro Planning Office since the late 1950's. Melbourne was already well-supplied with an extensive radial rail network by the end of the 1880s, built ahead of urban development (Mees 2000). The plans included electrification, new express tracks, duplication of single track lines, three new rail lines and the extension of existing lines, together with a CBD underground loop (MTC, 1969). Like Helsinki, some of these proposals had been mooted many years earlier.

The years following the completion of these transportation studies also resemble each other. The studies were completed at the dawn of global political activity against freeway-building. In 1973, inner-city sections of the Melbourne plan were removed (Morton 2014; Mees 2010) and the same happened to the Kuningasavenue/Vapaudenkatu section in central Helsinki a few years later. The era was characterized by massive public transportation investments in the inner city. The Melbourne study introduced the Melbourne Underground Rail Loop that was completed by 1981 and the Helsinki study proposal included a similar circular connection compiled from several intersecting metro lines. For the past 15 years Helsinki has been planning its own loop – Pisararata (*droprail*) – to operate commuter trains under the CBD.

Yet the implementation of the public transport system was slow. In Helsinki the first line towards the east from the CBD was opened in August 1982 after a 13-year construction period. In Melbourne the development was hardly any faster with the underground loop completed in 1981 and the proposed three new lines never realized (although the Doncaster line serving eastern suburbs continues through periods of being on and off the books). In Helsinki the extension towards the west in only now under construction and scheduled for completion in 2016. Two northern branches were never built, but instead covered partially by commuter train connections.

There was great optimism regarding growth that created an overwhelming expectation for transportation investments that only later were realized to be financially unrealistic. The Melbourne study concerned 1985, the Helsinki study 2000, yet both sets of plans contain transportation network sections that are still today under major debate. It appears that in recent decades urban transport planning has transformed from 'solving' problems to lagging behind but continuing to offer outmoded and financially challenging solutions. Despite public opposition to inner city freeways, the sections removed in the 1970s and 80s have returned in tunnelled versions. The Big Dig of Boston has its counterpart in Melbourne's East-West link and in Helsinki's Keskustatunneli (*Centre tunnel*) that some transport planners are expecting once again to solve the assumed congestion problem of the

CBD. Worse, by planning an urban structure in the 1960's predicated on continuing mobility, especially to the CBD, rather than on accessibility and proximity, those freeways plans that have been implemented (based on a philosophy of meeting demand for transportation) have not only fixed a template for urban structure today, but also a 'way of doing' transport planning for those planners.

In spite of these great similarities in the initial metropolitan scale planning exercise, Helsinki and Melbourne took quite different development paths. Curtis and Scheurer in their SNAMUTS studies found that these cities in fact lie at opposite ends in terms of public transportation accessibility. From the present day perspective the alleged major disgrace of both transportation studies is their effect on car-oriented travel patterns and diminishing shares of public transportation. During the 1960s studies the public transportation share of Melbourne was 38% and Helsinki 64% (WSPP 1968, 134). It is important to realize that there was a target: the estimated share of public transportation in Helsinki was to be around 38% (2000) in all planning options evaluated (WSPP 1968, 208). In Melbourne the estimate (1985) was 21.6% (MTC 1969, 22). By the mid-1980s the share of public transportation had decreased in Helsinki to 42% and in Melbourne to 10%, since when the decrease has been minor - the current figures are: Melbourne 7%; Helsinki 41%. Major decisions have thus been made within 10 to 15 years after these transportation studies which steered cities further from public transport use and resulted in higher levels of private car use. Our aim in this paper is to trace where these development paths actually departed and speculate on the proper role of these so-called comprehensive transportation plans in actual development.

## 2. Proposed transportation networks

*2.1 Characteristics of alternatives assessed in the Melbourne study*

The Melbourne study led with public transportation analysis and proposals and coined the term 'balanced transport' as a euphemism to downplay the major role of road-building. Two preliminary scenarios were tested – one for "maximum development of roads and freeways, together with a relatively smaller expansion of the existing public transport services"; one for "considerably less development of roads and freeways but greater expansion of public transport" (MTC 1969, 32). The outline of the survey on existing transport conditions was carried in the same way as in the Helsinki study (WSLT 1969a). It was supported with an extensive study on parking (WSLT 1969b), which played only a minor role in the Helsinki case, where most of the suburban area was still undeveloped. It is interesting to note that at the time of study the public transportation situation was considered fairly good and the main focus was on capacity. The study notes,

> "Because Melbourne already had this comprehensive rail network, one of the prime objectives of planning was to introduce improvements to the rail system to enable it to effectively carry out its 1985 transport task" (MTC 1969, 33).

Little or no effort was invested in arranging active suburban characteristics predicted as non-CBD person trips (MTC 1969, Figure 4-8), commercial vehicle trips (MTC 1969, Figure 4-12) or private transport travel desires (WSLT 1969b, Figure 5-11).

A critical issue was pedestrian congestion at Flinders Station in the CBD. This problem, however, had been around for decades. In the Plan for General Development 1929 it was stressed:

> "The Commission considers that the most suitable way of overcoming the present pedestrian congestion in the vicinity of the Flinders-street Station, and as a means or avoiding much more acute conditions of congestion in this area, is by the construction of further city stations which will encourage a distribution of the pedestrian traffic, not only in the vicinity of the stations themselves, but also on the footpaths in the whole of the city area" (MTPM 1929, 130).

The proposed underground loop would spread the load and deposit people closer to work locations in the CBD. The loop needed to cope with in increase in trains (service frequencies – from 108 trains in 1964 to 181 in 1985) in the rush hour through the two main stations (MTC 1969).

Besides the Underground Loop, the Melbourne study proposed three larger new rail connections: the 9½-mile East Doncaster Line, the 12-mile Huntingdale to Ferntree Gully Line, the 14-mile Frankston to Dandenong Line. The last two of these were peripheral loops connecting radial rail branches. The

parking study supported a park-and-ride principle that made station areas mainly for transfer use - "It is part of the recommended plan that parking facilities at railway stations should be kept under regular review and expanded as demand for parking grows" (MTC 1969, 39). From the image below it is easy to realize that the rail network had been planned prior to the 1969 Melbourne study.

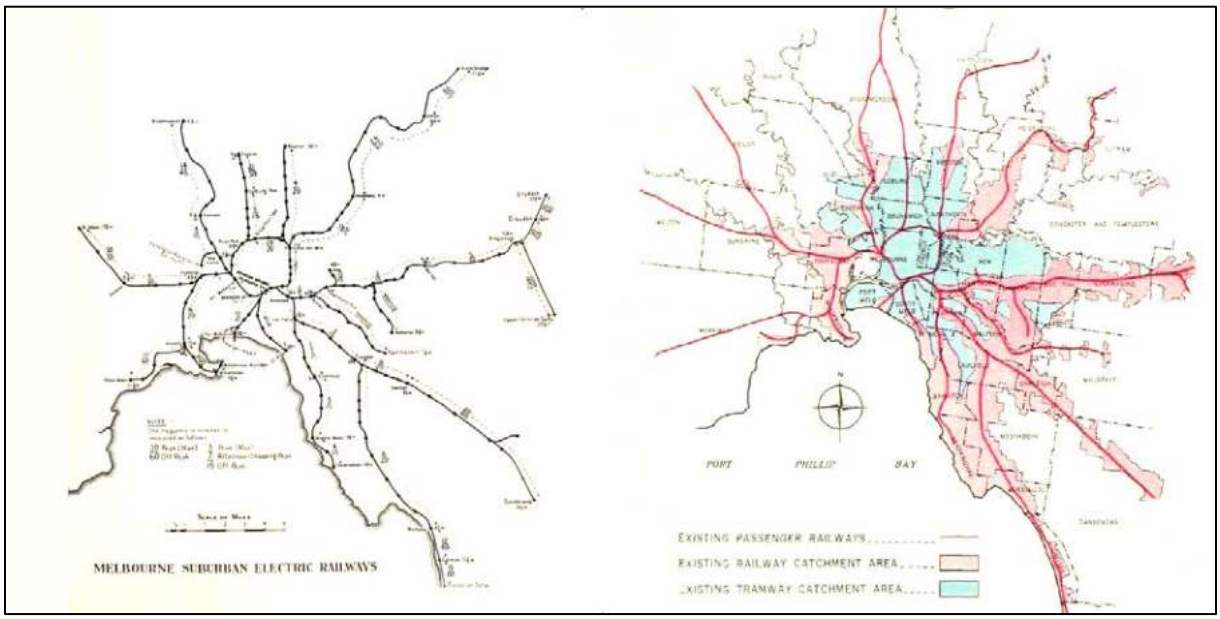

**Figure 2. Rail network of Melbourne Plan for General Development 1929 (left) and Melbourne Metropolitan Planning Scheme 1954 (right).** (Modified from MTPM 1929, 129; MMBW 1954, 108)

The road network was designated for major change. A three-fold increase in the number of private cars was predicted,

> "…road proposals assume that the public will want road construction to keep pace with travel demand…" (MTC 1969, 47).

The number of person trips by car each day was expected to grow to more than three times the 1964 figure. From 1964 to 1985 the average trip lengths were expected to grow from 4.8 miles to 7.1 miles (MTC 1969, 47). Based on these assumptions a novel freeway road typology was introduced to Melbourne. In the 1954 plan the intersections of the main arteries were mainly imagined to be roundabouts and occasionally flyovers, while the 1969 plan introduced fully matured multi-level clover-leaf intersections to retain flow capacity and speed. While the design and speed represented a significant change, as with public transport much of the road network had already been mooted in earlier plans - half of this road network follows reservations already in the 1954 metropolitan planning scheme. As we later learn, the shape of Melbourne owes much to the influence of these road proposals rather than to the influence of land-use planners at this strategic level (McLoughlin 1992). Indeed, it is odd that, despite the 1954 Metropolitan Planning Scheme proposing District Centres as a means of decentralizing from the CBD, this direction is not addressed in the 1969 Plan.

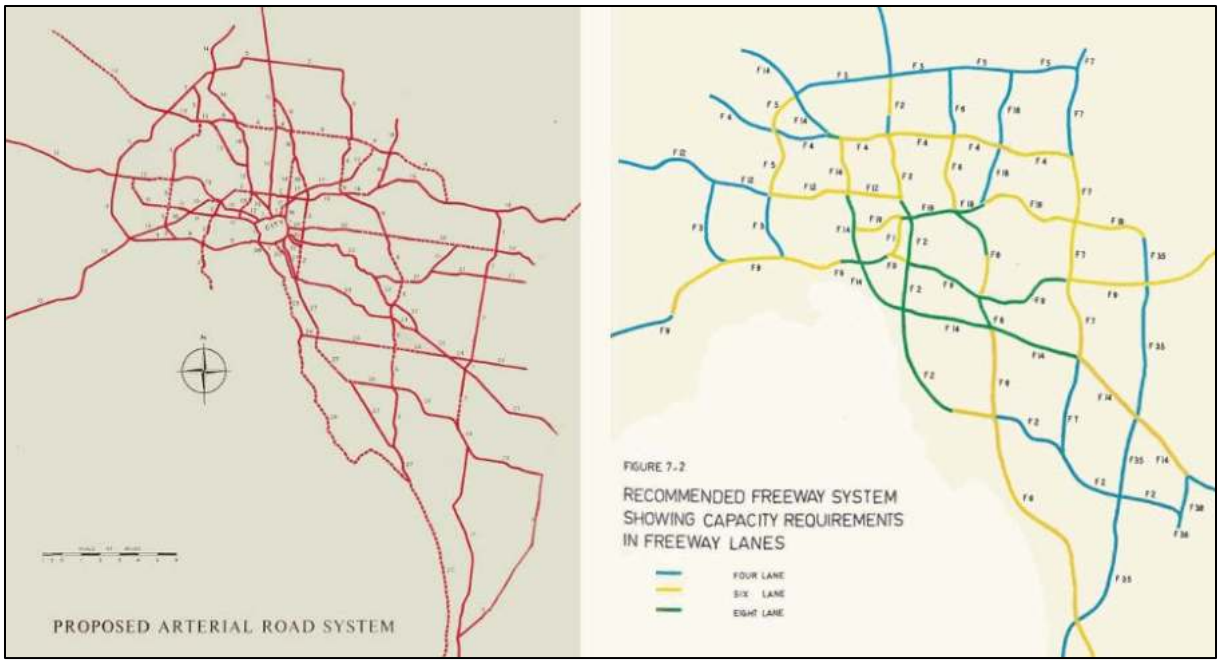

**Figure 3. Road network of Melbourne Metropolitan Planning Scheme 1954 (left) and the Melbourne study 1969.** (Modified from MMBW 1954, 97; MTC 1969, Figure 7-2)

*2.2 Characteristics of assessed alternatives in the Helsinki study*

The Helsinki study consists of three preliminary options named 0, A and B (WSPP 1968, 224). These planning options were created as combinations of wide and shorter alternatives of road network and public transportation networks. The option where both road and public transportation networks were short was not introduced. Options C and D were created to alleviate the problems found in the three earlier options. It is important to realize that there was no variation in the land use even in the improved versions C and D (WSPP 1968, 231), as was also the case in Melbourne. Table 1 presents a summary of all assessed options.

**Table 1. Size of transportation networks in the Helsinki study alternatives** (WSPP 1968, 243)

| **Size of road network** | **0** | **A** | **B** | **C** | **D** |
|---|---|---|---|---|---|
| Large (329 km) | X | X | | | |
| Medium (309 km) | | | | X | X |
| Small (236 km) | | | X | | |

| **Size of public transport network (rail + bus lines)** | **0** | **A** | **B** | **C** | **D** |
|---|---|---|---|---|---|
| Large (90 + 560 km) | X | | X | | |
| Medium (60 + 710 km) | | | | X | X |
| Small (37 + 345 km) | | X | | | |

The assessment criteria serve as a perfect example of how the desired planning alternatives of planners themselves can always be made to look the most favourable. The created multi-criteria frame of assessment looks ambitious and professional containing separate sections for efficiency, performance, community impact and financial consideration. At first sight the evaluation frame looks extremely detailed, but when tabulated as we have done in Table 2 the true nature of evaluation becomes apparent. Most of sub-criteria in each category become meaningless and a single evaluation criterion may dominate the result of the entire category.

**Table 2. Weights of various assessment criteria in the Helsinki study** (WSPP 1968, 243)

| **Criteria** | **Criteria impact** | **Category impact** | **Overall impact** |
|---|---|---|---|

| | | | |
|---|---|---|---|
| 1. Efficiency criteria | | 30% | - |
| 1.1. User Costs | ~80% | | **24%** |
| 1.2. Public transport operating costs | ~9% | | **2,7%** |
| 1.3. Road maintenance costs | ~0,1% | | **0,03%** |
| 1.4. Parking costs | ~1,9% | | **0,57%** |
| 1.5. Capital costs | ~9% | | **2,7%** |
| 2. Performance criteria | | 25% | - |
| 2.1. Reliability | 30% | | **7,5%** |
| 2.2. Flexibility | 30% | | **7,5%** |
| 2.3. Preservation of capacity | 10% | | **2,5%** |
| 2.4. Comfort and convenience | 15% | | **3,75%** |
| 2.5. Mode option | 15% | | **3,75%** |
| 3. Community impact criteria | | 20% | - |
| 3.1. General economic benefits | 30% | | **6%** |
| 3.2. Employment opportunities | 25% | | **5%** |
| 3.3. Temporary disruptions | 5% | | **1%** |
| 3.4. Relocation of families | 5% | | **1%** |
| 3.5. Neighbourhood identity | 10% | | **2%** |
| 3.6. Aesthetic considerations | 10% | | **2%** |
| 3.7. Noise and fumes | 10% | | **2%** |
| 3.8. Opportunities for social interaction | 5% | | **1%** |
| 4. Financial considerations | 25% | 25% | **25%** |

An additional difficulty of the assessment is seen in the rank-based evaluation. Even though the differences in each category are small, the planning options are graded from 1 to 5. So, for example, in the category Efficiency, the cheapest alternative was 95% of the costs of the most expensive one but got five times more points in the final evaluation round. Not that this was an overly generous benefit; it was doubled in the category Financial considerations, which analysed largely exactly the same costs.

Two other assessment criteria were topics of more subjective evaluation. Even though performance may sound like a very rigid transportation quality less than half a page was devoted to describing what it meant. Finally the phrase somewhere in-between seems to indicate what type of assessment they were talking about: “Table 10-12 indicates the rating and evaluation of each system in a subjective evaluation based on the Consultant's opinion” (WSPP 1968, 278). The community impact category is equally subjective, but the stated emphasis is said to be on general economic benefits and employment opportunities, which in fact are completely outside the study focus and also left undiscussed in the report. This is interesting since this category became a dividing criterion between options C and D. It looks very much as if option 0 had to be better than option D merely to avoid a tie.

**Table 3. Total rating of alternative transportation systems** (WSPP 1968, 282)

| **CRITERIA** | **WEIGHTING** | **RANK ORDER** | | | | | **EVALUATION** | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | **0** | **A** | **B** | **C** | **D** | **0** | **A** | **B** | **C** | **D** |
| Economic evaluation | 30 | 1 | 3 | 2 | 4 | 5 | 30 | 90 | 60 | 120 | 150 |
| Performance rating | 25 | 2 | 3 | 1 | 5 | 4 | 50 | 75 | 25 | 125 | 100 |
| Community impact | 20 | 4 | 2 | 1 | 5 | 3 | 80 | 40 | 20 | 100 | 60 |
| Financial considerations | 25 | 1 | 3 | 2 | 4 | 5 | 25 | 75 | 50 | 100 | 125 |
| **TOTAL SYSTEMS RATING** | **100** | **8** | **11** | **6** | **18** | **17** | **185** | **280** | **155** | **445** | **435** |

In addition to this clearly unsound overall assessment, a typical error in transportation assessment caused by a static land use alternative is clearly pointed out in the Helsinki study Figure 9-7 (WSPP

1968, 244). It shows that the overall costs of road building remain static regardless of the proportion of public transportation and exaggerates the estimated travel time costs. Since public transport in a non-congested optimal planning situation is always slower, the higher the proportion of public transport the higher the costs lost in travelling. In these single-constrained model settings (see e.g. Joutsiniemi 2010, 119-125) it is possible to seek optimal network configurations as the Helsinki study options C and D clearly indicate. In the real- life adaptive land use settings this is naturally nonsense.

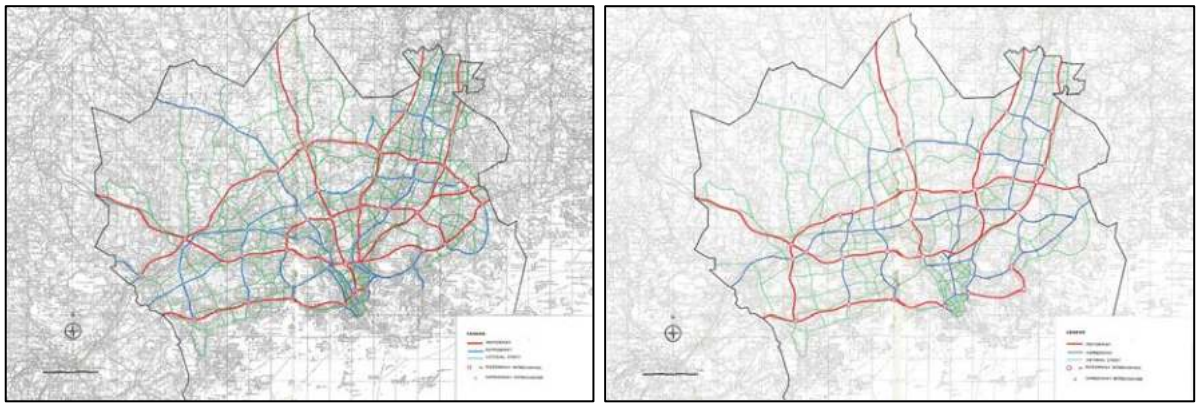

**Figure 4. Options A and D of the Helsinki Transportation Study** (WSPP 1968)

## 3. Transportation networks realized

Comparison of the Helsinki and Melbourne studies reveals some differences in the transportation systems realized and the proposed and existing road categories. In the Melbourne 1954 plan the road categories and geometry are slightly different from those proposed in the 1969 study. In the 1960's maps the emphasis in both cities is on 4-, 6- and 8-lane highways and the smaller Expressway category seems to indicate a minor road. Closer scrutiny of the proposed road sections (WSPP 1968) and detailed plans (WSPP 1969) shows that these both are main arteries with multi-level intersections where the right-of-way varies between 50 and 100 metres – not so very different from the roads actually built in Helsinki or Melbourne.

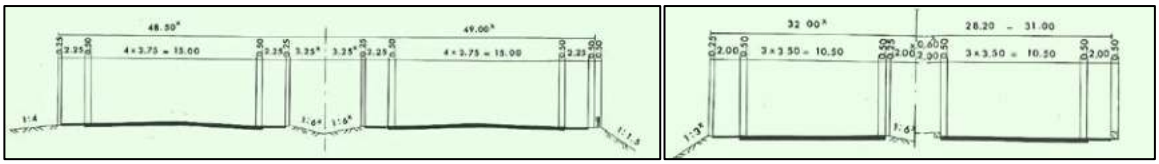

**Figure 5. Variations of a 98-metre wide highway cross-section (left) and a 63-metre expressway road cross-section (right) in the Helsinki study** (WSPP 1968, 300)

Melbourne in its 1929 plan had already shown its appetite for large-scale road widenings in the central area based on Haussman's Paris (Mees 2000, 170). The 1969 Recommended Plan does not provide cross-sections but indicates an adopted design standard of 49 metres (160 feet) for the freeways (MTC 1969, 49). The Melbourne study also recognized the following lower standard arteries: Major Divided Arterials, New Arterials, Widened Arterials, Widened Arterials to accommodate both public transport movement and increased travel by private car. A comparison of these two study areas shows how the Helsinki study tried to adapt road widths from American highway standards, while the existing land subdivision forced the consultancy group to use narrower road types. Therefore the width of the selected road type and its actual capacity to accommodate traffic flow do not go hand in hand.

In its day the Helsinki study was considered extremely radical and was in fact never brought into the official decision-making process. Similar to the Melbourne plan, a major public concern was the inner city highway connections that were later removed. In 1967 planning for the Helsinki metro was

transformed to become more characteristically a heavy rail system and adapted as such in the ongoing Helsinki transportation study.

It is unknown to most of the critic that option D of the Helsinki study was almost identical to the proposed option C, the only difference being a reduction to car-based traffic in the CBD (WSPP 1968a, 231; see also Figures 9-5 and 9-8) i.e. to avoid suggesting the destructive solution shown in Figure 6. Moreover, it is disturbing to realize that the difference between options C and D is marginal and closely connected to the assessment frame based on a comparative ranking of options (WSPP 1968, 282). It is ironic that in the Helsinki study the proposed option C was ranked best in the assessment category "Community Impact". With a just a little bit more game-sense and alternative tweaking in favour of option D, the development of Greater Helsinki might have been different.

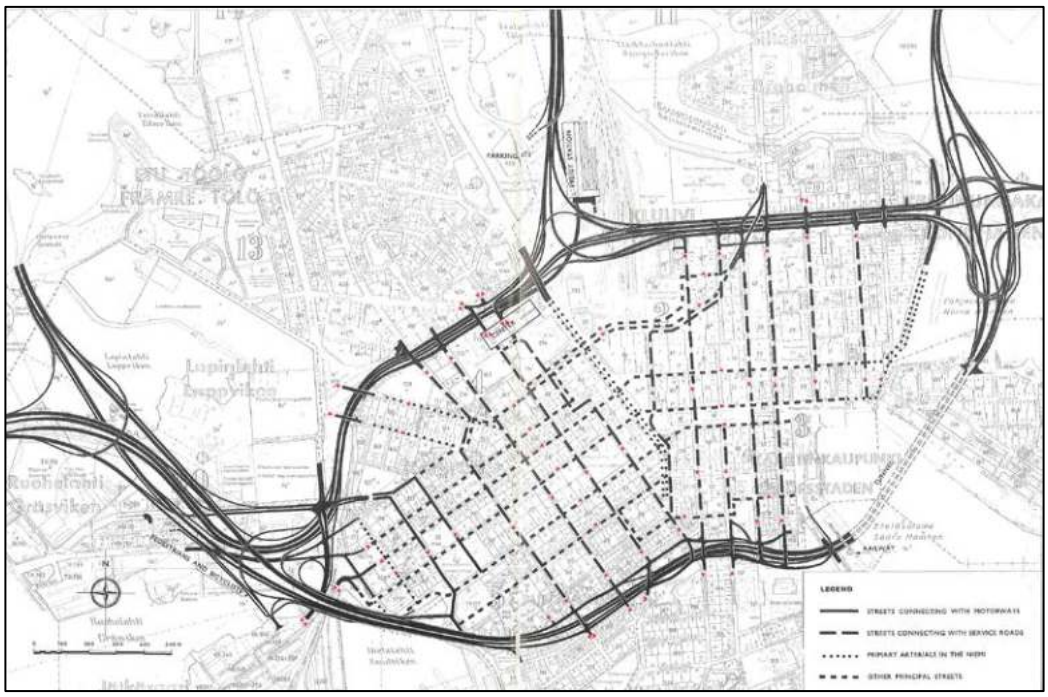

**Figure 6. Proposed street circulation plan for Helsinki CBD** (WSPP 1968, Figure 11-4)

It is interesting to note that even though there is general agreement among planners and planning historians that the Helsinki plan was never realized, one of authors of this text has shown elsewhere (Joutsiniemi 2006, 145) that the development of the road network in Helsinki has taken a course nearly identical to that of option A proposed in the Helsinki study. Option A was characterised in the study as follows: "The road component of the transportation system (...) was developed by combining a conglomeration of local roadway plans from various planning authorities, which were generally prepared in conjunction with individual neighbourhood plans. Since many of these planned street systems were not wholly compatible, numerous adjustments in alignment and standards were necessary to achieve a practical network for the whole metropolitan region" (WSPP 1968, 225). It is easy to see that the option A road network was mainly documenting the existing incremental planning phases rather than offering a comprehensive understanding of large-scale transportation needs.

In the following images we have highlighted the road sections included in the Helsinki and Melbourne studies that have been realized in the course of time. Both cities have created a highway structure that resembles a more orbital than a gridded structure. The larger number of "completed" sections in Helsinki is natural, since the Helsinki study had several alternatives – one of which was documenting the ongoing institutional trends. In Melbourne, too, several of the realized sections are those which can already be found in the 1954 plan. In Melbourne some of the suggested freeway segments have been built in using a lower arterial road standard or adjusted to the existing road structure which follows the chess board like land subdivision pattern typical of Australia and the USA. Therefore it

seem that the greatest impact on the road network introduced by the Helsinki and Melbourne studies is not to be found in large scale road geometry, but in novel high velocity standards that were adapted to existing route plans.

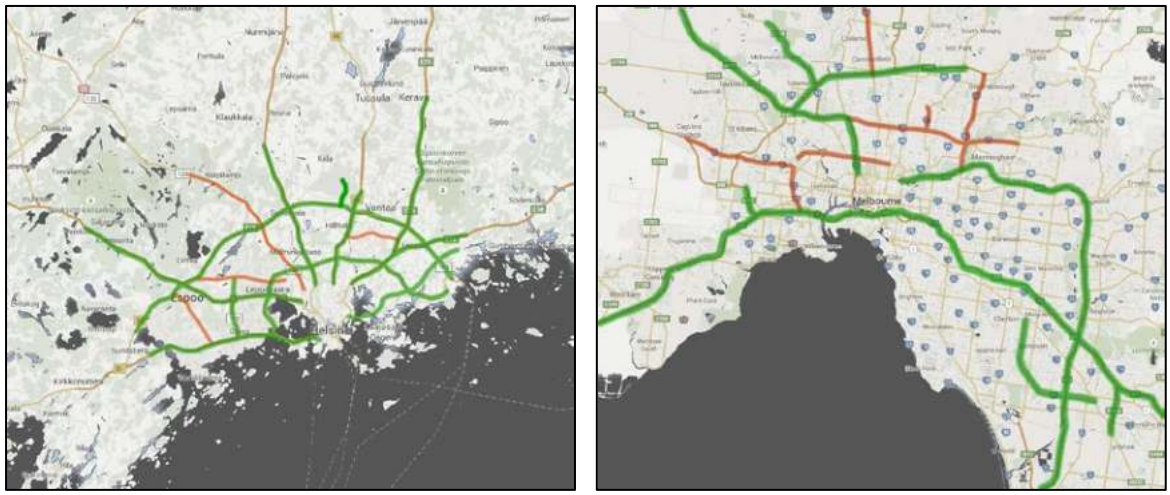

**Figure 7. Road sections in the Helsinki and Melbourne studies overlaid with present day road network.** Green lines indicate Highway, Expressway and Freeway sections included in the studies. Red lines are sections that are included in a study but eventually built according to lower arterial road standards.

## 4. Crucial assumptions made in the studies

After cross-reading multiple documents by the Wilbur Smith Associates it seems clear that the novel theory of car-based transport had made a couple of major shortcuts. In the Helsinki studies there is a well-documented section on the background theories the consulting group had created. This is clearly indicated in Figure 8. In this scheme it is very difficult to achieve a comprehensive transportation perspective. Highway design that originates from the demands of inter-city movement is mute to several intra-metropolitan movement characteristics like public transport and polycentricism. In the Helsinki study two items of this theory are found. In Figure 8 we have included two major background assumptions derived from the profoundly static land use scenarios and congestion-free transportation ideal. The only important variable for the road network size is the size of the CBD and increased time cost of accessing it if public transportation is chosen.

In addition to these oversimplified assumptions, an overview of the Helsinki and Melbourne transportation studies finds three types of assumptions that had a significant impact on the implementation of the transport plans: false expectations regarding traffic growth, an exaggerated role of long-distance transport, and a monocentric urban structure. In the following sections we summarize these briefly.

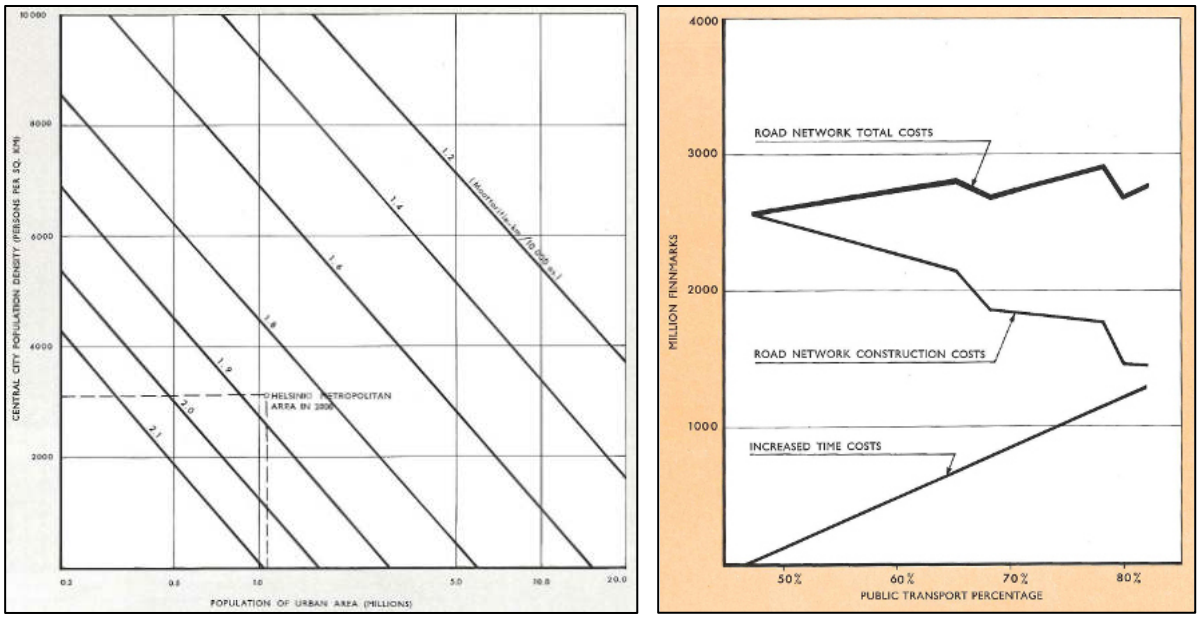

**Figure 8. Illustrated correlations between the size of the city (x-axis), the CBD density (y-axis) and required freeway kilometres per 10,000 inhabitants (diagonals) shown on the left.** (WSPP 1968, 388) and on the right the correlation between the share of public transportation (x-axis) and the transportation costs (y-axis). The upper graph illustrates the overall costs of the road network, the middle one the construction costs of the road network and lowest the cost of time expenditure on travel. (WSPP 1968, 242)

*4.1 Erroneous traffic growth expectations*

The Melbourne Plan, like many transport studies of that time, was focused on catering for travel demand for car use (Gleeson et al 2003; Curtis and Low 2012). Indeed, the Melbourne Plan itself alerts us to the problems of other western cities and affirms that road construction is the only viable solution. Traffic congestion and the cost of time lost in slow moving traffic were held up as concerns only to be addressed by road construction rather than any other transport or indeed land use solution,

> "The recommended plan has the task not only of making provision for the expected trebling of 1964 volumes, but also of providing the means by which these greatly increased volumes can be handled at higher service standards. This is not a matter in which there are alternatives…traffic congestion and greatly increased transport costs would become chronic features of the metropolitan road system. Other western cities faced with the same rapid growth have had to cope with similar rapid rises in the demand for road travel. They have had to become involved in major road construction problems. Now Melbourne has to face the same problem" (MTC 1969, 47)

The Melbourne Transportation Study was based on a plan to increase the area of urban development by 49% – presumably this was based on the 1954 Metropolitan Plan although this is not specifically stated. There is no debate as to whether this is the best way forward or if other choices are considered. With population of 3.7 million by 1985 forecast in the Plan, this suggests an average gross density of 21.3 persons per ha in the 1985 urban development area. The predicted average household size in 1985 was 3.3 persons, implying an average housing density of 6.4 dwellings per ha, although this is never directly articulated. Designed in this way the study not only locked in extensive road proposals that proved financially unrealistic, but it also locked the city into extensive urban sprawl which has also proved financially unsustainable (among other measures of unsustainability). The cost of the Melbourne Transport Plan proposals was $2.6 million (based on 1968 costs) of which 86% was allocated to highways and parking. It is interesting to note that there was no discussion of different urban form or land use configurations – this was very much an era of assumptions based on demand-led planning – for both housing and modes of transport – but it is nowhere evident that the public were apprised of this. McLoughlin's (1992) account sheds some light on the trends at that time when the

population was deserting central Melbourne in favour of the suburbs, but what role should urban planners have played in restricting this in favour of more sustainable development?

The Melbourne Committee estimated that this population of 3.7 million would make 2.5 times more daily trips by 1985 and that the average trip length would be longer. While it is clear that trip lengths would be longer, given the planned extensive spread of the urban area, it is unclear why trip making per capita was expected to rise. People's daily activity patterns remained constant.

*4.2 Priority for long distance transport.*

Following on from above, with the urban area forecast to spread, the priority was on longer distance transport – this despite land use plans of the 1954 Metropolitan Plan arguing for decentralisation and the creation of District Centres,

> "the recommended plan places major emphasis on bus/rail coordination and the complementary role of feeder buses in making rail more attractive to the public" (MTC 1969, 41).
>
> "It is part of the recommended plan that parking facilities at railway stations should be kept under regular review and expanded as demand for parking grows." (MTC 1969, 39)
>
> "Experience shows that construction of commuter car parks leads to additional demand…this further emphasises the need to keep parking facilities under continuing study" (MTC 1969, 9).

In both cities trams were considered obsolete and an impediment to car travel. In Helsinki only planning options O and B preserved the existing 17 km tram system. In Melbourne the existing 323 km tram network was more difficult to tackle. The committee considered scrapping trams but decided this was unrealistic. They were concerned that,

> "a fixed rail system in the middle of streets already inadequate to handle motor traffic, contributes materially to street congestion (MTC 1969, 42)"

They cited the example in Swanston Street, a major CBD, where free-flowing trams would place limitations to cars on cross-street movements. Six options were considered, some aimed at removing trams but interestingly not cars (which is the case today). The policy recommendation of the 1969 Plan was that trams be placed underground or replaced by underground trains in the future and that trams be have their own separate right-of-way, including,

> "Provision for such rights-of-way will be made in appropriate cases in the widening of arterial roads proposed in the plan (MTC 1969, 42)."

The tendency seems to be that cars must be kept moving and public transport moved out of the way of cars.

Again the theoretical background of the consultancy group reveals some major differences between the Helsinki and Melbourne proposals and gives some indications to why public transport fared better in Helsinki than Melbourne. The schematic representation of suburban transportation alternatives also summarizes our previous findings. If the ultimate aim of public transport is to access the CBD then the alternatives shown in Figure 9 all seem equally feasible. Both the studies discussed emphasize the structure shown as number 1. In both studies the backbone of public transport was a heavy rail system that was to be supported by local buses and trams. In the Melbourne study it was explicitly mentioned that,

> "the recommended plan places major emphasis on bus/rail coordination and the complementary role of feeder buses in making rail more attractive to the public" (MTC 1968, 41).

In the Helsinki study the improved planning options C and D contained a 150 to 200% larger bus network than the other options. In reality the choice was not so clear. The Melbourne study contained major parking facilities in transfer terminals so in schematic representation it was much closer to option number 2 in Figure 9. The private car and feeder station combination unfortunately did not prove very successful and people already sitting in cars saw no major point in changing to the train unless major congestion occurred, the catering for parking demand in the CBD also facilitated car over public transport choices. In Helsinki the high investments required to build the extensive metro network were postponed and only partially resolved with commuter trains when funding was available

from central government. Large portions of the Helsinki metropolitan region were operated using schemes numbers 3 and 4 in Figure 9, since it was considered the only feasible way to operate on the low density suburban fringe. It is also noteworthy that these assumptions remain valid only if assumed trip origins and destinations are either at the CBD or the remotest branches of suburbia.

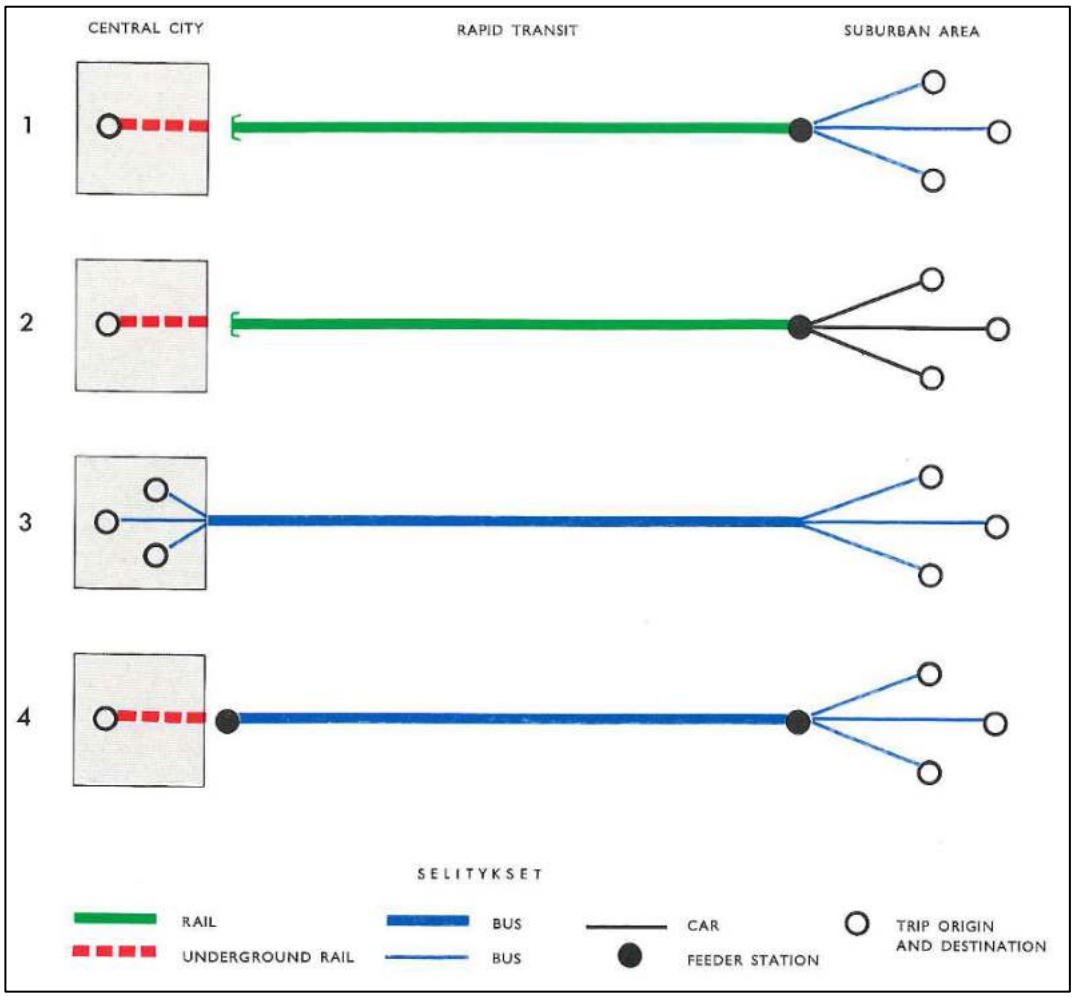

**Figure 9. Schematic representation of public transportation system alternatives** (WSPP 1968, 390)

*4.3 Monocentric urban land use structure*

In Melbourne there was already a firm intention to decentralize the congested city and develop local district business centres (MMBW 1954, 51), yet the preference for the American type of mall development was not kept secret (MMBW 1954, 60). The railway system is radial, with all routes leading to the CBD, and this is still the case today. The freeway proposals that have been constructed (Figure 3) are also predominantly leading to the CBD. Thus despite the Melbourne study being initiated ten years later than the 1954 land use plan, which argued for decentralization, the public transport system continued to focus on the CBD.

The same assumptions are to be found in the Helsinki study area. In fact, they are here even more evident since in the 1960s major parts of the current metropolitan area were in agricultural use. The only assumption the consultancy group was able to make was that in 1966 the monocentric city would only grow into a bigger monocentric city by the year 2000. This is clearly seen from the assumed location of workplaces that were used to populate the transportation network (Figure 10). Unfortunately the reality could not be more different. Somehow the simplified assumption made in the studies on land use size seem strange. In their 1961 book (WSA 1961, 37) the consultants seemed to have a clear understanding of how accessibility changes land use, so possibly the limitations on the

computation side or the demands of the client determined the course of the study. This is especially interesting in the case of Melbourne, which ten years earlier already had a strong drive for district centres. The proposed freeway grid structure of the study obviously served other areas but the CBD.

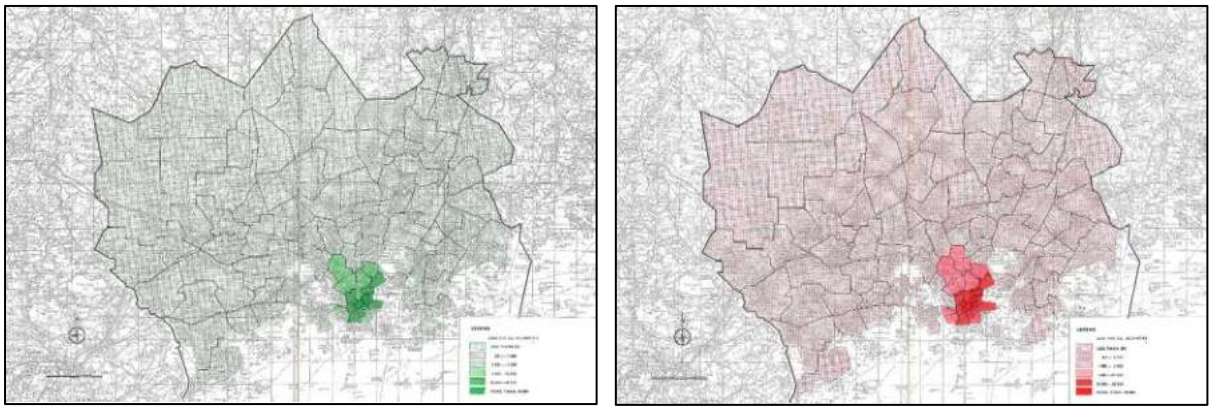

**Figure 10. Workplace locations in 1966 (left) and 2000 (right) Helsinki** (WSPP 1968, Figures 7-8 and 7-10)

## 5. Discussion and Conclusion

We entitled this paper 'Unlikely Similar', and in many respects it seems that the two cities, despite being both peripheral and on opposite sides of the world, have experienced similar trajectories in both transportation planning and the institutional response, at least in the past. We find three key points of interest.

First, we find that path dependence of planning solutions was present in both cities. However this is not so much the primary result of the Wilbur Smith studies. It seems that it did not matter entirely what the Wilbur Smith studies proposed, ultimately the institutions in the respective countries did what they had already planned to do – they continued to implement transportation plans devised prior to the Wilbur Smith studies. In the case of Helsinki this was true of both the road and the metro system, even though the plans back then were extremely weak; in the case of Melbourne this was a road network based on a system of arterial and orbital roads quite similar to that proposed in the 1954 Plan.

Second, we find that the notwithstanding the above, the Wilbur Smith studies had a major impact on the approach to road design which was to have far-reaching consequences for both cities by locking in the car as a major transport mode. Excessive designed standards adopted as high speed, friction-free roads in the form of freeways were new to both cities and saw the car given priority as a mode of transport over everything else. In Helsinki public transport remained important in radial connections, but the service in the orbital direction is practically non-existent, and despite being partially recognized in the Melbourne Plan it was never implemented. The tram was questioned for its suitability since it held up car travel. Cars were selected as the mode to interchange with rail – likely resulting in the choice to travel by car for the whole journey rather than to transfer to rail. Even road designations included "widened arterials to accommodate both public transport movement and increased private car travel". The attitude to urban structure largely ignored the possibility of polycentricity even though district centres were proposed and favoured by some local governments. That railway stations were seen as transfer points from car to rail rather than destinations in their own right also supports this. Clearly this new approach to road design and network structure has seen a new path-dependence locked in and maintained today. This approach had a profound effect on car dependence.

Third, we find the first major difference between the two cities. In public transport Helsinki's local government were able to promote their own policies. Helsinki was eager to keep its CBD liveable and

made a major decision only five months after the Helsinki study was made public to finance the construction of the first metro line even without support from central government. In Greater Helsinki the local government consisting of only three cities has relatively greater power over infrastructure investments and they were able to compete with regional level planning, which for its part has only a minor role in the national legislation, whereas in Melbourne the regional tier of planning was much stronger than the local level, at least as regards transportation planning.

From this analysis, triggered by the Wilbur Smith studies, we have yet to find the full set of reasons as to why, today, Helsinki and Melbourne are at opposite ends of the spectrum on public transport accessibility. What is clear is that the initiation of a major freeway network via these Wilbur Smith studies resulted in a profound turnaround in the mode share. Both plans assumed a drop in the public transport mode share, but it plummeted in both cities and in Melbourne it has not recovered. Groenhart and Mees (2014) note that,

> "Melbourne has built more lane-kilometres of freeway and tollways since 1976 than any other Australian city, but has not constructed a new suburban line since the Glen Waverley line opened in 1930 (although some lines have been extended)" (MTC 1969, 125).

Funding has been more easily obtained for road projects, with considerable support from the federal government (Curtis and Low 2012). Public transport has suffered from a lack of federal funding and an attitude by the State government of 'public transport deficits' (Curtis and Low 2012) since the 1970 'Lonie' inquiry into public transport, which proposed radical public transport service reductions (Mees 2000, 276). At the institutional level the Melbourne road agency has consolidated whereas the myriad of public transport agencies has seen fragmentation and weak financial support (Curtis and Low 2012).

In Helsinki the situation appears different, at least institutionally, since the municipalities have pressed ahead with joint public transportation planning throughout the Greater Helsinki area. In Helsinki all modes of public transport now have unified ticketing, priority lanes on main arteries and highways since the beginning of the 1980s. It is also important to realize that in Helsinki car-oriented development started much later than in Australia – after World War II private cars remained a regulated good and were not released onto the open markets until the early 1960s. Therefore the public transportation share was very high when the Helsinki Transportation Study was initiated. It would be an exaggeration – although probably favourably for some – to say that the Greater Helsinki Area succeeded in its public transportation policy because they did not implement the proposed planning solution of the late 1960's. As we have shown, Helsinki in fact chose an alternative that was not only among the worst of the alternatives assessed, but also the one which by rough measures contained most highway kilometres and effectively supported a sprawling urban structure.

These are only preliminary conclusions, further research questions arise relating to the role of path-dependency and organizational structure that, in both cities, have constantly over-ruled the seemingly rational argumentation of the comprehensive transportation plans of the 1960s and 70s. There seems not to have been a single ideological feature introduced in the two studies examined here. More likely there were certain aspects of the plan that were adopted only if there were fertile institutional grounds for it.

No matter how distorted the assessment of the Helsinki study was, a detailed analyses of it indicated that the priorities of transportation consultants are not necessarily those of the decision-makers or even planners in their role as civil servants. It is clear that in the municipal decision-making process road maintenance costs play a more important role than 0.03% of overall costs. In the Helsinki study it became painfully clear that in a democratic political process the societal impact was playing a far greater role in evaluation. During the Helsinki study this was completely surreal to the team of professionals, as can be sensed from the following quotation from their proposed planning option C considering the CBD location at Niemi.

> "Disadvantages of the »C» system are noted to be temporary disruption of normal activities during the construction period and the relocation of families caused by the southern motorway in the Niemi. However, in the Consultant's opinion these disadvantages will be far outweighed

by all of the advantages gained from other community impact criteria, so as to become minimal" (WSPP 1968, 280).

In Melbourne it is not so easy to separate the role of the transportation consultants from the decision-makers in this desk-top study since the Transportation Plan is a product of a committee composed of decision-makers from the various transport modes and land use planning. Wilbur Smith Consultants effectively reported their surveys and modelling through this committee.

# Interactions between strategic spatial planning and local state in weak institutional settings

Antonis Kamaras[1] Athena Yiannakou[2]

## Abstract

*The pressures of globalization have ushered in new supranational and sub-national governance arrangements. Cities and urban regions have been perceived as the optimal spatial units in which local competitive advantages can be cultivated and combined to the benefit of local and, in aggregate, national economic growth. In line with this tendency strategic spatial planning, in its widely accepted theoretical conceptualization, became a terrain for balancing decisions about consolidating a city's international competiveness and its role in a wider international context. Thus, it emphasized shared responsibilities between the public and the private sector in economies where the roles between the public and the private sphere are visible in their complementarity. In countries with weaker institutional settings such distinctions are purposely obscure as both spheres are enmeshed in statist and rent-seeking structures. Often in these contexts strategic planning has been principally connected with an external necessity of Europeanizing of planning policies. Based on an investigation of the strategic spatial plans endorsed in the past 15 years in the city of Thessaloniki, the present paper attempts to explain the specificities and the failures of strategic spatial planning in the Greek institutional environment in the context of four defining features of the Greek local state: the centralization of the Greek government, the financing arrangements of the local government, the nature of the local institutional interlocutors and stakeholders and the political economy privileging consumption over the production of internationally competitive goods and services which would necessitate the marshalling of location-specific assets by the local state.*

## Key words

Strategic spatial planning, local state, weak institutional environment, Thessaloniki

## 1. Introduction

Strategic spatial planning in its widely accepted theoretical conceptualization during the last 20 years has been very much concerned with the creation of strategic visions, designing city-wide spatial strategies, developing common assets in a city and becoming a vehicle for the city's transformation along with the globalized spatial development trends (Salet and Faludi, 2000; Albrechts, 2004 & 2006, Healey, 2006). Based on this approach, strategic planning became a terrain as well as a process in itself for balancing decisions about the future of a city with particular emphasis on consolidating the city's international competiveness and its distinctive role in a wider international context. In its normative definitions strategic spatial planning is a transformative and integrative socio-spatial process through which a vision, coherent actions and means for implementation are produced to "shape and frame what a place is and what it might become" (Albrechts, 2006, p. 1152). In these definitions, such a process becomes an arena for public contestation and consensus building and

facilitates spatial 'governance' structures at the metropolitan level (Healey, 2006) as indeed has happened in many cities and urban regions.

Since the end of the 20th century many cities in Europe went on to produce city-wide strategies with various motivations (Albrechts et al, 2003). A mixture of factors is connected with the development of these spatial strategies, the city competition agenda standing at the top of the list. Through the actual production of strategic plans the concept of strategic spatial planning came to represent a diversity of multifaceted and fragmented practices often related to specific planning cultures (Walsh and Allin, 2012). There are certain common objectives in all these practices drawn from the most normative approaches that might be said to constitute a template for the spatial planning process. More specifically strategic spatial plans aim to articulate: (i) a territorial vision for a city's development with emphasis on place qualities, (ii) coherent spatial planning priorities for the integration of investments, (iii) a framework for specific development projects, and (iv) a terrain for consensus building to facilitate the sharing of responsibilities between the public and the private sector. On the whole, whatever the form they took in the planning practice, strategic spatial plans concerned the metropolitan level, pursued wider governance practices bringing together and in equal terms the two main parties of urban development, the public and the private sector (assuming that the roles between the public and the private sphere are to a large extent visible in their complementarity), and focused selectively on specific aspects of urban development leaving many decisions into "lower" levels of planning (Wassenhoven, 2010).

In this template, for the more classical approaches, the political role of strategic spatial planning is considered mainly through its function in strengthening the role and the voice of local government (Healey 2004). More recently, the study of specific cases, such as in the case of the regional spatial strategy experiment in England (Baker and Wong, 2013), conceives the political dimension as an important aspect in minimizing the role and scope of strategic planning. According to a more radical perspective, on the other hand, such practices of spatial planning actually 'neutralize politics' (Allmendinger and Haughton, 2010).

In order to understand both the specificities of the process as well as its different outcomes it is important to explore more thoroughly and based on specific experiences the interplay between the national and local state, the economy and the relative power of social actors embedded in the strategic planning process. A number of studies stress on this interplay arriving at different conclusions. For example, Walsh and Allin (2012) highlight the tendency of a sustained real estate boom to undermine planning intentionality and how this tendency is aided and abetted by administrative and thus political fragmentation at the local level of government. Macleod and Jones (2011) in their analysis of the "new urban politics" (NUP) argue and that NUP of local growth coalitions involve collaboration but also collusion between public and private entities. The analysis highlights that the need for local growth, as a compensating mechanism for a retreating central state which can no longer guarantee equity and affluence across the national space, marginalizes those most in need of state action (the underprivileged) and brings into being a coalition of the powerful and privileged in politics, business and society. Finally, Albrechts (2013) introduces the notion of co-production and posits it in spatial planning as a complement to representative democracy helping to utilize a precious asset, the people, which are also the purported beneficiary of such planning. As such, planning cannot be dominated by a technocratic elite under the direction of a political leadership to which only the strongest and most privileged of stakeholders have uninhibited access. This understanding even warrants from the democratic local state to spur and institutionalize coproduction with the average citizen, up to and including the underprivileged citizen, even if such coproduction will not be achieved spontaneously.

The case of Greece can enrich the above discussion by providing a further understanding regarding in particular the interactions between the national and the local state, local stakeholders and the failure,

manifested in the spatial planning process, to articulate and pursue a coherent vision of the common good at the local level. One of the common arguments concerning spatial planning in Greece, despite its important transformations that took place by the end of the 1990s (Giannakourou, 2005), has been the lack of the strategic dimension which is the corollary of the weak governance practices. However, this does not mean that the main cities lacked of specific strategic spatial experiments or plans. This paper analyses three strategic spatial plans elaborated in the city of Thessaloniki during the past 15 year on the grounds of a thorough examination of their documents, the procedures followed, the available consultation and public debate material as well as the authors' personal involvement in parts of these procedures. Situating as much as differentiating strategic plan-making in Thessaloniki in the above scholarly debates, this paper focuses on the defining features of the Greek local state, described in the second section of the paper, in the context of which it attempts to provide, in the third section, an account of the particular characteristics of the strategic spatial planning experiment in Greece.

## 2. The Greek local state: defining features and consequences

### *2.1. A classification of the main defining features*

The first defining feature of the Greek local state is the *centralization of the Greek government* (Hlepas and Getimis, 2010). Greek centralization has been shaped by forces of different vintage, overlapping and redefining, reshaping and renewing each other. In terms of sequencing, centralization is not only a function of historical reasons as commonly argued. It is also a function of an equality-seeking redistribution aligned with clientelism of the 1980's period when the Greek socialist party, PASOK, saw local government as a transmission belt for its egalitarian policies and for the expansion of a formidably effective clientelist machine. This centralization imperative has been manifested through (i) limited or nonexistent authority in spatial planning, transport, social and educational policy, and economic policy, in the municipal and regional tiers, (ii) the still the fragmented governance structure in the metropolitan areas of Athens and Thessaloniki, Greece's two big urban centers and (iii) in the overlapping and multiple jurisdictions between municipal regional and national governance structures.

The second defining feature of the Greek local state is its *financing arrangements* (Council of European Municipalities and Regions & Dexia Credit Local, 2012). What little the Greek local state spends is mostly derived from central government transfers. Greek local government exhibits one of the smallest public expenditures to GDP ratios in the whole of the EU while its meager financial resources, in terms of the percentage originating from central government, which exceeds 70% of the total, are at the extreme end of the range in the EU. Additionally EU program funding is run by the central government so EU programs, although they have indeed formed a policy framework and administrative units necessary for the creation of a 'local state', they have, at the same time, become a de facto element of central government vertical control, via financing, over the local state.

The third defining element of the Greek local state has been *the nature of its local institutional interlocutors and stakeholders* (Mavrokordatos, 1988). Associations (professional, chambers of commerce, employers and employees organizations etc.) were structured by the successive center left PASOK governments, via the instrument of proportional voting, so that they, as much as local government, operated under the same national-party dominance rhythm, making for coalitions driven by the imperatives of national parties as opposed to locally defined goals and priorities. This subordination of local stakeholders to national party purposes build, as much as governmental centralization, on the earlier traditions of right wing authoritarianism that mandated a controlled associational life.

Finally, the fourth element defining the local state, in the period under consideration, was a *political economy privileging consumption* over the production of goods and services, which would be internationally competitive and, as such, necessitate the marshalling and combination of location-specific assets, over time, by the local state (Bower et al, 2014). While Greece undertook in the 1990's major reforms of its national economy, so that it could enter the EMU, these reforms were geared towards fiscal consolidation and only indirectly and unintentionally had a spatial aspect and effect, relevant to Athens, by internationalizing Greek finance head-quartered in the capital and attracting shipping to the wider-Athens area. Post-EMU Greece once again reverted to a consumption driven economic model financed, this time, by eurozone low interest rates and ample international financing of the Greek state and financial sector.

*2.2. Consequences of the local state's structure*

Local government in the context that we sketched above did not feel the need to upgrade its personnel but rather build clientelistic machines, serving both local and national political machine imperatives, notwithstanding the fact that this choice further circumscribed its own competence and ultimately autonomy. In a vicious circle, this lack of administrative depth regrounded central government dominance with its, relatively speaking, superior administrative and planning resources.

Fiscal dependence, either through central government transfers or EU funding, circumscribed the autonomy of the Greek local state as these transfers have justified rigidly bureaucratic central government controls. EU funding has also necessitated time-consuming and access-based seeking of favours from the central government, long time leads from the time of application to the time of implementation and policy discontinuity as, due to the lack of own local funding, even successful policies funded by the EU could not be supported subsequent to the termination of such funding. EU funding made the local state a policy implementer, these constraints notwithstanding, but almost exclusively in the capacity of the policy-taker as opposed to that of the policy initiator. Additionally, the availability of EU funding weakened demands for local fiscal autonomy at the local level as this additional source of funding enabled local authorities to eschew the politically onerous task of taxing one's own voters. The lack of local government fiscal autonomy which, were it to exist, would make local contestation that much more critical, , has meant that the debate on the need to have a local economy robust enough to sustain a sufficient, for necessary public goods and services, tax base, has never taken place. Additionally, this lack of contestation, originating in near absolute fiscal dependency, has undernourished contestation in general on all other issues, whether they would be related or unrelated to local taxation (Kamaras, 2013).

In terms of the interaction between the local state and local stakeholders their respective structuring and orientation, made both for discontinuity as well as back-scratching. The objective has been to produce nation-wide winning political machines, that would then distribute the division of the spoils across the nation's localities, and not effective collective action, underpinned by long term local coalitions, geared towards locally originating wealth creation. More specifically such national party based coalitions would engender discontinuity at the local level as they would not want to strengthen politically and legitimize, through the fact and the consequences of jointly undertaken and completed projects, a local state that would be affiliated with a party opposite to the one they would support. This zero sum game would also engender, at the local level, an ethos of mistrust as opposed to an ethos of trust, as collaborative efforts would be few and far between, further undermining the capacity for local autonomy in the service of locally defined common goods, contested, defined agreed and acted upon: from the preservation of the environment to the promotion of local competitive advantage.

What does this politico-institutional reality mean for the creation of a single site of contestability, for the creation of locally-grounded legitimacy and consensus out of such a single site and the implementation of democratically endorsed policy priorities? The single site of contestation underpinning the creation of what Kafkalas (2008) calls the strategic parameter is of course undermined. Absent a single identifiable demos, an election process, local accountability based on locally raised taxation, a public debate, with the power and authority to resolve differences, issue rallying cries, create friends and enemies, articulate and pursue authoritative directions, there can be no strategic intent and implementation.

## 3. Strategic spatial plans in Thessaloniki in the period 2000-2015 and interactions with the features of the Greek local state

### *3.1. An account of the main plans and the planning process characteristics*

In the following paragraphs the three main spatial plans of a metropolitan scale and strategic nature that were prepared in the period after 2000 are examined: the Strategic Plan for Thessaloniki's Sustainable Development 2010, the New Master Plan of Thessaloniki and the Development Strategy of the Municipality of Thessaloniki 2006-2015.

*Strategic Plan for Thessaloniki's Sustainable Development 2010*

Efforts to shape a common strategy along specific strategic priorities for the city's development started in the 1990s with a couple of studies which attempted to bring into the city's planning agenda the major socio-economic changes of the 1990s (Kafkalas, 2008) that privileged geographical proximity to large markets accessible since the collapse of the Berlin Wall. It was in this period that the discourse about upgrading the role of the city in the Balkan region became almost a slogan in all relevant documents. However, the first strategic plan which was prepared following the lines and ideas of strategic spatial planning as presented in the relevant literature was the Strategic Plan for Thessaloniki's Sustainable Development (SPSD) 2010. This was an initiative taken in 2000 - in the middle of a period of high growth rates both locally and nationally- by the then Ministry of Macedonia-Thrace, a ministry with very few responsibilities, which functions as a central government agent in northern Greece and represents the earliest origins of centralism. The initiative was supported by the Region of Central Macedonia, at that time a centrally controlled administrative tier, and mainly by the Organization of Thessaloniki Master Plan ("Organismos Rythmistikou Thessalonikis" – ORTHE), a locally based governmental agency with important spatial planning responsibilities at the metropolitan level, which operated (until its abolition in 2014) under the supervision of the then Ministry of Spatial Planning and Environment. A team of planners from the Aristotle University of Thessaloniki, who actively supported the idea for such a strategic planning experiment, undertook the preparation of an initial draft report, an "action plan" as it was called, and the coordination of all the relevant procedures in cooperation with the above bodies. The main difference of SPSD 2010 from previous ones was that it emphasized the procedures to be followed and what was called at the time "social dialogue", in other words a consensus building among the stakeholders and various agents involved in the city's development (Kafkalas 2008). A number of forums were organized with the purpose to shape a final action plan where all central and local government authorities, as well as all main local agents and stakeholders took part.

SPSD 2010 suggested that a spatial strategy for the city should be prepared and shaped at the metropolitan level, instead of the persistent overlapping of the central and local bodies, while it acknowledged the failure of the local economy to move to a knowledge-intensive model capable of producing internationally competitive products and services with high added value. The plan identified

four strategic priorities (international role-national territorial cohesion, competitiveness-innovation, social cohesion-equal opportunities and ecological balance-quality of life) and a framework of actions for the year 2010.

The consensus building that was part of the official public discourse and officially adopted by a large number of the involved actors in the SPSD 2010 forums, revealed the diverging strategies, to the SPSD, of important local stakeholders. One characteristic example was the reservations raised by the local department of the Technical Chamber of Greece (one of the powerful local stakeholders which represents professional interests) as SPSD 2010 was a plan that, for the first time in the city's spatial planning, was not concluding by suggesting specific public infrastructure projects, some of which (such as the Thessaloniki metro, the undersea tunnel and the outer ring motorway) were for years in the official agenda of both the central and local urban politics and remained so in the years to come: "The process of the strategic plan can not in any case become a reason to renegotiate or delay the promotion of major projects"[1]. Essentially there was a differentiation between the academic team (which coordinated the SPSD project) and the professional associations, the former favouring not a large-public-projects-driven but a governance-driven plan (that also suited the skills of the academic planning community) and the latter, along with the local political community, favouring the economic opportunities to their members, the gains to the local economy, to politically well-connected contractors and design offices and so on. None of these stakeholders took the opportunity of the SPSD to promote the agenda of improved governance and performance of critical local assets – the port, the universities, the cultural heritage, the hospitals – for the purpose of city's economically profitable engagement with its surrounding region of South East Europe. .

An evaluation and updating of the action plan was suggested in the final draft report to take place in 2006, the year of the expected completion of the 3rd Community Support Framework. The plan also set as important milestones the years 2004 (related to the 2004 Athens Olympic Games and the nomination of Thessaloniki as Olympic city) and 2008 (associated with the claim of organizing the 2008 EXPO). However, the entire effort was completed by 2002 with a final report called "Results on the Social Dialogues", which actually was articulated on the lines of the initial action plan. Since then no action regarding the city's development was related to this SPSD although many of its ideas and priorities were used in later plans to come.

*The New Master Plan of Thessaloniki*

In 2003 ORTHE started officially a long promised project to update the 1985 Master Plan of Thessaloniki. Among the three plans examined in the present paper, the Master Plan of Thessaloniki (Rytmistiko Shedio Thessalonikis, RSTH) is the only officially endorsed plan, part of the wider national spatial planning system. Although it has been categorized as a strategic spatial plan (Kafkalas, 2008; Yiannakou, 2008; Thoidou, 2013), it is does not really fulfil what Albrechts (2006) calls "the hard core of the strategic" (selective, relational annex inclusive, integrative, visioning, and action orientated), as it rather follows the tradition of "the integration of nearly everything" of older decades (Albrechts, 2006).

The preparation of the main study report -funded by the 3rd Community Support Programme- was commissioned in 2006 and completed in 2009. The report for the new RSTH was divided into two main stages: An initial draft concerned only the so-called boundaries of the RSTH and was put into consultation in 2008. It should be noted here that for all the areas that fall within the boundaries of the

[1] Technical Chamber, Department of Central Macedonia, Position statement on the SPSD, http://teeserver.tee.gr/online/epikaira/2002/2189/pg108.shtml

RSTH, lower "level" plans as well as crucial environmental and planning permissions fall into the jurisdiction of the Ministry of Spatial Planning, instead of the locally based regional administration. Yet most local municipalities and other stakeholders gave consent to a proposal for much wider boundaries of the RSTH, covering not only metropolitan Thessaloniki but a large part of the Region of Central Macedonia. A year before the official onset of the crisis and at a time when the first signs of a significant decline of the dominant property development sector was becoming evident (Yiannakou 2013), local politicians were seeing in the new RSTH a chance to integrate their municipality into a permissive, for real estate development, RSTH, to essentially wheel and deal, in the context of the RSTH, with the Ministry of Spatial Planning so that they could determine the specifics of such permissiveness within their own jurisdictions. As for the Ministry of Spatial Planning and its local agent ORTHE, which over the years developed strong linkages with the local political and professional community (an interface with real estate development) thus becoming an agent with its own "autonomy" and mandate over crucial decisions, the geographical reach of the RSTH builds on the fragmentation of municipal jurisdictions and thus allowed for ad hoc decision making facilitative of rent seeking behavior. To clarify what is at stake, we only need to imagine a RSTH that covered only metropolitan Thessaloniki and a city of Thessaloniki being a metropolitan municipality as opposed to being divided into 14 autonomies municipalities (31 before the 2010 Local Government Reform). Were this to be the case, the Ministry of Spatial Planning and ORTHE could not avoid sharing and contesting responsibility for the RSTH's design and implementation, in a single public space, with a demos who would be democratically legitimated to have a view of the RSTH coterminous with its democratic mandate and the policy priorities that this mandate would be identified with.

Be that as it may, the final draft of the plan was put into public consultation in 2011. In the next couple of years the plan was modified without major changes but adopting certain objectives related to the crisis' onset and it was only in 2014, in other words after ten years of preparation procedures, that a Bill was introduced in the Parliament for the endorsement of the RSTH along with that of the New Master Plan of Athens. However, one of the coalition parties in government, the New Democracy Party, suggested the withdrawal of the RSTH on the grounds that some of the main Thessaloniki stakeholders, such as all the local chambers representing the industrial and commercial firms, objected to the plan. Thus while the new Master Plan of Athens was voted into law, the RSTH was withdrawn for a new round of consultation. For the first time, the above mentioned Thessaloniki stakeholders were strongly questioning the authority of ORTHE[2] to provide planning permission for all new installations of more than 5.000 $m^2$ considering it as another licensing layer for rent-extracting through planning and environmental permission procedures. In this new round of consultation certain municipalities as well as the local department of the Technical Chamber also questioned strongly the extensive boundaries of the RSTH referred above and suggested to be confined to the actual metropolitan area of Thessaloniki. So far, the new RSTH has not been voted into law.

*The Development Strategy of the Municipality of Thessaloniki 2006-2015*

A third strategic plan which is of interest to this review was the Development Strategy of the Municipality (DSM) of Thessaloniki 2006-2015. The Municipality of Thessaloniki is the main local municipality covering the central, older and most populated part of the city and naturally its priorities tend to be perceived as those of the city as a whole notwithstanding the fact that it is one of 14 municipalities of metropolitan Thessaloniki and possesses no municipal jurisdiction. This strategic plan was prepared as a prerequisite anticipated by the 2003 Local Government Law in order to shape a

[2] In 2014 the Organization of Thessaloniki Master Plan was abolished (as part of the reductions made in the public service following the fiscal measures of the period) and its responsibilities were transferred in the main administration of the Ministry in charge of spatial planning.

framework for the operational programming of the municipality, basically its public works programme. The plan has been drafted following the specific guidelines provided by law and sets a "vision" and specific "fields of actions" implying that these municipal strategic plans are by their guidelines oriented towards more selective principles.

The DSM compares the city of Thessaloniki with a number of other European cities of similar size, such as Barcelona, in an effort to set a more sustained vision for the city and its international role. Focusing on more selective fields of actions the operational plan that followed the preparation of the DSM specified a series of public investments of a renewal or regeneration based on property development character that had sufficient size to positively affect economic activity in the city, by stimulating demand caused by large projects. It also proposed the creation of new institutions such as the creation of an Agency for the Promotion of Tourism which, in synergy with the Municipal Authority and stakeholders, would give the opportunity locally to implement policies with a significant economic effect on the city of Thessaloniki. The DSM reviews all models of metropolitan governance in the European space and recommends, from the options analyzed, the weakest one, namely the creation of a consultative body that would bring all municipalities of metropolitan Thessaloniki to review and decide on issues that warrant metropolitan solutions. The DSM also lists all of Thessaloniki's assets – transport infrastructure, educational system, hospitals etc – that substantiate the city's ability to play a nodal role in the wider region of South Eastern Europe, according to the DSM, but does not recommend a strategy and performance goals that would commit all stakeholders to the fulfillment of this role. Thus on both sides of the equation – political structure of the city and governance and aims of its key assets – the DSM is not designed to facilitate change and implement the strategic direction that it is nominally committed to.

The preparation of the DSM was a completely internal process, confined to a study undertaken by a municipal development agency. The strategy was never put into any type of consultation and it was in fact prepared as a document-prerequisite for getting EU funding for specific municipal projects. Yet the proposed public investments reached at best only the study stage, as once again they were treated as centrally controlled public projects and not as locally formed processes for regenerating specific areas affecting the city's economic activity or re-designing its image.

### *3.2. Understanding the main interactions with the Greek local state*

The above account shows that strategic spatial planning in Thessaloniki was a fragmented process consisted of the preparation of various spatial plans with no connection to each other. These plans came into being either as an initiative of locally based agents of the central government (Ministry of Macedonia-Thrace, University of Thessaloniki, ORTHE in the case of SPSD) or as a "statutory planning" procedure under the traditional supervision of the central government, again through its locally based agents (Ministry of Spatial Planning and ORTHE, in the case of MPT), or finally as an internal prerequisite of the development planning incorporated in the EU funded programmes (Municipality of Thessaloniki, in the case of the DSM). Following the main common objectives of the strategic spatial planning as presented in the introduction -vision, strategic priorities, fields of action and consensus building- Table 1 provides a summary of the three spatial plans examined in this paper. All plans were nominally committed to a set of strategic priorities which were mostly similar.

Consensus building was an official target mainly of the SPSD 2010 but the 'owners' of the SPSD, and of its consultation process, the Ministry of Macedonia-Thrace and the academics who helped conceive it, and prepared it, had limited political legitimacy and non-existent executive authority. Thus the consultation process manage to elicit, through their criticism of the SPSD, the standard preference of local stakeholders for high prestige, expensive public projects, while not engaging them in the co-

articulation and concretization of politically difficult solutions to the strategic priorities that the SPSD itself recommended. Nor was the political owner keen to fully flesh these solutions and their implications themselves, enmeshed in a politico-institutional setting that did not prioritize, both nationally and locally, ambitious and politically risky change The RSTH followed a more statutory consultation process and was addressed to a very wide range of stakeholders in an attempt to get a wide legitimization especially regarding one main policy, that of the extension of the metropolitan area boundaries, in other words of the control over crucial decisions that produce rent-seeking benefits within a fragmented local state. Notwithstanding its sponsorship by a powerful, this time, Ministry, that of Spatial Planning, the RSTH never really acquired powerful political support, as local stakeholders either engaged with it to secure small-scale, opportunistic advantages or to resist yet more burdensome regulation. Thus the RSTH also revealed the lack of local ownership, as much as the objective inability for such ownership to be available, due to municipal fragmentation, resulting in its failure to be turned into law and to be implemented. Finally, the DSM illuminated the limitations of municipal governance itself, as it was an exercise in paying lip service to the metropolitan mission of Thessaloniki by a municipal authority that lacked metropolitan jurisdiction, did not see it in its interest to fight for such an authority and rather legitimized and operationalized, through its strategic planning, its limited public works programme and other operations of limited significance.

Table 1. A comparison of the 3 strategic plans against 4 main parameters of the strategic spatial planning process

| | Vision | Strategic goals or priorities | Fields of action | Consensus building |
|---|---|---|---|---|
| Strategic Plan for Sustainable Development 2010 | The document does not synthesize its priorities into a single vision | –International role – national territorial cohesion<br>–Competitiveness-Innovation<br>–Social cohesion-equal opportunities<br>–Ecological balance-quality of life | *6 Operational Plans (as key fields)*:<br>–Governance<br>–Competitiveness<br>–Employment<br>–Infrastructure<br>–Residential development<br>–Quality of life | –General and specified forums |

Based on the four defining features of the Greek local state, the strategic spatial planning experiment in Thessaloniki can be summarized in the following points:

The *centralization of the Greek state* is expressed in the fact that strategic planning was mainly an initiative of the central government but with specific characteristics. The preparation of the two plans, the SPSD 2010 and the new RSTH, was managed partly in the former case and wholly in the latter case by a strong locally based agent, ORTHE, officially controlled by the central administration yet operating with an important degree of "autonomy". This "autonomy' was itself an outgrowth of centralization which is sustained by the fragmentation of municipal power within the limits of metropolitan Thessaloniki. The third plan, the DSM 2006-15, was prepared as an internal process by the central municipality of Thessaloniki which did not possess metropolitan authority and certainly did not result in any policies of metropolitan consequence being implemented. Within such processes it is characteristic that instead of debating on the consequences of local fragmentation and promoting the possibility of local political engagement though a metropolitan governance structure, the stakeholders who took part in the process gave consent to the most centrally based forms of decisions, such as the extension of the statutory metropolitan plan boundaries, seeking to gain access in the centrally oriented political agenda at a period of large expectations from the property development sector. Within this context the debate focused on the implementation of specific so-called large infrastructure projects which were either cancelled (ex. undersea tunnel) or have faced with serious delays even by the standards of projects of such scale (ex. Thessaloniki metro) So we have (a) plans that are enunciated but take extremely long time to be approved if at all (b) their own strategic priorities are not acted upon (c) and even those public works projects that have direct benefit to a critical mass of local stakeholders fail, by and large, to be executed. This is evidence first of the lack of both local power and autonomy and of the resulting ability and necessity to articulate and 'own' the strategic parameter. Second, it is evidence of centralisation's limited aim of managing rent-seeking relationships while only paying lip service to itself-proclaimed strategic intent.

The *specificities of the financing arrangements* run though all the planning process in various ways. Even in SPSD, which officially focused on a consensus building around the adoption of selective strategic priorities, the stakeholders involved considered it as a process concerning central government transfers for specific publicly funded projects. The RSTH handles more typical development or regeneration schemes as public works without providing any guidelines or necessary preconditions for the spatial development of large private investments. The DSM, although officially stated as a strategic plan, it is exclusively focused on forming a framework for EU funded projects, a tool for a local government which functions as a policy implementer of policies that are decided at the central level. Spatial planning, and strategic planning in general, does not concern itself, in substantive and tangible terms, with the issue of expanding the tax base of the local state, as this state is fragmented and financed via central government and EU transfers, and is thus devoid of a developmental

perspective and of the governance and overall performance criteria that can render such a perspective credible and actionable.

In the spatial planning procedures the most prominent *local institutional interlocutors and stakeholders* involved were the local municipalities and professional associations, chambers of commerce, employers and employees organizations governed by politicians or leaders with strong connections with national party politics who seek to play a role in the central politics. This feature in fact led to the subordination of local stakeholders to central politics, as much as to governmental centralization. Such stakeholders see this type of decisions as ways to update their ability to extract various benefits from the territorial extension of the centre's planning power. Furthermore instead of forming common visions for the city's growth and development, through this process of consultation and codetermination, what happens is to leave untouched critical public assets and goods which remain hostage to rent-seeking coalitions thus undermining growth and equity goals at the local and eventually at the national level. As we mentioned above none of the three planning exercises subjected to critical scrutiny the governance and resulting performance of these public assets and goods notwithstanding the fact that all three plans identified them, correctly, as critical to Thessaloniki's achieving its potential as a metropolis of regional consequence. Last but not least, a special type of "nimbyism" has become influential in resisting public/private partnerships, again hiding narrow as much as private interests under the guise of the public weal, to deny to the general public both growth, and its distributional potential, namely though the financing by this growth of desirable public amenities. This type of "nimbyism" blocked most of the investment proposals which had a regeneration dimension in different derelict sites of the city, regeneration that never took place eventually.

Finally, all three spatial plans were products of a period during which *the economy was based on consumption over the production of goods and services*, with the residential property development sector being the main driver of the urban economy which does not necessitate the marshalling and combination of location-specific assets, over time, by the local state. This boom was made possible by the easy financing conditions that Greece's EMU entry brought about, conditions which boosted state-led consumption across Greece, and in Thessaloniki, and allowed for mortgage and consumer credit to balloon. Thus all three plans do not incorporate clear proposals regarding the spatial dimension of strategic planning per se and as such do not place any restrictions on residential development. It should be noted here that, behind the notion of sustainability the RSTH conceals a policy of extensive releases of new land for development. This real estate boom (that tends to undermine planning in general) was aided and abetted by administrative and thus political fragmentation at the local level of government. Fragmentation also, in the case of Thessaloniki, entrenched the inability to offset the structural decline of the city's and the Region of Central Macedonia's economy, with the exception of the residential development sector, through the pursuit of structural, long term opportunities through precisely the utilization of multi-sectoral and multi-spatial coordination. The politico-administrative mechanisms which would undertake and execute such developmental commitments on behalf of a single metropolitan, political community simply did not exist. .

## 4. Conclusions

The above discussion is an attempt to highlight those aspects in the literature regarding strategic spatial planning that build on the interactions of the process with the local state as an interpretative path to understand its successes and failures in the specific institutional context of Thessaloniki, Greece's second largest city.

The strategic spatial plans under consideration reflect a reluctance, notwithstanding the strategic priorities that they set, both to diagnose the problems present obstacles to the pursuit of these priorities and to shape the policies within a lasting spatial planning process which aims to fulfill these priorities. In all the three plans under examination very little thought and effort was devoted to actual outcomes and to answering the question of how the city's assets can better utilized to the public benefit. As such, these planning exercises represent an effort to reproduce the main features of the local state and the way it interacts and is circumscribed by the central state. These strategic planning exercises legitimized statis by being strictly pro forma in the way they set about outlining the creation of an internationally competitive metropolitan production complex. Spatial planning, in turn, facilitated residential construction, through its ex post legalization, such construction being key to the consumption led model of the national economy funded indirectly by state expenditure and the financing that the national economy could attract from international money and capital markets. It may sound provocative but in the political economy of a bankrupt local as much as national state, when a system fails completely it seems that transformation or change is left not to extra-local but to extra-national agents, in our case Greece's Troika of lenders which have mandated to the Greek government the privatization of key local assets, such as the port, the water authority and the international trade fair in Thessaloniki.

Perhaps the solutions should be searched within the local level and to models of decision such as coproduction (Albrechts 2013), which may be proven useful for a local polity where vested interests have long claimed, with great effect, to represent the common interest, and as such it may allow, in times of crisis, a gifted local political leadership to share a vision with the general public and invite the general public to participate in the materialization of this vision, rendering redundant the claims of vested interests groups while also justifying the promise that co-productions defenders have claimed for it.

# URBAN PLANNING LOST IN TRANSLATION: COLONIAL URBAN PLANNING SYSTEMS AND TODAY'S REALITY

Dr. Wolfgang Scholz

Technical University of Dortmund, Faculty of Spatial Planning, Germany,
wolfgang.scholz@tu-dortmund.de

**Keywords**: informal urban development, planning standards, Tanzania

***Abstract***
*In Sub-Saharan Africa urbanization is progressing at a rate unprecedented in human history. In most countries, the state is not in a position to apply a responsive legal framework and to mobilize adequate resources to guide urbanization. A major obstacle are the outdated legal framework, its institutional set-up and the inappropriate planning concepts inherited from colonial governments which often contradict post-colonial policies and are unsuitable to respond to rapid urban growth.*
*The paper will present results of a joint research analysing empirically factors on space standards and land use in prevalent types of formally planned and informal settlements in Dar es Salaam as well as the stakeholders involved in planning decision. To understand the current urbanisation there is the need to understand its history: The paper will analyse the historical development of urban planning, its legislation and the physical outcomes as settlement pattern on the ground.*
*In Dar es Salaam, Tanzania, now informal settlements cover more than 70% of the city areas because the statutory system cannot provide sufficient building land and settlers have to find plots on the informal land market. It shows the need for a new approach to statutory planning in order to guide urban development effectively, to create more functional settlements, to assist the urban poor to access affordable plots with basic services. Or with other words, there is a need to rethink urban planning for a weak institutional environment and develop an idea and a model for urbanization Africa under poverty.*

## 1. Introduction

Dar es Salaam in Tanzania is among the fastest growing cities in Africa with 70% informal settlements. They have emerged because the statutory system cannot provide sufficient buildable land due to inappropriate inherited planning standards from colonial times and inefficient land allocation procedures. The author poses the hypothesis that a residential plot provides income and employment generation which can be supported or hindered by planning regulations. The study examines the land use changes taking place in both planned and informal urban settlements in Dar es Salaam. Its aim is to learn to what extent the formal planning regulations are applied and efficient; which current development processes are on-going; how these processes impact on the livelihood strategies of the residents; and which land use conflicts typically take place due to the lack of development control.

## 2. The planning system

In Tanzania, as in many other former British colonies, the British Town and Country Planning Act of 1947 was adopted in 1956 as Town and Country Planning Act. It is still the main legislation for urban planning in Tanzania and deals with the use of land and buildings, the intensity of use of land, the size, and form and construction materials of buildings. For public land uses it manages e.g. roads reserves and the protection of natural resources. The land use plans assign separate land uses (i.e. residential, commercial, educational, etc.) for an ordered physical development, as perceived by the statutory planning. The land use categories are a mean of territorialisation of urban land to create distinguish land use pattern by the separation of activities following a principle of order.

The planning legislation as well as its land use categories did not follow a process of translation and appropriation into local reality but rather reflect still an imported planning ideal of a small green city

with limited growth in Tanzania since colonial time without much dispute. Similarly, the three still existing different plot size standards (named today low, medium and high density areas) for residential areas thus resonate the former colonial principle of racial segregation by zones (zone 1 for Europeans, zones 2 for Asians and zone 3 for Africans) and even use still the same parameters (Scholz et. al 2015). The former racial segregation continues today as territorialisation principle along income groups in the three zones.

The planning system is organised on different levels and scales with regional and district plans and on urban level with General Planning Schemes and detailed layout and regularisation plans (for upgrading of informal settlements) on the neighbourhood level. Therefore, it can be assumed that the Town and Country Planning Act in Tanzania provides a statutory institutional framework to fully control and manage urban development and thus the production of space similar to European countries where it actually is coming from.

Local government units (district council, town authorities and Mtaa (Sub-ward) governments) have a full mandate for land use planning in their areas following procedures legitimised by the political power of the central Government over space. The central Government finally controls and approves local planning schemes (Scholz et. al. 2015). This final step guaranties the territorialisation of urban land by the Central Government.

A similar process of adaptation of colonial principles can be observed in the planning approaches still following mainly the standardised top down master plan approach aiming at a determined controlled urban development over decades. This approach favours a strong Government. It can be therefore interpreted that both planning legislation and planning approaches are used as a mean to territorialize urban land under control of the Government and follow the principle of an ordered and controlled urban development.

Another factor shaping the urban fabric is the land tenure system. During the socialist period of independent Tanzania, land became public in 1967. Actually, it can be said land became under the control of the Government respectively the ruling party in the then one party system (Kironde 1995). When land is needed for public purposes, including residential areas, it can be acquired by the President. If an agreement to acquire the land from the current land holder fails, then compulsory acquisition should take place. Originally the compensation was made on unexhausted improvements on land only, but since 1995 land has officially a value (Kironde 2006). However, the value of land is often under dispute between land holders´ expectation and actual compensation paid by the state. Land holders expect compensation based on future land value after being planned and developed while the Government pays only a compensation based on the current value as e.g. agricultural land. The expectation of the higher price is fuelled by the option of the land holder to sell the land on the informal land market for residential purposes to individuals. Also often valuation surveyors estimate total different prices for similar neighbouring plots which lead to mistrust of the compensation model (Mollel et. al. 2007: 6).

All these three issues, the planning legislation, the planning plot size standards and the land tenure system support the centralised power over land by the Government. However, actually they led to a loss of power of the planning machinery. Four interconnected reasons can be observed. The first is the current high urban growth rate which overstretches the capacity of the planning administration to produce new building land and to provide an ordered urban development according to its own ideals. Second, the inherited urban plot size planning standards require large plot sizes for housing (official minimum plot size is 400-800 m² for high density areas). These standards are today too expensive for the Government to acquire and to service the areas with infrastructure and unaffordable by most social groups, especially the urban poor. (Scholz et. al. 2013). Thirdly, the inherited top down master planning concept which has been the main planning procedure from colonial to post-colonial times has come in contestation in the early 1990s due to its negligible impact on urban development control and the lack of participation. And forth, the mentioned above option of land holders to sell land on the

informal market by by-passing the official procedure to acquire land for planned areas by the Government.

The high urban growth rate at about 5% in combination with the low rate of new statutory planned housing areas leads to a serious shortage of building land. Today, the unmet demand for affordable building land is largely covered by the informal land market offering also smaller plot sizes but no infrastructure services. Informally developed areas do not follow any planning scheme or building regulations. This creates a balance on the land market according to supply and demand but creates disorder in the urban structure at least in the view of the planning administration (Kombe and Kreibich 2007, Kironde 2006, Lupala 2002). In the informal land market, land under customary land tenure (former village farm land at the then periphery of the town but now part of the urban area) is subdivided and sold to dwellers at market prices and not at the lower official compensation rate. This system works well for both sides because it meets the expectation of a higher price for the land holders and provides access to land for residents. Security of tenure is provided by local officials and witnesses during the selling process (Kironde 1995: 81) undermining the power of statutory planning. It can thus be argued that the statutory planning machinery, the official procedure and loop-holes in the land tenure system and land management contribute to the problems of growing informal settlements (Scholz et. al. 2015). This informal urbanization leads to new forms and actors of territorialisation beyond the public domain.

The lack of building land provided by the formal system has also increased the development pressure on existing settlements. This applies to residential but also to commercial land uses. The growing commercial and service sector in the current market-led economy in Tanzania has given rise to land use changes towards commercial activities and redevelopment of residential plots towards multi-storey buildings in residential areas. An unguided development of commercial activities can cause land use conflicts among neighbours as described later in the case studies.

## 3. Dar es Salaam

Dar es Salaam in Tanzania serves as the case study area for these processes. It is among the fastest growing urban agglomerations in Africa, with about 150,000 new inhabitants per year and a total 4.3 million population (National Bureau of Statistics 2012). Dar es Salaam is characterised by low density informal settlements with mainly single storey houses shaping the urban fabric. Between 70 per cent and 80 per cent of the built-up areas of the city are informally developed residential settlements. Fig. 1 displays the different settlement types in the urban fabric. It was prepared by analysing satellite images and maps over the period of the last 20 years. Most of the urban development is informal (red) spreading into the hinterland along trunk roads and around existing villages under transformation (dark red) on former farm land under customary land tenure. Informal urbanisation is therefore the main factor of territorialisation of urban expansion. During the 1980s, some planned residential areas following the neighbourhood unit concept and developed as Site-and-Service-Scheme (among those the first case study of Sinza, orange, see below) were established. Only a few new housing areas under the 20,000 plot development scheme at the mainly unserviced periphery (orange) were established recently but not able to cover the demand. Inner city planned areas as well as informal settlements close to the centre face today a development pressure towards a vertical and horizontal densification as well as land use changes towards commercial activities (see case study one).

The following case study of the planned neighbourhood of Sinza in Dar es Salaam will display the outcomes and contestation of these densification and land use change processes (case study 1) while the second case of the informal settlement of Sandali displays unguided land uses changes (case study 2).

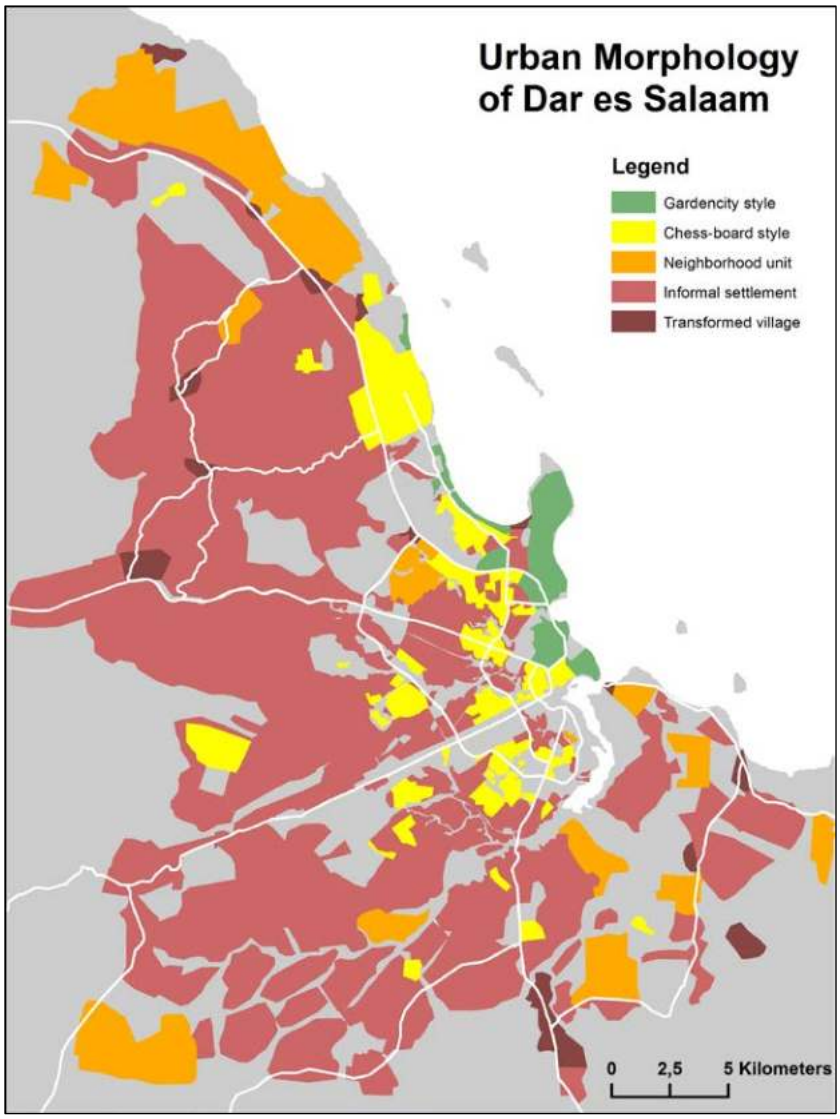

Fig. 1 Urban Morphology of Dar es Salaam. Source: Wolfgang Scholz 2014. Cartography Ines Standfuss.

### 3.1. Sinza

Sinza is a planned area developed in the 1980s with the support of the World Bank as Site-and-Service-Project. It is located about 10 km from the city centre at the then urban fringe. Sinza is subdivided into smaller neighbourhood units all well organised with a central open space in the middle of mainly small residential plots of 288 sqm. In Sinza tenants represent today a significant number of the residents. In the planning scheme, developed during the socialist period with restricted commercial activities, only a few areas were designated for commercial land uses (Fig. 2). The layout plan for Sinza, designed by foreign experts, follows the neighbourhood unit concept with clear ordering elements (standardised plot sizes, strict land uses categories, clear demarcation of private plots and public land for roads and open spaces) to have control over urban space by public authorities. Sinza can be seen as example to create order in the urban fabric.

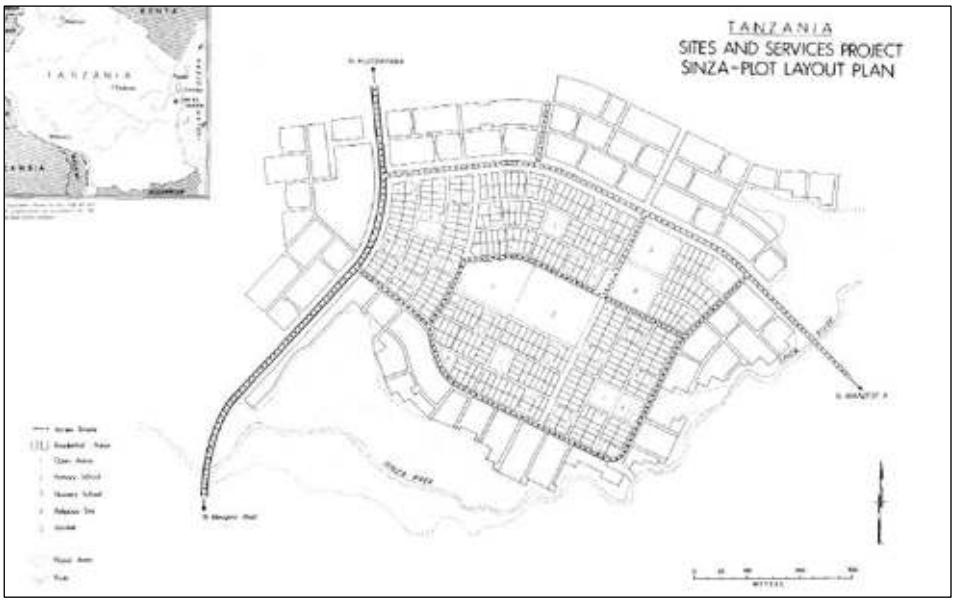

Fig. 2: Layout Plan for one neighbourhood unit in Sinza. Source: Worldbank Report 337a-TA, 1974)

However, the planning scheme came under contestation when new economic activities in the current market led economy came back to the stage and these actors demand their territory of urban space creating disorder. Sinza displays today, however, a high density due to extension of buildings and high percentage of commercial activities due to the central location in the urban fabric and good accessibility of the areas between two trunk roads. This reflects the development pressure on the settlement and the tendency to more commercial uses in the purely residential area. (Authors fieldwork)

The former planned residential area has become now a rather mixed use area. The planned order of a purely residential area is under contestation towards disorder of land use conflicts. About one third of the plots are turned into commercial. A growing number of commercial activities are today mainly located along main roads at the fringe of the neighbourhoods. Locational preferences of the operators of commercial activities along the main roads are based on the need to ensure accessibility and proximity to the major consumer flow channels. They follow their own logic and order of space due to economic forces. This causes severe negative impacts on the functionality of the settlements since plot sizes, parking areas and set backs of the former planned residential area are not designed for such commercial activities and their spatial and functional needs. Fig. 3 displays the recently developed commercial plots (blue) which has been originally designed and used as residential plots.

The following two examples represent cases of the contestation of urban space and how different actors try to achieve control over urban space in a situation where the layout plan and building regulations are either outdated or not enforced.

Sinza is increasingly becoming an area for hotels, bars and beer gardens (see also Mollel 2007: 3) which often disturb the residents. *"Sinza is the beer garden of the entire city"*, an old residents complained. *"Just behind me there is a bar which most of times play music up to midnight, so you can't do anything at night."*

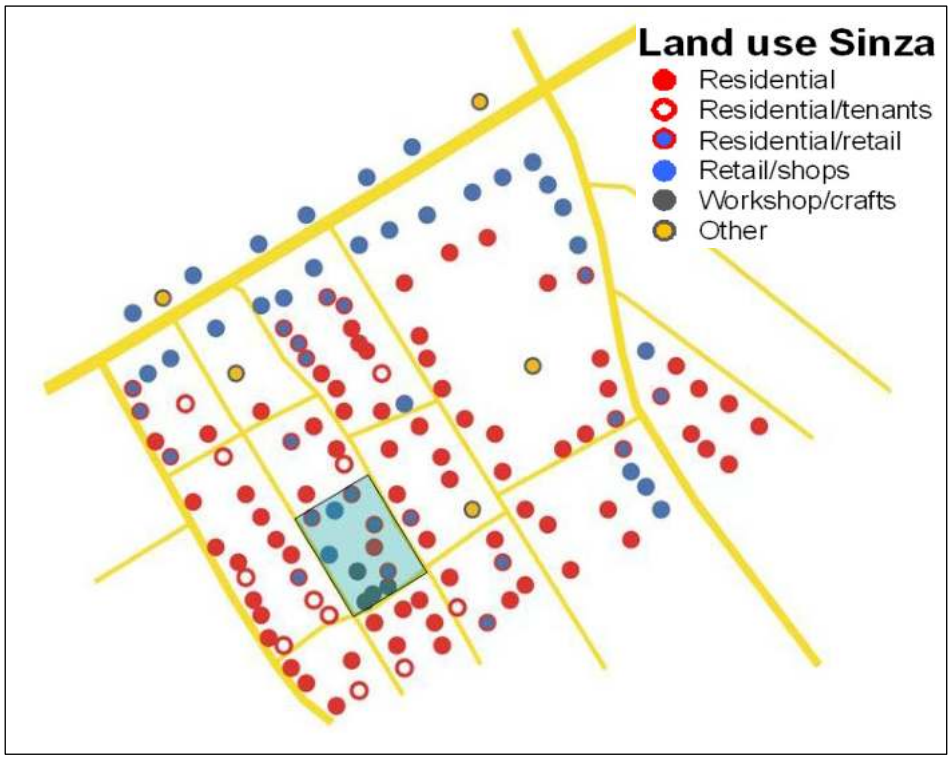

Fig. 3 Land use distribution in one neighbourhood in Sinza. Source: Wolfgang Scholz 2012. Cartography Ines Standfuss.

A bar in Sinza along the main road was playing loud music after midnight. Most of the visitors of the bar and the owner himself are not coming from Sinza. Adjoining settlers won a court case on noise reduction; however, it was only successful for a short time and music after midnight started again. *"We have problems here especially with the noise which come from the bars around here at night. I heard that the local government stopped them to play music without being sound proof, they stopped once but then they have started again"* a resident complained and another one added: *"We have tried to report them, they stopped only for few months but now the problem is the same."* The manager of the bar, however, is rather ignorant about complains from the neighbours: *"There are always problems when you run a business like this."* This example clearly displays land use conflicts caused by the change of land use and contestation over territory.

However, the outcomes of this land use changes towards more commercial activities are not always negative. Operators of businesses and workshops on the open space in the middle of the neighbourhood (see Fig. 4) are aware of the disturbances they cause (such as blocking access during delivery time, noise and dust production) and recognise the need to negotiate arrangements with the neighbours. The operators of workshops who have encroached upon communal open space in Sinza have started informal negotiations and agreements for a co-existence with the surrounding residents. *"No, we have no certificate for land use changing. We got an authority to change the use from the local government but it is only a temporary permit,"* one worker stated and a resident added *"During the day when they come to collect by lorries, they make a lot of noise, but it is for a short moment and usually we got informed, so it is fine with us.*" The operators are also fully aware of the fragile legal status of their presence. Therefore, they try to avoid open confrontation with their neighbours unlike the operator of the bar above. Although, their activities are examples of disorder in the residential settlement, they try to re-establish order by negotiations over territory.

Fig. 4: Workshops on the open space. Source: Wolfgang Scholz

The disturbances for residents by the activities on the open space are lower since they operate during daytime when residents are out at work while the bars and beer garden operate mostly at night and weekends.

### 3.2. Sandali

The informal settlement of Sandali is taking after an upgrading program introducing storm water drainage and basic access roads a similar path of land use distribution and new commercial activities (see Fig. 5). Besides bars there is another example in Sandali displaying the limits of local decisions. Workshops for used oil recycling are operating in a residential backyard. The surrounding residents have complained about the pollution of this dangerous activity but without any reaction from the operators. The sub-ward leader stated that he is not able to stop these activities since the operators are tenants only, and the landlord is living outside the settlement and therefore not accessible for the local leader. Only after termination of the current valid rental contract, would the local leader be able to guide new activities on the plot. This case shows the limitation of locally made decisions or local regulatory systems which are often based on a lack of knowledge and awareness, as well as being difficult to enforce (authors' fieldwork, 2011).

## 4. Findings

### 4.1. Conflicting land uses

The fieldwork revealed that disturbances for residents, both in planned and informal settlements, caused by conflicting land uses are mostly related to noise from bars, music halls and religious buildings, less from commercial activities like workshops or repair workshops. The main reason is that the latter operate during daytime when residents are out at work while the first ones also operate at night and weekends. Income generating activities such as shops, pharmacies, tailoring shops are generally more tolerated, while leisure activities, such as bars, and places of worship are less tolerated by residents because of their potential to cause disturbances. Problems in the settlements are mainly related to uncontrolled changes of the land use and the tendency toward mixed uses.

### 4.2. Planning regulations and decision-making

The interviews in the case study settlements, both planned and informal, revealed that there is hardly any sensitivity or adherence to planning regulations and land use categories among the residents. Only plot boundaries of neighbours are respected. Developers are only aware that structures can be demolished if built on the road reserves; however temporary encroachments, like the tables and chairs of bars, are common.

Most respondents state that they lack knowledge about planning regulations and the potential positive or negative impacts of the regulations. This is a contradictory finding since, in Sandali, planning instruments and urban layout plans were used during the formal regularisation process. In that process, intensive surveys, consultation with residents were undertaken and demolition of buildings executed to facilitate the expansion and construction of access roads and storm water drainage.

There is also lack of awareness of planning regulations at the institutions at the grassroots level of the Government (Mtaa, ward level). For instance, in the sub-ward office (Mtaa) of Sinza the copy of the land use and layout plan was missing. It seems that in the understanding of residents as well as local leaders, planning only focuses on the change of land use at the plot level approved individually by the local leaders and not according to the general planning scheme. Thus individual decisions do not correlate to the existing plans (Sinza) or general regulations (Sandali). Permission to build, extend or to change the use of a building are issued by local leaders based on the political influence of the applicant overruling a planner's technical statement and thus in disregard of public interests. Therefore, conflicting land uses easily emerge. Such permissions focus only on the plot itself, and ignore the neighbours' plot and the construction on it (concerning size, height, setbacks and land use).

### 4.3. Differences between planned settlements and informally developed areas

There seems to be little difference between planned and informally developed settlements in terms of adherence to planning and building regulations. Uncontrolled building construction, extension, in-fills and change of land use persist. The land uses are likely to be similar because of processes of gentrification and the pressure of the real estate market on these settlements which are often located in attractive areas of the city. Therefore, the distinction between informal and planned settlements is becoming rather an administrative term only, with less relevance on the ground. However, the planning authorities both at national as well as at local levels still consider informally developed areas as areas where no regulations can be enforced.

Horizontal densification is seen as one of the key future challenges in Sinza, especially because many individuals would like to build multi-storey buildings on the same plot that is today occupied by a single storey house. In Sandali the new, modern buildings which are replacing the old structures made of rather poor building materials are seen as a symbol of a better future. Most new buildings are fenced like in Sinza, which will create a higher "visible" density, may block footpaths since former shared

space between the buildings is becoming private space behind walls and can hinder ventilation. Both planned and informally developed settlements undergo processes of land use changes, densification and potential gentrification following the rules of the real estate market and seek more economic land use.

### 4.3 Land use categories do not support residents' livelihood strategies

The majority of the residents in Dar es Salaam are poor. However, as noted earlier there are no newly planned areas dedicated to low income residents. The rigid land zoning concept and land use categories (residential, commercial, and residential cum commercial etc.) does not reflect the reality of the residents' need for a flexible livelihood including changing employment and income generating activities.

Commercial uses are necessary in settlements to provide income and services for residents. However, there is a need to regulate and designate them in specific suitable areas in advance before they emerge uncontrolled.

There is no clear concept for the distribution and localisation of the emerging commercial and service related activities. They are spread haphazardly throughout settlements without a proper planning concept. This calls for the re-view of the current zoning concept which provides space for retail business in the centre of a neighbourhood regardless of the predominant traffic flow which is along the main roads between neighbourhoods. Thus, planning should consider locating disruptive uses like bars, warehouses, workshops along the main roads at the fringe of the neighbourhood on the one hand, and restricting the centre to purely residential uses. This means the spatial reversal of the neighbourhood design concept used in Tanzania and the development of new land use categories (disruptive/non-disruptive commercial activities) in combination with plot coverage rules and increasing setbacks according to the height of the building (authors' fieldwork).

## 5. Conclusions

Both planned and informally developed settlements undergo numerous transformations such as densifications and increases in commercial activities. This leads to problems in the settlements, mainly related to uncontrolled changes of land use. Some of the uses have a negative impact on neighbours (e.g. bars) while small corner shops or small-scale workshops have little or no significant negative impact.

The examples above also reveal that there is hardly any sensitivity or adherence to planning regulations and land-use categories among the residents, local leaders and operators. Most interlocutors stated that they lack knowledge about planning legislations and the potentially positive or negative impacts of regulations. It seems that residents, like many local leaders, understand planning only as focusing on changes of land use at the plot level and not as dealing with public interests or neighbours' rights. A resident from Sinza stated*: "If regulations are followed they are good, but people don't follow. That's why you find more complaints to the government. Also the government hasn't provided enough education concerning those regulations."* Thus, it is at the individual decision-making level where compliance with existing plans or general regulations fails. Permission to build, extend or change the use of a building is issued by local leaders and is often based on the political influence of the applicant, in many cases in disregard of public interests. So conflicting land uses easily emerge.

Titus Musoga, from the National Land Commission, Nairobi, Kenya summarized in an interview in 2013 the situation of urban planning in African cities: *"The perception of (urban planning) laws is that they only apply to the former colonial core city and not to the recent post-colonial expansions. Land-use regulations are perceived to be only applicable in the colonial city since they are a colonial construct."*

# Impact of politics on the planning of the New Desert City of Toshka in Egypt

Yehya Serag

Associate Professor of Urban and Regional planning, Faculty of Engineering, Ain Shams University,
yehya_serag@eng.asu.edu.eg

Keywords**:** New City planning, Politics and urban planning, Desert Communities

**Abstract:**

*Through the last few years, Egypt witnessed turbulent political changes in the form of two successive revolutions in 2011 and 2013. This was preceded by several decades of a strong central ruling culture. Although, wide aspirations and hope for a new decentralized governance system have prevailed following the recent revolutions, much of the traditional central system still prevails. Such environment is strongly evident within the city planning disciplines. When it comes to planning new cities in different regions, decisions are still taken in Cairo. Such decisions are not correct all the time, owing to the argument that most Heads of the different planning bodies, do not really have a final say in the planning decisions even if these are based on solid contextual studies. Many of them are concerned from the consequences of defying the upper heads of the physical planning authorities. This paper attempts to analyze the dynamics of the urban planning decision taking when it comes to new city planning, within a highly central and bureaucratic institutional environment. The analysis is done within the case study of the New Desert city of Toshka in the South West of Egypt, intended to be the main service center for a new rural community that had been initiated based on a national project in the 1990s to transfer the Nile water to the desert through an artificial canal. The cycle of this project passed through different periods of stagnation and activity within three successive regimes in Egypt.*

## 1. Introduction

The population distribution since two decades earlier and until now in the Egyptian territories has been characterized by concentration of almost 93% of its size along the Nile Valley, which forms only 7% of the total area of the country, hence resulting in several problems of over crowdedness, shortages in services as well as environmental degradation (Serag, 2008). Accordingly several national projects had been launched in the attempt to create other inhabitable areas with good incentives to attract some of the Egyptian population. Such projects include but are not limited to the development of the North West coast in the 1980s, the development of the New Valley in the Western Desert in the 1960s, and the attempts to develop Sinai. Among such projects is the Toshka project which is a regional rural development project in the South West of Egypt that started in the second half of the 1990s and is still ongoing until 2015. The project aimed to establish new rural communities in the desert after transferring the Nile's water for cultivation activities. This paper attempts to analyze the flow and development of the project over the last two decades to examine the impacts of politics on the planning process especially after two successive revolutions in 2011 and 2013.

## 2. Methodology

This research work is based mainly on literature review to track down what happened in the earlier phases of the project and how it was initiated and perceived in the pre-revolution period and during the Mobarak reign. Since the author of the paper has been a member in the team responsible for the planning of the New city of Toshka since 2009 until early 2015, there is a strong reliance on the observation done during this period and the analysis of the process that took place during both the pre and post revolution period. In that sense a good insider perception and analysis is made. The research included also some interviews with involved planners and officials who would stay anonymous as per their request. The paper follows a straight forward chronological timeline with the main political events that took place through the duration of the project.

## 3. The Planning context In Egypt

Egypt has had a long tradition of comprehensive planning and top down decision making approach; this was coupled with the concept of the central government that prevailed in Egypt throughout most of the 20th century. This tradition drastically changed by the mid-2000s towards strategic planning and participatory planning approaches (Serag, 2008). However, this is argued to have been mostly applicable in the context of re-planning existing cities, where public participation is a key principle of the planning process. Through two main initiatives in the 2000s with the help of the UNHABITAT and the SIDA (Hassan et al, 2011), the shift towards strategic planning including citizen participation has been achieved.

Yet, when it comes to the spatial planning of new cities and regions, the top down approach is evident. This could be understandable as in many cases there are no inhabitants in the targeted areas especially if these areas are located in the desert, although in some cases some inhabitants may exist and might be neglected in the planning process. A recent interesting example on such a top-down approach is illustrated in the new capital for Egypt project, where the citizens were not consulted neither on the concept of having a new capital nor on the location, hence maintaining the long tradition of the top down decision as argued by Bhattacharya (2015). Within such context, the Toshka project was initiated in 1997 and continues until present. During the lifespan of the project it witnessed several phases of slow and rapid progress. This fluctuation depended mainly on the interests of the upper tiers of the government in most cases reaching the levels of the successive presidents and prime ministers, in such a way that the progress becomes rapid, if the upper tiers are interested in the project, and it slows down or even stops, if such tiers shift their interest.

## 4. The initial phases of the Toshka project 1990s – 2000s

The main objective of this project is to create another spine of water in the Western desert parallel to the Nile, starting near the Aswan dam lake and ending in the Frafra Oasis, which is foreseen to promote spatial regional development in this area. This is done through the construction of the South Valley Canal of Toshka, with Emirati and Saudi investments (Merdan, 1999). This canal would transfer the sufficient water to start a new rural development intervention in the desert, which will be the economic base to start

a tangible regional development in such location. This intended development was supposed to provide incentives and pull factors for job seekers from all around the country. A settlements pattern was introduced in that area to include a hierarchy of villages with the New city of Toshka on top of that hierarchy as the main service center in the region.

The construction of the canal finished during the reign of former president Hosny Mubarak, and few rural development interventions were realized and introduced. The target was to cultivate half a million Feddans[1], moreover, Mubarak saw the project as a new social contract with the Egyptian youth as he targeted that 20 percent of the Egyptian population will move to this region, however, corruption and mismanagement led to the crippling and slowing down of the project (Nelson, 2012).

Figure 1: Location of the Toshka Project
Credit: Kevin Uhrmacher/NPR, 2012

However, the project was and is still considered controversial. Some academic and professional opinions, on one hand, questioned the feasibility of this project in starting new communities in such a harsh desert environment from scratch and whether people will find enough incentives to go there or not, they also questioned that the project is based on political decisions, regardless the difficulties of conducting such a large scale construction (Serag, 2008).

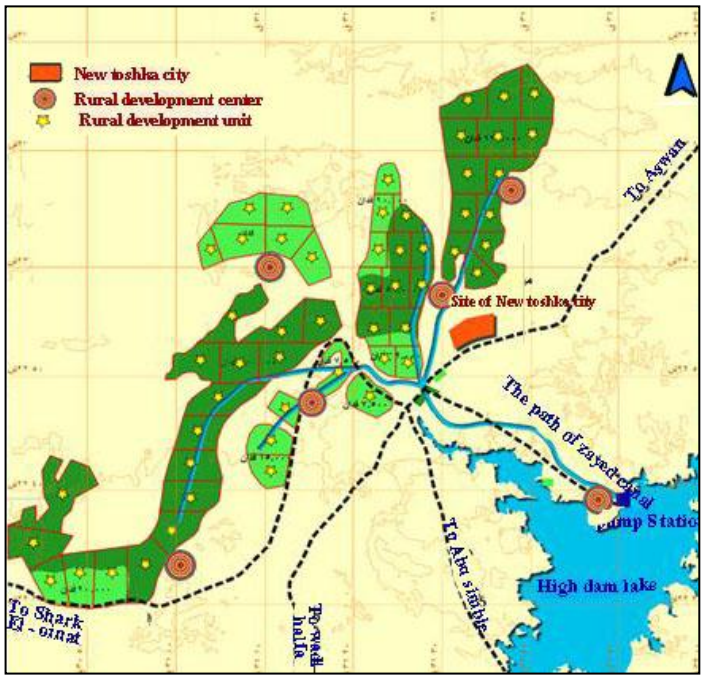

Fig. 2: The settlements pattern of the Toshka project
Source: GOPP, 2001

On the other hand, some opinions were in favor of the project and advocating it as both a mean to expand the populated area of Egypt and to help in its national economic development, substantiating this by the fact that that the experimental farm established by a Saudi prince is already functioning and exporting abroad as well as other thriving individual farms that started over there. Perhaps some logistical problems and constraints exist; however, the thriving of those farms remains an evidence of success (Nelson, 2012). The project had a fast momentum during its first few years starting from circa 1997, when Prime Minister Ganzouri was in

[1] A feddan = 4200 m2, an Egyptian unit for measuring large areas.

office and was the key supporter of the project, the momentum lasted until the PM was replaced in 1999 and the project slowed down afterwards (*ibid).*

The project slowed down; however, it did not fully stop, as the canal in Toshka was constructed as well as the giant water pumping station that would pump the water from Lake Naser to the Canal's level, as well as some farms. As early as 1999 the General Organization for Physical Planning (GOPP), affiliated to the Ministry of Housing, assigned urban planning consultants to prepare the structural plan for the city of Toshka which is said to be the main service center in the region (GOPP, 2002). In 2007, the attention towards the project was revived from government back then and once more was put on top of the agenda. The Ministry of Housing announced for a project tender to make the detailed plans for the city . The tender was announced by a different planning agency affiliated to the Ministry that is the New Urban Communities Agency, the project was to still be cosupervised by the GOPP. The Engineering Consultant Office for Planning and Architecture (ECOPA) was the consultancy firm that got the bid.

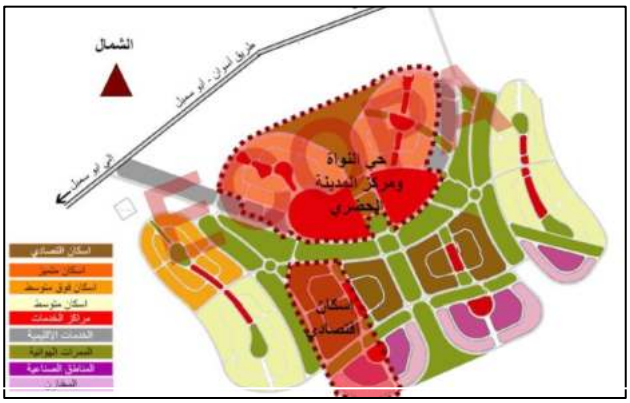

Figure 3: The Master Plan for the New City of Toshka
Source: ECOPA, 2014

Figure 4: Part of the detailed plan of the city
Source: ECOPA, 2014

In the period between the end of 2007 and early 2010, the detailed planning of the city was almost finalized including the infrastructure networks, road networks and housing patterns. The project witnessed the second phase of its rapid momentum ending with presenting the project to the Minister of Housing and the upper tiers of the government. At that time, it was argued that President Mubarak revived his attention and support towards the project. However, because of the bureaucratic procedure and mismanagement the project momentum was crippled.

## 5. Politics and Planning in Egypt Post January 2011

In order to be able to understand and analyze the impact of politics on the planning of the New City of Toshka, in the post January 2011 revolution period and the pre June 2013 revolution period, a general background on the impact of the political situation on the planning process is given.

Following the ousting of President Mubarak in February 2011, Egypt was administrated and governed by the Supreme Council of Armed Forces (SCAF). In that period there were no plans set to introduce new cities, however, there had been some promises made by the government to resolve the housing problem in Egypt by introducing 1 million residential units, as a consequence, the Ministry of Housing, whose Minister was once more replaced by an interim Minister, called for a competition to provide affordable housing prototypes in the form of housing neighbourhoods with the designs of apartment buildings (MOH, 2011). Despite that the competition was concluded by announcing the winners, the initiative was never realized and described by some critics that it had opaque results (Selim, 2011).
It is argued by some critics that the governmental announcement of building the million units and the competition were both launched for political reasons to gain public support for the interim government by demonstrating to the people that it is working on the ground for the people, in other words, the initiatives that were introduced are argued to be providing a **placebo effect** for the people to appease the Egyptian masses.

## 6. Toshka Project and the Inter-Revolutions Years 2011-2013

In the first few months of that period the Toshka project almost came to a complete stop. Perhaps the reason for this was that the Ministers and the government at that time did not want to take any crucial decision as they were considered an interim and temporary government that would leave office once a new president was elected. This period in 2011 after the revolution witnessed a strong situation of political instability with continuous changes in the government that was formed three times at least with a new prime minister each time. The last prime minister to rule during the SCAF was Dr. Ganzoury, who was the Prime Minister when the Toshka project was initiated during his office time in the late 1990s. The PM believing in the project and its importance to achieve economic development by providing job opportunities, once more advocated for the project and brought it back to the highlights (Nelson, 2012). Despite his beliefs in the project to the extent that he mentioned it as a reminder to the people in a public speech, nothing serious was done at this period as it was merely an indecisive period were no decision was taken because of the fear of responsibility during a transitional phase.

## 7. The one year rule of Morsi and the Toshka Project

Dr. Ganzoury continued in office until the new presidential elections were concluded in June 2012 and a new president was elected. Following the elections and after the new president resumed office, a new government headed by a new Prime Minister was formed who appointed a new Minister of housing. The Ministry of Housing during this period with its agencies perhaps were introducing new urban visions, and launching new calls concerning the development of the new Suez Canal corridor, deviated once more away from the Toshka project and other similar projects. During this period between June 2012 and June 2013[2], the tendency of the Ministry of Housing was to announce new initiatives for urban development; however, most initiatives did not go beyond media announcements. Nelson (2012) argues that during the rule of Morsi and because of his affiliation to the Muslim Brotherhood, there was no desire or tendency to revive the Toshka project, so as to avoid any remembrance to the Mubarak rule.

[2] The period between June 2012 and June 2013 witnessed the rise of the Muslim brotherhood group to power with President Morsi as the upper tier of the government.

## 8. Politics and Planning in Egypt post June 2013 revolution until June 2014

During the one year of the Muslim brotherhood reign in power, public anger and internal divisions built up in a very rapid way, as a result of the failed strategies and ideologies at that time. Egypt was suffering from striking economic conditions, as well as other internal social crises, together. A series of consequent events led to the second revolution of June 2013 when the president and his government were toppled (Friedman, 2013), and an interim government with an interim president and prime minister were set to power.

During the this interim period that lasted for one year, the interim government focused mainly into tackling the critical issues of the plunging economy, the deteriorated safety and security conditions, international diplomacy as well as confronting terrorism, while the other aspects took further priorities on the agenda. Due to the fact the Minister of Housing (Mr. I. Mehleb) of this period was a dynamic professional person who led an Egyptian contracting company that is considered among the largest in Africa and the Middle East, he aimed to reactivate and motivate the completion of several halted projects[3].

The Ministry of Housing at that period focused on ***reactivating the already ongoing projects*** mainly those concerned with the strategic planning of the "already existing" Egyptian cities that focused mainly on urban renewal attempts. However, the attention to establishing new cities or embarking on new mega national urban development projects had a low priority. It is to be mentioned that usually in Egypt, the commencement of new large scale projects should get an approval from the upper tiers of the government. And as the government at that period had an interim status, no such approvals could be obtained or given, especially when it was known that there will be presidential elections within a year that will be followed by forming a new government. In February 2014 a new government was formed with the then Minster of Housing as its PM, hence appointing a new Minister of Housing to fill in for his position.

During this period the Toshka project, was still being revised by the technical departments of the New Urban Communities Agency, which applied many red tape in this revision process. In some cases conflicts took place between the different governmental bodies with the main conflict was to find a source of power supply. This conflict took place between the public electricity company, and another Ministry, to the extent that the project continued in a stand still situation. The almost complete halt of the project continued with no desire to take firm actions.

## 9. Urban and Regional Development in post June 2014 onwards

Following the presidential elections of June 2014, president Sisi kept the Prime Minister who in turns kept most of his ministers, although in a later phase he made a partial change in the government, but the current Minister of Housing, kept his position.

[3] https://www.egyptthefuture.com/speaker/excellency-mr-ibrahim-mahlab/ , May, 2015.

The newly appointed president wanted to sustain his popular support, in doing so he wanted to achieve tangible actions on the ground. The government in return attempted to adopt a policy of materializing, different services, infrastructure, economic development and housing projects.

Mainly the Ministry of Planning (economic planning) as well as the Ministry of Housing introduced a spatial development vision to Egypt aiming the year 2030. Among the Vision for Egypt of 2030 is to work on developing the different Egyptian regions, including the marginal and desert regions, in such a way so as to introduce new urban communities with different economic bases (GOPP, 2014), in a way similar to that proposed almost 40 years ago in the New Map of Egypt during the Sadat Era (Attia, 1999). The development projects in this vision included ***Toshka***, Sinai, the Halayeb region close to the borders with Sudan, and the New Valley region in the Western Desert of Egypt. Parallel to this initiative, there was another initiative by the president to redraw the borders of the Egyptian provinces to enhance investment opportunities (Mada Masr, 2014). This is justified by the fact that the current borders of the Egyptian provinces included in some cases vast desert areas that are difficult to manage and develop or in other cases smaller areas with no desert or sea hinterlands.

As such several versions of the new administrative borders were discussed and the initiative was announced in the media. Although this initiative had been announced in the second half of 2014, a final official decision on the division has not been taken yet. It is to be mentioned that one of the versions for the new provincial borders introduced the Toshka region as a new Province (governorate) in the South of Egypt. The introduction of this new entity coincided with the new official will to continue the development in the ***Toshka project***. However, in later versions, the idea of having Toshka as a province of its own was abandoned.

Figure 5: A version of the new proposed borders of the Egyptian governorates, with Toshka as being one of them.

**10. Mega Projects as Flag Ship projects**

As mentioned earlier, it is argued that the new president wanted to realize development achievements on the ground, to sustain national support. The adopted development strategy is then characterized by its speed and tangible effects. Accordingly, it could be argued that one of the components of the strategy is large scale (mega) projects that are considered as flag ship projects in the development process to generate jobs and tangible economic revenues. The main projects since August 2014 until March 2015 could be summarized as follows according to their sequence of appearance:

1- ***The New Suez Canal project***, which was inaugurated in August 2014. The idea is to use the existing asset of the Suez Canal and its capacity by adding to its naval passages and digging an extra canal to

increase its capacity in both ways[4]. The project duration initially was estimated to several years, however, the Egyptian administration and presidency asked for the completion of this project in one year by August 2015. The project is coupled with another development dimension that is the "Development of the Suez Canal Corridor", this tackles the urban development dimension, that includes the construction of new urban communities based on new economic, logistic and industrial projects

2- ***The Toshka rural development project,*** which is considered as a continuation of the old project that has been crippling for the last few years. The idea is to go forward in land reclamation and rural development and to proceed with the establishment of villages and their new service centre, the new city of Toshka. In this case the government will gain benefit from an already started project with most of its studies and plans ready for execution, as well as the already existing infrastructure that was build in the last decade (Ayyad, 2015). The continuation of this project was announced in August/September 2014. As part of the urgent phase of the project, the construction of the main district of Toshka city together with the main service facilities was considered a priority, to host the first wave of migrants from the Nile valley who would work in the project. A period of one year was initially given for this phase, however, it is said that it was later shortened to six months.

3- ***The reclamation of 1 million feddan (Feddan =4200m2);*** this project aims to reclaim 1 million feddans of desert land and transform them into agricultural fields. The project was announced also in 2014, promising to reclaim the Million Feddans by December 2014. The project would focus on reclaiming lands in the Western Desert of Egypt as well as Sinai to increase the agricultural production. It is to be mentioned that the area to be reclaimed in the Toshka project is counted among the Million Feddans. However, according to the Media only 50% of the objective has been realized (Alaa, 2015).

4- ***The New Administrative Capital of Egypt (CAPITAL CAIRO);*** in March 2015 and during the Egypt Economic Development Conference, the project for constructing a new Capital of Egypt was revealed. The intention of doing was announced earlier in 2014, however, the exact details of the project were blurred until the announcement date. The project aims to establish a new capital to the East from Cairo and about 60 kms from the cities of Suez and Sokhna (Williams, 2015). The announced aim is to integrate the new city with the development projects of the Suez Canal Corridor, to transfer most of the governmental buildings and facilities there, hence easing the pressure on Cairo[5]. The announced plans and perspectives of the new city, show a modern city with skyscrapers in a Dubai like image. Many argue that such an image gives a new branding to the city, hence attracting investments, with aspirations to several spin off projects that increase the economic competitiveness of the city. The

[4] http://www.suezcanal.gov.eg/sc.aspx?show=69 , May 2015

[5] The majority of the urban planning society learned about the details of the project after it was announced during the conference. To the dismay of many planners, the project was awarded to an International American firm SOM, hence, unfamiliar to the context.

project stirred several discussions about its pros and cons, however it is not the scope of this paper to discuss that in details.

There are of course other projects that the government is pushing for in present time, for example the 1 million residential units' project. And while having these projects as the main flagship projects in the development process, the government is also investing largely in infrastructure projects mainly in road networks and accessibility (Ayyad, 2015).

*As seen from the discussion, the government is pushing for the flagship projects to push forward the economic development in Egypt. This of course is reflected in the spatial interventions of new cities, settlements and reclaimed lands. It is argued that despite the fact that some of these projects are economically sound, there is still the trend of announcing large numbers (i.e. million Feddans, million units, etc.) to make a sound propaganda effect. It is also argued that sometimes the announced time frame of some of the projects might sound unrealistic in terms of making the sufficient studies and applying the necessary works.*

It is evident that the upper tier of the government and the presidency intend to realize swift results on the ground, which is welcomed by many segments of the society, owing to previous long periods of failed attempts. However, sometimes, high government officials who might also include the ministers fail to warn the upper tiers of the real time needed to carry on the projects and the consequences that might result from a hasty decision. In a recent discussion with a member of the presidential advisory council, it was obvious that not all the ministers, only few, would be frank enough with the upper tier of the government and the president. In many cases the advisory council would advise against the scopes of some of the intended projects. Accordingly it is argued that in some cases, some members of the government, i.e. ministers, tend to appease the upper tiers of the government and the president and attempt to realize the intended projects with their large scopes and scales within a proportionate timing or settings.

This section gave a brief overview of the general mechanism of spatial development in Egypt. The following section will focus once more on the last and most recent phase of the Toshka city project, to discuss how such settings were reflected on the decisions taken for the project.

**11. Continuing the Detailed Planning of the Toshka City- September 2014 – January 2015**

As mentioned earlier, the re-initiation and continuation of the Toshka project once again made it to the priority list of the development projects. The project became among the priorities of the president. The Toshka project lies among the responsibilities of at least three ministries, the Ministry of irrigation and water resources, to ensure the sufficient water supply for irrigation and living, the Ministry of agriculture to set policies for land reclamation and the Ministry of housing to provide the new settlements that will host the new migrants to this area. As such the Minister of Housing asked the New Urban Communities Agency to continue with the project, which in their turn asked the consultants (ECOPA) who finished the first phase of the project to finalize the remaining work of the infrastructure networks.

Despite that the remaining parts of the infrastructure works, mainly power supply was not among the responsibility of the consultants, they almost managed to reach a compromise to resolve the pending issues. While this stage has been going on, the consultants were informed by the agency that the Minister would like to set one of the districts ready for the construction process, as this comes in-line with the priority projects. The agency also asked the consultants to make the architectural design for the housing prototypes with its different levels as well as the designs for the main service and governmental buildings in the city centre. At this point the consultants were told that the time frame for this project is set for a year, after which preliminary constructions and buildings should have been realized.

**Planning under pressure**[6]

The detailed plan for Toshka city was already finished in 2009. The consultants at that time prepared the designs for the residential prototypes and introduced a general image of how the city centre should look like. The consultants also defined the different housing levels, and got an approval at that point from the agency. With the new revival of interest in the project in 2015 and because of the Minister's urge to start the construction process and the receiving of the migrants from the Nile valley, he asked for structural modifications in the master plan that critically differs from the one that was initially approved. The Minister is very familiar with the project since he was the chief of the General Organization for Physical Planning (GOPP) which was co-supervising the project.

In Egypt, it is argued that throughout most of the planning projects, the planning consultants are always in the backstage. The relationship with the Minister or any other upper tiers of the government is usually through the top management of the governmental planning agency, which in this case is the New Urban Communities Agency. As such, the consultants never get the chance, in most cases, to have an open discussion with the Minister to explain their point of views or object to any top-down decisions. Accordingly at this incident, the minister is under pressure from the president who set this project among the priority list. The planning agency is in its turn under great pressure from the Minister with its chiefs mainly working to appease their upper tier. Finally the agency would in its turn exert pressure on the consultants to do the modifications and to work in general under pressure to meet the set deadlines by the upper tiers, even if there are other constraints that should be considered when doing and finalizing the modifications for the city plan.

At this point the consultants decided to fulfil the demand of the Minister and the agency, as they are anyhow not represented with any of the discussions with the minister. The consultants were asked afterwards to prepare the designs for the main residential and service buildings. The consultants indeed did that. However, they wanted to examine more the building material in such a very hot arid zone in the South of Egypt in the Western desert as the temperature might reach 50 Celsius hence would need specific treatments as well as climate friendly designs, otherwise the project might turn into a total failure if the conventional concrete blocks were used.

[6] This section is based mainly on the personal involvement of the author with the consultancy firm ECOPA.

At this point, the time frame set for the project was even made shorter, causing a situation of panic among the planning agency and possibly the Minister who wanted to meet the deadline. A proposal was conveyed to the consultants to use a prototype of building that was used in another region in Egypt in South Sinai which is almost 550 Kms North to the given position, hence climatically unsuitable. The consultants at that point argued to the planning agency that negative consequences might result from this, making the buildings of the city uninhabitable. However, as the planning system in such cases leans more to the top-down settings, the consultants were asked to stop working in the designs, and the task was reinstated and given to another consultant who would accept to apply the other prototype. Ironically the original consultants spent almost 4 months in addition to the initial phase of the project working on such prototypes, as they restarted in September 2014 and were asked to stop in January 2015.

Figure 6: The consultants' vision and design for the housing district in Toshka.
Source: ECOPA, 2014

It is argued that the decisions made here were to catch the deadlines to start constructing the buildings of the city, despite the fact that these would be inadequate so as to appease the upper tier of the government and the presidency apart from being scientifically correct or wrong. The project continued to echo more in the media for three more months, after which the frequency of the project news, started to fade away, as if the priority given to the project is also fading away. As such the progress in such a mega project is argued to have been tied to the interests of the upper tiers of the government apart from being important to the regional and economic development of the country. Thus, a strong top-down decision was made in the project against the advice of its consultants.

## 12. Finding and Conclusions

This paper attempted to look at the impact of politics on the planning process in Egypt through analysing the New Toshka project. From the discussion it is evident that the planning process is directly affected by the top-down approach from the government, at least within the scope of new city planning and regional planning. The planning process within the scope of the New City of Toshka gained and lost momentum in accordance with the priorities set by the presidents and their governments. In most cases the performance of the responsible planning agencies fluctuated according to the pressure level and interest from their upper tiers. The momentum of the project was also subject to the will of appeasing a specific audience. This is evident during the 1990s and the 2000s when the line ministries were appeasing the president, then later during the inter-revolution years when they were appeasing the people to gain support and finally in the post 2013 revolution, when they are appeasing the new president who was interested in the project.

Unfortunately, it seems that the Mega projects in Egypt are affiliated with the interests of the presidents and the upper tiers of the government. Even if the project is strategically important and crucial, it proceeds according to the level of interest of the upper tiers. This attitude should be changed aiming to establish a more scientific and strategic planning approach in Egypt.

**Acknowledgments**

The author would like to thank the Prof. Dr. Shafak El Wakil and Prof. Dr. Mohamed Serag, the chief consultants of ECOPA for providing the necessary material and information on the planning process of the New City of Toshka.

# INSTITUTIONS, VERSUS THE REAL WORLD: PLANNING GREEK METROPOLISES IN THE CRISIS TURMOIL

Pantoleon Skayannis[1]

[1]Dept. of Planning & Regional Development, School of Engineering, University of Thessaly, Greece; leonska@prd.uth.gr

## Abstract

*The paper suggests that in Greece (taking the example of Thessaloniki and Athens) the conceptualization of planning is related to the cycles of the economy, while at the same time it does not really observe planning regulations and laws. The complex, mazy and very detailed planning system is rigid and at the same time weak to protect itself from violations. The end result, the planning product, i.e. the cities, is facing a multitude of problems, due to these planning inadequacies and to the course the accumulation regime of the country has taken over the last years.*

*Firstly, the paper draws from the example of Thessaloniki, highlighting the inadequacies of planning tools, budget estimations, social concern, and lack of realistic public consultation, with the end result of a city with stagnant infrastructure projects, poor peripheral communities and serious inner city issues.*

*Secondly, it draws from the example of Athens which has lately become a dense and problematic city with uncontrollable, partly unauthorized, sub-urbanization and severe social problems in the Centre.*

*In both cases, the perennial Greek planning weakness became evident, i.e. the controversial co-existence of physical planning and economic-social planning Community Support Framework style. Planning, being not cohesive and having embedded institutional pitfalls, has been proven to be inadequate to face the rapidly accumulating problems.*

*A deeper understanding of this development calls for a complex answer to the problems, a kind of multi-tasking exercise, an integrative plan which would be strong enough to set the rules even for the City Master Plans. However, for this to happen the institutional environment has to be changed; to become effective it has to become simpler, more comprehensive and above all realistic.*

Keywords: Athens, Thessaloniki, Metropolitan Planning

## 1. Introduction

The paper suggests that in Greece (taking the example of Thessaloniki and Athens) the conceptualization of planning is related to the cycles of the economy, while at the same time it does not really observe planning regulations and laws. The complex, mazy and very detailed planning system is rigid and at the same time weak to protect itself from violations. The end result, the planning product, i.e. the cities (though we cannot say that cities are products as they are subject to continuous change, therefore the notion of product should be relativized), is facing a multitude of problems, due to these planning inadequacies and to the course the accumulation regime of the country has taken over the last years[1].

Though I claim that the conclusion/ result of this paper has a diachronic validity and it is characteristic by and large of the theory and praxis of planning in modern Greece, for analytical reasons this paper focusses: a) on the scale of regulatory master plans of the major two Greek cities. These examples are more than enough in order to illuminate the argument; if I would go into the detailed level of smaller planning scales (physical city plans, etc.) the reader would be lost in a maze of legislative measures; b) on the two examples of Athens and Thessaloniki, drawn for the post 1985 period, as this was the year the only two regulatory master plans were passed in the parliament and became a Law; c) on big infrastructure projects of transport infrastructure as an example and not on all other aspects of planning, such as the development (evolution) of the urban fabric; d) on specific areas within the two cities that face problems which are related to the current crisis, namely on the centre of Athens and on the Lachanokipoi area in Thessaloniki.

The problems all Greek cities face are cause by the same reasons but of course have different yet similar manifestations. The problem of the cities lies in the rapid post war urbanisations caused by a complex set of primarily socio-economic but also political (related to the civil war 1945-1949) reasons. The result has been a rampant urbanisation of the major urban centres whereby most of the 52 prefecture capital cities are included in varying degrees. The country's administration, legislative system and formal economy were not in fact adequately prepared to face these waves, and the conclusion was the creation of large illegally built housing areas which planning laws and regulations were employed to legitimise in different waves of legitimisation over the years.

Apparently, this is a first historic picture of how any planning regulations were bypassed (and violated) by crude reality, the result of individual actions of big numbers of common people. Yet, this paper's concern, keeping this as a background knowledge, deals with the planning-wise second part of the post war period (as mentioned post 1985), as 1985 with the introduction of regulatory master plans and the establishment of ORSA and ORTH a new planning period was supposed to be inaugurated[2].

Firstly, the paper draws from the example of Thessaloniki, highlighting the inadequacies of planning tools, budget estimations, social concern, and lack of realistic public consultation, with the end result of a city with stagnant infrastructure projects, poor peripheral communities and serious inner city issues.

Secondly, it draws from the example of Athens which has lately become a dense and problematic city with uncontrollable, partly unauthorized, sub-urbanization and severe social problems in the Centre.

## 2. Thessaloniki

The diachronic attempt to plan the metropolitan area of Thessaloniki has only led to partial success and comprised fragmented projects, and lack of an updated regulatory plan that has not managed to appear to the parliament to be voted.

In terms of **metropolitan planning**, Thessaloniki being the major city of central Macedonia has a multidimensional impact on its national and international wider environment and develops a dialectical relationship with it. This applies to regions of neighbouring countries, for instance regarding the transport of goods from and to Thessaloniki's port, or Thessaloniki being a major shopping centre. Especially after the transition of the ex-socialist countries to the market economy (early 1990s), the aspiration of the Thessaloniki elite was for the city to become the capital of the Balkans.

These, in combination with the growing economy of the period and the CSF funds coupled with the accentuation of the cities' growing problems, were calling for a new wave of metropolitan planning. However, planning remained *in scripto* and actual planning was only done in the a-spatial context of the CSF programmes to utilize the funds coming from the EEC (and then EU). In this sense, numerous plans were elaborated and few were actually implemented (due to insufficient funds, unsatisfying appraisal, or lack of political determination). In this context the 1985 regulatory plan was not updated until the period of 2009-2012 when two new versions were consequently elaborated, but were removed and did not pass through the parliament in 2014 when the corresponding plan for Athens did.

In-between, a series of **transport infrastructure projects**[3] were planned to be materialised, the most important of which were the metro of the city, the subsea tunnel, the outer peripheral ring (motorway). Out of these, the latter two were foreseen in article 14 § [3.1.7.] of the 1985 master plan and only the western part of the outer peripheral ring was materialised until May 2015.

The metro was stalled due to unsatisfactory appraisal in terms of cost that resulted into facing important budget problems. Minor changes of alignment, delays in expropriations, change of methods, archaeological findings, all caused significant time delays and cost increases and became major problems besides the general economic crisis problem that itself caused dramatic delays to the project. As a result, the metro was delivered in 2015 and is not going to be for a few more years. In addition the local community of Thessaloniki is very displeased because the Athens metro company which is responsible for the project does not have an office in Thessaloniki at a high level and all decisions are made in Athens; hence there are further delays and relative unfamiliarity with the local situation.

The subsea tunnel was never constructed due to unsatisfactory appraisal regarding the cost and the archaeological risk. Archaeological findings required the tunnel to be aligned deeper which would have rocketed the cost. In addition, several sides argue that the planning of this tunnel not appropriate because it links two parts of the coastline which should have been at a larger distance, as well as because the completion of the metro and the possibility of the completion of the ring road should actually bring new data as to whether this project is really required. Yet the cancelling of this project has already cost the state several millions of euros as compensation to the contractor who had won the tender.

[3] For a general account of infrastructure projects in Greece, including Thessaloniki, see Skayannis and Kaparos, 2013.

The outer peripheral ring, leading to the area of the airport, was never completed (only the western part was), as the cost would have been huge because the missing eastern part requires several tunnels and bridges. It is not clear yet how this shall proceed.

A specific area which epitomises a series of problems that Greek cities face is **Lachanokipoi**, part of the (old) Western Entrance of Thessaloniki (WET) area. "This is practically a derelict space that could be considered as a brownfield. A number of significant old buildings, along with remnants of its industrial past, characterise the current image of the place that local authorities wish to regenerate. Plans that have so far been proposed have either been maximalist (especially if viewed in the light of the current crisis-ridden situation), or partial in their conception, being geared to one-sided architectural solutions" (Skayannis and Kyratzakos, 2015). "The problems with the area are that: a) in this period of crisis[4], development opportunities that can generate growth are urgently needed, i.e. investments and the promotion of economic activity that is, if possible, extrovert, innovative and with high added value. The WET area might offer the chance to host such activities provided there is a suitable and realistic plan in place; b) land is an asset that can be exploited to trigger development processes. Land in the study area is relatively cheap; and c) the area is dominant along the western entrance. Its current image as a derelict space is degrading the image of the city in an era when image is all-important for interurban competition" (Skayannis and Kyratzakos, 2015).

"The various plans made over a lengthy period of time for the area can be divided into both state plans (originating from the central government) and local plans (originating from the municipality of Thessaloniki and/or the adjacent municipality of Menemeni). In terms of thematic object, we can differentiate between plans dealing with the general planning of the area and plans that specifically deal with the transport aspects" (Skayannis and Kyratzakos, 2015). This is a clear indication that a series of institutions have taken planning action employing a corresponding number of planning tools (legislative instruments). But what was the result up to now?

As indicated in Skayannis and Kyratzakos (2015), in a study scrutinising the most important 15 post 1985 plans made for the area, the planning of the WE and the Lachanokipoi area of Thessaloniki has faced certain major problems:

"a) planning tools were not adequate enough and planning was taking place whilst only partly facing the problems i.e. from a general land use planning perspective in combination with transport plans (in the best case with a certain compliance with each other)[5];

b) though in some cases budgets were roughly calculated, the sources of the funds were by and large expected to be provided by external actors (besides the state, such as the EU), while the idea of fund leverage by private investors was not embodied into the planning processes;

c) questions of social concern, such as poverty, professions, etc., were not addressed under the understanding that 'development' will become a panacea and will solve the problems" (Skayannis and Kyratzakos, 2015).

These interesting planning studies were placed in the historical context of the three planning eras within which they were carried out. "They all have tried to tackle the problems, suggesting series of measures on several domains. Yet none of them has gone into the appropriate detail, hence none has proposed composite measures for the very same area on a small local scale from different perspectives

[4] In Greece the manifestation of the very significant public debt and budgetary crisis started in 2010.

[5] This has generally been the case in Greece. As Skayannis notes, there has been a multitude of proposals to face the problems of the crisis ridden Centre of Athens, yet almost all were partial, either purely 'sociological' or 'economistic' or of solely an urban design nature, seeming not to comprehend the complexity of the problems hence the requirement for composite solutions (Skayannis, 2013).

(something which in official planning terms has now become possible with the SOAP tool). Consequently, the policies (if any) that have been so far rolled out over the area have not managed to revitalise/regenerate it. The 'invisible hand' of the free market, in the absence of a robustly articulated policy, has provided its own solutions, creating a mosaic of conflicting land uses and maintaining pockets of poverty and derelict spaces adjacent to red light services, two high class hotels and cultured recreation facilities" (Skayannis and Kyratzakos, 2015).

According to this analysis, it would be reasonable to assume that though the WE of Thessaloniki was acknowledged to be a problematic area, did not become the focus of many plans, neither a special detailed plan was made for it. The problems were mentioned generally and proposals were made at a level of abstraction that could not provide specific interventions. On the other hand, whichever developments, besides an effort for the restoration of a few buildings, were not made after any plan in particular but rather in an emergent way by local actors.

## Athens

The diachronic attempt to **plan the metropolitan area of Athens** has been (marginally) more successful than the one of Thessaloniki in the sense that at last a new regulatory plan, after the initial 1985 one and the withdrawn 2009 one, was passed in the parliament (Law 4277/August 2014). However, this was only a partial success, as prior to the regulatory plan of 2014 a series of projects were implemented (more successfully than in Thessaloniki) that were not foreseen (at least in the form they were accomplished) by the previous regulatory plan of 1985, and actually pre-emptying the 2014 plan. This is because these projects eventually became parts of the Community Support Frameworks and were accelerated in view of the then upcoming Olympic Games (2004). This 2014 regulatory master plan reflecting the new realities of the crisis managed to include "extensive consultation with various social actors and stakeholders. However it did not include an effective system of public consultation with individual citizens" and faced three sets of contrapositions (Skayannis, 2013), that led to its resubmission before being presented for approval by the parliament (August 2014).

Athens in most plans has been defined and designated to play the role of a major pole in the eastern Mediterranean, supported at the spatial level, amongst other interventions, by the mentioned **transport infrastructure projects**. These projects have been the Athens Metro (basic project and extensions), the Attiki Odos (Athens ring road, motorway level), the Tram, the Regional railway, the Athens International Airport (relocation of the previous one). As opposed to the Thessaloniki case all were materialised, primarily because of the urgency created by the upcoming of Olympic Games and the contractual interdependencies (e.g. between the ring road and the airport). "This materialization was over and above existing planning (in the sense of the master plan of the city). Special laws, such as Law 2730/1999 "Planning, Integrated Development and Materialisation of the Olympic Works and other provisions", were passed in order to accelerate and legitimize pre-decided projects which did not exist in the master plan of the city" (Skayannis, 2013).

Despite these advancements, part of this construction planning, in fact those not foreseen or necessary for the Olympics, was left for later stages (e.g. the extension of the ring road, the connection of the area of the old airport with the new one, the connection of the Athens - Corinth motorway with the north- south motorway, the metro extensions, the decisions on the area of the previous airport), and later on suffered delays.

Besides the Olympics urgency, "this top-down and bottom-up by-passing and overlooking of pre-existing planning legislation was left to survive due to the fact that construction had been one of the major locomotives of the Greek economy, able to speed up or slow down the pace of the economy

(Skayannis, 1990). This was coupled by a planning governance that on the one hand would collect the opinions of formal stakeholders but on the other would disregard the opinions of ordinary citizens and their organizations, in essence a political choice of non-participatory planning of any sort that obviously faced the problem of applicability''.

Yet, while special attention was paid to the aforementioned infrastructure projects (with all the pitfalls and drawbacks), the major challenge in Athens became the deterioration of the conditions of the Centre of the city due to an explosive mix of impoverishment due to the crisis, to influx of excessive illegal immigration, and to the perpetuating and unsolved problems. "

According to Economou, Skayannis, Deffner, et al (2012), the problems of the centre of Athens have their origin in the early '90s or earlier (e.g. lack of comprehensive city planning, high-density building, green space deficit, old building stock, low quality of public spaces, lack of the necessary urban infrastructure, urban sprawl and suburbanisation). Other problems are more recent (e.g. increasing criminality, drug trade and prostitution, illicit trade, closed shops, abandoned buildings, increase in the number of homeless on the streets and impoverishment of a significant number of the population). The latter have been caused either by heavy migrant inflows in the city of Athens or/and by the effects of the current financial crisis on urban population. The immigrants' problem has developed to a major concern, as has got out of proportion by all standards. This influx is a combination of two factors, namely the economic and political migration reasons and the fact that due to European legislation, immigrants are not allowed to be transferred to other European countries and are stuck in Greece. Low, unpaid and mostly black labour deprive the state from potential resources and result into low social welfare possibilities and danger for public health conditions. These problems pose manifold risks, primarily to public health and safety but also to entrepreneurship and property and to the quality of life as well.

As a consequence, over the last years, the inner city of Athens (the historic and commercial centre) has been changing in a rapid and hostile way, suffering from an increasing decline. Rising crime and lawlessness have reached "crisis proportions" in downtown areas, while the concentration of legal and illegal immigrants in some neighbourhoods has led to concern about the creation of ghettos in the heart of the city. At the same time, the economic crisis has led hundreds of stores to close down, to the increase of unemployment, and to the breakdown of social services and the degradation of the quality-of-life standards in many traditional middle-class districts (Economou, Skayannis, Deffner, et al, 2012), as well as allegedly to serious land speculation activity in view of a possible future gentrification process. This situation has triggered the activation of groups of the extreme right, something which has increased the fragility of the social tissue.

Given the above, there is a question whether the problems of the city –in crisis- would be reasonable to be faced with tools from the sphere of physical planning, especially of the urban design scale, or from those of socio-economic development planning.

However, in parallel to this plan, various agencies (Ministry, etc. with the tolerance of the Athens Municipality) were elaborating a major intervention to the city that was very vaguely foreseen in the 1985 master plan, namely the pedestrianisation of the major road axis (Panepistimiou, ave) in the very centre.

The various proposals (a total of more than seven sets of proposals) (cf Skayannis, 2013), diverse in nature and orientation, do not necessarily abide with existing planning, but do respond to different efficacy degrees to the urgent need to face the situation of the dilapidation of the Centre. The plans can be divided into two major groups: those that have architectural – design approach and those that have

a more development socio-economic orientation, being spatially aware (some are purely socio-economic and not directly referring to spatial matters). Yet it seems that planning so far was not able to face the problems in the context of such complexity and a new planning tool, SOAP, was devised that combined the spatial with the socioeconomic aspects. The plan, focussing on the city centre of Athens, was elaborated by our University of Thessaly team and makes a conscious effort not to violate the pre-existing planning at the metropolitan master plan level (at the time the on-going regulatory plan) but to make proposals in the context of this planning (being spatial but not intervening with the physical form and restructuring of the centre). In this sense, this planning tool and the plan that came out was aspiring to bring closer planning to the real world. But in order for this to happen, the plan has to materialize.

The materialisation of the SOAP plan requires resources and the incorporation of its provisions into the plans of the different ministries, while a co-ordination can be with one of the ministries (YPEKA) with a major contribution and involvement of the MA. This is a problem in the Greek legal and administrative system, and obviously endangers any plan of this nature to happen. At the same time, though, dealing the very centre of the city brings forward the need for a metropolitan municipal structure having the appropriate competences (and capacities) to deal with complex problems that directly or indirectly concern the whole of the metropolitan area.

## Discussion - Conclusion

A very interesting issue is the real practice of planning, i.e. the attempts and the reality of implemented planning as opposed to the result of it.

There are two parallel universes: the universe of master-regulatory planning which is conceived and is partly implemented if at all, and the universe of the construction world which is planned and partly implemented.

In both cases we have the coordinates of conceived space (Lefevbre, 1991/1974)[6] which is however not the same. In this sense we have two conflicting versions of conceived space for the same physical space, and two versions of the perceived materialised space which however does not conform to any of the two. The perceived space is a mixture of an ill implemented version of both not actually expressing any of the two. Yet it creates a lived space for the users with its own denotations and connotations.

The winner, yet in a pyrrhic victory, is infrastructure construction. This is possible to happen for a series of reasons: interests behind it are very strong, it comes to satisfy need of the wider population (e.g. modern transport), politicians use it because of its very direct visible and tangible results and nature in order to appeal to an equally wider electorate (electioneering purposes). In this way it is a win-win short term situation for the direct stakeholders involved. In the long run (besides all of us being dead – re: Keynes) a layer situation is formed which becomes a given in the city. This kind of development in a manner of distorted planning is to a certain extent organic, as players have exercised a role to produce an emergent environment that might not be completely non- planned but yet it is partially planned or plans are distorted by multiple interventions.

Firstly, in this whole set-up, institutions are at the same time present and absent, put differently, they face the real world being heavily undermined.

[6] According to Lefebvre (1991), urban environment is constructed by three major factors, conceived, perceived and lived space, (in spatial terms: spatial practice, representations of space, representational spaces) (p.40).

In the case of statutory planning (master plans, regulatory plans, etc.) plans are undermined from inside. This is because they are unrealistic and with inadequate comprehension of reality. They are frequently caught into traps of windmills in the heads of planners (or policy makers) e.g. Thessaloniki being the capital of the Balkans, or of what is feasible and what is not. Frequently this is caused by a partial understanding of reality as plans are made by architects i.e. the socio-economic background of the plan is not enough or is not solid or is not taken fully into consideration because simply sometimes is not pleasant enough or does not fit with the preconceptions or ideological fixes of the planners - designers (or politicians). In this sense planning is made in the spheres of phantasy crystallised in phantasmagorical blueprints but having lost touch with reality.

In this situation, institutions are the ones that due to internal inefficacy are undermining themselves. So the product of the process of planning (the pan) is not standing properly on its feet. The plan then comes to the real world to be implemented. But the plan is weak because it is not realistic.

The second - antagonistic- constituent of planning is infrastructure planning (leaving aside the purely technical part). Locational decisions are here very important as well as the necessity of projects (in the sense of social opportunity costs- i.e. versus other projects of a different nature possibly more required by society, such as the case of the undersea tunnel). But even if these conceptual dimensions were left aside, institutions that plan infrastructure projects (even if ministries or similarly relevant authorities are considered) research in Greece has shown that they lack certain qualities: appraisal of projects is often problematic. The metro of Thessaloniki is a very good example as well as the possible problems from the undersea tunnel. Though I would by no means argue for the case of the iron triangle (time-budget-specifications fix) in the construction of large (if not mega) infrastructure projects, a considerable level of appraisal should secure the fortunate/ successful delivery of the project (of course in contextual terms, and taking into account what really would make it successful, i.e. the fulfilment – or a considerable effort to - of the four sustainability dimensions).

Part of the problem of the clash between plans and the real world is that plans are not discussed with the people they concern. Though in theory they have gone through the scrutiny of public consultation, this is organised and done in a way that the real recipients are unable to express radical (or even incremental) objections not even are they in the position to make proposals. Though before the conclusion of drafts various agents are advised or consulted these are by and large those of the official state, so they are in a sense part of the planning side. And if in planning this is the case (in part and to an extent also responsible for illusionary and partial interpretations of reality in an effort to combine opposing interests), the case is even more valid in the case of infrastructure planning especially as far as the social environmental impacts are assessed i.e. as far as the various sustainability challenges (all four) are tackled.

But the problem is not only that each particular constituent of spatial structuration at the level of spatial representation (conception) is coming into the picture with its particular problems. The problem is exacerbated because of the fact that the two sets of plans are not necessarily compatible (to say the least). Regulatory planning and master planning does not necessarily abide by what is planned by the other side (infrastructure planning and construction).

In this sense, planning as a form of conception and major component of conceived space is starting with a twofold deficiency. Institutions are not really performing in a way to guarantee an implementation of the plans that would be unproblematic. So implementation starts with problems.

That is, the institutional side, before even starting to implement a plan, i.e. to face the real world, has an intrinsic problem. It's like starting a war with defective weapons.

In the sphere of implementation, there are several deficient forcers that counteract the plans (besides the state itself with its bureaucracy and bad organisation). These come from two major sets of actors: a) civil society i.e. the various organised civilian interests and also individual opponents; basically his means for the case of Greek local organisations of inhabitants, professional groups, political organisations, etc.; b) organised economic interests major stakeholders with economic power who for 'some' reason did not intervene in the first place to influence the plans or were not successful in doing so. This frequently takes the form of court cases whereby the judicial power opposes the legislative and executive power of the state itself, thus bringing into the surface another dimension of insufficient preparation [this is not to oppose the distinction between the three powers as organisational base of the state securing the freedoms and counterbalancing contradicting societal forces].

And if this twofold problem is faced, then the even more real world is to be confronted; the world of real problems, barriers, be it technical or related to human resources, or other factors.

But there is something even more important when it comes to implementing regulatory plans: this is time.

Slow-moving procedures (due to a variety of reasons related to administration practices and culture, to other cultural dimensions, and to organisational capacity) often make (whatever) plans redundant. The reasons are a) objective reality: changes in modes of production and regulation, technical advancements, external forces, changes in the economic situation, etc.; b) subjective: this is when the attitudes of people are against 'the plan' (or the processes of planning), i.e. the changing values, expectations, assumptions, understanding of space, finally the changed (over time and because of time) lived space that produces different expectations for the future lived space. This counteracts the process of space production via interventions to the process of planning implementation whether planning regulations or infrastructure construction delivery.

In contrast to this, the new fast track regulations for investments, as a counter economic crisis measure (Law 3894/2010) and the practice of concession agreements for big projects also come often in contradiction to pre-existing planning. This is because the need for investments brings the state (from the side of planning authorities) to a weak situation *vis a vis* a prospective investor. As a result, existing planning regulations are relaxed, by utilising legal bypasses and special legislation.

In the cases analysed above, the perennial Greek planning weakness became evident, i.e. the controversial co-existence of physical planning and design with economic-social planning Community Support Framework style. Planning, being not cohesive and having embedded institutional pitfalls, has been proven to be inadequate to face the rapidly accumulating problems. A deeper understanding of this development calls for a complex answer to the problems, a kind of multi-tasking exercise, an integrative plan which would be strong enough to set the rules even for the City Master Plans. However, for this to happen the institutional environment has to be changed; to become effective it has to become simpler, more comprehensive and above all realistic and more communicative.

Keywords: Urban growth modelling; Flood modelling; Land use planning

ABSTRACT. *Recent research has looked at questions of flood management in Kampala, Uganda in the context of climate change by combining an urban development model and a dynamic flood model. This work is now being extended to include Kigali, Rwanda. Both Kampala and Kigali face enormous and complex developmental problems: relatively weak economic performance; the urbanization of poverty; relatively poor infrastructure (roads, public transport, water, sanitation, health, education, etc.); complex environmental management issues including regular flash flooding; etc.. Both Kampala and Kigali have recently prepared new urban plans that are now being implemented. The paper examines three main issues: what policy instruments for urban growth management and flood management are in place in the two cities; to what extent do their governance environments allow these instruments to be effectively applied; how such differences could or should influence the design and performance of integrated urban flood modelling approaches. Our analyses from Kampala suggest that ineffective of urban planning and management procedures are a significant factor in increasing storm water run-off rates and discharge as well as in increasing the level of exposure of communities to flooding due to the occupation of flood prone areas. In Kigali, where urban planning and enforcement has recently become stronger, integrated models may still provide useful insights into potential problems through ex-ante evaluation of the impact of urban development projects.*

## 1. Introduction

Recent research has looked at questions of flood management in Kampala, Uganda in the context of climate change by combining an urban development model and a dynamic flood model. The Integrated Flood Management Project Kampala (IFMK) was undertaken by a consortium led by ITC in the city of Kampala (Sliuzas, Flacke, & Jetten, 2013). In this project, a series of land cover modelling exercises based on spatial logistic regression methods (Fura, 2013) and cellular automata (Pérez-Molina et al., 2015a) were completed for the Upper Lubigi sub catchment and for the Kampala metropolitan area (Abebe, 2013). The openLISEM model (De Roo et al., 1996) was calibrated for Upper Lubigi by prof. dr. Victor Jetten (see an analysis of this model in Habonimana, 2014); Mhonda (2013) used this model to assess the impact of non-conventional interventions, such as rainwater harvesting, infiltration trenches, and retention ponds on storm-water discharge and flooding. The land cover scenarios developed in Fura (2013) and Pérez-Molina et al. (2015a) were later used to simulate the consequences on flood impacts of urban development (Sliuzas, Flacke, & Jetten, 2013; Sliuzas, Lwasa, et al., 2013), in combination with other measures (such as improvement of the drainage system). The openLISEM flood model of Upper Lubigi provided the capacity for flood simulation.

While results from the Kampala experience were directly applicable to urban management in this city, they also provided an appropriate platform to formulate more general research questions. Particularly, to what extent can land use planning reduce the impact of flood hazard in urban contexts? The experience of Kampala provided important insights on infrastructure investment as a tool to reduce flood hazard; but since enforcement of land use controls is deficient, broadening the scope of analysis to the city of Kigali –were regulation is more stringently applied– is expected to generate a wealth of

knowledge, especially when comparing both cases and by setting them within the more general context of Sub-Saharan African cities.

**2. Opportunities to advance knowledge through comparative case studies**

The cities of Kampala and Kigali, and the countries of Uganda and Rwanda, present striking similarities. As discussed by Goodfellow (2013), Ugandan and Rwandese national economies are largely agricultural-based but have been reporting very high economic growth rates over recent years (Annual change in GDP for 2008-2013: Rwanda 8.4% p.a. and Uganda 5.74% p.a. (APP, 2014)) poverty levels are similar (according to UNDP in 2010-2011 both have around 71% population suffering multi-dimensional poverty), both have a low Human Development Index (HDI 2013 for Uganda is 0.484 and that of Rwanda is slightly higher at 0.506) (http://hdr.undp.org/en/data) and political regimes have a shared background.

The cities themselves also present similarities. The have similar overall population levels (estimated for 2015 at 1.9 million residents in Kampala and 1.3 million in Kigali). Physically, they are located in a hilly terrain with wetlands occupying the low elevation areas (Kampala appears to have preserved the natural vegetation of these areas better, although encroachment into the inundated area by industry and housing is larger, with Kigali having occupied them with agricultural fields and some industries and housing). Both cities are also growing at a yearly rate of 4% (est. for 2010-2015), although when land patterns are analysed, the level of dispersion in urban development is much larger for Kampala than for Kigali (Fig. 1).

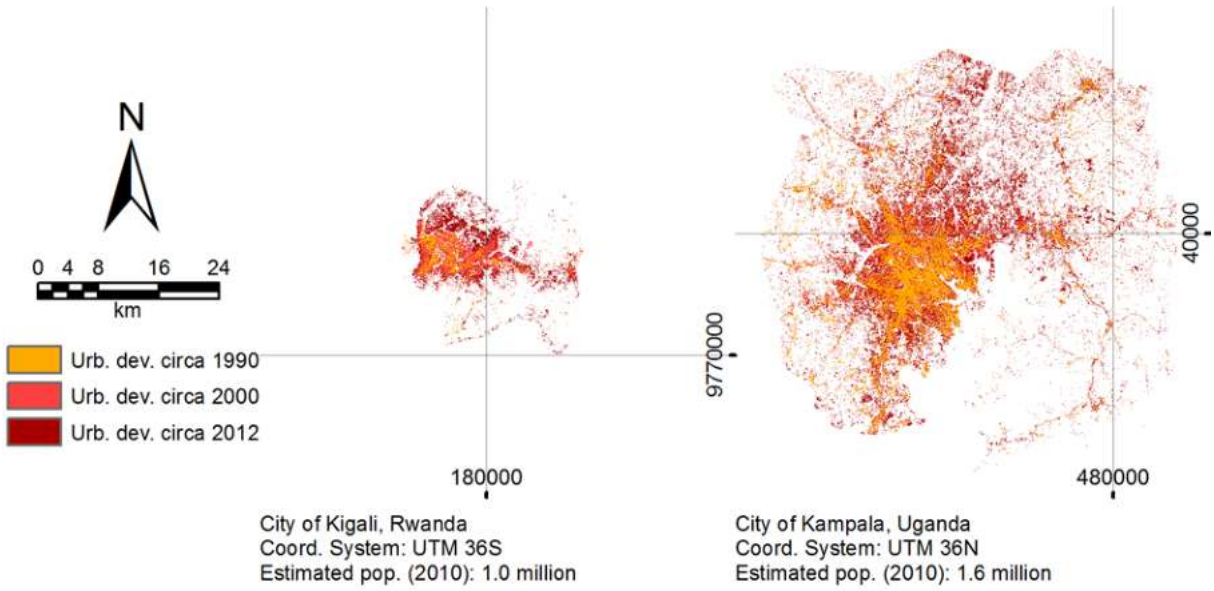

Figure 1. Urban development trends for Kigali and Kampala

Further, the challenges faced by both cities are also comparable. Both cities show important limitations in infrastructure provision (roads and public transportation, water and sanitation, and notably drainage systems). However, they do diverge in one fundamental way: the willingness of enforcing land use controls, which Goodfellow (2013) ascribes to "fundamentally different political bargaining environments". Whereas in Kigali, the central government's commitment to implementation of land use plans created a "virtuous cycle" encouraging both local authorities to enforce plans and urban dwellers to comply with them, Kampala presented the opposite situation: both elite *and* popular groups could effectively sidestep decisions by the City Council by appealing to

higher levels of government (in turn, de-incentivizing local authorities' will to enforce urban regulations). Moreover, in Kampala many large landowners such as religious groups and the Buganda King who owns much of Kampala's wetlands, allow leasehold access to their lands for group members or citizens, and development of such lands are often poorly regulated by government officers (Muinde, 2013).

A comparison of these two very similar cases, with such a contrast in urban management practices, offers an interesting opportunity to assess the differences introduced by land use planning.

*2.1 Land use planning instruments*

Both Kampala and Kigali have recently prepared new urban plans that are now being implemented. The Kampala Physical Development Plan (KPDP) was approved by the City Council in April 2013[1]; the Kigali Master Plan (KMP) was finalized in 2013, based on the conceptual plan existing since 2007[2].

When comparing both documents, one can conclude that both plans have a strong focus on physical development and in particular land use (zoning) and regional transportation. Transportation, further, also adopts the same technological solution – bus rapid transit, complemented by regional road systems and at least mentioning non-motorized modes. But there is a difference in the level of detail of the land use provisions in each plan.

- The KPDP generates a conceptual proposal, including identifying new satellite towns to be reinforced as well as suitability analysis for urban development. Some sketches of possible future (re)development options are provided for some localities such as the city centre, but mostly it is a conceptual plan.
- The KMP goes into greater detail, to the point of identifying and proposing conforming, conditional, and non-conforming land uses (e.g. in the Natural Environmental Management Strategies section). More detailed district level development plans are also used to guide development application and approval processes.

This difference is also apparent in the conceptualization of flooding within the plans. Thus, in Kampala, flooding is addressed in the section corresponding to infrastructure, assuming the solution of drainage systems. Indeed, coordination between urban development and drainage systems is proposed, emphasizing detailed design of drainage systems and adequate funding to accommodate future growth (the IFMK fits perfectly within this scheme by developing one such urban development/drainage capacity analysis for the most critical area, the Upper Lubigi basin corresponding to the Kawempe division, which is expected to have significant development due to its suitability for urban land uses), with detailed land use planning having the role of preventing further encroachment of urban land uses on flood prone areas, a role which until now has been largely unsuccessful.

In contrast, the KMP deals with flooding in the Natural Environmental Management Strategies section (of the city level master plan report). The relationship between flooding and urban development is posed in terms of protecting the natural value of wetlands –which might seem contradictory, since many of the wetland areas are not occupied by natural vegetation, unlike Kampala, although urban encroachment into them is also much more limited than in Kampala. Specific goals of the plan include zero loss of existing wetlands (to urban development) and riparian buffer zones from wetland fringes and from drainage (20 to 50 m); the elements suggested in the proposed storm water system (in the infrastructure section) are vegetated and bioretention swales, bioretention basins and constructed

[1] http://www.observer.ug/component/content/article?id=32676:-kampala-is-making-headway
[2] http://www.kcps.gov.rw/index.php?id=21

wetlands; these have the goal of re-using storm water for beautification and non-potable water source, rather than merely channelization of storm water. (The KMP does consider the 2008 Storm Water Master Plan to be in line with its own vision.) Recently Kigali City has relocated several industrial and housing areas out of wetlands and commenced an ecological restoration project in two large wetlands. Further displacements from wetlands are also envisaged.

*2.1 Enforcement of land use controls in Kigali, Rwanda*

Figure 2 illustrates a case of large scale relocation of an informal settlement originally located in a wetland; the area was transformed into roads and green space. According to Republic of Rwanda, Ministry of Natural Resources (2013), residents of the centrally located Ubumwe slum –a densely populated area with "dilapidated and unhygienic" buildings– were moved to Batsinda, a fringe area at about 5 km distance from Ubumwe. This space is to be partly re-developed for commercial land use but, since part of it is in close proximity to the wetland, a grass buffer will be maintained in its north-east part.

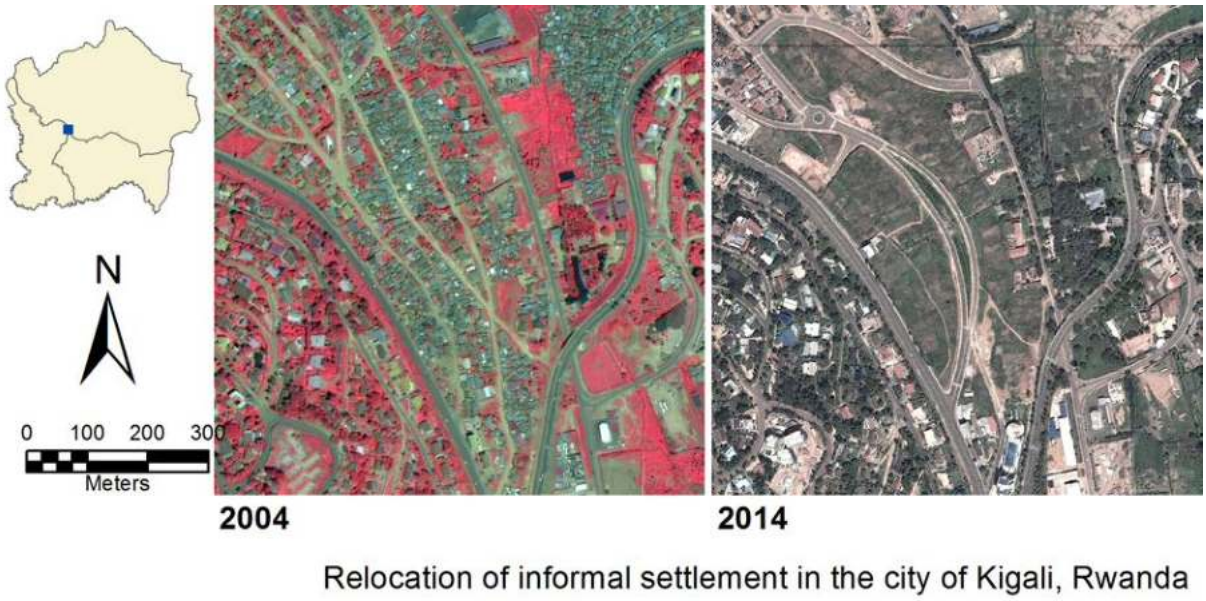

Figure 2. Example of enforcement of land use controls via displacement in a wetland area of Kigali

*2.2 Infrastructure drainage system investment in Kampala, Uganda*

The landscape of Kampala consists of 8 main catchment areas, each draining into a broad and very gently sloping wetland area; some wetlands drain directly into Lake Victoria while others channel water into neighbouring local government areas and eventually into rivers and lakes. Kampala itself does not contain any rivers as such, though each wetland does include both natural and artificial channels .

Kampala's drainage system is, however, poorly developed and managed. There are 8 primary drainage channels, two of which have been recently upgraded according to the 2002 Drainage Master Plan (KDMP): the Nakivubo channel that drains much of the city centre area feeds into Lake Victoria and the Lubigi channel that drains much of the north western parts of Kampala and feeds into Lake Mayanja Kato to the west. To date the upgrading of the Lubigi channel has been limited to its upper reaches only. Upgrading was undertaken through a combination of channel widening and lining and the installation of high capacity culverts at bottlenecks such as under roads. Recent flood events show that such improvements may not always be sufficient. In 2014 a new project to update the 2002

KDMP was started but this too was focussed on the primary drainage systems, albeit with more attention for Sustainable Drainage System (SuDS) options than was apparent in the KDMP. Secondary drains do exist but are of variable quality and durability; some are constructed with lined channels but many are in a more natural state and poorly maintained. Tertiary drains, where they exist are frequently community-made and poorly maintained.

Drainage systems form part of any city's basic infrastructure, however, there are many ways in which they can be designed and managed. In Kampala's case, given the relatively weak technical, financial and human capacity of the city administration, it is especially important to consider the implementability and sustainability of all planning and engineering options. One of the major proposals of the IFMK project is to adopt a SuDS principles in drainage design, especially in case of new developments and the foreseen growth of Greater Kampala's population to as much as 8-10 million by 2040. A SuDS approach can utilize the natural capacities of the landscape to manage surface water runoff to reduce peak discharges and, in so doing, reduce the investments required for traditional drainage systems. The approach can also be combined with community based management practices for solid waste management, protection of natural wetlands etc.. Their ultimate success will also require improved regulation and control of urban development activities. Improved understanding to the combined effects of such measures can be assessed through modelling activities that can provide insights into the relative merits of different mixtures of measures and behaviours. The construction of the Northern Bypass alongside the Lubigi Channel for example has significantly reduced traffic load in the city centre but aggravated pluvial flooding in some areas and necessitated the forced displacement of multiple households. Such effects can be foreseen through ex-ante model based analyses that may lead to modified designs and decision making, or at the very least more timely displacement in view of the changed flood risks in certain locations.

Figure 3. Improvement of primary drainage channel in Bwaise, Upper Lubigi, Kampala 2013 (photo taken from Habonimana, 2014)

**3. Modelling framework and application**

The approach applied during the IFMK is of widespread use in the field, especially in recent years, when computational power has increased: it consists of a land use/land cover component and a flood component. In essence, land cover patterns are researched (and generally base line conditions are used to simulate future land cover conditions). The output of this analysis is then used as input to a rainfall-runoff model, which in turn can be used to simulate the flow of runoff over the landscape –and detect any flooding, should it occur.

From a scale perspective, the final objective is to analyse a key catchment within the city. The strategy is to develop an analysis pilot case study, ideally in a critically important area (i.e. an area undergoing rapid change that increases flood risk in it). This pilot can later be replicated by local authorities in other catchments; it serves to develop specific modelling products, pertinent for the context being explored, while generating knowledge that informs higher level theoretical models of urban and environmental dynamics.

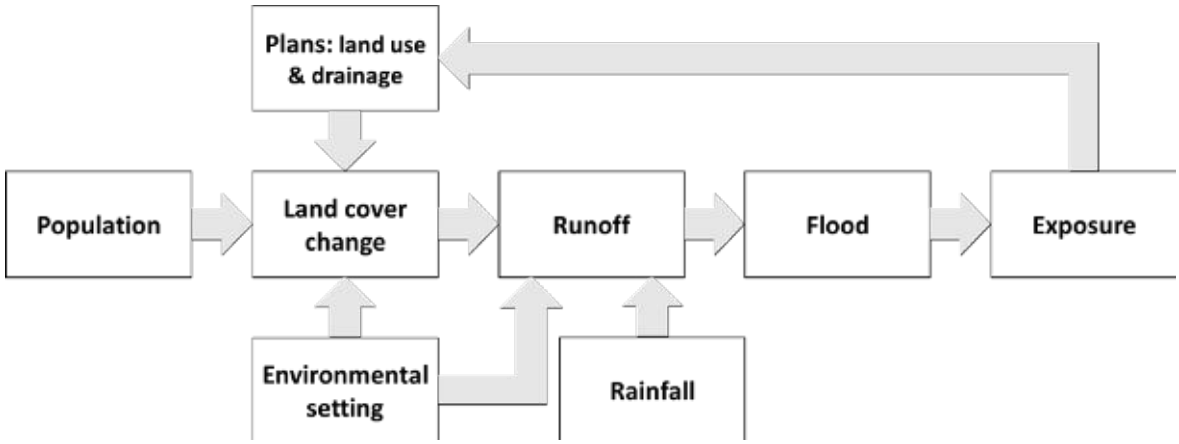

Figure 4. Conceptual framework

Land use/land cover simulation for Kigali and Kampala has included two approaches: spatial logistic regression (SLR) and cellular automata (CA). SLR, in turn, has been performed at city-wide scale and also for the specific catchment being analysed. Smaller scale studies of specific functional aspects (e.g. runoff generation) or of design have also been used to complement the overall narrative. Flood modelling has been performed using the openLISEM flood model, a rainfall-runoff-flood model appropriate for mid-scale analysis. openLISEM has the advantage of receiving as inputs land cover and rainfall data, as well as an infiltration map, and producing a diversity of spatially explicit flood measures.

## 4. Discussion on modelling for policy and findings

*4.1 Land use dynamics modelling*

Sliuzas et al. (2013a) synthesized integrated results of the IFMK project: spatially explicit scenarios of land cover change, projecting land cover conditions to 2020 (assuming trend and high population growth), were used as inputs into the flood model of the Upper Lubigi catchment in Kampala, Uganda. Twelve scenarios were simulated: a baseline scenario with unimproved drainage and baseline year (2010) land cover; a set of scenarios with improved primary drain and clean secondary drains; a set of scenarios in which the secondary channels were grassed waterways (increasing infiltration); a "Zone" scenario considering the removal of built up flooded in the baseline conditions (replaced with grass), and a scenario were 15 thousand house owners increased grassed area in their plots. Output results included flood depth maps, total flooded area, discharge and flood volume, as well as quantification of the number of structures flooded in each scenario.

Future land cover scenarios used in Sliuzas et al. (2013) were developed using the SLR results of Fura (2013). This analysis was carried out on 10m square cells; the predicted land cover category was built up (designated as 1 or 0). Identified drivers of land cover (built up) included: proportion of

surrounding built up, distance to CBD, minor roads, industrial sites, and to major roads (positively correlated with probability of being built up) and slope, distance to market centres, streams and proportion of undeveloped land surrounding the cell (negatively correlated). The predicted probabilities were used as a suitability score to spatially allocate future urban development.

SLR predictions, however, have two problems: firstly, they tend to over-cluster the predicted landscape pattern; this is shown in figure 5, where most cells correspond to the 40 to 60% built-up category. Secondly, it is difficult to use them to generate land patterns deviating from the trend conditions (e.g., for Kampala, it would be difficult to model the effect of stronger land use plan implementation, since enforcement has been historically weak). Therefore, in a second stage, a simple CA model was developed (Pérez-Molina et al., 2015a). This model was based on defining a simple suitability measure, including percentage of built up in neighbouring cells, wetlands, non-vegetation percentage, and distance to CBD. It is a simplified version of the SLR; factors were chosen and weighed in such a way as to replicate trend conditions (with the advantage that any new suitability index, based on the researchers interest, could be defined and used to simulate alternative land patterns).

Unlike the SLR of Fura (2013), the CA model used a 20m-side cell as the basic geographic unit. Each cell (automaton) was characterized by the percentages of built up, vegetation, on-road bare soil, off-road bare soil, tarmac, and water within it. Also associated to each cell was a potential condition, such that built up and on-road bare soil both increased (randomly but with the overall basin conforming to a statistical distribution consistent with historic urban development) and other categories declined. The model selects the most suitable cells and, to simulate future landscape, assigns to these the potential (future) urban condition. Further, this potential condition can be modified to reflect policy constraints (e.g., no land cover change was defined for institutional land uses such as the Makerere University campus).

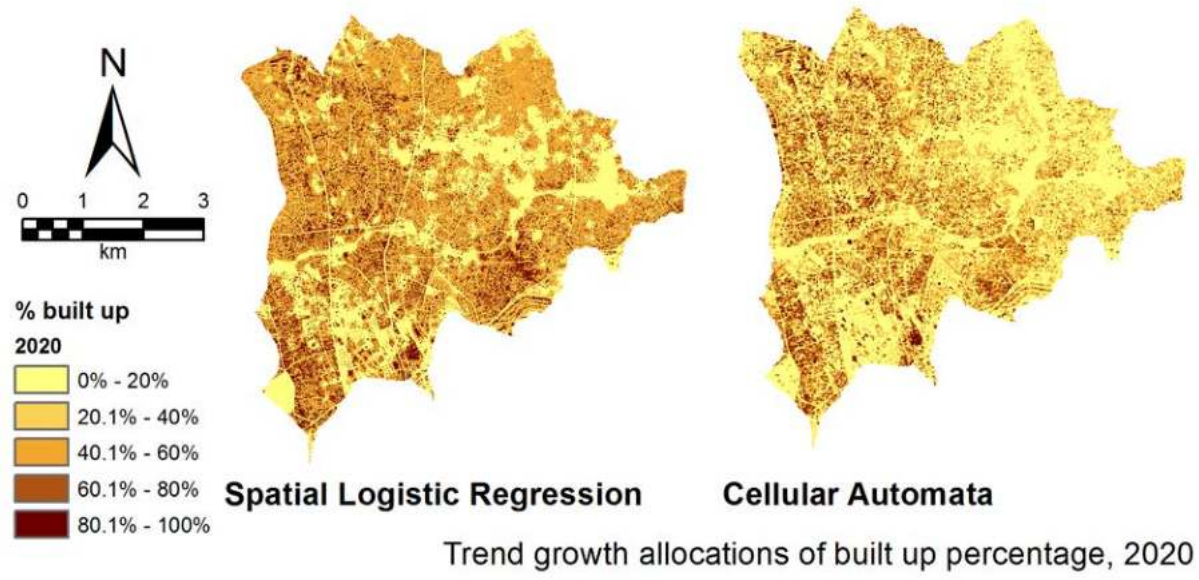

Figure 5. Comparison of simulated scenarios of urban development for Upper Lubigi, Kampala

For Kigali, Nduwayezu (2015) recently completed a SLR modelling exercise using Landsat (mid-resolution) satellite imagery to derive land cover, describe land pattern changes, and identify determinants. As in the work of Fura (2013) and of Abebe (2013) for Kampala, the neighbourhood

factor –percentage of built up surrounding the cell– was identified as the main determinant of land cover change. Nduwayezu (2015) simulated trend conditions and found troubling potential problems, such as possible deforestation and occupation of wetlands in the western part of Kigali.

All of these models have formalized built up land cover as a single category, which is treated as the sole dependent variable; even the CA model implicitly does this, since the percentage of on-road bare soil is determined by the increase in built up land cover and other categories (vegetation, off-road bare soil) decrease proportionally to their base line values. For future extensions, two key modifications are being analysed:

- The disaggregation of built up into a set of land use/land cover categories (specifically, formal high density built up, formal low density built up, industrial, and informal). It is expected that urban growth simulations will be both easier and richer, in the sense of providing more information, than a single entity; further, policy simulation would also be eased, given that many policy targets vary per building typology. However, this decision also means better land use/land cover data models must be generated in data sparse environments.
- An exploration of the relationship between non-built up land cover categories and their dynamics. A recent analysis (Pérez-Molina et al., 2015b) detected that only a few land use scenarios differing in the distribution of built up land cover caused differences in flood impacts. However, if the proportion of off-road bare soil and vegetation were modified, hydrological impacts do substantially change; in particular they are much smaller for larger vegetation percentages. This finding suggests that it may be critical to better understand how vegetation changes within the urban landscape and how such changes affect the processes of water retention, infiltration and runoff; additionally, sustainable urban drainage systems and other forms of local infiltration could be re-assessed, in light of this result, as possible policy measures to reduce flood impacts.

*4.2 Flood modelling*

openLISEM (documented in the webpage http://blogs.itc.nl/lisem/) is an event-based rainfall-runoff-erosion-flood model. It transforms total rainfall falling over a catchment into runoff by subtracting various fractions, depending on landscape characteristics and conforming to several physical processes: soil hydrological characteristics and initial humidity result in an estimate of the infiltration fraction; a vegetation land cover map triggers interception, as does a housing (built up) land cover map; roads and housing introduce total or partial imperviousness of the soil (no infiltration). Once runoff has been determined for an initial time step, rainfall will vary for the second timestep according to a hyetograph and overland flow will be accumulated towards the channel system, from which the landscape may eventually be inundated.

openLISEM, and the PC Raster platform on which it was built, have been used to explore how different elements can be incorporated into the drainage system (or upstream) to reduce runoff, and what general impact they cause on hydrological outcomes.

Habonimana (2014) explored the impact of the spatio-temporal variation of rainfall on flood estimates for Upper Lubigi, Kampala. Both Kigali and Kampala are data sparse environments (to the point that, for Kampala, a rain gauge was installed in order to generate basic data for the IFMK project), with the consequence that simulations are generally performed with point rainfall data assumed as valid for the entire catchment (see Sliuzas et al., 2013). However, Habonimana's (2014) results suggest that spatial variations of intensity may indeed impact hydrological outcomes in unforeseeable ways (some areas over predicting and others under predicting, relative to a constant intensity); at the very least, more attention should be paid to this issue and perhaps uncertainty should be addressed by simulating various rainfall events.

Mhonda (2013) tested three strategies to promote local infiltration (rooftop rainwater harvesting, infiltration trenches, and retention ponds); he found rainwater harvesting to have, by itself, negligible effects. But the combination of all measures was argued to be the best option in reducing runoff, with peak discharge at the outlet being up to 25% less than peak discharge without any measure.

These case studies show the versatility of openLISEM in incorporating pertinent policy measures, in line with alternative approaches to drainage systems (such as sustainable urban drainage systems) that prioritize local infiltration of runoff. The calibrated openLISEM models for Kampala, Uganda (specifically for the Upper Lubigi basin) assumed certain simplified land cover conditions. For example, all built up units were of the same type (although, as can be seen, barrels for water harvesting for some of these could be simulated) and vegetation is also assumed constant. Would variations to these aggregate categories be useful or are they necessary? This question is particularly important for the vegetation fraction, currently also being treated as constant in the land use dynamics models.

*4.3 Findings on the case studies*

In both cities, the development and use of such models, and the capacity to use them in local decision making across various spatial and temporal scales can contribute to a strengthening of the evidence base of planning and management decisions.

Our analyses from Kampala suggest that ineffective urban planning and management procedures are a significant factor in increasing storm water run-off rates and discharge, and perhaps more importantly in increasing the level of exposure of communities to flooding due to the occupation of flood prone areas. A pre-requisite for the enforcement of wetland protection and a development moratorium in flood prone areas is information on their location and extent. Such analyses are, however, not just technical exercises. Implicit in such a spatial definition of flood proneness is a political discussion of acceptable risk, as the flood extent varies according to the return period of the rainfall (i.e. a 1:100 year event will generate a larger flood extent that a 1:10 year event). Moreover, if flood zones are to be created and enforced these should also consider the effects of future developments within the catchment and perhaps also the effects of climate change.

In Kigali, where urban planning and enforcement has recently become stronger, integrated models may still provide useful insights into potential problems through ex-ante evaluation of the impact of urban development projects. The examination of longer term scenarios related to climate change could also be beneficial, though as in Kampala, they are likely to be less critical in the short term.

Keywords: urban regeneration, institutional tool, implementation

## ABSTRACT

*In Greece, there are numerous legislative instruments which, despite being significant spatial planning tools, are not practically used at all. Regarding urban planning, the most important and already implemented law is the law 2508/1997 ‹‹Sustainable Residential Development in Urban and Country Settlements and Other Provisions››. Several provisions of this law address major urban planning, socio-economic and environmental problems of the country's cities and smaller settlements. A typical example of this is the regeneration tool, aimed primarily at improving the residents' living conditions and built environment, protecting and showcasing the area's cultural, historical, morphological and aesthetic features. This paper examines whether this tool has been implemented in the case of a medium-sized Greek city, Volos. The analysis showed that since 1997, when the law was adopted, and up until today, no region has been declared a regeneration area. So, this paper also examines the reasons why a useful tool with so many urban planning and developmental benefits was never used. Is it due to the stiffness of the state apparatus, the lack of interest on behalf of the competent authorities or the inadequacy of available resources? Therefore, the main question that arises in this case-study is why are point interventions being recorded since they are not part of a broader and integrated project.*

## 1. Introduction

The term 'urban regeneration' has acquired quite a few meanings both over the years and, to a certain extent, over different countries. According to a general descriptive definition, regenerations are urban planning interventions in parts of the existing urban fabric which include, though not entirely consumed by, their physical (re)structuring. In this context, the specific objectives, thematic range and emphases on regeneration are determined by the urban planning problems (if any) and some general parameters, such as the cities' changing roles or socio-economic data (Oikonomou, 2004).

Defining the term's notion and content is particularly significant, because urban regeneration is very often confused with urban renaissance. The first case concerns interventions in the morphological characteristics of the residential area (mainly in the public, but also in the private sector), while the second one relates to interventions in its structural characteristics. So, even though, for instance, regenerations may lead to an overall improvement of the city's image, urban renaissance aims at changing the city itself, that is to say, not only its morphological or even economic, social and cultural characteristics. Urban renaissance is a wider process that contains urban regenerations, without which it would prove quite difficult to bear fruits. The interventions made in the existing urban area, which focus on physical planning, are obviously not the only components of the urban renaissance spectrum. They practically have a central role in it as they are essentially connected to some of its principal

determinants (Oikonomou, 2004). There is, consequently, a two-way and clearly hierarchical relation between the two. What is more, it should be mentioned that urban renaissance, as a predominantly development process, requires the existence of a coherent framework and a combination of several sectoral policies.

**2. Urban regeneration in the Greek reality**

The basic element identified within the Greek reality, both in theory and in practice, is that the boundaries between urban regeneration and urban renaissance are not very distinct especially in institutional texts where the term of urban renaissance is never used in contrast to that of urban regeneration. The tool of urban regenerations which is established by the provisions of the law 2508/1997 (Article 8) is a classic example of this. Now, while the areas in question should be referred to as urban renaissance areas – based on their characteristics as well as their objectives – the institutional framework refers to them as urban regeneration areas (this specific tool will be extensively discussed later on). This is why there is still a growing confusion regarding the terminology used.

Even if we accept this institutional term on condition, the problem remains, as it has been informally established that any kind of urban intervention, whatever the intensity, is characterized as urban regeneration. As a consequence, the term is used today to describe fragmented or point interventions that have absolutely nothing to do with the philosophy and definitions derived from the institutional text, thus reflecting the lack of cohesion and planning in design (Vlachvei, 2012). Various problems arise, in this way, such as difficulty in implementing the urban planning policy and in evaluating the results of the underlying projects and the predominance of fragmented interventions over integrated planning.

**3. Institutional tool characteristics of the regeneration of law 2508/1997**

By law 2508/1997 ‹‹Sustainable Residential Development in Urban and Country Settlements and Other Provisions›› (GG 124 A'/13.6.1997), except for any other strategic type tools such as Development Plans, Open City Spatial and Residential Plans and Master Plans, the first institutional tool for problem or developing areas which are within the city plan – either by instalments or in entire urban units – has been introduced. (Chapter B' in articles 8-17). The law's objective lies in the environmental and urban planning recuperation of the city area as opposed to previous residential policies confined only to urban extension. (law 2508/1997)

Regenerations based on institutional provisions have yet to be realized, while even the ones whose designing had begun (Old City of Irakleio, N. Liosia, Zygos area – municipality of Filippon Kavalas) were never completed, due to the lack of issuing regulatory acts as provided by law. (Scientific Committee Report, 2006)

According to law 2508/97 regeneration is defined as: "…the set of guidelines, measures, interventions and procedures of an urban, social, economic, residential and specific architectural nature, which result from a relevant study and aim mainly towards improving the citizens' living conditions and built environment, protecting and showcasing the area's cultural, historical, morphological and aesthetic features". Regeneration areas are defined as:"…those areas of approved city plans or demarcated settlements where problems of degradation or deterioration of the residential environment are noted. These problems cannot be confronted only through the usual urban planning procedures of town plan revision and building terms and restrictions. A regeneration area may include one or more urban units or parts of urban units." "In order for an area to be classified as a regeneration area, there should be at least some of the problem categories below: High building densities or great lack of communal spaces

and spaces for recreational facilities. Conflicts on land uses or needs of radically restructuring land uses, depending on the area's potential and prospects. Lack of protection and promotion of the area's historical, archaeological and cultural features and activities. Increasing aesthetic degradation and generally that of the area's built environment quality and natural assets. Pressing housing stock problems."

The regeneration process consists of three stages: the preliminary proposal which includes the preliminary proposal and the financial information, the programme where the timetable, guidelines, measures and any processes needed for the project's completion including its budget are systematized and the regeneration design which includes the urban study and other relevant specific studies.

The Ministry is responsible for the approval of the regenerations which have to be part of an overall design while having emerged from the area's certified DP, OCSRP, MP guidelines. Furthermore, in case of any public interest reasons not having been considered during the designing phase, their approval is rendered impossible. (Scientific Committee Report, 2006)

Regeneration is perceived as a business plan, part of the current DP/ OCSRP /MP programming according to which the regeneration area is determined. The preliminary proposal constitutes the planning document that sets the goals, guidelines and implementation measures and the regeneration design is essentially the business plan. (Arvanitaki, 2005). Respectively, the regeneration study comprises the physical planning of a project within a given space, as reflected upon the planning and the business level.

Competent regeneration bodies, according to the law, are par excellence public institutions and namely the public administration at a NUTS 2 or even a LAU 1 level. Respectively, the responsibility for opening a procedure lies with the private sector either at ministry level or at the level of local authorities.

Regeneration is a fairly new term in Greece in contrast to the aforementioned foreign bibliography, though it shares common features with the term of urban regeneration due to its developmental character, which is based on the institutional framework (law 2508/97).

**4. Reasons for not implementing the institutional tool and its necessity**

Several critical points of the law 2508/97 on regenerations are expressed below:

- Legislative complexity as to the procedures to be followed.
- Stiffness as to the competent bodies. Public-private partnership is not given the opportunity to grow.
- The public sector, which has a major reserve problem especially during the current Greek economic crisis, is the only funding source.
- There is no legal differentiation as regards to the process of regeneration depending on its intensity degree (mild or highly invasive form of regeneration), and what is more, there is no regeneration possibility for the white land area included in the institutional framework. (Arvanitaki, 2005)
- Failure to inform the public so that they can participate in the process of regeneration in order to avoid negative reactions and for the project to be embraced by the local community. (Tsoukala, 2005)
- Lack of institutional measures about building renovations and reconstructions within the regeneration areas, in case the owners are indifferent to their restoration. (Tsoukala, 2005)

These problems were recorded in examples of cities where regeneration studies based on the law were approved but never actually completed (the example of Palaio Irakleio).
Undeniably, there is a need for a more flexible legislation on the regeneration issue, among others, which would offer the possibility for a public-private partnership, not only to avoid conflicts of interest, but also to seek funding, as the public sector does not possess the required capital especially during the economic crisis. Simultaneously, the participation and involvement of the local residents is an integral part of the project's success because quality urban planning for the society's benefit is a top priority. The stiffness of the institutional frameworks in the Greek reality complicates, of course, the projects' completion, while, at the same time, the DPs, ΣΧΟΟΑΠ, or MPs are revised after a quite long period of time and their updating according to economic, social and urban planning needs is seriously delayed.
In order for the property ownership to be defined, the Land Register completion is a necessary condition for exploiting the existing economic incentives offered by the law and for achieving efficient planning.

Nevertheless, the fragmentation which characterizes today's "regenerations" (better: point interventions) has eliminated the area's coherence and consistency both in physical planning and in the realization of its vision and design. This will result in urban planning as well as environmental benefits and will contribute to the area's economic growth through attracting suitable investments.

## 5. Case – Study of Volos

In the previous section of this publication, reference was made to the institution of regeneration and to what is happening in the Greek reality. In particular, emphasis is placed on the institutional tool of regenerations and on the fact that it remains inactive since the year the law was established, even though it could have made a major contribution to the way Greek cities are structured. Apart from the theoretical approach to the matter, exploring the tool's implementation is equally essential so that its practical importance can be understood as well. For this reason, a medium – sized city, Volos, is selected, where point interventions and the absence of integrated planning predominate, just as it happens in the rest of the country.

### 5.1 Analysis of the city

Volos is situated at the central part of the country at a close distance from both the metropolitan regions of Athens and Thessaloniki. It is the sixth biggest Greek city with a population of 141.675 citizens and a size of 385.614 sq km. The area specialises in the tertiary sector, while the primary and secondary sectors follow at lower rates.The Municipality, according to the Kallikratis criteria, includes 9 urban planning units quite different from each other as regards to their population, economic, social and urban planning features. As to the municipal units relating to the present proposal, it should be noted that there are many land uses, with residency, trade and recreation among them. The building densities within these uses are high, which is based on the absence of communal spaces, mainly green spaces and city squares, within the urban fabric. Moreover, the interventions made within the urban space are point interventions without resulting from an integrated plan with questionable results. It is estimated that the determination of an area as a regeneration one would effectively address its various urban planning and economic problems.

A broad band that includes a section of the Palaion area (Municipality of Volos) and a section of the Municipality of Nea Ionia is defined as the regeneration area. This band constitutes an integrated section that covers some of the considerably large area of the two Municipalities (chart 1).

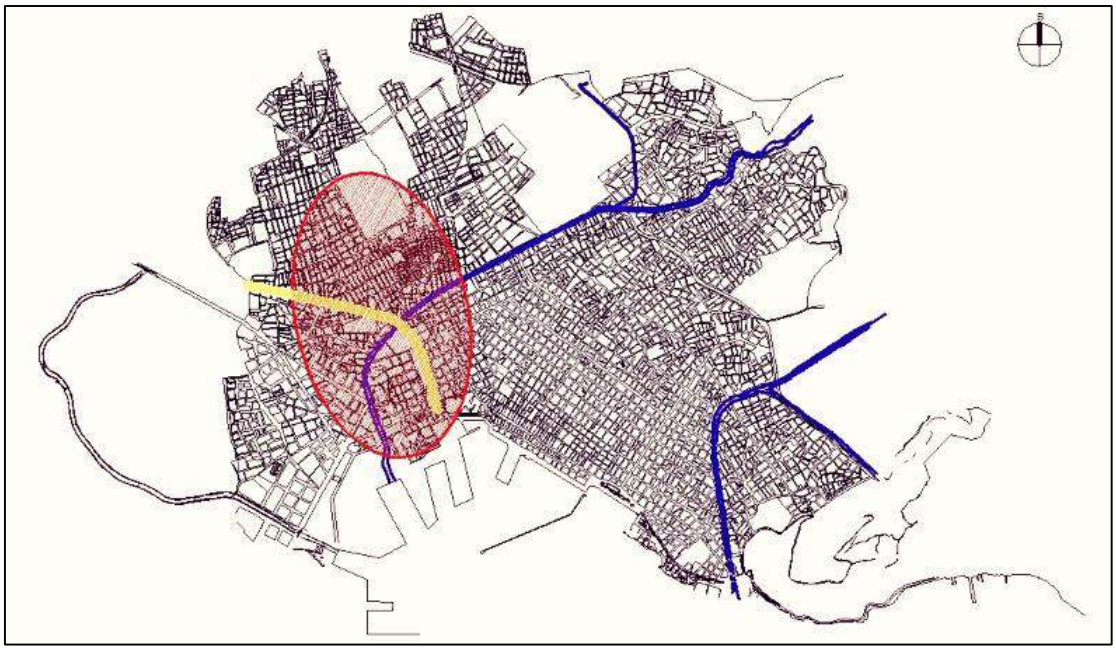

Chart 1. Regeneration area

This band's specific characteristics are those that make up the necessary and sufficient condition for this part of the city to be characterised as a regeneration area in accordance with the Greek institutional framework. The elements considered in order to explore whether the area meets the requirements and can therefore be characterised as a regeneration area are the following: urban planning – environmental, socioeconomic and cultural.

In more detail, as regards to its urban planning features, the main land uses that are being recorded within that band are those of residency, trade and recreation. In the absence of arrangements envisaged by the urban planning, it is quite reasonable for conflicts regarding land uses to arise. These are mostly between residency and recreation, as already observed in the Palaion area. The conflicts within the band section of the Municipality of N. Ionia are significantly fewer and spatially identified, even though the determination of measures/arrangements for their immediate restoration is necessary. In addition, another basic element of the area that contributes to the degradation of the urban environment are the high building densities. The absence of communal spaces reflected on the low sqm/resident rates (common feature of Greek cities), in combination not only with the absence of networking, but also with the bad quality, render interventions of an integrated nature absolutely necessary.

The analysis revealed two main facts regarding the proposed area's socioeconomic features: first, that the majority of citizens comes from lower and middle classes and second, that social discrimination phenomena against the area's different minorities (immigrants, Roma etc.) are often recorded. Moreover, due to the economic crisis the country is facing, there are numerous stores that are no longer in business, which has multiple effects on the local economy (e.g. unemployment, reduction of land values, etc.). As a result, features of a shrunken city can already be detected in the area.

The cultural features are equally important since the area as a whole has a unique historical nature which is strongly reflected upon the urban landscape. The archaeological sites, monuments and mainly the housing stock are typical of this. While, however, the existing cultural and housing stock is especially rich, it remains unreliable and in bad condition.

It can easily be deduced, now, that the proposed area has common features even though it is formed by sections of different urban planning units. Further differentiations, though not really significant, can be detected as well. There are, of course, some features, which may contribute to a better relationship between the two sections in the future through implementing an integrated urban planning project, although today these same features accentuate their differences. The first one is the railway premises (chart 1) which while connects the city of Volos to the district's headquarters, does not serve the connection between different parts within the city. On the contrary, it presents a further barrier that interrupts the spatial continuity. The second feature is the river Krafsidonas which up until today has yet to be exploited, leading to the environment's aesthetic degradation.

It is established, therefore, that the proposed band meets all five of the criteria – problem categories of the law 2508/97, in order for the area to be classified as a regeneration area. The Municipality of Volos is appointed the body responsible for the area's regeneration, so the benefits resulting from this process can be fully exploited by it and especially at an economic level, without the existence of lost profit.

### 5.2 The purpose of this proposal

The purpose of this proposal is twofold. On the one hand, the very useful institutional tool that has remained inactive up until today has to be implemented, and on the other hand, it has to become the stimulus for comprehending the importance of a complete and clearly stated urban planning policy. In other words, urban planning should not be identified with point interventions, as it usually happens today in the country. The need for a comprehensive approach to problems and the link between urban planning and development design should be understood. Particularly in a country like Greece, where problems besetting the city centres are not only of an urban planning but especially of a socio-economic nature, their holistic treatment is necessary. This indicates that the means and tools to be used are going to have both an urban planning and a development dimension since, by their own nature, society, economy and urban planning are inextricably linked.

The proposals discussed in this article are limited to guidelines and do not specialise in particular arrangements – measures. This is because regeneration areas are determined, according to the law, by the Development Plans (DP) which are of a strategic and not of a regulatory nature. Detailed arrangements will, therefore, have to be provided for by other types of planning such as urban planning studies and implementation acts.

More precisely, the proposed guidelines address the following axes:

A) Increase in the percentage of communal spaces per citizen and creation of networks such as green spaces, foot and cycle paths.

Finding available space for the creation of communal spaces in the case of Greek cities is undeniably a cumbersome and time-consuming process mainly because of the dominance of fragmentation of private property (Getimis, 2000) and smaller property. Furthermore, unregulated building projects that resulted in reshaping the peri-urban space illegally and in advance and where the subsequent urban development plan of '87 was based, are the urban planning policy's status quo. This causes a plethora of problems within the urban space among which is the difficulty in locating communal spaces. Nevertheless, both the national legislation and the European programmes, in which the country participates, allow the possibility of locating spaces suitable for this specific purpose. Using tools such as reimbursement, the preferential right and the building rate transfer, the national urban planning legislation and the exploitation of European programmes of type Jessica ensure the regeneration body that there are the resources necessary for the projects to be completed. They also provide the landowners with the incentives so that they can participate in it. What is more, the exploitation of

unstructured spaces and empty shells is the alternative to ensuring the existence of the communal spaces required for the regeneration area. Finally, the public – private partnership should be a top priority. Both sides can benefit from this partnership. For the public body, the benefits are directly related to the location of the required land and to the maintenance of any communal spaces that will arise. For the private sector, the benefits are related to investment incentives that will be provided within the band.

B) Addressing the nuisances occurred by different land uses.

Within the study area, no land use conflicts serious enough to require modification of the designated uses by the Development Plan are detected. However, individual nuisances between recreational spaces and residences cannot be overlooked. To address this problem, it is proposed by way of illustration, to reduce the authorised noise levels and to impose stricter fines in case they are exceeded.

C) Protection and promotion of the historical and cultural features.

The area in discussion, as mentioned above, possesses a rich historical and cultural stock which is, unfortunately, neither protected nor exploited. Thus, its negative impact is the degradation of the historical monuments and archaeological sites themselves and, by extension, the loss of the area's historical identity and the creation of lost profit instead of it being exploited (e.g. used as a resource for tourism). In order to address these issues, the creation of a network of archaeological sites and historical monuments is suggested. At the same time, an indicative way to protect and promote them is to provide the urban equipment and specific lighting needed for them to be accessible to the public for longer periods of time.

D) Upgrade in the quality of the structured and physical environment.

The communal spaces, the foot and cycle paths as well as the paths connecting archaeological sites will contribute significantly to the reformation of the urban environment. Additionally, emphasis is placed on providing the right incentives, such as funding or municipal tax reduction in case of building renovations that will contribute to great improvement of the housing stock.

Simultaneously, using the existing infrastructures, the promotion of the railway station and establishments, the exploitation of the river as an important resource of the area and their smooth integration into the urban fabric, will remove the barriers that previously existed. After having achieved these objectives, further benefits are expected at an urban planning and economic level. The urban planning and environmental benefits are obvious. The economic ones, though, arise indirectly from increasing land values, attracting capital and granting aid to local small and medium-sized businesses about which further incentives are proposed.

E) Providing urban planning – economic incentives

The regeneration tool of the law 2508/97, as stated in the previous section, has a strong development dimension, which cannot be disregarded in this proposal. So, then, besides public – private partnership and benefits to the local economy, which were analysed earlier, it is appropriate for urban planning and economic incentives to be provided as well within this band. Some instances of these incentives are funding new businesses, tax reduction for small and medium – sized businesses and favourable building conditions.

It is estimated that the above mentioned guidelines will effectively contribute to the improvement both of the morphological and structural features of the area in the short and in the long term. That being

said, they will enhance the quality of the urban environment and at the same time create prospects for the local economy to recover and for the social cohesion to be strengthened.

## 6. Conclusions

Having understood the need to connect spatial and development planning, the use of multidimensional tools is absolutely necessary. The forefront of the law 2508/1997 lies in incorporating the development dimension into urban planning. Since it includes tools that are capable of yielding substantial effects at numerous levels, it thereby highlights the socio – economic terminations of urban planning. However, several provisions of the law, including those on regeneration, have not yet been implemented in Greece. On the contrary, the ‹‹regenerations›› take place only at a point intervention level. The reasons why such a practical tool is not in use are many, varying from bureaucracy (e.g. delays in completing and approving projects) and lack of available resources to stiffness of the country's intricate legislative system. The main issue that arises, though, is the absence of a clear and integrated policy and the existence of multiple legal instruments, which are sometimes confusing, since they operate in opposition to each other. It is, then, particularly important to lay some foundations so as to perceive that urban planning has to have a strong development dimension and not be restricted to planned and point interventions

# TRACK 11

# Planning across Borders: Transnational, International and Intergovernmental Planning and Spatial Management

## Track description

Co-chairs: **Stefanie Dühr**, **Wil Zonneveld**

Spatial planning initiatives for functional regions that stretch across political and administrative boundaries are often challenged by the 'boundedness' of how spatial planning is conceived and organised. The political, administrative, cultural or ethnical territoriality is a real challenge for trans-boundary planning in a world of multi-scale organizations and large-scale spatial development issues. In this track, we invite papers discussing theories and practices of trans-boundary planning in relation to the agreement on agendas for cooperation, the organisation of trans-boundary spatial planning processes, and questions over their democratic accountability. Questions which we would like to discuss in this track include the following: How can territorial governance and shared responsibility be organised for planning of flows crossing political borders? How do ideas and discourses spread through collaborative planning processes, and do they influence planning approaches in the involved regions? What is the role of planning cultures in collaborative planning processes across political borders? How can the complexity of spatial planning issues combined with the complexity of intergovernmental planning across borders be managed? What skills and qualities are needed for planners to deal with these tasks?

# THE IMPACT OF EUROPEAN TERRITORIAL COOPERATION AND TRANS-EUROPEAN TRANSPORT NETWORK POLICIES ON CROSS-BORDER TRANSPORT

Beate Caesar

University of Kaiserslautern, beatecaesar@ru.uni-kl.de

Keywords: Coordination of EU-policy sectors, Trans-European Transport Networks, European Territorial Cooperation

*Although ambitious goals have been formulated and efforts have been made to contribute to a good inner European transport system, the effects of the borders are still observable: bottlenecks and inefficient cross-linked transport at borders are the hard facts within large parts of the EU. Cross-border transport is supported by two major EU policy sectors: Cohesion Policy and Transport Policy. Both programmes have been running in parallel, often without interlinkages. In the new funding period there are attempts to link these two EU policy fields in a better way and to avoid duplications (European Parliament and Council of the European Union 2013c). This is a challenging aim because the two policy fields have always had contradicting interests (Robert et al. 2001).*

*Within this paper the contents and aims of EU policies are analysed by means of a document analysis as conducted in policy analyses (Jann and Wegrich 2003). Policies that address cross-border transport within the frame of the Trans-European Transport Networks (TEN-T) or European Territorial Cooperation (ETC) of the last (2007-2013) and current funding period (2014-2020) are taken into account with the purpose of analysing their aims and coordination. On that basis, the contribution of the ETC-policy to the establishment of the European transport network is evaluated. The paper concludes with recommendations on how the European cross-border transport can be improved by a further alignment of the two policy fields.*

## 1. Introduction

EU policies show a high variety in terms of execution measures, evolution and spatial relevance. Intervention measures can be legal regulations and treaties, softer development guidelines, as well as financial incentives. The Trans-European Transport Networks are an example of guidelines and show a long-time perspective. EU policies have different spatial demarcations and impacts. The Cohesion Policy demarcates broader areas eligible for funding. The Transport Policy is focused on the improvement of certain infrastructures and has a direct spatial relevance with a linear or punctual concentration in the case of the TEN-T (Robert et al. 2001).
The establishment of a common European transport system is partly funded by the European Transport Policy (currently the Connecting Europe Facility), but also supported by other funds like the Structural Funds and the Cohesion Fund as well as the European Investment Fund, the European Investment Bank and the Horizon 2020 Programme (former Research Framework Programme) (Robert et al. 2001). This raises the question if the investment in Europe's transport infrastructure is conducted systematically and expedient or if no coordination exists.

In the following, challenges and potentials that occurred in the coordination of Cohesion and Transport Policy are presented first. Then the results of a document analysis on TEN-T policies and European Territorial Cooperation and their aims concerning cross-border transport are illustrated. In the conclusion, the contribution of the European Territorial Cooperation to the completion of the European transport network is evaluated and recommendations for the further support of cross-border transport through the additional alignment of the two EU policies are given.

## 2. Challenges and potentials of coordinating EU policy sectors and their related funding programmes in European cross-border transport

The Directorate Generals (DGs) of the different EU policy fields at the European Commission are responsible for the coordination of the European policies. These policies should be coherent and follow the defined aims and priorities of its president (Robert et al. 2001). Challenges and potentials of a coordination of cohesion policy and transport policy are discussed in the following based on a literature review.

### *2.1 Cohesion Policy*

The EU and the Member States have a shared competence on Cohesion Policy (Mairate and Hall 2001). With the accession of more and more countries to the EU, the disparities between the Member States have been growing. In the Treaty of Rome a balanced development for the European territory has been anchored as a goal. Moreover less favoured regions are to be supported (Dunford et al. 2001). After the introduction of the European Single Market the competitiveness between the European regions has grown. Globalisation contributed additionally to an increased competition. The Cohesion Policy shall foster a balanced sustainable development of the EU territory and therefore has a spatial dimension (Peters 2003). The European Regional Development Fund (ERDF), introduced in 1975, was then the most important fund to support this aim (Dunford et al. 2001).
Cohesion Policy is a territorial and not a sectoral policy. Its aim is to support the development of the EU territory. In this context Cohesion Policy has several connections with other EU policy fields like environment and transport. It tries to make use of synergy effects by supporting the sectoral policies with its funds. However, this ambition has not always proven to be successful. In the past the programme was criticized as inflexible and highly bureaucratic. Furthermore, it was difficult to reach consensus for common aims among the different DGs of the European Commission and among the different administrative levels involved. Additionally, the contribution to its own aim of territorial balancing was questioned when donating its funds to the sectoral policies without taking into account less favoured regions (Robert et al. 2001).
This shows that the aims of the Cohesion Policy have not been easy to reach: The idea of a balanced development has been in conflict with the fostering European competitiveness. As the Cohesion Policy is a territorial policy, it influences the sectoral EU policies.

### *2.2 Transport Policy*

Although Transport Policy is a sectoral European policy and mainly focuses on the European transport development, it has a strong impact on the European territory. It is therefore tied to the European Cohesion Policy. The Cohesion Policy Funds ERDF and Cohesion Fund are spent to support both policies. They contribute so much to the Transport Policy that the policy is dependent on this financial support while following its own policy aims (Robert et al. 2001).
Transport is directly connected to the economy but also to the quality of life. Without a good access to transport infrastructure and services the economic production would be strongly hampered and the quality of life would be reduced. To provide a good transport system, a physical infrastructure and its operation, long-term investments have to be made, coordinated, planned and regulated. This was traditionally done by the national levels of the Member States without taking into account neighbouring countries. Therefore at the beginning of the European Union the infrastructures across national borders were in a poor state. To reach the aim of non-discrimination and competitiveness on a European scale, the establishment of a common European Transport Policy was decided by the EU Member States in 1957. Disadvantaged regions should be supported in their transport development to contribute to the minimization of disparities within the EU. However, the influence of the European

Transport Policy turned out to be very low in the beginning. The establishment of the Internal Market was a new impetus to the common Transport Policy. In 1992 an integrated European transport system became an item of the political agenda together with the aim of European social and economic Cohesion. In political practice, however, it was criticized that European Cohesion was not treated as a main focus and goal of European Transport Policy: It was taken into account rather marginally and not often implemented into practice (McGowan 2001).
To calculate the impact of the Transport Policy to European Cohesion is hard. The contribution of the Trans-European Network investments to European Cohesion is measured by the change in accessibility. This evaluation method, however, shows several shortcomings: Although the accessibility might have grown in urban agglomerations, the effect is much lower for rural regions far away from the network. Furthermore, a region covered by a TEN-T does not necessarily benefit from being close to the network if it does not have an access point. Having no access point can mean being less attractive (Economic and Social Committee of the European Communities 1995; McGowan 2001).
The historical development of European Transport Policy shows that there have been several attempts to coordinate Transport Policy and Cohesion Policy. However, it has proved to be a challenge in practice.

*2.3 Coordination of the two policy fields*

In scientific literature the existence of different, contradicting development aims at EU level is criticized: These might lead to conflicts in the implementation of policies. An example of the discrepancy of EU aims is the funding of Trans-European Network priority projects on the one hand and the aims of Cohesion Policy on the other hand. The funding of priority projects focuses on the most important transport links in the EU core and invests in their further upgrading. Cohesion Policy, on the contrary, wants to reach a balanced European development and supports disadvantaged regions outside the EU core (Peters 2003). It is proposed to minimize the strong concentration effects of the TEN-T by supporting several smaller transport projects (Robert et al. 2001) and to establish a broad spatial investment strategy for the TEN-T. The latter especially focuses on the connection to secondary networks and making use of all benefits (European Commission 1996).
There are further points of criticism: If EU funds were spent on cross-border transport sections they often supported already well developed border regions and not geographically disadvantaged regions lagging behind (Assembly of European Regions 1995; Robert et al. 2001). Therefore it is proposed to develop secondary networks that ensure the access of all European citizens to the transport network. Investments in these areas should be prioritized to secure their realization. Although the TEN-T guidelines aimed to establish good connections between core and secondary transport networks, the funds did not focus on the implementation of this goal but on sectoral issues and the core network instead. The Cohesion Policy and its funds - in contrast - have a stronger integration focus and aim at supporting the secondary networks. Therefore it would be an opportunity to establish a better linkage between EU Transport Policy and spatial planning (Robert et al. 2001).
Most important in terms of legislation for the European Transport Development is the European Transport Policy. In the funding of infrastructure investments, however, also the Cohesion Policy with its Structural Funds is decisive together with EIB and EIF support. The different funds apply different territorial assignments. The Transport Policy supports the linear and nodal investment of transport axes and Cohesion Policy distributes its funds on NUTS level (Robert et al. 2001). This might lead to contradictions and complicate a policy coordination. At the same time this can be seen as a chance to coordinate the funds and contribute to a balanced spatial impact of transport investments.

Consequently, the two policy fields European Cohesion Policy and European Transport Policy are strongly interrelated. However, they do not exclusively follow the same aims and often contradict each

other. As both are very important for the territorial and economic development of the EU, the policies should be coordinated to contribute to a sustainable European development.

## 3. Aims of EU policies on cross-border transport between 2007 - 2013 and 2014 - 2020

In this chapter EU policy documents that address cross-border transport within the frame of the Trans-European Transport Network (TEN-T) or European Territorial Cooperation (ETC) within the current and last funding period are analysed with the purpose of comparing the development of their aims and of detecting possible cross-references.

### *3.1 Funding period 2007-2013*

In the funding period 2007-2013 the **ETC Policy** regards a good transport infrastructure to be of high importance for European Cohesion as it is said to contribute to a higher attractiveness of the European regions and to economic growth. As the support of the Cohesion Policy is dedicated to cross-border and transnational regions, cross-border TEN-T projects should be supported. Reasons for a support of cross-border transport projects are diverse. First, it is considered to support the integration of the domestic markets of the Member States and the European identity. Second, Cohesion Policy is needed to manage the cooperation to achieve a solution to a common challenge because cross-border transport projects concern several Member States. Therefore an integrated approach is needed. Third, a good cross-border infrastructure is seen as prerequisite for cross-border cooperation and is expected to develop an added value for cooperations. In the transnational cooperation the zoning of the cooperation areas has been amended. It is to take into account functional spaces within the EU based on commonalities like the crossing of a common area by a transport corridor. This shall enable the transnational space to react jointly on possible challenges and opportunities. Commonly conducted transport projects in the transnational cooperation are expected to contribute to the cross-linkage of European regions. Especially highlighted is the establishment of European transport corridors. ETC projects should be used to support TEN-T projects and transport connections of strategic importance under the premise that they contribute to economic growth and competitiveness (Council of the European Union 2006)
The ERDF shall support ETC projects that lead to a higher accessibility. This can be reached by establishing links to the TEN-T and improved transport services. Transnational projects can also support TEN-T cross-border sections and secondary networks. With these projects the sustainable development of the EU territory shall be guaranteed (European Parliament and Council of the European Union 2006).

The **European TEN-T Policy** between 2007 and 2013 also accredits a high importance to cross-border transport. Cross-border projects are considered to be less profitable and cost-effective but of high European added value. Therefore they should be financially supported. Border regions often contained bottlenecks because the national systems still had a nationally centred view in 2001. Cross-border infrastructure planning and a common approach for the concept, financing and evaluation was missing (European Commission 2001).
The ‘White Paper on European Transport Policy for 2010’ focuses on some more technical problems of cross-border infrastructures like operating problems. Transport infrastructures that link the EU to its accession countries are of highest priority and should get the highest financial support (European Commission 2001).
The TEN-T guidelines from 2004 contain many references to cross-border sections and ascribe them also a high importance. The aim followed by the TEN-T guidelines is the completion of the Single Market, especially in the light of the European enlargement in 2004. The Member States are called to define important border crossings in their countries. One of the priorities of the TEN-T is

the completion of the TEN-T by establishing missing links and removing bottlenecks especially in the cross-border sections of the most important routes (European Parliament and Council of the European Union 2004).
Furthermore, the policy documents contain several measures to facilitate the implementation process of cross-border transport projects. First, they should benefit from a speeded-up strategic environmental impact assessment procedure. Second, European Coordinators shall simplify and coordinate the infrastructure implementation. The defined TEN-T priority projects shall contribute to the implementation of the main transport corridors and concentrate their support on border crossings (European Parliament and Council of the European Union 2004).
Concerning cross-border transport not many changes were introduced to the amended TEN-T guidelines from 2010. It was still considered as an important priority. One novelty was the idea to employ the European Coordinators also in whole transport corridors (European Parliament and Council of the European Union 2010a).
Also the aim to enlarge European competitiveness is a reason for the support of the TEN-T and cross-border transport projects. Because of missing connections between some Member States, not all countries are said to be able to benefit from the internal market. This is expected to be negative for economic growth. Therefore especially cross-border linkages need to be improved. This is also a reason why the EU dedicates a higher funding rate to cross-border sections (European Parliament and Council of the European Union 2007).
The TEN-T policy concentrates its scarce funds on priority areas that ensure a European added value. Border-section projects should be given special attention and support. Especially, joint projects by several Member States shall be funded that aim to complete cross-border sections. To ensure the implementation of a cross-border project, the involved Member States should sign a declaration on the completion of the missing link (European Parliament and Council of the European Union 2007). The amended rules on Community Aid for the TEN-T from 2010 contain fewer references to cross-border transport. Still the cross-border projects are eligible for funding and shall receive more funds when being part of a priority project defined in 1996. These projects shall contribute to the completion of the internal market in the EU-27. To be eligible for funding, cross-border projects should contain a schedule of implementation for its sub-projects (European Parliament and Council of the European Union 2010b).

Both funding programmes related to the two policy fields attribute a high priority to cross-border projects. The TEN-T documents show a stronger technical focus and a higher grade of detail than the Cohesion Policy documents and define the funding prerequisites for cross-border transport projects more clearly. A direct reference to the TEN-T also exists in the ETC documents. Even the ERDF can support parts of TEN-T projects and is not solely dedicated to the establishment of secondary networks. This illustrates an overlap of both policy fields. Inverse, there is no funding of the ETC transport projects by the TEN-T fund. The funds of the TEN-T policy, however, are strongly enriched by the ERDF[1].
Comparing the general aims connected with the support of European cross-border transport (Table 1), both, the policy documents related to Cohesion Policy and Transport Policy, show references to the economic development as an increased competitiveness of the EU, a contribution to the completion of the Single European Market and an improvement of the accessibility and interconnectedness of the European Member States and regions. The Cohesion Policy, however, also refers to rather soft factors like the contribution to the European identity by improving European mobility as well as to the European sustainable development of its territory. The comparison shows that the general aims connected with the support of cross-border transport do not contradict each other on the level of EU policy formulation. After the implementation of these

[1] In eligible countries the Cohesion Fund also plays a major role in addition to the ERDF.

policies in the respective corridor- and cooperation area-programmes, however, differences in the interpretation may occur.

Table 1. Comparison of aims of the support of cross-border transport (2007-2013)

| **ETC Policy (Cohesion)** | **TEN-T Policy (Transport)** |
|---|---|
| Increased attractiveness of the regions | Competitiveness |
| Economic growth | |
| Completion of the Single Market | Completion of the Single Market |
| Cohesion by accessibility and interconnectedness | Completion of the TEN-T |
| European identity | - |
| Territorial sustainable development | - |

The TEN-T-policy focuses on the implementation of the TEN-T axes and priority projects, defined in 1996. ETC support can be dedicated to TEN-T axes as well. At the same time cross-border projects in secondary networks can be funded if they have a European added value. Transnational cooperation focuses on the development of transport corridors. Cross-border cooperation usually supports smaller (sub-) projects in border regions.

*3.2 Funding period 2014-2020*

The policy documents for the new funding period changed especially in their organisation. This is connected with the introduction of the Europe 2020 Strategy that strongly concentrates on certain goals to be reached until 2020. Therefore it defines a stronger focus on certain priority sectors on which all EU policies should be aligned to achieve better results. Additionally, it contains a stronger evaluation component. Output indicators are defined to monitor the results of the financed actions as a measure for a better implementation (European Commission 2014a). This thematic concentration is strongly mirrored in the ETC- and TEN-T policy documents.

The **ETC policy documents** intend to reach a concentration on certain priority areas. This shall lead to more perceivable results. The ETC programmes on cross-border and transnational cooperation can choose freely out of 11 priorities but they can only choose 4 at the most. At least 80% of the funding has to be concentrated on these four.[2] The removal of bottlenecks and sustainable transport in key transport infrastructures is one of the ETC aims that can be chosen (European Parliament and Council of the European Union 2013c; European Parliament and Council of the European Union 2013a). The amount of support of cross-border transport through the ETC depends on the decision of the Member States and cooperation areas. However, in general it is still possible to spend money on the improvement of cross-border transport.

[2] Under the ‚Investment for growth and jobs'-goal of European Cohesion Policy, the ERDF should be spent mainly on 4 priorities. Here, support in cross-border transport infrastructure is less important (European Parliament and Council of the European Union 2013b, art.4).

Another novelty of the new funding period is the introduction of output indicators in the ETC policy documents: the number of constructed or upgraded infrastructure kilometres is to be calculated (European Parliament and Council of the European Union 2013a).
A further innovation to ensure the maturity and implementation of projects is the definition of ex-ante conditionalities. These need to be fulfilled by projects in order to be funded. In the case of transport projects the Member States need to develop a comprehensive plan on transport investments beforehand. This plan needs to contain plans at all administrative levels and take into account all transport modes. It needs to be in line with the respective environmental assessment provisions and should aim at fostering the Member State's infrastructure development and at improving the access to the comprehensive and core TEN-T network. The plan needs to contribute to the establishment of the Single European Transport Area and detail the planned investments in the TEN-T network, secondary networks and other projects. The envisaged projects should be mature and viable (European Parliament and Council of the European Union 2013c).
The ETC programmes should contribute to the achievement of the Europe 2020 Strategy goals and Cohesion. As before, the existing cross-border infrastructure should be described to determine missing links (European Parliament and Council of the European Union 2013a; European Parliament and Council of the European Union 2013c) and contribute to a "sustainable cross-border mobility" (European Parliament and Council of the European Union 2013a, preamble 17).
Beyond all the novelties, the ERDF provisions emphasize the fund's still remaining basic goal to contribute to a balanced territorial development of the EU by supporting territorially disadvantaged regions (European Parliament and Council of the European Union 2013b; European Parliament and Council of the European Union 2013a).
The tasks for ETC projects differ: The ERDF should especially contribute to the development of secondary and tertiary networks and their linkage to the core network (European Parliament and Council of the European Union 2013a). At the same time it is communicated that the Cohesion and Transport policy should be coordinated to ensure the joint implementation of the most important transport projects of European added value, i.e. the TEN-T priority projects. Furthermore, ETC projects should take on the task to facilitate a common and coherent planning and development process of transport infrastructure for a broader border region or a transnational region (European Parliament and Council of the European Union 2013c). Transport projects which are based on a high demand and contain cross-border sections should be supported preferentially. Missing connections and bottlenecks between Member States and regions shall be detected and improved (European Parliament and Council of the European Union 2013c).
One important demarcation of the aims of ERDF-funded ETC projects is the focus on the territorial support of the European regions (European Parliament and Council of the European Union 2013c).
The ETC policy documents contain more references to the TEN-T policies and funds than before. First, the Common Provisions cross-reference to the Connecting Europe Facility (CEF), which is the new financing instrument of the Transport Policy. The ESIF regulations should be coordinated with the CEF regulations to enlarge the European added value of transport projects. The aim of this coordination is a joint contribution of the funds to the establishment of the European transport network, i.e. a linkage of secondary or tertiary networks to the core network and to ensure the accessibility on all levels. Second, it is stated that the ERDF should respect the TEN-T guidelines. Therefore transnational ETC transport projects should be aligned to existing plans of the respective Core Network Corridors. The same is true for ETC support in macro-regional transport projects (European Parliament and Council of the European Union 2013c).

Compared to the last funding period, the ETC policy documents show some new elements. First, the policy documents contain calls for policy coordination with the TEN-T policies. This is a novelty because it concerns policy documents and not only the coordination of its funds as before. Second, the ETC documents contain strong references to the establishment of the TEN-T: The

network shall be supported. Third, the ETC documents contain more concrete descriptions on the possible design of transport projects. Fourth, output indicators have been defined to measure the impact of transport projects.
The policy documents contain some contradictions. The ERDF is supposed to contribute to a balanced development and support the accessibility of all regions and therefore aims at linking tertiary and secondary networks to the core network of the TEN-T. In the coordination with the CEF and TEN-T policy, however, the ERDF should be focused on the most important infrastructure routes. This implies a clear prioritisation of core areas which contradicts the balanced development of the EU.

**The TEN-T policy** documents also refer to the Europe 2020 Strategy. The strategy's aims are to be supported by the Connecting Europe Facility. The TEN-T are still supposed to support transport across national borders and therewith contribute to Cohesion (European Parliament and Council of the European Union 2013e).
The TEN-T guidelines from 2013 introduce a new two-layer structure: a Core Network and a Comprehensive Network. The Core Network should focus on projects with a high European added value that concentrate on cross-border sections, bottlenecks and missing links. These projects should contribute to the reduction of $CO_2$ emissions. The Core Network consists of connected nodes and contains the most important cross-border nodes - also at the EU's external borders[3]. Therefore cross-border connections are of high importance for the Core Network. Also the Comprehensive Network prioritizes the connection of transport axes through the removal of bottlenecks especially in border sections (European Parliament and Council of the European Union 2013d). Despite the division in these two layers, both contain border crossings that shall be supported.
The European Transport Corridors, being part of the Core Network, shall foster the implementation of the core. They should put an emphasis on transport interconnections across borders by eliminating bottlenecks and establishing missing-links. This shall contribute to a higher efficiency and sustainability as well as to European Cohesion by fostering territorial cooperation (European Parliament and Council of the European Union 2013d). This is especially important as most difficulties in the implementation of transport projects have been experienced in cross-border transport sections (European Commission 2014b). European Corridor Coordinators have been appointed to support the corridor development. They shall especially search for funding opportunities for cross-border transport projects and support their implementation within the corridor. Working groups can be set up for each transport corridor and facilitate the implementation of cross-border projects (European Parliament and Council of the European Union 2013d).
'Cross-border sections', in the understanding of the TEN-T, contain the space between the closest urban nodes at two sides of a border. All cross-border sections are said to be of common European interest because a good transport connection secures the continuity of European transport routes. Although these projects might have lower direct economic effects for the individual Member States, they need to be prioritized because of their European added value (European Parliament and Council of the European Union 2013d).
The TEN-T policy documents of 2014-2020 encourage the use of other funding programmes like the ERDF. The coordination of funds is said to contribute to the achievement of common goals like the implementation of cross-border projects (European Parliament and Council of the European Union 2013d; European Parliament and Council of the European Union 2013e; European Commission 2014b). Transport projects in cross-border sections get a higher financial assistance than other projects. Even road infrastructure can be funded in cross-border sections. 80% of the

[3] The TEN-T guidelines from 2013 define the cross-border nodes to the external borders in Annex II 3.

funds, available from CEF and Cohesion Fund,[4] are dedicated to the removal of bottlenecks, rail interoperability, establishment of missing-links and support cross-border connections (European Parliament and Council of the European Union 2013e).
Also the CEF defines output indicators to measure the outcome of cross-border transport projects: The number of improved cross-border sections and bottlenecks as well as the amount of kilometres of improved infrastructure need to be calculated (European Parliament and Council of the European Union 2013e).

In the current funding period the TEN-T policies introduced some new elements like the dual layer structure of the TEN-T and the definition of European Core Network Corridors. As in the ETC policies, reference to the Europe 2020 Strategy is made and output indicators have been defined. Furthermore, it is recommended to coordinate the TEN-T funds with other EU funds that support the European transport development as the Cohesion Fund and ERDF. Also reference is made to territorial cooperation and cohesion that shall be fostered by the support of TEN-T border sections. Cross-border transport sections are of a high priority in the TEN-T. This is true for the Comprehensive and Core Network as well as for the Core Corridors. Therefore cross-border projects get a higher financial support compared to other transport projects. They are generally considered to have a European added value.

Both the ETC and TEN-T policy documents for the funding period 2014-2020 still ascribe a high priority to the development of cross-border transport. However, the restriction of choice in the ETC – the Member States and cooperation areas must choose four out of 11 priorities - might lead to a loss of importance of transport topics in the operational programmes. As far as cross-border transport is concerned, the documents of both policy areas mutually refer to each other - especially in the case of funds. Additionally, it is recommended to coordinate the different policies to jointly reach common aims and contribute to the Europe 2020 Strategy.

Both policy fields define several reasons to support cross-border transport and some are very similar (Table 2). Others contradict each other. The Europe 2020 Strategy can be seen as a catalyst that leads to the convergence of aims and the establishment of a common focus. Both policy fields acknowledge for instance the importance of the reduction of $CO_2$ emissions.
Further reasons for the support of cross-border projects are a sustainable and efficient transport development and European Cohesion. Both policy fields contain references to the further completion of a continuous European transport network.
The ETC policy concentrates its funds mainly on the comprehensive network. The TEN-T policy fosters both layers. The European Territorial Cooperation additionally supports the establishment of secondary and tertiary networks and their linkage to the TEN-T.
The aim of an equal access throughout the EU is connected with the aim to contribute to a balanced development of the EU territory that is taken up by the ETC policy documents again. The TEN-T policy rather pursues the contradicting goal: It wants to concentrate scarce funds on key infrastructures.
Both policy fields see the need to cooperate in the field of cross-border transport: Aims, orientation of funding and common projects should be coordinated to achieve common goals and prevent contradictions.
Special tasks of ETC projects can be the support of cross-border transport projects to improve and establish a common planning process on cross-border infrastructures and services. Also the TEN-T policies consider improved territorial cooperation to be important for the development of cross-border transport.

[4] The Cohesion Fund is solely dedicated to the Core Network (European Commission 2014b, 8)

Compared to the former funding period more aims and reasons for the funding of cross-border transport projects have been defined and the policies interrelated in a stronger way. Still some contradicting aims exist.

Table 2. Comparison of aims of the support of cross-border transport (2014-2020)

| **ETC Policy (Cohesion)** | **TEN-T Policy (Transport)** |
|---|---|
| Europe 2020 Strategy | Europe 2020 Strategy |
| Reduction of $CO_2$ emissions | Reduction of $CO_2$ emissions |
| Sustainable transport | Sustainable and efficient transport |
| European Cohesion | European Cohesion |
| Single European Transport Area | Continuity of European transport axes |
| Support of comprehensive network (mainly) | Support of both layers |
| Access to the Comprehensive and Core Network, Balanced development | - |
| Better Coordination with CEF and TEN-T | Coordination of the transport funds |
| Common, coherent planning across borders | Territorial cooperation |

## 4. Conclusions: Contribution of European Territorial Cooperation to the Completion of the European Transport Network and Recommendations for a further Improvement of Cross-border Transport

The European Territorial Cooperation (ETC) can support projects in the transport sector and already did so in the past. Also the new policy guidelines offer the possibility to do so in the cross-border and transnational cooperation. Besides the Cohesion Fund, the ERDF has been and will be an important financial contribution to the scarce funds of the TEN-T policy.

The ETC and the ERDF shall contribute to the balanced development of the EU territory and especially support disadvantaged border regions as well as foster the Cohesion in larger cooperation areas. Therefore in the cross-border cooperation secondary and tertiary transport networks should be funded. These shall generate the activation of positive effects of the existence of the TEN-T core corridors by linking border regions to them and by improving their accessibility. Transnational cooperation projects with a broader spatial scope might support the core transport corridors by linking the main transport routes with the regions they cross and foster the linkage to secondary networks. In the future an important task of ETC projects might be the establishment of transnational spatial planning strategies based on the transport development and effects of the core network corridors.

Therefore the ETC can promote the establishment of the European Transport Network by focusing on the lower scales. However, it should be taken into account that the TEN-T policy concentrates solely on cross-border transport links that connect the major transport routes. ETC projects, though, rather focus on transport networks on a lower scale or on the connection to the main corridors. An expansion of the ETC funds to major transport axes of the TEN-T should not be pursued because this would contradict its basic aims. Instead both policy fields and support mechanisms should join forces to support links between the two transport network levels. The economic added value of the European

transport corridors and main routes should be made use of. The corridors should not solely cross regions and connect main hubs but also connect all parts of the EU territory.
A better alignment of the development of cross-border transport could be reached by involving the Core Corridor Managers of the European Core Network Corridors. These managers should be informed about ETC projects conducted in the sphere of their corridor and then coordinate the aims of the projects and their linkage to the Core Network. Furthermore, the managers themselves could contact the ETC authorities of the respective regions and inform them about possible projects that could contribute to the linkage of the Core Network to secondary networks.

Based on the conducted document analysis it can be stated that the reference between the EU documents on cross-border transport in Cohesion Policy and Transport Policy has been strengthened. The importance of cross-border transport in both policy fields has remained stable and the coordination between the policy fields has been improved in the EU documents. Several references have been made in the current regulations to coordinate the aims and to support cross-border projects and the overall transport development of the EU. The Europe 2020 strategy has contributed as a catalyst because all EU policies of the current funding period have been oriented to the achievement of the strategy's goals. This is evaluated to be a positive development. However, it needs to be seen how these demands for coordination in the EU policy documents have been implemented by the Member States and which impacts can be reached in practice.

A further analysis of the adopted Operational Programmes in European Territorial Cooperation needs to be done to see how often the transport priority has been adopted by the cooperation areas. This decides about the possible amount of projects funded between 2014 and 2020 and about the ETC's contribution to the completion of the European Transport Network. Here it would also be interesting to see which tasks are connected to the transport objective and how this objective relates to the Trans-European Networks. Additionally, it needs to be investigated how the TEN-T projects refer to ETC projects that are conducted in their proximity. Based on the results of such an analysis the impact of the EU policies - calling for a coordination of policy areas - can finally be evaluated.

Keywords:City Integration ,Effectiveness, Jiuquan-Jiayuguan

*Abstract: City integration derived from the regional integration, urban agglomeration, has become a new regional phenomenon in China.This phenomenon has attracted wide attention. The paper examines the case of city integrate development between Jiuquan –Jiayuguan neighboring cities based on two spatial scales. Firstly,at the neighboring cities level,the paper studies the influence extent of facilities, complementarity extent of industries development and efficiency extent of institution system construction.secondly,at city linkages level, The authors study Changs in Intercity transport links and Changs in Intercity residents' daily behavior.Next,the paper analyzes the problems of city integration development and its influencing factors.On the basis of the above discussions, the paper believe that Jiu-Jia should build high-efficient cooperation mechanism, "complementary development"of land use function, "convenient" Intercity travel supply and jointly build complementary industry types and these four aspects help better promote the healthy development of the city integration in Jiu-Jia.*

## 1.Introduction

Since the 1980s, with the continual development of global economy and internet progress, either regional economic integration or urban agglomeration has replaced single city, became main spatial regional unit for global competition and cooperation of countries and region, accelerated economic globalization and regional economic integration, increasingly become the most important character for current development of global economy. Regional economy integration is characterized as city agglomerations, city belt, as well as regional cooperation between cities, all of which regard the large city, and super city as center, and also behaved as trend conversion and expansion from urban space to regional space. City integration is developed from the huge context of economic globalization and regional economy integration, especially, as advanced products of development of industrialization, urbanization, and all the more so, it is making an "concordance" focusing on the common benefits between neighboring cities(Qunhua Zeng, etc,2013). The two central city areas of Jiu-Jia have a distance of 18 kilometers,both had long historical origin since ancient era. Jiayuguan is a new modernization city developing with the Jiuquan Iron and Steel Group in first five-year national key construction project, and was approved by the state council as municipality of province instead one part of Jiuquan. Both Jiuquan and Jiayuguan are transportation gateways, as known as a strategic town

in Hexi, a key in border. The two cities are linked with geography, joined by mountains and rivers, connected with human relation, and equipped with mutual basis of city integration. This paper aims to dig and trim the influences of City integration to these two cities, summarizes experience from them, and eventually provides beneficial references to city integration in the Jiu-Jia and other areas.

## 2 .City Integration Research Overview

### 2.1 Feature analysis

City integration contains two or more than two cities which have adjacent or closer built-up areas geographically, similar natural environmental conditions and social cultural background, developed rapid transportation network and communication network in a certain historical and realistic conditions. The cities, which have complementarity on the function and close connection on the industrial structure, become an urban aggregation with polycentricspatial structure and mutually independent in administration(Guodong Zhang,2008). The practice of the city integration across the different regions has been varied. For instance, Tai-Yu city integration proposed “Ten integrations”, Chang-Zhu-Tan integration proposed “Five integrations”, Xi-Xian New Direct proposed “Eight integrations” etc., all have their own characteristics.

Table 1. The Main Practice in Different City Integration Objects

| City Integration objects | Start Year | Composition city | Main approach |
|---|---|---|---|
| Chang-Zhu-Tan | 1982 | Changsha, Xiangtan, Zhuzhou | Transportation with ring、Electricity with net、Financial city、Information share、Environmental co-governance |
| Tai-Yu | 2001 | Taiyuan,Yuci | Planning jointly consider 、 institutional isomorphism、market with the body、industrial with the chain、Common prosperity of science and technology 、 Transportation with ring 、 Facilities with layout 、 Information share 、 Environmental co-governance |
| Xi-Xian | 2002 | Xian、Xianyang | Planning jointly consider、Transportation with ring、Information share、Market with the body、Industry synchronization、Common prosperity of science and technology 、 Travel with line 、 Environmental co-governance |
| Guang-Fo | 2002 | Guangzhou、foshan | Construction of Guangzhou and Foshan cities cooperation framework agreement 、 urban planning、Transportation Infrastructure、Industry Collaboration、environmental protection the four special docking Agreement |

**2.2 Driving mechanism**

As a special form of regional economic development stage, city integration has different generation mechanism in the areas with different developing levels, thus producing different development patterns.In this paper, a few city-integration cities in china are taken as objects, which have different generation mechanism in the areas with different developing levels, to analyze the difference on driving mechanisms under the different economic developing levels.

Table 2. The Main Driving Mechanism in Different City Integration Objects

| City Integration Objects | Driving Mechanism |
|---|---|
| Shen-Fu | Increasingly closer economic and social space links, Aspects of government and inter-city cooperative enterprise governance methods.. |
| He-Huai | Economies of scale and competition effects, diversion effect, the welfare effect |
| Guang-Fo | The driving force of government and impetus of market mechanism |
| Tai-Yu | Economic strength is the real foundation of the city integration; the industrial structure is the basis for the city integration; development and competition is the source of the city integration |

## 2.3 The Relationship Between City Integration and Regional Integration

City integration and regional integration are not equal entirely, the key to discriminate is that whether the involved areas belongs to the same region. When the involved area of city integration is same with the regional integration's, city integration and regional integration can be equal. When the involved area of city integration is less than or is assigned to the involved area of regional integration, city integration is a crucial stage in the process of regional integration, city integration area is equivalent to a "growth pole" in the involved area of regional integration. The development and construction of "growth pole" contributes to regional development and promotes the construction of regional integration with clear priorities and gradual process.

## 3. Development Review of Jiu-Jia City Integration

City integration is a development particular form among regional cities and its essence is a process of close cooperation between the regional cities. City integration experiences city integration consensus, co-construction between cities, city integration alliance, city merge each other, city integration realization from the initial phases to the mature phase of development. So far,The development of city integration is at the stage of co-construction. Co-construction is the elementary stage of city integration, and the guidance of co-construction also has a critical impact on health

promotion of city integration.

### 3.1 City Integration Consensus

Jiu-Jia cities have enormous potentiality in economic cooperation and strong complementarity in cooperative development. Jiayuguan has an enormous steel smelting strength and a higher urbanization rate , while Jiuquan possesses rich mineral resources, complete industrial categories and prosperous service industry. Numbers of the consumption in Jiuquan need to drive by Jiayuguan, and that Jiuquan need Jiayuguan to provide consumer sentiment . The population of permanent residents in city in Jiuquan is 245,000, and rural population is 245,000. Jiayuguan, with 219,900 city permanent population and 15,600 rural population, provides large developing space to peasants' urbanization in Jiuquan. A sentence has been circulated in Jiu-Jia is that seeing the city in Jiayuguan, shopping in Jiuquan, buying a house in Jiayuguan, working in Jiuquan. Jiu-Jia connect closely in the region, landscape and the culture. With the rapid development of economy and the speeding up of urbanization, the Geopolitical contact between Jiu-Jia cities have been more closer, and city integration development has been an irresistible trend.

### 3.2 Co-construction between Jiu-Jia cities

Through the current situation of urban land in 2000, 2004, 2006 and 2009, it can be seen that Jiu-Jia city integration had been in gestation period and had relatively slow development before 2009. After 2009, the development strategy of Jiu-Jia regional integration was proposed by the Gansu province, and a series of development policies were introduced to accelerate the development of Jiu-Jia regional integration. The trend of spatial extension approaching to each other in Jiu-Jia began to accelerate. Industry park in the West of Jiuquan started a large scale construction from 2009 and Jiu-Jia cities expressway was opened to traffic in 2012. Mingzhu Park and Taolai River Park in Taolai River New District completed first and then residential communities, administrative office, schools and other communal facilities followed up.

## 4 .The effectiveness analysis of Jiu-Jia city integrate

Urban space development effectiveness study allows us to go from the bottom-up perspective seriously examine the problems and the reasons of the urban development process, in turn, to better guide our planning. In this part, the author will use a combination of qualitative and quantitative manner, starting from different periods of development of the Jiu-Jia city integration to analyze the actual effectiveness, the concrete can be from the city integration development's influence on the whole Jiu-Jia area (the neighboring cities level) and the influence on the inter-city link (city linkages level) to analysis the two scale.

## 4.1 The Neighboring Cities Level

### 4.1.1 Changs in the Industry System of the Neighboring Cities

Currently Jiuquan takes new energy equipment manufacturing, agricultural processing, chemical industry, commercial logistics industry as the mainstay industries. The gross output value of the four mainstay industries in 2009 were 69.4%, 5.8%, 2.5% and 16.1%.While Jiayuguan's steel industry appears to be the dominant industry with the steel industry accounting for more than 90% of overall industrial output value. The city industrial integrate development between Jiuquan and Jiayuguan is then based on industry structure differences, differences in the proportion of light industry and heavy industry and the industrial categories differences.The industry system development in Jiu-Jia is mainly based on the traditional manufacturing upgrades and fostering strategic emerging industries, thus promoting the coordinating development of three major industries and enhancing regional industrial competitiveness.

The specific development strategy of the city industrial integration in Jiu–Jia is mainly focus on building clustered industrial parks including Jiuquan western industrial park, Jiuquan southern industrial park, Jiayuguan eastern industrial park, Jiayuguan northern industrial park and Jiuquan steel group. Through analyzing the area of site's space changes of 7 categories of industries of the year of 2000,2004,2009,2012 and 2014(Figure 1), this paper finds that each industrial park gradually forms its backbone industry over time. Jiayuguan northern industrial park forms metallurgy and new materials and building materials as the leading 2 types. The land size of metallurgy and new materials increases from 83ha in 2004 to 592.4ha in 2014 that reflecting a rather fast pace. In Jiuquan western industrial park, the agricultural products processing industry and the chemical industry based on biopharmaceuticals become its two leading industries. Wind and solar power generation equipment manufacturing have grown rapidly in Jiuquan western industrial park, which also become the emerging industries of Jiu –Jia in about 2012. Commerce and Trade Service Industry lay in the industrial parks in Jiuquan western industrial park and Jiayuguan northern industrial park. Jiayuguan eastern industrial park started later than others, which leading industry is metallurgy fine and new materials.The leading industry of northern part of Jiayuguan is new materials and building materials .T he leading industry of western part of Jiuquan is the equipment manufacturing and new energy. The leading industry of southern part of Jiuquan is agriculture and sideline products processing and chemical industry. In a word, these three main industrial parks have their characteristic industry. From the view of the whole region of Jiu-Jia, there is a long way to go.The industrial types of these three main industrial parks are similar. So there is a keen competition among the three industrial parks. Jiugang group, as the upstream firm, does not have enough drive effect to the stainless steel, alloy materials, R&D, circular economy, producer service industry of the three industrial parks. This is a long way to go for the complementary of industry in Jiu-Jia.

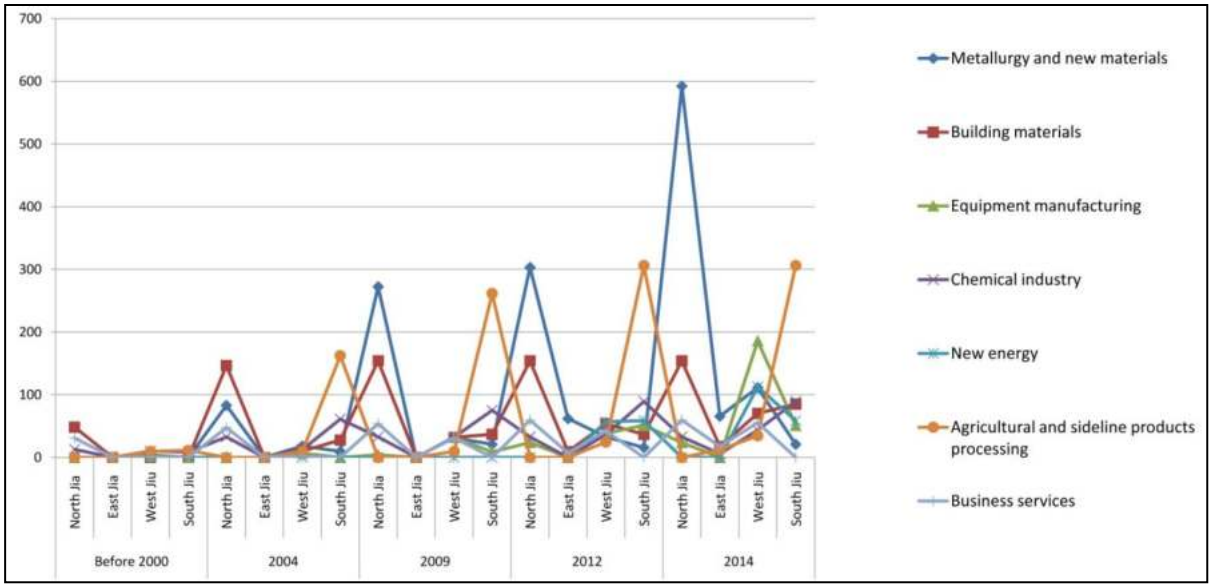

Figure 1. Industry Development Status of Each Industrial Park

### 4.1.2 Changs in the urban space of the Neighboring Cities

Urban form is one of the external manifestation of association degree of the city elements, and a different urban form can have different effects on the regional urban transport links, organizational structure, land layout and so on. From the point view of the boundary of urban built-up area, Jiayuguan and Jiuquan are all single central cities before the year of 2009, and then ,Jiayuguan urban area gradually evolved into more structured form of group layout form, while built-up area of Jiuquan city is showing a form which is similar to "7".

By comparing the status of urban land use of the central city of jiujia among the year 2004, 2006 and 2009(Figure 2-5), we can see that Jiayuguan and Jiuquan developed maily to the south before 2009. After 2009, the two cities accelerated the face-to-face development， and Jiayuguan developed mainly to the east, while Jiuquan to the west. with the continuous development of urban space between the two cities, the spatial distance between the two cities is shrinking continually. Currently, the shortest linear distance of the construction land edge of the two cities is less than 10 kilometers, and the shortest distance between the two cities reduces at the speed of 1-2 km per year, then the two cities will naturally blend in the next 5 to 10 years. Hence, the overall urban form will change greatly.

Through land-use structure changes of the two cities in recent years, there exists differentiation which is mainly manifested in the aspects as the followings: the increasing proportion of Jiayuguan road traffic, public service facilities and municipal infrastructure and decreasing trend of the industrial warehouse proportion; On the contrary, in Jiuquan, industrial warehouse proportion increased rapidly,which shows that Jiayuguan is already transforming from late industrialization to service industry,while Jiuquan is experiencing a period of fast development of industrialization.

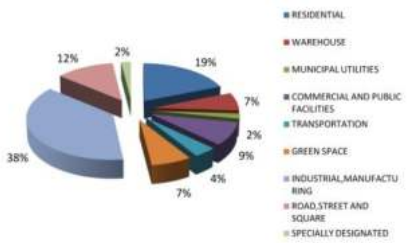

Figure 2. Jiayuguan land use structure in 2007

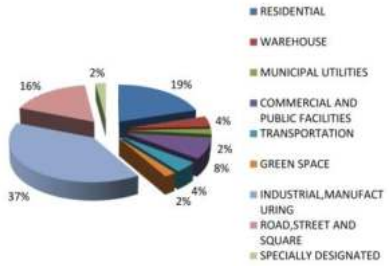

Figure 3. Jiayuguan land use structure in 2011

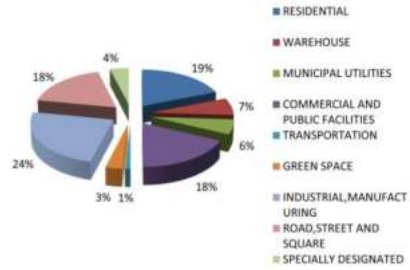

Figure 4. Jiuquan land use structure in 2004

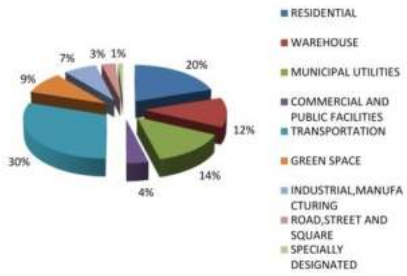

Figure 5. Jiuquan land use structure in 2011

## 4.2 The city linkages level

### 4.2.1 Changs in Intercity transport links

On contact channel construction, 2000 years ago,in addition to the rail way,G312 Jiu-Jia section is the only contact channel between two cities; In 2006, the second contact channels Qing Jia highway officially opened to traffic,Jiu-jia fast track was opend in 2012 with a line design speed of 80km/h and two-way eight-lane. The line is open free to the public, has become the the most convenient way between the two cities . In 2014 years,Jia yuguan Mingzhu Road and west industrial park Guangda road of jiuquan communicated with each other, the third contact channel was built so far. 2005 years ago, public transport links between the two cities is only interoperability Shuttle every 30 minutes. In 2005, the two cities intercity bus line started operations.The bus company of Each city provided half vehicles, Initially,Jiuquan and Jiayuguan only have 11 and 9 little buses,2009 onwards,the two citis gradually replaced them to the large.To 2014,there are 18 large vehicles in Jiuquan and 15 in Jiayuguan.2005-2014 years,Jiayuguan issued annual passenger volume increased to 1.5 million from less than 300,000 and jiuquan from less than 400,000 to 1.9 million.The constantly opening up of the contract channel and continuously improvement of the ability to inter-city bus service reduce the contact barriers between the two cities ,promoted the further development of the City integration.

### 4.2.2 Changs in Intercity residents' daily behavior

In order to know the effect of city integtation promoting to residents' daily behavior, this study adopted the method of questionnaire and interview carried on the thorough research to the residents in two citis. In addition to the research of the current situation of the people daily inter-city behavior, also please residents recalled their daily behavior of inter-city memories for nearly a decade and complete the questionnaire, to gain a certain amount of historical data to reveal people daily behavior changes at a period of time. Research site selection to cover the major area of the two cities, two cities each randomly distributed 150 questionnaires , of which 134 valid questionnaires recovered Jiayuguan, Jiuquan 137.

(1) Changes in Travel frequency and travel time

Through the questionnaire analysis showed that more than 35 percent of residents in the two cities daily more frequent travel between the two cities, the main frequency to 1-3 times a month(Figure 6), more frequent contacts between the two places in the crowd, about 18% who before 2005 started travel between the two cities, but by 2010 this figure is small change, about 68% of people suddenly start more frequently from 2010 to the other cities(Figure 7).

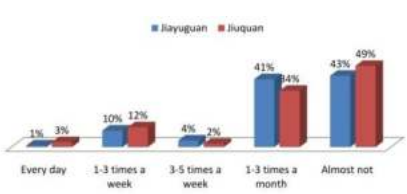

Figure 6. the frequency of Daily to Other City

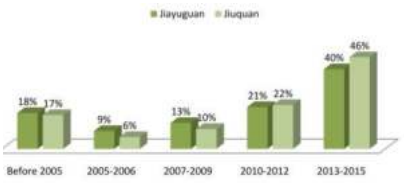

Figure 7. Time to Other City

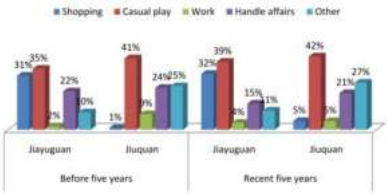

Figure 8. Purpose To Other City

（2）Changes in the purposes of traveling and travel destination

In the past five years, Jiayuguan residents traveled to Jiuquan mainly for recreation and shopping purposes. Before 2010, Jiayuguan residents traveled to Jiuquan for the same purposes yet in a slightly lower ratio. The destinations of their traveling were concentrated to Gulou Business District. Fukang Shopping Center and Jiuquan Municipal Square had attracted more and more Jiayuguan residents to areas surrounding Jiuquan People's Administration, which caused the changes in their choice of destinations. Major part of Jiayuguan residents who travel to Jiuquan for work reasons traveled to Jiuquan City to do business, yet in the past five years more people went to the Industrial Zone in Jiuquan's western suburbs.

In the past ten years, Jiuquan residents traveled to Jiayuguan also mainly for mainly for recreation and shopping purposes. However, before 2010 only a few Jiuquan residents traveled to Jiayuguan for recreational reasons, and travel destinations were concentrated to Guancheng Scenic Area and several large parks(Figure 8). In the last couple of years by the newly openned Taolaihe park attracted more Jiuquan

residents. When it comes to Jiuquan residents who travel to Jiayuguan for work reasons, more people worked at Jiayuguan, Jiuquan Iron & Steel Group before 2010, while in the recent five years, with Jiuquan's local employment pressure been eased thanks to the newly built Industrial Zone in Jiuquan's western suburbs, less Jiuquan residents came to work in Jiayuguan.

（3）Changes in people's way to travel

Before 2010, up to 70% of the citizens from both cities chose to travel to each other's city using intercity public transportation, and only about 18% chose to travel with private cars. In the recent 5 years residents from the two cities who drive private cars to each other's city doubled, while the number of people who used intercity public transportation dropped to around 54%. Not so many people chose to travel with electric vehicles or other transportation methods.

## 5 .Reflections on the Jiu-Jia city Integration Development

### 5.1 A high-efficient cooperation mechanism led by local governments can guarantee a smooth process of city integration development

In light of Gansu Province's regional development goals of "Cities in the center of Gansu (Lanzhou, Baiyin) should lead common development for surrounding cities in Gansu's both wings; All cities should develop as groups according to overall planning", Jiuquan and Jiayuguan are important cities in Gansu's western wing. In the year of 2010, the Gansu People's Government drew up the Jiu-Jia Regional Economic Integration Development Plan, aiming to guide the embodiment integration development of the two cities under an overall plan. Yet until now, the intergration development has stayed on an initial stage. Both Local enterprises and the public have strong demand for an intergration development. Local enterprises wish, with the help of an intergration development of Jiu-Jia, to have the free flow of production factors promoted, the combined effect enhanced and the upstream and downstream industry chain extented. While the public wish to see imcrease in employment opportunities employment and improvement in their quality of life. Higher level governments have not been very active during the process of intergration development, which has been relatively slow on the whole and have encountered many problems. Under the process of intergration development, Jiayuguan seems to be more active while Jiuquan seems to hang back. The frequent vicious competition between operating companies for intercity public transportation has seriously affected residents from the two cities to travel freely. The serious of problems root in the lack of an efficient cooperation mechanism led by both governments. Without sufficient information exchanges and collaboration, intergration development has not been organized disorderly like a heap of loose sand. Local goverments should after balancing the views of all interested parties take initiative to establish a high-efficient cooperation mechanism and draw up an overall intergration development strategy.

In this respect, the cooperation mechanism of Yangtze River Delta Urban Economic Coordination Conference can be a good reference(Xiaolong Luo, Jianfa Shen, 2007). The Economic Coordination Conference holds mayoral meeting and working meeting every two years, at which academic elites and members of higher level governments are invited. Topics at these meetings includes discussion around

strategic objectives, interactive policy and ideas for development, as well as a variety of other topics. In addition, under the coordination mechanism between major cities, special leading groups for integration develoment work, leading groups should also be set up, in order to build a multi-level platform for negotiation, communication, inforrmation exchanges and cooperation, thus to jointly promote the sound and rapid development of both cities.

## 5.2 "Complementary development"of land using can be a channel enhancing friendship in daily intercity contacts

The American Geographer Ullman in the mid-1950s proposed that complementarity is an important condition for the occurrence of spatial interaction, i.e. if the material provided by a region meets the need of another, there is a basis of spatial interaction. The greater the complementarity, the larger is the amount of mutual interaction between these two places. After analysis on Jiuquan and Jiayuguan residents' daily interaction, we have found out that the main reason for Jiayuguan residents go to Jiuquan is shopping, while the main reason for Jiuquan residents to go to Jiayuguan is recreation and sight-seeing. In order to find the the main driving forces that triggers these interaction, we have done a related analysis between the land-using of business, leisure & entertainment, sports centers and exhibition in different periods, and the residents daily travels under the corresponding period (Table 3).Analysis showed that complementary land-using under the integration development can play an important roll in guiding the daily interaction of residents. The beautiful environment of Jiayuguan and the concentrated and bustling shopping centers in Jiuquan can form a kind of complementary land using, which stimulate the frequent daily exchanges between the residents of both cities. On the other hand, the frequent daily interactions between the residents of both cities in turn accelerated the integration development.

Table 3. The Relationship Between the Behavior and Urban Development

| **Year** | **Building of Large- and Medium-sized Retail Business** | | **Land used for Large- and Medium-sized Leisure & Entertainment Projects, Sports Center and Exhibition** | | **Changes in interactions** | |
|---|---|---|---|---|---|---|
| **Before year 2005** | Jiayugu an | Jiuquan | Jiayuguan | Jiuquan | Jiayuguan to Jiuquan | Jiuquan to Jiayuguan |
| | Dispers ed along Xinhua Road | Concentrated around Gulou area | 3parks，<br>1 big theatre,<br>2 stadi，<br>1museums，<br>1 public square | 3 parks，<br>1museum | Not many people,<br>For shopping purposes maily ，<br>Concentrated to areas near Gulou business center | Not many people, for sight-seeing purposes maily<br>Concentrated to large parks |

| | | | | | | |
|---|---|---|---|---|---|---|
| **Around year 2009** | +1 shopping center | + 3 shopping centers | + 1 park | + 1 public square, 1 museum | Number of people grow slowly, for shopping purposes maily , Concentrated to areas near Gulou business center while more people visit the newly built Leisure & Entertainment Projects and Sports Center | Number of people grow slowly, for sight-seeing purposes maily Concentrated to large parks |
| **Around year 2012** | Not much changed | Not much changed | + 1 park | Not much changed | Number of people grow fast, for shopping purposes maily , Concentrated to areas near Gulou business center while more people visit the newly built Leisure & Entertainment Projects and Sports Center | Number of people grow fast, For sight-seeing purposes maily Concentrated to large parks. Many visit the two newly built parks. |
| **Around year 2014** | Not much changed | Not much changed | + 1 park, + 1 large-scale amusement park | + 1 museum | Number of people grow rapidly, for shopping purposes maily , Concentrated to areas near Gulou business center while more people visit the newly built Leisure & Entertainment Projects and Sports Center | Number of people grow rapidly, Concentrated to the 3 recent newly built parks. |

## 5.3 Convenient transportation as a solid foundation for city integration development

Spatial Interaction is a precondition for integration development while the flows of people and things are its basic manifestations. Convenient transportation is an important means to accelerate flows of key factors between regions, and a solid foundation for integration development. If two cities are built into a

half-to-one hour living circle, where residents can have a daily life and commute like in one city(Yingkui Zhao, Jianjun Zhang,ect, 2010). Highway system connecting Suzhou District in Jiuquan and Jiayuguan has grown from one road to the current three roads. Residents from both cities are given special free access to the Jiuquan- Jiayuguan Highway Channel. The construction of the Jiuquan- Jiayuguan Highway Channel has fastend interaction between city residents, promoted cultural integration between the two cities, and at the same time led the developmet of the whole Integration Development area as wll as the internal development of each city seperately. Public transportation between the two cities can provide convenience in travel for the residents and reduce their difficulty in finding a car. Thus it plays a vital role in promoting integration development. Coordination system should be build for public transportation operation between the two cities to guarantee an efficient and convenient intercity travel. On the basis of accelerating highway channel construction between the two cities, intercity public transportation should be given high priority in the city integration development process.

### 5.4 To jointly build complementary industry types is the key in complementary development

To jointly build demonstration areas, high-level model areas, management innovation zones and area of most dynamic growth can lead and coordinate the development of the whole region. Industry is an important pillar of regional development, jointly built industry types must not only drive their own development, but also to the greatest degree of optimize the industrial chain in the entire intercity region, thus the former vicious competition between similar industries can be transformed into complementary collaboration so as to enhance the overall competitiveness of the whole integration development area. The new region of Jiuquan-Jiayuguan is a united constructed zone, which includes two major industrial parks: the Industrial Park in Eastern Jiayugaun, and the Industrial Park in Western Suburbs of Jiuquan. The latter has two characteristics of industrial types: new energy equipment manufacturing and automobile sales, and business services, especially sales of regional agricultural products. These two major industrial types not only lead the growth of the Industrial Park in Western Suburbs of Jiuquan itself, but also play an important complementary role in optimizing the industry structure of the whole Jiu-Jia integration development area. The Industrial Park in Eastern Jiayuguan is still in an initial stage of large-scale construction. Judging from the current enterprises its main features are metallurgy and new materials, which is similar to Jiayuguan, Jiuquan Iron & Steel Group and the Industrial Park in Western Suburbs of Jiuquan. With the opportunity of Jiu-Jia integration development, The Industrial Park in Eastern Jiayuguan should be coordinated into having complementary industrial types from the other industrial parks thus optimize the industrial chain in the whole region.

## 6 .Conclusion

City integration as a new phenomenon of regional development, which plays a vital role in driving the overall development of the region and promoting the new urbanization. On the basis of the development of the domestic city integration reviewed research,taking jiuquan-jiayuguan development as an example,at the eighboring cities level,from the whole industrial system variation, urban space

development variation and at the urban linkages level,from the Intercity transport links variation、Intercity residents' daily behavior variation，the authors analysis development effectiveness of city integration from these two different spatial scales . Ultimately the paper believe that Jiu-Jia should build high-efficient cooperation mechanism, "complementary development"of land use function, "convenient" Intercity travel supply and jointly build complementary industry types and these four aspects help better promote the healthy development of the city integration in Jiu-Jia.

# Building a cross-border spatial planning strategy between four countries: a wishful thinking?

ID: 280

Keywords:

- Cross-border spatial planning
- Cross-border governance

Abstract:

*Since 2010 and the launch of the METROBORDER project, funded by ESPON, Luxembourg and the neighbouring regions in Belgium, France and German pursue the objective of creating a cross-border polycentric metropolitan region. This strategy should bring more coherence and cohesion within this region which is strongly functionally integrated, due to the very high number of cross-border commuters but which is still poorly institutionally integrated. We have been involved in the building of the economic part of this strategy as moderators and scientific advisors. As such, we were able to identify obstacles to cross-border cooperation. The objective of this presentation is to depict the gap between the initials ambitions and the strategy issued with the required critical distance. We propose to describe and analyse the policy content of this strategic territorial vision but, most of all, the difficulties faced by the policymakers in its elaboration. These problems are due mainly to institutional mismatches, diverging policy priorities and differences in planning cultures. We will also highlight the importance of trust between individuals, which remains understudied in the field of cross-border spatial planning but which is, according to our experience, a crucial parameter. In this difficult context, the consensus that has been reached by all the stakeholders is the "smallest common denominator", that is to say the less constraining. Of course, such a posture is far from being enough to tend to a more coherent and integrated cross-border area.*

# Building a cross-border spatial planning strategy between four countries: a wishful thinking?

## 1) Introduction

Europe, with its numerous internal borders, appears as a very fragmented space. The challenge linked to the European project of a multicultural supra-state space of freedom, security and justice is to remove the barriers to exchanges (Balibar, 2005). One of the issues of the European Regional Policy is to strengthen the integration between the border regions in order to better (re)shape ties between the populations. In the 2007-2013 program of the Regional Policy, the EU has set in a more precise way the strategic orientations for the use of the structural funds, especially concerning territorial cooperation. The ambition is to promote a more even, harmonious and sustainable development of the European space and to contribute to a better cohesion between its territories regarding its economic, social, cultural and environmental dimensions. Through the structural funds, the objective is to finance the networking of regional actors as well as the concrete actions in favour of a more territorially integrated development. In this context, numerous regional stakeholders have taken the initiative to structure and organize spatial development within their cross-border spaces, by elaborating a territorial strategy in a collective manner.

The idea of this article is to question the ability of these initiatives of cross-border strategic spatial planning to contribute to better integrate the territories, answering to the different dimensions of the cross-border integration process, as defined in the academic field of border studies. Indeed, this concept appears as a complex and multidimensional one, but in the European planning discourse, theoretical references are lacking to describe it properly and in a comprehensive form. This hinders the production of cross-border spatial strategies which can efficiently articulate border territories and create synergies between them.

The first part of this paper will consist in formulating a conceptual framework aiming at cross-fertilizing the academic works from the border studies with the discourses and policy concepts coming from the more applied field of spatial planning. The goal is to build a suitable tool-grid to analyse how cross-border spatial planning strategies serve the different dimensions of the concept of integration. Such an approach should allow to question the non-scientifically demonstrated postulate of the EU according to which more integration leads to more cohesion. In a second step, this conceptual framework will be applied to the case-study of the Greater Region where a cross-border spatial planning strategy is being elaborated. In this space of cooperation, which includes one State and parts of three other ones, most of the very numerous flows which cross the borders are oriented towards Luxembourg. At last, the third part will highlight the most important limits and obstacles which hamper the success of this strategy.

## 2) A conceptual framework derived from the articulation between the fields of border studies and strategic spatial planning

If the literature on comparative spatial planning territories (Knieling & Othengrafen, 2009; Newman & Thornley, 1996) has flourished during the last decades, as well as works on the emergence of a European spatial planning policy and discourse (Dühr *et al.*, 2010 ; Faludi, 2010), cross-border spatial planning has still been little studied. The notion of cross-border spatial planning refers to the search for a collective cross-border decision making (Herzog, 2000), which goes through a process of reinforcement of the institutions for pursuing beneficial outcomes for all the involved parts (Peña, 2007). Its primary purpose is to make the spatial planning objectives of all the border regions converge. From a conceptual point of view, the aim of cross-border strategic spatial planning is to develop a common project with a variety of actors on both sides of the border in order to discuss a joint development strategy (Durand, 2014: 117). Most of the time, the approach consists, for the spatial planners, in producing strategic documents which are not constraining, which are limited to a high degree of generalization, and which have very small effects on cross-border

integration. For Bufon (2011), "*regional cross-border policies thus remain mostly administrative and bureaucratic in character, addressing real life and real needs of the borderland population only to a small extent*". In a way, cross-border spatial planning is restricted to the definition of vague and simple orientations, which have no legal impacts on practices. Indeed, spatial planning priorities and strategies are still defined at the national or regional scale and embedded within these territorial logics.

The EU doesn't address directly the issue of cross-border spatial planning, but it has defined a spatial planning vision for the whole European area through diverse documents (ESDP, 1999; Green Paper on territorial cohesion, 2008; Territorial Agenda 2020, 2011). It has introduced a European dimension in spatial planning, by influencing territorial policies through the elaboration of guiding principles and concepts (polycentrism, territorial cohesion…) (Dühr et al., 2010, Jean & Baudelle, 2010). In order to implement this conception, the EU has established a regional policy which aims, first, at reducing the inequalities between the different European regions –the convergence policy- and which mobilizes an important part of the available structural funds (Objective 1).The EU also promotes the intensification of cross-border interactions, with the help of specific financial tools (INTERREG programs) and legal ones (Objective 3). Concerning the cross-border context, the intention of the EU Policy is to better interconnect the territories beyond the administrative borders which underline the ruptures between states and generate obstacles with regards to flows of people, goods and capital. The EU policy in favour of cross-border integration appears to be deeply impregnated by this cross-border flows approach. However, even if a lot of works have studied the notion of cross-border integration, including studies funded by the EU (Study Programme on European Spatial Planning 1998-2000, Metroborder 2009-2011), the understanding of this process remains tricky. This is why we propose, in the next step, to examine in depth the concept of cross-border integration before seeing how its different dimensions can be transferred in a planning approach. In a second step, we will see how a cross-border territorial strategy can potentially contribute to serve the dimensions of cross-border integration.

### 2.1 The different meanings of the concept of cross-border integration

In the scientific literature, the study of cross-border integration is often limited to economic interactions between border territories (Anderson & Wever, 2003). Other works have tried to see if the existing interactions between two border regions lead to a greater convergence of the development trajectories (in social, economic and urbanistic terms), and therefore to a diminution of their structural differentials (De Boe et al., 1999). The results show that when cross-border interactions are very asymmetrical, they can tend to increase the territorial disparities instead of reducing them. This observation seems to contradict the hypothesis that more cross-border interactions always lead to more convergence (Topaloglou *et al.*, 2005; Decoville *et al.*, 2013). The concept of integration can therefore not be summarized to a process which would have a single causal effect. Indeed, the cross-border integration process between border regions results from symmetries and similarities as well as from asymmetries and differentials (Durand, 2015). Consequently, in order to overcome the misunderstandings linked to the equivocal meanings of this concept, it has been deconstructed and reveal four different dimensions:

First, the **functional dimension** of integration relates to the interactions on both sides of a border for motives such as work, shopping, leisure or services. They are the results of everyone's actions. The functional dimension of integration can be compared to *the flow approach*, as defined by Van Houtum (2000). The quality of the inter-linkage between two border territories by the network of public transport contributes also to improve the functional dimension of integration.

The **institutional dimension** of integration is linked to the organizational side of cross-border cooperation and to the networking of actors in order to generate, to support or to regulate the functional dimension of cross-border integration. This governance can be either very formalized or more informal from an institutional point of view.

The **structural dimension** of cross-border integration refers to the characteristics of a geographic cross-border space (in terms of urban development, economic activities, social patterns) and to the differences and differentials on both sides of the border. A structural integration process relates to a diminution of these differences and differentials. Most of the times, socioeconomic indicators are used to express the structural integration process.

The **ideational dimension** of integration gathers a variety of distinct subjective elements linked to individual and collective representations, such as the sharing of common social and politic references and symbols, or the feeling of identification to a common cross-border living area (Donnan & Wilson, 2001). Indeed, individuals can cross the border to benefit from opportunities without sharing this feeling of belonging to an integrated space, or without developing cultural affinities.

The concept of cross-border integration appears therefore to be polysemous. The different meanings of the concept of integration show how difficult it is to foster a comprehensive cross-border integration process. Nevertheless, a cross-border spatial planning strategy can contribute, due to its trans-sectorial approach, to support the integration process by opening the debate on the most important directions which should be pursued at the cross-border scale, by institutional actors, civil society, or the business representatives.

### 2.2 How can a cross-border spatial planning strategy contribute to the different dimensions of cross-border integration?

As previously mentioned, there is no real cross-border spatial planning policy, since there is no real legal framework for it, nor common financial means that are provided at the cross-border scale. Cross-border contexts are characterized by a juxtaposition of different territorial systems with their own functioning, that is to say with their own regulation systems, tools and methods to plan urban development that are inspired by different planning cultures. As a consequence, cross-border spatial planning consists in a cooperation between actors located on each side of a border, without a clear and recognized hierarchy between them (De Vries, 2008). In addition, concrete actions remain very limited since there is no legal instruments, at the cross-border scale, which can directly impact on land use policy, and since financial means remain very restricted. Most often, cross-border initiatives are confined to sectorial approaches, put in place to regulate certain issues, such as mobility questions. It should be added that different factors influence cross-border spatial planning, such as the size of the area of cooperation, the need for cooperation, the structure of the cross-border cooperation, language barriers or cultural differences (Knippschild, 2011). For these reasons, it requires a strong coordination between the different administrative and governmental stakeholders from the different countries (Peña, 2007). Furthermore, the conceptualisation of a relevant cross-border spatial planning policy appears impossible without considering the societal issue, with its different planning cultures and priorities (Jacobs, 2014). However, a cross-border spatial planning strategy can potentially offer relevant tools to foster the process of cross-border integration. Indeed, numerous policy concepts or actions associated with the EU spatial planning policy contain references, more or less explicit, to the different dimensions previously described.

Concerning the structural dimension of integration, its translation into the European spatial planning objectives can be associated to the concept of convergence, that is to say to the reduction of the gap of development on both side of a border. From a strategic point of view, the idea is to include elements from the European territorial cohesion policy to tend towards a more homogenous development on both side of a border. This is reflected on the one hand by a convergence of the socioeconomic characteristics (reduction of the differences) and, on the other hand, by a convergence of the policies, the strategies (in terms of economic, social, educational and spatial priorities), and the legal and tax settings.

The functional dimension of integration is more clearly addressed by the planning policies, especially by the concrete inter-linkage of border territories, which is promoted in order to increase cross-border flows. At the

European level, the transport infrastructures policy is the most important tool (Trans-European Transport Network), even if the competence remains a state sovereignty.

In terms of institutional integration, the setting up of a cross-border spatial planning policy requires the implementation and the structuring of a dedicated cross-border governance between the stakeholders. In order to organize the exchanges and the debate in a constructive way, and to allow the decision-making process to take place, a multi-level governance is usually put in place, which gathers all the institutional actors which have the required legal competence to realize concrete actions and to elaborate projects. In this sense, cross-border spatial planning strategies contribute to structure the institutional integration process.

The ideational dimension of cross-border integration refers to issues relating to the perceived and lived space. A cross-border spatial planning strategy can contribute to build a common identity by creating favourable conditions for an appropriation of space by individuals. In more concrete terms, this can be fostered by taking into account the wishes of the population, or by involving it in the elaboration of the strategic documents. It can also be promoted by implementing diverse initiatives which allow to strengthen social and cultural ties between the populations (organization of events, festivals, meetings). Territorial marketing actions also contribute to improve the image of a cross-border space.

The different elements described above do not constitute a "best practice" guide, but just an attempt to conceive a new conceptual framework, built from the cross-fertilization of the works previously done in the fields of border studies and strategic spatial planning. It is with the help of this conceptual grid that we will analyse the way a cross-border spatial planning strategy has been put in place in the Greater Region.

## 3) The territorial development scheme of the Greater Region

In this part, the territorial development scheme of the Greater Region, which is still under construction, is going to be analysed with the previously described theoretical framework. Its impact on the different dimensions of cross-border integration will be underlined. But before entering the topic, it is necessary to present the context of the Greater Region as well as the approach that has been followed by the institutional actors.

### 3.1. Elements of context

The Greater Region is a 65 400 km² cross-border cooperation space which gathers more than 11 million of inhabitants. Its juridical setting, as well as its names and territorial boundaries have evolved since the first initiatives of cooperation, at the beginning of the sixties. Today, this vast cross-border space contains a sovereign State (Luxembourg), the Walloon region of Belgium, the French Lorraine region, and two German *Länder*: Saarland and Rhineland-Palatinate. Most of the challenges are concentrated around the borders of Luxembourg (see Figure 1). Indeed, concerning the functional dynamics, most of the cross-border flows are directed towards the Grand-Duchy. With more than 160 000 cross-border workers (STATEC, 2014), which represent 44% of the total employment in Luxembourg, the borders of this country are among the most permeable to cross-border work flows in Europe. Structural differences, in terms of employment opportunities, wages and working conditions explain this attractiveness of Luxembourg with regards to the surrounding areas. These flows strongly impact on spatial development within the cross-border functional region, especially concerning housing development (Sohn et al., 2014). There is another active cross-border space of cooperation around the capital city of Saarland, Saarbrücken, and the northern part of the French department of Moselle: the Eurodistrict Saarmoselle. Cross-border flows are lower there (approximately 20 000) and mostly directed to Germany. The Greater Region appears to be a very large space of cooperation in comparison to the border regions which are concretely impacted by the cross-border dynamics. Taking into account these particular settings, and the administrative complexity of the entire region, the Greater Region

institution has set itself the objective of fostering the complementarities between the territories which compose it, by establishing a common territorial strategy.

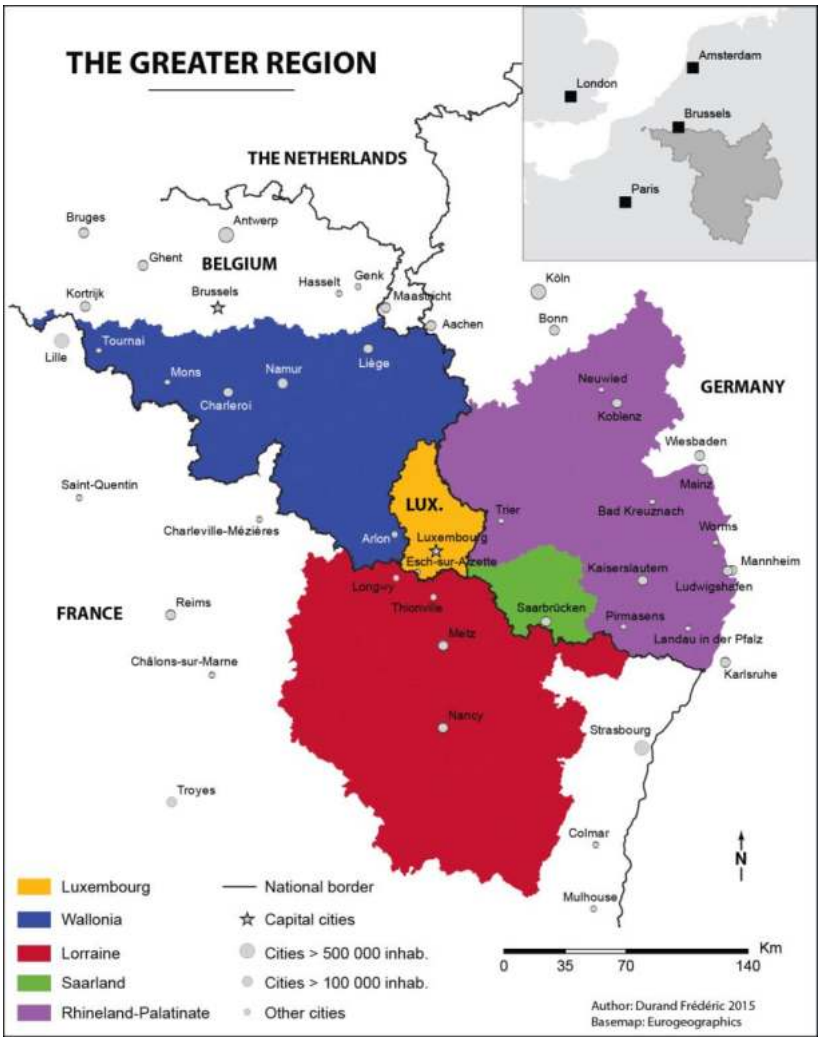

Figure 1. Location map of the Greater Region

### 3.2. The approach of the territorial development scheme of the Greater Region

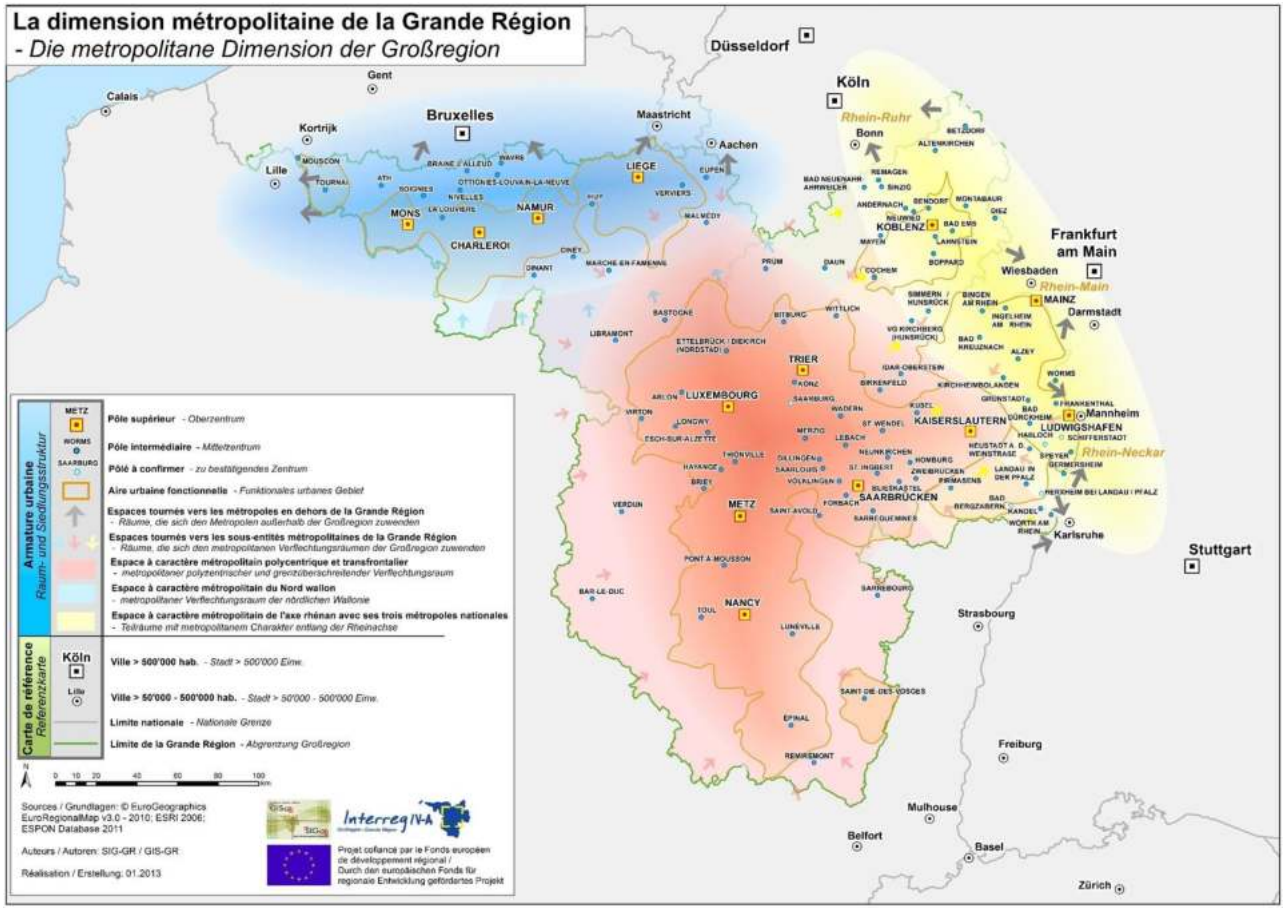
The links which bring together the different territories within the Greater Region have encouraged the authorities to initiate a strategic reflection, called the "territorial development scheme of the Greater Region", which aims at fostering the development of a cross-border metropolitan polycentric region. The observation which underpins this strategy stands on the results of the study realized in the frame of the ESPON program called METROBORDER (2010), which shown that the Greater Region, characterized by a network of small-and medium sized cities, doesn't possess the critical mass to position itself on the European scene. The cross-border polycentric metropolitan region strategy suggests a better inter-linkage of the different urban centres, in order to provide a larger offer of metropolitan functions. Through a better integration of the different urban centres, the objectives are also to generate scale economies and to share certain public facilities. The cross-border strategy might tend to constitute a socio-spatial process, driven by the public sector, through which a vision, actions and means to shape and organize spatial development of the cross-border area are developed. However, it remains limited by the fact that it is not constraining and has not the requested means to achieve its objectives.

The elaboration of this strategy has been given to the Committee for the coordination of territorial development (CCTD), a working group which gathers different representatives of the institutional partners of the Greater Region for the issues related to spatial planning. The elaboration of this strategy is a multiple steps process: First, the Executives of the Greater Region have defined the guidelines of the strategy. In the second step, which is still under process, the CCTD coordinates and leads the development of the preliminary works done in the frame of the strategy building. At last, the different parts of the strategy will be validated by the Summit of the Executives, which is the supreme authority of the decision-making process in the Greater Region.

This approach has led to the production of different documents which treat different themes. The first document, produced in 2012, deals with the metropolitan dimension of the Greater Region and consists in an overview of the urban structure of the Greater Region. It has been followed by a second one which defines the existing transport networks, and identifies, on the basis of a common agreement, the future networks which should be given priorities on the policy agendas. The third one focuses on the economic side of the spatial planning strategy, and aims at providing the representatives of the Greater Region with the required statistical and qualitative information to identify the economic domains which should be prioritized and supported by the policy-makers. Two other documents should be produced soon, on the touristic valorisation of the Greater Region and on its demographic challenges.

### 3.3. The contribution of the territorial development scheme of the Greater Region to the different dimensions of cross-border integration

The document which focuses on the metropolitan dimension has allowed to define the levels of centrality of the most important cities within the Greater Region, as well as their functional profiles. Three different metropolitan spaces have been identified which possess their own logics (Figure 2). The first so called "cross-border polycentric functional space with a metropolitan dimension" is located in the central part of the Greater Region and includes the functional space around Luxembourg, Metz, Nancy, Saarbrücken, Sarreguemines, Trier and Kaiserslautern. The second one is located along the Rhine axis and incorporates three different German metropolitan regions: Rhine-Ruhr, Rhine-Main and Rhine-Neckar. The last one is located on the northern part of the Walloon region, and is composed of cities which are under the gravity of Brussels, as well as cross-border metropolitan areas such as Lille-Kortrijk-Tournai or Aachen-Liège-Maastricht. This first document doesn't provide concrete solutions to increase the cross-border integration process, but it highlights the potential importance of a better articulation and of more complementarities within these three different spaces. It also gives precisions concerning the cross-border territorial strategy which should be envisaged within the Greater Region. Indeed, since spatial planning is carried out under the responsibility of each territory the actions should be defined and realized in accordance with the competences and tools which already exist in each territory.



Sources: CCTD 2012 (*Schéma de développement territorial de la Grande Région – volet 1 : la dimension métropolitaine de la Grande Région*)

Figure 2. The three metropolitan spaces of the Greater Region

The document which refers to the priority transport networks highlights the challenge of cross-border mobility in a context which is characterized by a growing number of cross-border workers and, more generally speaking, by an increase of flows. The first priority concerns the development of road transport infrastructures as well as the railway network (improvement of the motorway network, construction of high-speed railway line, implementation of the Eurocap-Rail project, which aims at better linking the three different European capitals of Brussels, Luxembourg and Strasbourg). The second priority targets a rise in the offer of public transport lines and an improvement of passenger's services (single information platform, pricing strategy). In this context, institutional stakeholders have already conducted bilateral initiatives, such as the "Scheme for cross-border mobility" between France and Luxembourg (another one is scheduled between Belgium and Luxembourg). Concerning the delicate issue of airports, no strategic discussion have taken place so far, due to the importance of the competition between the different territories. Waterway transport has not been considered as a priority.

The document which focuses on the issue of a spatial strategic reflection on the promotion of economic development has underlined the strong heterogeneity of the Greater Region as well as the divergences concerning the economic priorities identified in the different territories. The strong specialization of Luxembourg in the financial sector pushes the policymakers to search for a diversification of its economy, by fostering other kinds of high added value sectors, such as research, highly specialized services, IT. Saarland, which is facing a serious problem of population shrinking, tries to foster its attractiveness in order to offset its loss of qualified working force to maintain its industrial sector, mostly dealing with automotive industry and machine-tool production. Rhineland-Palatinate has also a strong specialization, in the sector of

the chemical industry and in the machine-tool production. Most of the economic actors in Rhineland-Palatinate are not really turned toward the "heart" of the Greater Region (except for the city of Trier). The economic activity of the Walloon region is also not really deeply tied to the Greater Regional context, excepted for its most eastern part, which is sparsely populated. For these reasons, Rhineland-Palatinate and the Walloon region do not seem to consider the Greater Region as the most relevant territorial scale to elaborate an economic development scheme. At the opposite, the Lorraine Region, which is encountering difficulties since the closing of numerous steel industries in its northern part, largely considers the importance of Luxembourg in its strategic reflections. Around 80 000 workers cross the French-Luxembourgish border every day to work in the Grand-Duchy. Of course, this also doesn't go without creating problems, including a feeling of strong dependency towards Luxembourg. These differences between the territories which compose the Greater Region have made it very difficult to pinpoint clear priorities at the cross-border scale. Nevertheless, two domains have been identified: the development of new materials and the silver economy (the economy linked to ageing).

➔ How do these different reflections serve the four dimensions of cross-border integration?

It seems that, generally speaking, the scheme for the territorial development of the Greater Region consists more in a modest attempt to answer to the growing importance of cross-border interactions, than to a proactive approach aiming at reinforcing the cross-border integration of the different territories. Indeed, the structural dimension of integration is not considered in the targeted objectives, that is to say that the reduction of the inequalities of development is not mentioned. At the opposite, and concerning the functional dimension of integration, the agreements and consensus are much easier to find. The need for a better fluidity of people and goods is clearly recognized by all the stakeholders. This consensus also goes beyond the mere spatial planning policy, since initiatives have been taken to improve the access to the cross-border labour market, to allow the recognition of foreign diplomas, and so on.

The scheme for the territorial development of the Greater Region doesn't address directly the issue of the institutional integration, but suggests changes to improve the cross-border governance. Indeed, a strong original impediment remains: how to define a relevant inter-territorial political coordination in a context characterized by a strong institutional imbalance between the nature of the territories (State, *Länder* and Regions), by a splitting of the decision centres, and diverging priorities? So far, no concrete decision has been taken, but the Walloon presidency intends to deepen the reflection on this specific issue and to rationalize the governance to improve its functioning. At last, the ideational dimension of integration has not been addressed in the frame of the strategy so far.

To understand the lack of more concrete results concerning some of the dimensions of cross-border integration, it is necessary to shed light on the different obstacles that the stakeholders have to face before adopting concrete resolutions.

## 4) A cross-border strategy constrained by numerous obstacles

The cross-border strategy conceived by the institutional actors aims first at fostering the economic development and at reinforcing the metropolitan potential of the Greater Region. However, this strategy is confronted to numerous difficulties which restrain its capacity to make the cross-border area more coherent. Three types of obstacles can be identified: the technical obstacles, the political obstacles, and the relational obstacles.

### 4.1. The technical obstacles

These obstacles are linked to institutional mismatches, differences in planning cultures and tools, and legal problems. These obstacles are usually the one which are the most often cited by actors in the field of cross-border cooperation. Indeed, they constitute huge hindrances to the concrete implementation of a strategy. In the case of the Greater Region, the situation with respect to this type of problems is very complex due to the number of countries which are concerned. Institutional structures and state organizations (centralism vs federalism) vary on each side of the borders. The institutional levels have not the same competences, and are not systematically represented in the cross-border governance (Nelles & Durand, 2014), even if they would theoretically be needed. This doesn't help to serve the dialogue between actors and to reach a consensus. Luxembourg, of course, has the full competencies of a sovereign country. The *Länder* in Germany benefit a strong autonomy, as well as the Walloon region. The Lorraine region reflects a more centralized structure of the French territorial organization. Indeed, the central State authority is involved in the cross-border governance through the "Prefecture" of Lorraine. These institutional mismatches impact the efficiency of the cross-border governance.

Beyond these institutional mismatches, planning cultures largely diverge between the different territories of the Greater Region. A distinction can be done between the *regional economic planning approach*, which dominates in Lorraine and in Luxembourg, the *land use management approach*, in the Walloon region, and the *comprehensive integrated approach* in the German *Länder* (Newman & Thornley, 1996). The confrontation between these different planning conceptions doesn't constitute, at first sight, a strong impediment to cooperation, since the setting up of a cross-border territorial strategy constitutes a flexible and non-constraining process. Nevertheless, the conceptual tools that are used are not always understood in the same manner, as "polycentrism", "centrality" and "metropolitan". This impacts on the mutual understanding of the strategies that are followed by the neighbours. Moreover, the priorities that are targeted by the different representatives of the planning authorities diverge. Whereas the promotion of economic development is prioritized by the French and the Belgium actors, the issue of mobility seems to monopolize the attention of the Luxembourgish stakeholders. Our analyses did not allow us to see if the German actors were really following a *comprehensive integrated approach*, in line with the description given by Newman and Thornley.

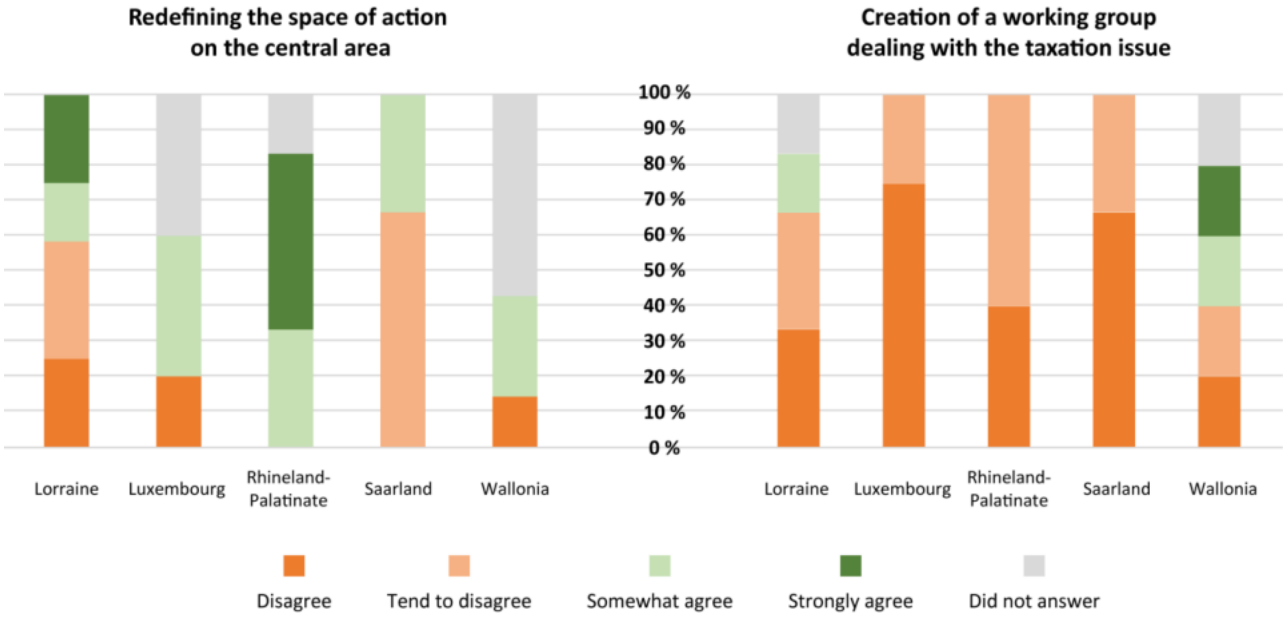
In addition to these obstacles, the inequalities in terms of economic development and tax regimes between the different territorial members of the Greater Region make the situation even more complex. The tendencies concerning the evolution of the average wages, the variation of the total tax rates on business, the total labour cost and the unemployment rates show that the inequalities, which are very high, will probably not decrease in the coming years. These disparities tend to generate, for some territorial actors, a feeling of dependency on the "wealthy Luxembourg" which provides work opportunities. When the qualified work force from France, Germany, and Belgium crosses the border every day to work in Luxembourg, it is sometimes seen as being at the expense of the capacity of these territories to rebound and to develop their economies. These feelings lead to defensive postures that are not in favour of a more peaceful and fruitful dialogue.

### 4.2. The political obstacles

The development of a cross-border strategic reflection raises political problems linked to the representativeness of the stakeholders that are involved. For instance, the local actors are not members of the decision-making process within the Greater Region, even if they are strongly impacted by the border effects and by the challenges of cross-border integration. On the contrary, state actors still dominate the cross-border governance sphere and largely influence the outputs of the debates (De Vries, 2008; Dörry & Decoville, 2013; Durand & Lamour, 2014). The case of the Greater Region is no exception to this rule, and the content of the exchanges expresses the differences concerning each national strategy. The cross-border cooperation is thus, in a way, the place where national strategies are confronted, where everyone supports his position. State actors import in the debate their "institutional culture", and defend most of all the interests of their institutions.

Beyond the confrontation of the different national priorities, the stakeholders have also diverging opinions concerning the desired future of the cross-border space. During the realization of the preliminary study related to the economic part of the strategy, a workshop took place, which highlighted these contrasting positions. Two issues discussed on that occasion show divisions between territories (Figure 3).

Figure 3. Stakeholders positions (according to their territorial belonging) concerning cross-border related questions



Sources: Data from the workshop conducted in the frame of the study on the development of the economic component of the Territorial Development Scheme of the Greater Region (2014)

Concerning the first question, which suggested a redefinition of the space of action on a restricted area centred on the space where most of the interactions take place, strong differences appeared between the positions defended by the different actors. The stakeholders from Lorraine and the Saarland are not in favour of such a redefinition, and they suggest to stick to the boundaries of the Greater Region as a whole, whereas the other actors were more favourable to the suggestion. The lack of consensus on such a crucial issue makes it impossible to converge towards a more efficient implementation, in concrete actions, of the general orientations of the strategy.

Concerning the thematic of tax regimes, which generates important disparities between the attractiveness of the different territories on some specific types of activities, goods and services, a quite unexpected consensus appeared. All the stakeholders agreed to answer that this topic should not be addressed by a dedicated working group. Such a rejection clearly shows that beyond the appearing desire of more cross-border cooperation, competition and national interests remain stronger. Tax regimes is a very sensitive and strategic tool, and sharing information related to these strategies is not conceivable. This taboo is nevertheless a real political obstacle, which restrains discussions within the cross-border governance.

Furthermore, there are other division lines between the actors on the issue of cross-border governance. Should the local actors be more involved? Should an integrated team, dedicated to cross-border issues and funded by the different territorial members be created? The answers to these questions are far from converging, and these oppositions constitute serious impediments to the success of the cross-border territorial strategy.

### 4.3. The relational obstacles

At last, another type of obstacles should be considered, which lies in the formal or informal relations which tie individuals and that can be called "relational obstacles". These obstacles should be differentiated from the political obstacles because they are not linked to differences in terms of ideologies or policy priorities, but because they depend on the quality of the human relations between members of the cross-border governance. This type of obstacle is rarely studied *per se*, and it is very complex to obtain reliable information on such a sensitive issue. Cross-border cooperation has a lot to do with the image that it should reflect from the policymakers, and for this reason the communication on cross-border governance is usually quite controlled. However, a good understanding of the functioning of a policy network, through the perceptions that each stakeholder has from the other members of the decision-making process is a necessity in order to better grasp the limitations or successes of the different initiatives. Indeed, cross-border governance is most of all a space of dialogue and exchange between individuals who do not have the same social capital, the same legitimacy, or the same leadership. In order to understand the power relations which structure the decision-making system, 41 experts belonging to 34 different organizations have been interviewed in a dedicated research project[1] (Dörry & Decoville, 2013). These experts were selected for their involvement in the cross-border governance related to the issue of public transportation. In a first step, we have asked the actors to relate their subjective feeling concerning the importance of the other actors in the decision-making process. By summing the scores obtained by all the individuals who belonged to the same organisations, we could provide an estimation[2] of the perceived importance of the different institutions, considering that the social capital of people "*aggregates into the social capital of organisations"* (Burt, 1992: 9). This "perceived" importance is not the same as the "institutional" one, which is given by the official legal competences. Table 1 presents the five organisations considered as being the most important.

Table 1. Main organizations perceived as important within the cross-border governance network on the public transportation issue

| Organisations | Perceived importance in the decision-making process |
|---|---|
| Ministry of Sustainable Development (Luxembourg) | 55 |
| Lorraine Region (France) | 38 |
| National Transport Agency (Luxembourg) | 20 |
| Ministry of Economy, Transport, Agriculture and Wine (Rhineland-Palatinate) | 17 |
| Ministry of Environment, Energy and Transport (Saarland) | 17 |

The first finding is that two institutions appear as being much more important than all the other ones in the subjective representations of the interviewed people, even if the Greater Region includes four countries and five regions which should have, theoretically speaking, similar weights in the decision-making process. These two institutions are the Ministry of Sustainable Development and Infrastructure of Luxembourg (MDDI) and the Lorraine Region. The MDDI is both an initiator of projects and a key decision-maker. The Lorraine Region has been given the competences of managing railways transportation in 2002. The three following institutions are the National Transport Agency (Luxembourg), the Ministry of Economy, Transport, Agriculture and Wine (Rhineland-Palatinate) and the Ministry of Environment, Energy and Transport (Saarland). No Belgian stakeholder appears in the top most important ones. These differences in the level of perceived importance in the decision-making process appears to be more due to the level of involvement of the individuals who represent an institution than to the legal and official competences of the

[1] Metronet Project, funded by the National Fund of research, Luxembourg.
[2] The score corresponds to the number of times one or more actor(s) belonging to a single institution has (have) been mentioned as "important in the decision-making process".

latters. It should be noticed that most of the time, the actors who participate in the cross-border governance have this task in addition to other attributions that they have to fulfil for the institutions they belong to. In the hierarchy of their tasks, the cross-border files are seldom the first priorities.

In the frame of these interviews, the experts have been asked to express their perception concerning the involvement, the leadership and the trust capital of the other actors involved. For that, the interviewees were asked to give a value ranging from 1 (weak) to 3 (strong). The figures presented in table 2 correspond to the average values obtained by each individual, according to the perceptions the others had from him. Of course, the results were anonymized, and they translate subjective representations of the situation, and not absolute ones. Table 2 shows the five most important actors of the previously mentioned institutions.

Table 2. Perceptions of the involvement, the trust capita and the leadership qualities of a few important stakeholders in the cross-border governance

| | **Involvement** | **Trust** | **Leadership** | **Type of actor** |
|---|---|---|---|---|
| Actor 1 | 3,0 | 2,9 | 2,9 | driver of the CB cooperation |
| Actor 2 | 2,7 | 2,5 | 2,1 | driver of the CB cooperation |
| Actor 3 | 1,9 | 1,7 | 2,4 | hindrance to CB cooperation |
| Actor 4 | 3,0 | 2,7 | 2,5 | driver of the CB cooperation |
| Actor 5 | 1,5 | 2,5 | 2,0 | not involved |

The actors obtained scores which greatly vary from one to another concerning their capital of confidence (trust), their quality of leader or their level of involvement. Table 2 just gives a short overview of the different profiles that can be identified. The stakeholders who obtained good values in the three above mentioned fields can be view as drivers of the cross-border cooperation. They are involved, they are recognized, and they can stimulate the debate. On the contrary, some actors can be characterized as constituting a hindrance to the cooperation. Indeed, they are important in the decision-making process, but they do not inspire "trust" to the other members. The reasons of this lack of trust can vary. Either they are seen as actors who are not really in favour of strengthening the cross-border cooperation, or they are seen as lacking the required diplomatic skills. At last, a third type of actors can be distinguished, the ones who are considered as being not engaged and committed in the cross-border issues.

This very brief summary of the survey has no ambition to present the results more in details, but to remind that the elaboration of a cross-border strategy is not only impeded by the well-known obstacles of the institutional mismatches or diverging policy priorities. It is also, sometimes, limited by the bad quality of the inter-individual relationships. Cross-border governance is not a compulsory demarche, it relies on the desire and the willingness of some actors to create, strengthen or maintain ties with the neighbours. It consists in a fragile network mostly driven by policymakers and civil servants who show very different levels of involvement. It is not easy to evaluate the impact of these relational obstacles in comparison to the technical or the political obstacles, but one thing is sure: technical problems can be solved, whereas it is much more complicated to recreate trust when it is not existing anymore.

## Conclusion

At its actual stage of development, the scheme for a territorial development of the Greater Region appears to be seriously hampered by the extreme complexity of the geographical configuration, with distinct territorial identities, but also by technical (multiplicity of actors, institutional mismatches, variety of competencies), political (divergence of priorities) and relational (lack of trust, of legitimacy) obstacles. It should be reminded that this strategy is still an ongoing process, and that no definitive conclusion can be given. However, it seems that it cannot serve the ambitions of promoting a more comprehensive cross-border

cooperation, in the different dimensions of the meaning. This strategy can be qualified as the one of the "smallest common denominator", even if it would be unfair and false to say that cross-border cooperation in the Greater Region has led to no result. In the field of cross-border public transportation, for instance, numerous cross-border lines and services were created to accompany the economic dimension of cross-border integration. Facilitating the workers flows is necessary for Luxembourg, which needs work force for its economy, but also for the border regions, which are facing high unemployment rates and which see the proximity of Luxembourg as an opportunity to develop their residential economy, based on the incomes of the cross-border workers. Allowing a better fluidity of these flows constitutes a win-win challenge. But the other dimensions of cross-border integration are very poorly addressed so far. The complexity of the context is often evoked, but when we try to look beyond the scene of the cross-border governance, by looking at the individuals who drive it, and not at the institutions which are represented, it appears that solving the technical problems is not a purely technical issue, but more a question of willingness. Studying the importance of these notions of trust, leadership and commitment is crucial to better understand the "disillusions" often associated with cross-border governance (Knippschild, 2011), and to be more nuanced with respect to the EU paradigm, according to which more interactions should lead to more integration.

# RE-THINKING LOCAL GOVERNANCE IN POST-COMMUNIST COUNTRIES: THE CONCEPT OF URBAN TASK FORCES AND ITS APPLICATION IN THE STATUS PROJECT

Sabina Dimitriu[1], Pietro Elisei[1], Radu-Matei Cocheci[1, 2]

[1] Planning and policy design, Urbasofia, Bucharest, Romania, sabina.dimitriu@urbasofia.eu
[2]Department of Urban Planning and Territorial Development – "Ion Mincu" University of Architecture and Urban Planning Bucharest, matei.cocheci@gmail.com

*While there is a vast literature on the specific problems of small and middle-sized towns in Europe, the effect of planning issues on development opportunities in post-communist countries in these towns has been less documented. In this case, the centralist approach and focus on obsolete normative planning often determines a weak capacity of local authorities and lack of stakeholder involvement in strategic planning processes.*

*The STATUS project (Strategic Territorial Agendas for "Small and Middle-Sized Towns" Urban Systems) in South-East Europe can be regarded as an attempt to stimulate a paradigm shift in local governance and integrated development in lower tier cities from several post-communist countries. The aim of the project was to design strategic territorial agendas (flexible urban programming tools transposing the results of local workshops into a coherent strategic planning document) for ten partners, based on a participative planning methodology. Through the STATUS project the concept of territorial cohesion was put into practice, making it easier to grasp by decision makers at different levels and defining a governance framework that facilitates a more effective and efficient use of EU structural funds.*

*This paper overviews the Strategic Territorial Agendas realized in six partner cities located in post-communist countries, with a special focus on the future implementation of these agendas by the Urban Task Forces (UTF). Crystallized during the STATUS project, the latter comprise the most relevant local stakeholders interested in local development. Benefiting, in some cases, from cooperation platforms known as Urban Centers, the UTF can be regarded as an alternative governance framework for ensuring the integration and correlation of sectorial projects at local or metropolitan level.*

**Keywords**: Participative Planning, Small and Middle-Sized Towns, Stakeholder involvement

## 1. Introduction

The paper is based on the authors' experience in the design and content management of the project STATUS (Strategic Territorial Agendas for "Small and Middle-Sized Towns" Urban Systems), initiative financed by the European Commission under the programme SEE 2007-2013 (South East Europe, assignment running from January 2013 to December 2014). The SEE programme was an instrument that, in the framework of the Regional Policy's Territorial Cooperation Objective of EC, aimed to improve integration and competitiveness in an area (namely Balkans and Adriatic Sea Basin) by presenting, from a geopolitical viewpoint, multiple and articulated identities and sensitive urban questions. STATUS tackled the problem of incoherent urban and regional development in South Eastern European countries by jointly developing an approach that can assist cities in designing integrated and sustainable urban agendas and place based strategies by practice of participatory planning tools (Elisei, 2014a).

Out of the ten territorial partners in the project (Figure 1), six are located in post-communist countries: Montenegro (Herceg Novi), Romania (Alba Iulia, Baia Mare, Satu Mare), Republic of Moldova (Bălţi),

Republic of Serbia (Temerin).The aim of this paper is to analyze how the work accomplished in project STATUS has managed to propose an alternative, integrated and participatory planning model in countries where planning systems are often regarded as obsolete and strongly focused on normative and regulatory aspects.

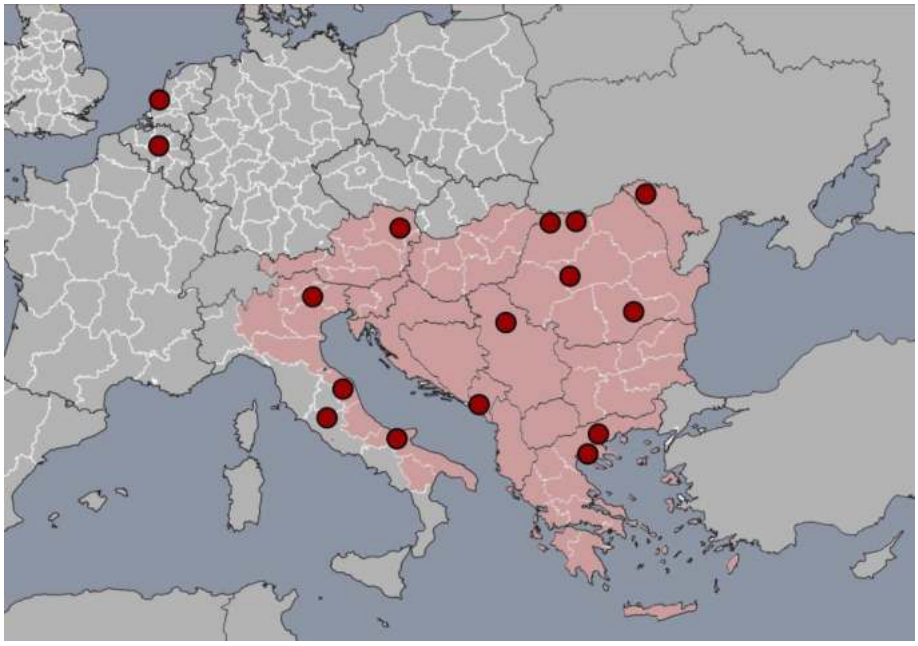

Figure 1. The STATUS project partnership (authors' contribution)

## 2. Background

Small and middle-sized towns comprise 72% of the European population (OIR, 2006), as 97.9 % of the European cities have a population of under 100,000 inhabitants (Elisei, 2014b). Consequently, there is a need to shift focus in at EU level from High Density Urban Clusters (HDUC) to smaller urban settlements, as a matter not only of policy relevance, but also of spatial justice (Servillo et al, 2014).

Overshadowed by larger urban agglomerations, small towns need to find local solutions to capitalize their endogenous potential, often by strengthening their social and cultural networks (OIR, 2006).However, problems with strategic planning culture are evident in partners in post socialist countries, which often fall short in ensuring coherent long-term development and even access to EU funds.

Strategic planning should be centred on the elaboration of a mutually beneficial dialectic between top-down structural developments and bottom-up local uniqueness (Albrechts, 2004). In the first ten post-revolution years, planning practices in post-socialist countries showed a growing interest, especially from capital cities, in going strategic (Tsenkova, 2005). From the Baltics to the Balkans, cities have gone through a process of strategy development with a varied degree of success (Buckley and Tsenkova, 2001; Maier, 2000; Nedovic-Budic, 2001). This first generation of strategic plans usually have been an "import" of models and methodologies from western planning cultures, but again the ownership of these instruments has been limited to elites and not fully participated by an enlarged arena of urban actors. To generate planning results through participative approaches is still something to achieve, as we still deal and strive with political and technocratic legacy generated in those years. During socialism, strategic

planning was done in the upper echelons of political power, but planners were still called upon to determine how the goals handed down by the bureaucracy will be incorporated in urban space (Stanilov, 2007). Pre-1989 normative plans and procedures, in the post-communist planning environment, were considered to be no more effective and efficient as they represented the legacy of a system shaped according to some principles inspired by the ideology of that time:fast industrialisation, egalitarian development, containment of the built-up areas and collective housing in high density residential areas (Elisei and Pascariu, 2012).

There is a tendency in strategic planning to ensure the design of strategies which allow both the participation of various stakeholders and multi-source funding (Ciaffi, 2005). In this context, new governance allows for a successful integration of horizontal and vertical initiatives and actors, thus including citizens, enterprises, different municipality departments and other public institutions by realizing shared projects (Weeber et al, 2011). While the cooperation between groups to achieve a common goal is referred to as governance, in the case of the EU, where the actors involved can be located at different levels of government, the term multi-level governance is used (Grisel & van de Wart, 2011).

Multi-level governance indicates cooperation among the various players in a vertical order, involving national, regional and local players in the design and implementation of EU policies. But it has its horizontal dimension as well, in compliance with the EU principles of subsidiarity and partnership. The provisions for setting up partnerships at local/regional level and the need for involving relevant stakeholders into planning, programming and implementation of interventions, had already been part of the Structural Funds regulations since 1988. The aim of good governance hasn't changed since then: it requires commitment, involvement and engagement at the various levels of governance. Consequently, the problem of multilevel governance mostly concerns the ways of coordinating activity between and across levels of government, while also taking into account subsidiarity, a key organizing principle of the EU system (Grisel & van de Wart, 2011).It is recommended that bottom-up and top-down processes be integrated within multi-level governance models, as the former refers to an extensive degree of motivation while the latter guarantees resources and specialized means (Ciaffi, 2005).

Tasan-Kok & Vranken (2011) single out spatial policy instruments that are designed to facilitate integrated action from a spatially, administratively and sectorial point of view in a multi-dimensional setting by taking into consideration environmental, social, cultural and organisational aspects. The local actions plans, defined as such instruments, must be developed at local level within a framework established at a higher level of public governance hierarchy. The main aim of this kind of instruments is to avoid fragmented interventions and replace them with strategic interventions which seek integrated actions with a multi-dimensional, multi-actor and multi-scalar setting for achieving better results (Tasan-Kok & Vranken, 2011).

The advantages of participatory instruments are mainfold: they focus on goals by creating a framework for structuring diffuse discussion, they are democratic as they ensure the equal participation of all members in the group and are efficient as workshops can bring quick outcomes and answers. In participatory planning approaches, it is crucial to involve target groups into the early stages of the project, as community engagement in the beginning can determine the effectiveness of strategy development and implementation in later stages (Demeter, 2012).

The STATUS project, shortly described below, has placed a great focus on these kinds of participatory instruments, knowing that widening stakeholder involvement and building social networks contribute to the institutional capital (Healey, 1998), with the Urban Task Forces considered to be partnership structures where stakeholders share planning and decision-making responsibilities, strongly resembling

planning committees (Arnstein, 1969) or URBACT Local Support Groups. The introduction of the participatory approach has been a great challenge especially in post-communist countries, where the heritage determined weak local governance systems (Elisei, 2014b).

## 3. STATUS project: Objectives and Methodology

The STATUS project's overall objective was to assist city authorities of the SEE countries in developing Strategic Territorial/Urban Agendas (ST/UA), depending on the scale of the partners' institutional territorial management, as a tool for sustainable and integrated development, and in implementing Urban Centers (UC). Finally, generated practices and emerging city networks have been archived and promoted through the SEE Web Platform (SEE-WP – www.seecityplatform.net).

STATUS project's main challenge was defining locally rooted urban projects, based on a strong involvement of local communities in the creation of Urban Task Forces, inspired by the URBACT Local Support Group model. The project served as a platform to observe urban community action in South-East Europe states, many of them post-socialist and still operating through centralistic top down decision making, through the interaction with new governance contexts, where strategic territorial and urban decisions are being shared (Elisei, 2014a).

STATUS is structured in three main phases (Figure 2):
1. Analysis
2. Urban programming
3. Creation of urban centers

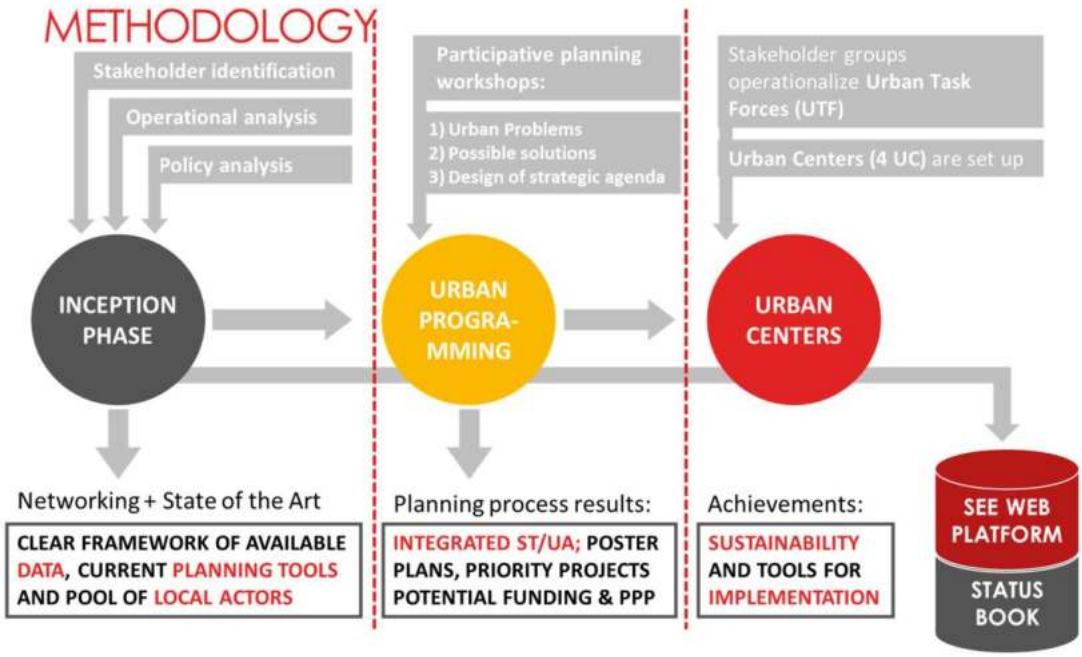

Figure 2. STATUS Project Methodology (authors' contribution)

The first phase has been designed proposing a set of activities that permit planners to assess the current planning "state of art" in the partner territories, from stakeholder analysis to operational analysis and the assessment of each partner's planning framework.

The second phase was based on the realization, in each partner city, of three workshops involving stakeholders and citizens and focusing on (1) problem identification in a set of planning domains, (2) identification of solutions through the creation of local working groups helped by international experts in town and regional planning and (3) design of the final strategic planning document and graphical representation (poster plan). STATUS aimed at finding the right solution to operationalize the concept of integrated territorial approach, thus the result was named a Strategic Integrated Urban/Territorial Agenda and not a plan, a flexible urban programming tool transposing the results of the local workshops into a coherent strategic planning document which contains the vision, mission, action plan and monitoring. Moreover, the Agendas were designed to be also a tool for future partnership and negotiation with the national and EU levels, containing a portfolio of the flagship projects for each city together with the potential funding sources and local, regional and national opportunities for partnership.

The last phase, which will be further detailed in this article, related to the consolidation of an Urban Task Force (UTF) from the stakeholders involved in the three urban programming workshop, with the opportunity to finance the realization of urban Centers as physical places to be run by the UTFs (Figure 3).

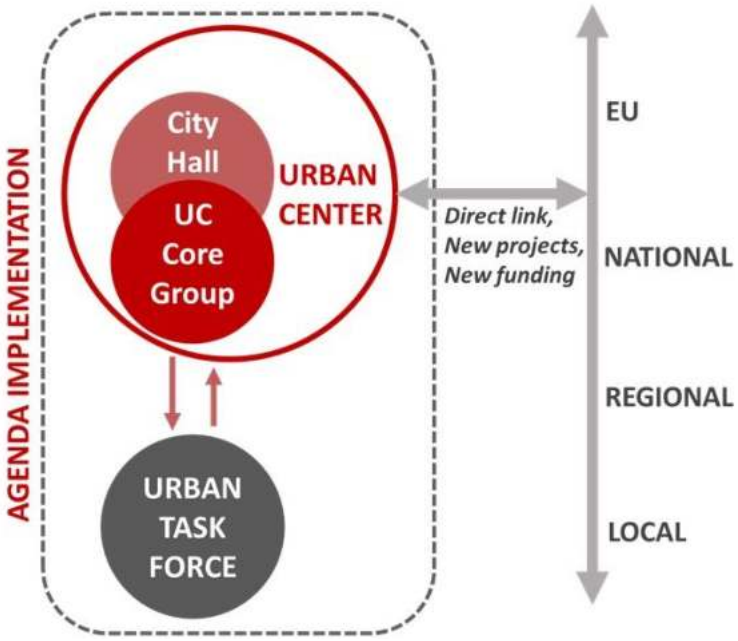

Figure 3. The relation between Urban Task Forces and Urban Centers

Urban centers are places generated by the experience of participation initiated through the STATUS methodology. In these places the continuous urban dialogue that will monitor the agenda results in the incoming years will be generated, but, very important,they will represent the engine of future development initiatives in involved partners' areas.

Synthetically we can describe the role of an Urban Center as (Ginocchini, 2014):
• A *Megaphone*, explaining the city's evolution and promoting its projects and programmes
• An *Antenna*, collecting the ideas received from civil society;
• An *Arena*, a platform for publicly discussing urban projects, with the possibility to thus influence public policy

In the following section, an analysis of Strategic Agenda provisions and Urban Task Forces in the six territorial partners located in post-communist countries will be realized, with the progress regarding the implementation of urban Centers also being taken into account.

## 4. UTFs – a local governance framework for implementing Strategic Agendas

This section is based on contributions from the territorial partners regarding their process of designing the Strategic Agendas and consolidating their Urban Task Force during the STATUS project.

In the city of ***Bălți*** (Republic of Moldova), the Strategic Urban Agenda has had a great focus on the re-vitalization of the city's central area, with the five priority projects related to public space interventions and the provision of different services to the population. The Urban Task Force will function on the basis of a *Regulation on the functioning of the Urban Task Force* and a *Parnership Agreement*, being directly supported by the administration of the City Hall of Bălţi municipality. The interesting part about the Urban Task Force in this case is its division into three working groups of *Expert Teams*: (1) economic field group, (2) socio-cultural field and (3) public space field. An Urban Center was also created, as a division within the Local Public Administration managed by the team involved in the implementation of the STATUS project. While created for the specific focus of providing a platform for the implementation of the Strategic Urban Agenda, the Urban Center has become a talking point and is currently promoted as a tool for urban planning and development at the „Upper-Prut" Euro-region level. The sustainability of activities will be ensured by the additional role of the Urban Development Center to constantly search for opportunities and new sources of funding to implement new projects designed together with the Urban Task Force

In the case of ***Herceg Novi*** (Montenegro), the Strategic Urban Agenda was focused on developing tourism and infrastructure, with the target being to establish the city as a well-established, all year-round touristic destination. The Urban Task Force that emerged throughout the participatory workshops gathered great array of stakeholders: representatives of the public sector, NGOs, planning and engineering experts, professional association representatives, as well as representatives from institutions at national level. This has been an important step forward, if we take into account the fact that, at the beginning of the project, local public authorities had identified weak local public participation as one of the priority problems in the area.

Based on the paradigm of integrated sustainable development, the Strategic Urban Agenda in the city of ***Alba Iulia*** (Romania) contained projects from all development axes for the 2014-2030 period. The Urban Task Force gathered not only representatives of the local public authority (the city manager, municipal chief architect and directors of the departments of urban planning, environment, mobility and finance), but also other qualified stakeholders from both private sector and civil society: business, academics, NGOs, cultural institutions etc. As a result, more than 30 people are expected to continue to contribute in the implementation of the priority projects proposed by the new Strategic Urban Agenda. While Alba Iulia has not developed an Urban Center within the STATUS project, guidelines for its future development have already been drafted, with special attention being given to the management team of the urban center which would be needed to ensure its financial and functional feasibility.

***Baia Mare*** (Romania) was the only territorial partner in the STATUS project that had its Strategic Agenda designed at metropolitan level. The priority projects selected with the aid of local stakeholders focused mostly on economic development through the creation of a wood-industry cluster related to future industrial parks, as well as on infrastructure development – road network, water and sewage and waste management. Consequently, the Metropolitan Task Force (MTF) formed within the STATUS

project was conceived as an executive entity responsible for preparing and monitoring the implementation of the Strategic Territorial Agenda. Its creation was based on a partnership agreement which was signed between the Metropolitan Area Association, local public authorities at county and local level, professional associations and private companies providing utilities or public transport services. The Metropolitan Center, as the physical space where the Metropolitan Task Force will function, has been established in the premises of the Baia Mare Metropolitan Area Association's headquarters as a „factory of ideas". The Center's scope is to promote of the efforts undertaken by the Baia Mare Metropolitan Area Association and MTF, while also being the place to collect feedback upon the initiated project proposals. The Metropolitan Center is to ensure its resilience through various means, from constituting the reference point for local knowledge incubator, creative think-tank for wider metropolitan opportunities and facilitating schemes, territorial planning center bridging the private sector and community engagement, as well as a "polis theatre" in accommodating harmonised needs within the metropolitan area, in its capacity of implementing the BMMA Strategic Agenda.

In ***Satu Mare*** (Romania), the Strategic Urban Agenda included projects related to diverse domains such as accessibility, environment, energy efficiency, tourism development, social and economic development or public administration. The Urban Task Force consisted of a number of stakeholders and City Hall experts who had already been involved in the participatory process of designing the Strategic Agenda. In Satu Mare, the envisaged role for the UTF is that of a consultative body whose main role will be to monitor the implementation of the strategy. The UTF members are set to assume different tasks according to their individual domain of expertise, with the overall structure being flexible enough to allow, if necessary, the creation of thematic or project-based workgroups.

The strategic priorities for the Municipality of ***Temerin*** (Republic of Serbia) included brownfield redevelopment, tourism and recreational development in areas with historical heritage and eco-farming. The Urban Task Force has included a wide range of experts: a University professor in regional studies, a traffic engineer, an urban planner, an architect, a civil engineer, a regional development specialist, a business cluster manager, an industrial designer, an economist and a lawyer, who have all been involved in the elaboration of the Strategic Urban Agenda. The UTF is shaped as a non-formal association with the primary mission of working on the ideas, methods and tools of proposed in the Strategy.

The Urban Task Forces of the post-socialist countries in STATUS are as diverse as the subjects tackled in their Agendas, but nevertheless there is a core common understanding of their overall role and importance in ensuring the sustainability of the initiative started by the project.

For the partners analysed in this article, which have understood that their participatory processes are very much at the beginning of the roadmap towards true, active and lasting community co-creation of planning instruments, it was important to focus also on *form*: clear provisions on future activities of the UTF and UC, on frequency of meetings and organizational framework, in order to keep the momentum going.

However, in the case of all partners, the aim of creating the Urban Task Forces has been to ensure lasting effects of the actions employed during the project, through a negotiated, better informed and long-term involved local dialogue. Further than that, it was each of the six cities' prior experience and focus of the agenda which made the difference between structure, composition and future activities of the UTFs.

## 5. Conclusions

The STATUS Project represented a test bed for participatory and integrated area-based strategies for urban areas, focusing cohesion policy resources on performance-yielding interventions, collaboration,

capacity building and fund integration. During its two-year implementation period, it managed to prove an important point – that, given the opportunity of experience exchange between international experts, cities of the more advanced parts of Europe in terms of participatory planning and cities of the ex-EasternBloc, the latter can create and implement the tools necessary to transition from traditional planning to an integrated territorial approach, and truly capitalise on the potential of public participation. It proved that small and middle-sized cities from Romania, Moldavia, Montenegro and Serbia can move away from deterministic and rule-driven planning and invest themselves into adopting, through co-ownership and a collaborative process, a flexible strategy to reach their goals.

Yet the STATUS project has been a guided process, and its main challenge still lies ahead. The future of the Strategic Agendas and set-up local processes lies with both the administrations and the stakeholders which have been involved in STATUS: the Urban Task Forces will need to self-organize and take ownership of the flagship projects designed in the Agendas, while the local administrations will need to ensure a steady investment into the management of the project portfolio and its implementation, making the most out of the European, national and local funding opportunities.

In this sense, the EU Member State cities (Baia Mare, Satu Mare, Alba Iulia, all in Romania) have an advantage: the Partnership Agreements signed for the 2014-2020 Multiannual Financial Framework provide very important funding opportunities for the flagship projects of the Agendas, as well as a framework for the use of two new, innovative tools for integrated development: Integrated Territorial Investments (ITI) and Community-Led Local Development (CLLD).

Last but not least, continuing the legacy of STATUS is not just about implementing the co-designed projects of the Agendas, but also keeping new ideas and projects coming, as the needs of the city and its inhabitants change. Perhaps the most important lesson which the partners have learned in STATUS is that the traditional planning instruments and top-down attitude are obsolete tools for fostering coherent urban development, and that the latter can be achieved only by sharing power and adopting more flexible, inclusive and integrated tools. The catalysts for these changes should be the Urban Centers, as participation outlets where the future development of the cities can be monitored, intervened upon should the conditions and opportunities change and further shaped through the generation of new ideas and new projects.

The Strategic Agendas and participatory processes out of which the Urban Task Forces and Urban Centers crystallized responded very well to these challenges so far, and as they are highly replicable instruments, they could be successfully promoted and developed in other post-communist countries and cities that also lack other operational planning instruments.

# TWENTY-FIVE YEARS OF EU DEBATE ON TERRITORIAL POLICY: TIME TO GO BEYOND INTERGOVERNMENTAL RHETORIC!

Philippe Doucet

Senior Lecturer on Urban and Regional Planning Theories and Practices, Institut Supérieur d'Urbanisme et de Rénovation Urbaine (ISURU), (Higher Institute for City Planning and Urban Renewal), Brussels

Senior Consultant (Société française des Urbanistes and ISOCARP member), European / cross-border territorial development, phd@gephyres.eu

Keywords : territorial integration, EU territorial governance

***Abstract***

*Twenty-five years have elapsed since the first ministerial meeting on European territorial policy held in Nantes in 1989. It is worth taking stock of progress achieved by policy makers since this landmark event. Arguably, mixed results have been achieved, in terms of both content and process. The practical implications of the recognition of territorial cohesion as a formal EU policy objective have not yet been fully clarified.*

*Participants in the process raised various key policy issues, several of which remain to be clarified. Three of them will be commented upon in this paper:*

- *EU cohesion policy remit: should this policy be mainly dedicated to a mere communicating vessels game between better- and less well-off regions (question "how much EU funding in which regions?"), or on the contrary, should it also encompass a content-related and territorial dimension (question "ESIF[1] to do what and where?"); put otherwise, what are the implications for the EU territorial policy and should reference policy maps be elaborated to illustrate geographically differentiated policy options?*
- *Interdependence between various areas of the EU and the subsequent need for transboundary[2] territorial integration; to what extent have the successive INTERREG territorial cooperation initiatives actually contributed to a genuine territorial integration process?*
- *Governance / decision-making process in the area of EU territorial cohesion: should the "Community method" apply to decisions to be made in connection with EU territorial development? How should the subsidiarity principle be applied, with what specific practical implications?*

## 1. Introduction

A quarter of a century ago, on 24 November 1989, the first informal meeting of ministers responsible for spatial planning in the European Community[3] took place in Nantes. It had been convened and was chaired by Jacques Chérèque, French Minister Delegate for spatial planning, who had also invited his friend Jacques Delors, the then President of the European Commission (Faludi & Waterhout, 2002, pp.

[1] ESIF = "European Structural and Investment Funds"

[2] As recommended by Dühr, S., Colomb, C. and Nadin, V. (2010), the word "transboundary" is used generically in this paper to refer to various types of territorial cooperation, generally labelled "cross-border" and "transnational" in the INTERREG territorial cooperation supported by the EU.

[3] At the time, the "European Union" was still an unknown concept

34-35). This event, which went relatively unnoticed at the time, triggered a long-lasting policy process, which led to the publication of the European Spatial Development Perspective (ESDP) and the two successive versions of the EU Territorial Agenda ("TA 2007" and "TA 2020").

This process has already been extensively commented upon in various publications. Providing a detailed description of it in this short paper would be pointless. Suffice it to recall some key-milestones. In 1991, it was decided in The Hague to set up the "Committee on Spatial Development (CSD)", which brought together the ministerial departments responsible for spatial planning in the member states and the European Commission. In 1993, a large majority of Ministers participating in the Liège informal Council supported the elaboration of a "European Spatial Development Perspective (ESDP)". The first official draft of the ESDP was adopted in Noordwijk in 1997 and the ESDP itself in Postdam in 1999. In parallel, a new strand was introduced in 1996 in the INTERREG II Community Initiative "to foster transnational cooperation initiated by Member States and other authorities with responsibilities for spatial planning within a framework of common territorial development priorities" (EC, 1996, p. 23). This transnational cooperation strand has been maintained until now in all the generations of INTERREG (or "European territorial cooperation") programmes. In 2000, the CSD (which was informal in nature, albeit hosted by the European Commission), was replaced by the formal "SUD (Spatial and Urban Development) sub-committee" of the Management Committee of the Structural Funds, later renamed "Territorial Cohesion and Urban matters (TCUM) committee". On 3 June 2002, the European Commission approved the ESPON 2006 CIP[4]. In May 2007, the Territorial Agenda of the European Union (TAEU) was agreed in Leipzig at the Informal Ministerial Meeting on Urban Development and Territorial Cohesion. The same year, an Action Programme was approved in Ponta Delgada (Azores, Portugal) and the "Network of Territorial Cohesion Contact Points (NTCCP)" was created to provide technical support for the implementation of the Territorial Agenda. On 1st December 2009, the Lisbon Treaty entered into force, which means that "territorial cohesion" was henceforth explicitly recognised as a key policy-objective of the EU. In May 2011, the revised Territorial Agenda, "TA 2020" was agreed at the Informal Meeting of Ministers responsible for Spatial Planning and Territorial Development in Gödöllő (Hungary).

Various key policy issues were raised during this twenty-five year process. Three of them will be commented upon in this paper:

- the EU cohesion policy remit: should this policy be essentially limited to a mere communicating vessels game between better- and less well-off regions (question "how much EU funding in which regions?"), or on the contrary, should it also encompass a content-related and spatial dimension (question "ESIF[5] / structural funds to do what and where?");
- the interdependence between various areas of the EU and the subsequent need for territorial integration;
- the governance / decision-making process in the area of EU territorial cohesion.

Other very important policy issues would also be worth addressing below, in particular the need for policy integration between various sector policies with a territorial dimension (environment, transport/mobility, energy, etc.) However, this need is not typical of EU policy, since cross-sector integration is also a difficult issue in the domestic context. Recent years have witnessed growing

[4] CIP stands for "Community Initiative Programme". Initially, "ESPON" stood for "European Spatial Planning Observation Network". More recently, the ESPON 2013 programme has been renamed "European observation network on territorial development and cohesion" while keeping the "ESPON" acronym unchanged.

[5] ESIF : recently introduced acronym, standing for "European Structural and Investment Funds". These currently include the European Regional Development Fund (ERDF), the European Social Fund (ESF), the Cohesion Fund (CF), the European Agricultural Fund for Rural Development (EAFRD) and the European Maritime & Fisheries Fund (EMFF).

interest for urban development among stakeholders involved in EU regional policy programmes, as exemplified by the considerable success of the Reference Framework for European Sustainable Cities, the URBAN Community Initiatives, the URBACT programmes and other ERDF-funded operations dedicated to urban development. These issues are also outside the scope of this paper.

Thus, let us concentrate on the three key-issues referred to above, including the related policy responses which may be envisaged.

## 2. The EU cohesion policy remit: communicating vessels game or territorial strategy?

The first and second multiannual financial frameworks of the European Community, the so-called "Delors Package I" (1988-1992) and "Delors Package II" (1993-1999) were characterised by a dramatic increase of the budgetary means (or "structural funds") allocated to the regional policy. This was a major policy shift: the relative share of the Common Agricultural Policy in the EC budget, initially overwhelming, was projected to decline in future. Considerable amounts of ERDF monies, match-funded by national contributions, were allocated to various regions facing specific difficulties, in particular Objective 1 areas "whose development was lagging behind". Beneficiaries were not supposed to do whatever they liked with the subsidies. On the contrary, strict compliance with eligibility rules was required, but this had more to do with administrative and procedural aspects (e.g. the so-called "audit trail") than content-related issues. All the operations were supposed to contribute to the achievement of some key policy objectives, but these were defined in relatively broad terms. More recently, the Lisbon strategy, followed by the Europe 2020 strategy[6], put forward a series of policy objectives, for example in terms of education level, investment in R&D, job creation, energy and resource efficiency, etc. Despite this relatively more focused policy approach, a wide room for manoeuvre was still left, in principle, to programme managing authorities and project applicants to define their own specific objectives and work plan.

Paradoxically, this room for manoeuvre was not really exploited. For example, the reference objectives set out in the development strategies of most ERDF-funded operational programmes were strikingly similar. This stems from the fact that a set of key policy objectives was already included in the reference EU regulations[7]. Especially in the 2000-2006 and 2007-2013 programming periods, these objectives were rather accurately defined, and reproduced, often literally, in the various operational programmes. Even the reference performance indicators were often identical, which facilitated the aggregation at the EU level of outputs and results delivered by the various programmes. This standardisation process gave rise to criticisms among regional policy experts, epitomised by the celebrated Barca report and its plea for a "place-based approach" (Barca, 2009).

To deal with the EU regional policy, the relevant formation of the Council of Ministers was that responsible for "general affairs", attended by ministers responsible for economy and/or regional policy when cohesion policy issues were on the agenda. Among these ministers, a minority were also responsible for spatial planning. This was for example the case in France and Portugal, but more the exception than the rule. One of the reasons why ministers responsible for planning set about holding regular informal meetings from the nineteen-nineties onward was the sense of frustration they could legitimately feel when considering, on the one hand, the considerable size of EU budgetary means and their allocation discussed by their colleagues responsible for regional policy, and on the other hand the virtual impossibility to allocate these means to operations contributing to the achievement of specific objectives set out in territorial planning strategies. Most, if not all, of the ERDF-funded operational

[6] during the 2000-2006 and 2007-2013 programming periods respectively.

[7] See for example the regulations applying to the 2007-2013 programming period (European Parliament and Council of the European Union, 2006a and 2006b).

programmes and single programming documents did not include any map to provide a geographically differentiated picture of policy priorities.

This frustration of ministers (and their respective departments) responsible for planning was probably the main reason for initiating the ESDP / Territorial Agenda process. To some extent, the same comment applies to the "territorial cohesion" paradigm, whose rationale, however, seems more complex. At least two distinct, and even divergent, policy approaches to territorial cohesion can arguably be identified: the first tends to equate territorial cohesion to a range of positive discrimination steps in favour of different categories of penalised areas (peripheral, less accessible, mountainous, sparsely populated, prone to natural disasters, etc.); the opposite approach places the emphasis on the need for integrated territorial planning strategies and the integration of EU policies (Doucet, 2006). The first approach is of course favoured by various regional lobbies, and the second one by the world of spatial planning (ministerial departments, regional planning administrations, research centres addressing territorial development issues, including the ESPON network, etc.)

This ambiguity about the very content of the territorial cohesion paradigm has led to a paradox: whereas it has been formally recognised as a fundamental policy goal in the Lisbon Treaty, territorial cohesion remains some sort of UFO, as nobody has ever been able to provide an authoritative definition of it, not even the European Commission in its dedicated Green Paper (EC, 2008). Moreover, no reference EU policy map has ever been proposed, let alone approved, to illustrate what the achievement of the territorial cohesion ideal should entail in practical terms. However, some tentative contributions, e.g. the scenarios of the ESPON 2006 project 3.2 (Transnational project group of ESPON Project 3.2, 2007), the VASAB Long-Term Perspective[8] for the Territorial Development of the Baltic Sea Region (VASAB CSD, 2010), and the Territorial Vision ("TeVi 2050") of the ESPON 2013 project ET 2050 (Transnational project group of ESPON Project 2013/1/19, 2014), represent significant steps in the right direction.

The ESPON projects 3.2 and ET 2050 proved to be very stimulating exercises and produced considerable food for thought. However, it seems difficult to use the scenarios and the proposed Territorial Vision as formal policy tools. Even though quite many policy makers were consulted for the elaboration of these documents, the process was clearly informal in nature, and more a knowledge-based than a formal policy-driven exercise.

By contrast, the process initiated in the early nineteen nineties, which led to the adoption of the VASAB LTP in October 2009 (the so-called "Vilnius Declaration", VASAB CSD, 2010, pp. 49-53) represents a remarkable achievement. The authorities involved managed to reach a formal agreement concerning the implementation of a joint spatial strategy focusing on issues of transboundary relevance[9]. This seems to be an unprecedented achievement. True, similar strategies were also produced at an earlier stage, and not only in the Baltic region[10], but the degree of involvement of the national and regional authorities concerned, and of formalisation of their cooperation, was considerably lower.

Drawing on the VASAB experience, "EU strategies" have recently been elaborated by the European Commission, at the request of the European Council, to address various challenges and opportunities in the Baltic, Danube and Adriatic-Ionian macroregions: EUSBSR (EC, 2009 & 2012), EUSDR (EC, 2010) and EUSAIR (EC, 2014c) respectively. At the time of writing, one more such EU strategy is about to be published by the EC: the EU Strategy for the Alpine Region (EUSALP).

---

[8] Henceforth referred to as "VASAB LTP".

[9] i.e. issues which, by their very nature, cannot be properly tackled without transboundary cooperation, e.g. water pollution in an international river basin, missing links of a transport network in border areas, etc.

[10] See for example the Atlantic Spatial Development Perspective (CPMR, 2005) or the North West Europe Spatial Vision (NWMA Spatial Vision Group, 2000).

The content of these strategies, and more specifically their contribution to territorial integration, will be addressed in Section 3 below. For what concerns the territorial dimension of the EU cohesion policy however, it cannot be denied that their elaboration represent a significant step forward. Should such strategies be elaborated and implemented over the entire EU territory, a major breakthrough would be accomplished, especially if maps are also produced, on the model of the VASAB LTP, to clarify geographically differentiated policy priorities. The communicating vessels game between better- and less well-off regions, which has mainly characterised the cohesion policy so far (question "how much EU funding in which regions?"), would be supplemented (and of course not replaced) by a more strategic territorial approach (concentrating on the question: "ESIF[11] to do what and where?").

The current state of things, however, raises a real issue: would it be acceptable that significant parts of the EU territory are not covered by a strategy similar to the first four EU strategies mentioned above? Especially in Western Europe, the elaboration of such a strategy does not seem to be on the agenda for the time being. Perpetuating this asymmetric situation is not appropriate in the long run.

The time seems ripe for the European Council to request the Commission to go a step further. This would consist in elaborating similar strategies for other macroregions in such a way that the entire EU territory is covered. In an ideal world, a synthesis of all these territorial strategies should also be produced and approved by the European Council. The resulting document would provide, for the first time in the history of the EU regional policy, a consistent and geographically differentiated picture of policy objectives in the area of territorial cohesion[12]. A long-awaited but never attained objective since the initiation of the ESDP process in the nineteen nineties. This process could be preceded by the publication of a White Paper on EU territorial cohesion, a document which the European Parliament and the Committee of the Regions urged the Commission to produce (Böhme, K., Doucet, Ph., Komornicki, T., Zaucha, J., Świątek, D., 2011, p.23). At a meeting of ministers responsible for EU cohesion policy held in Potznań in November 2011, the Polish Presidency of the EU recommended this publication, but to no avail (Polish Ministry of Regional Development, 2011, p.3).

## 3. The need for territorial integration

For lack of clear reference definition, it remains difficult to know what "territorial cohesion" actually means. Things are different for what concerns "territorial integration", a notion which could arguably be regarded, by the way, as a component among others of the elusive territorial cohesion concept.

This notion was already referred to decades ago, after World War II, possibly even earlier on. At the time, "territorial integration" as well as "regional integration", its quasi-synonym, were essentially regarded as a process geared towards the integration of economies. Its starting point was often the establishment of a free-trade area, and it could potentially lead to the full unification of economic, monetary, taxation and social policies, as typically experienced in modern nation-states. It could also be argued that the EU integration process initiated in the nineteen fifties by the European Coal and Steel Community (ECSC) is destined to reach a similar outcome (Marchal, 1965, p. 33. Doucet, 2013, p.28.)

---

[11] ESIF = "European Structural and Investment Funds"

[12] The same document could also take on board various objectives of the EU integrated maritime policy. This question, however, is rather complex and intricate, and it seems difficult to address it properly in this short paper. Suffice it to indicate that Directive 2014/89/EU, recently approved, establishes an EU "framework for maritime spatial planning aimed at promoting the sustainable growth of maritime economies, the sustainable development of marine areas and the sustainable use of marine resources" (Art. 1.1). This entails the integration of economic, social and environmental aspects of various policies and the elaboration of "maritime spatial plans". One may wonder why a similar process would not be justified in the area of "land spatial planning"…

In more recent times, the phrase "territorial integration" has reappeared, especially in the framework of the INTERREG territorial cooperation supported by the EU Cohesion policy, but with a slightly different interpretation. The following definition[13] was proposed in a report published in 2011 by the Polish Presidency of the EU: "the process of reshaping functional areas to make them evolve into a consistent geographical entity; this entails overcoming the various negative effects stemming from the presence of one or more administrative borders, which hamper harmonious territorial development." (Böhme & al., 2011, p.29) This process may take place, for example, in a metropolitan area. In that case, the aim will be to overcome the fragmentation resulting from the competition between the various municipalities through promoting positive-sum games and a synergetic approach geared towards the implementation of a joint territorial strategy. Similarly, and more importantly for this paper, territorial integration may also take place in cross-border or macroregional areas[14]. In principle, it should even be regarded as a strategic objective, an arguably even the most strategic one, of the EU INTERREG cross-border and transnational cooperation programmes.

The reality is different. Despite some stimulating breakthroughs, the realisation of genuine territorial integration has for long been more the exception than the rule in the INTERREG operations. However, there seems to be growing (albeit still limited) interest about this topic, especially in the framework of the preparation of the new 2014-2020 programming period of the ESIF. To ascertain this, let us examine the achievements of the successive generations of INTERREG programmes.

### 3.1. INTERREG I and INTERREG II: the first experiments

During the 1989-1993 programming period of the EU structural funds, the first INTERREG "Community Initiative" was "designed to help border areas to prepare for a frontier-free Europe" (CEC, 1993, p.27). This means that cooperation, albeit encouraged, was not even a prerequisite for various operations to be recognised as eligible for ERDF funding. For example, various single-country operations were supported in Greece, France, Denmark and Germany[15].

Although genuine cooperation was strongly encouraged in the framework of INTERREG II (i.e. during the 1994-1999 period), projects taking place on one side only of the national border remained commonplace, especially at the EU external borders[16]. The INTERREG II ex-post evaluation team acknowledged that projects often contributed to reduce or eliminate the isolation of diverse border regions, but this observation also referred to the better connection of various remote regions to more

---

[13] Surprisingly, this definition appears to be the first ever published after more than two decades of INTERREG cooperation. While making several references to the notion of territorial integration (for example in the definition of "territorial cooperation"), the CEMAT spatial development glossary (CEMAT, 2007), does not define it. "Territorial integration" must not be mistaken for "integrated territorial development", whose (very ambitious) aim is to bring together and harmonise various sector policies of territorial relevance (transport, environment, regional development, etc.) with a view to defining and applying an integrated cross-sector strategy.

[14] Examples include the joint management of water resources and the green infrastructure in a transnational river basin, the integration of a transport network through the completion of cross-border missing links, the establishment of networks of SME and research centres in a macroregion, the integration of the labour market at the transboundary scale, etc.

[15] In general, the ERDF funding allocated to these INTERREG projects was modest (ECU 7m. in Bornholm, Denmark; 5m. in Baden-Württemberg, Germany; 6m. in Rhône-Alpes and 10m. in Franche-Comté, France). Yet some sizeably larger amounts were granted in Germany (ECU 37m., Bavaria) and especially in Greece (ECU 340m. for the construction of the Egnatia highway linking up the Ionian Sea to the Turkish border)

[16] Among the programmes dedicated to operations at the EU external borders, Programme No 28, "Greece / External borders" was the best endowed: no less than €540m. eligible expenditure (including €344m. ERDF funding) was entirely incurred on the Greek territory.

central ones of the same national territory. "One-side projects" took even place at the internal borders. This was particularly the case at the Spanish-Portuguese border. Measure 3.1 ("Accessibility") of the INTERREG IIA ES-PT Programme[17] supported 106 projects, whose total eligible cost amounted to €266.7m. According to the ex-post evaluation report, "Cross-border co-operation was non-existing in this measure. All projects in this measure are genuine one-side projects and the main reason for lacking cross-border partnership was, according to both Spanish and Portuguese parties, that there was no need for cross-border co-operation since the projects were simply implemented on one side." (LRDP Ltd & al., 2003, Annex 1.F, p.107) The same report also pointed to significant progress made towards greater integration / coordination of the management of various INTERREG II programmes, including the establishment of joint programme secretariats. However, a really integrated cross-border programme management took place in only about one-third of the programmes, almost entirely those on internal borders with low isolation and a long-standing tradition in cooperation (LRDP Ltd & al., 2003, p.13).

In 1996, the European Commission published the "INTERREG II C Guidelines" (EC, 1996). This was rightly regarded as a major step forwards in the ESDP process[18]. According to the Guidelines, INTERREG II C programmes were meant to foster, among other policy aims, "transnational cooperation initiated by Member States and other authorities with responsibilities for spatial planning within a framework of common territorial development policies adopted for continuous geographical entities covering areas in more than one Member State", and "to improve the impact of Community policies on spatial development." (EC, 1996, Art.5) Much could have been hoped for from such an innovative approach, including in terms of territorial integration (even though this notion was not explicitly referred to in the Guidelines). According to the ex-post evaluation report, the final outcome was below expectations: "Although a number of projects with strategic character were produced (the spatial visions, projects on transnational corridors, transnational flood protection initiatives etc.), bottom-up projects were in overwhelming majority. They were frequently carried out by partnerships composed of local or sub-regional authorities and related to the management of common issues of local character rather than to the tackling of real transnational issues. A reason for this imbalance in project generation was the rather modest involvement of the national and regional spatial planning authorities in the elaboration and implementation of projects." (LRDP & al., 2003, p. 21.)

### 3.2. INTERREG III: territorial cooperation comes of age

Taking stock of the first two generations of INTERREG programmes, the INTERREG III Guidelines (EC, 2004[19]) set the course for the 2000-2006 period. Paraphrasing the conclusions of the INTERREG II ex-post evaluation report, the Guidelines depicted as follows the state of play in the area of territorial cooperation: "The kind of strong cooperation that takes place, for example, in 'Euroregions' is still the exception rather than the rule. Whereas a great deal of development activity has taken place in border areas and those areas have certainly benefited from that activity, it has generally been much more difficult to establish genuine cross-border activity jointly. In some cases, this has led to perverse effects such as parallel projects on each side of the border. In any case, it has prevented border areas and Member States from reaping the full benefits of cooperation." (EC, 2004, §5)

---

[17] INTERREG IIA ES-PT was the best endowed of all the INTERREG II programmes, with a total budget amounting to €776m., out of which €569m. ERDF funding.

[18] At the time, the ESDP (European Commission, 1999) had not yet been approved, but a series of other reference documents were already available, including the "Europe 2000" and "Europe 2000+" communications published by the European Commission and the "Leipzig Principles" (approved in September 1994), elaborated in the framework of informal meetings of EU ministers responsible for spatial planning.

[19] This version includes the original of the INTERREG III Guidelines, initially published in 2000.

In response, the objectives of the INTERREG III initiative were defined more accurately in the guidelines published by the European Commission. Strand A cross-border cooperation was intended to "promote integrated regional development between neighbouring border regions, including external borders (neighbourhood programmes) and certain maritime borders" and "to develop cross-border economic and social centres through joint strategies for sustainable territorial development." (EC, 2004, §6 and §9). As to the transnational cooperation of Strand B, it was meant "to contribute to harmonious territorial integration across the Community" and "to promote a higher degree of territorial integration across large groupings of European regions, with a view to achieving sustainable, harmonious and balanced development in the Community and better territorial integration with candidate and other neighbouring countries' (EC, 2004, §6 and §12). Territorial integration was thus repeatedly referred to.

To what extent was this message taken on board in INTERREG III programmes and projects? According to the INTERREG III ex-post evaluation report, mixed results were obtained in this respect. Some projects of Strands A and B did contribute to territorial integration, but the cross-border or transnational relevance of the other operations remained a critical issue. Many of these, including various investment projects and others generating "soft cooperation outcomes" contributed at best to addressing issues faced on either side of the border. In other instances, especially in programmes covering the external and new internal borders[20], so called "one-sided projects" were still common place.[21]

In the same report, the following guiding principles were put forward to improve the elaboration of future INTERREG programmes:

- "Programme strategies need to address and effectively tackle issues of real cross-border or transnational relevance.
- This requires an analysis of cross-border and transnational areas taking into account the level of integration achieved and identifying how integration can be further enhanced.
- Programming partnerships should be required to select only a few strategic issues which demonstrate a clear potential for furthering an integration of the cross-border and transnational cooperation areas." (Panteia and Partners, 2010, p. 21.)

The 2007-2013 period of the EU structural funds was well under way when the INTERREG III ex-post evaluation report was published. Therefore these guiding principles were essentially relevant for the preparation of the current 2014-2020 programming period.

### 3.3. INTERREG IV : no explicit reference to territorial integration

During the 2007-2013 programming period of the EU structural funds, "European Territorial Cooperation" (better known as INTERREG IV[22]) was formally recognised as the third objective of the cohesion policy. Article 3 (c) of General Regulation 1083/2006 provided that the European territorial cooperation objective should be aimed "at strengthening cross-border cooperation through joint local and regional initiatives, strengthening transnational cooperation by means of actions conducive to

[20] In May 2004, ten new member states joined the European Union. This means that several national borders, initially "external", became internal borders of the EU during the 2000-2006 programming period.

[21] Further detail about the contribution of INTERREG III programmes and operations to territorial integration can be found in the INTERREG III ex-post evaluation report (Panteia and Partners, 2010). See for example section "IV. Conclusions on the overall impact of INTERREG III", pp. 16-17 of the report.

[22] In principle, the formal recognition of "European Territorial Cooperation (ETC)" as one of the formal policy objectives of the EU cohesion policy, has led to a change in terminology, "ETC" taking over from "INTERREG". In practice however, "INTERREG" remains widely used by participants in ETC programmes and operations. Therefore "INTERREG IV" and "INTERREG V" are respectively understood in this article as the equivalents of "ETC 2007-2013" and "ETC 2014-2020".

integrated territorial development linked to the Community priorities, and strengthening interregional cooperation and exchange of experience at the appropriate territorial level." (European Parliament and Council of the EU, 2006b, Art. 3 – 2 [c]). This regulation includes no explicit reference to territorial integration, which cannot be reasonably regarded as a necessary component of "joint local and regional initiatives" ("joint initiatives" may result in very soft exchanges of experience on issues of local interest) or "integrated territorial development" (which could refer to an integration between sector policies).

The same comment applies to ERDF Regulation 1080/2006. However, reference is made, especially in the presentation of strand A (cross-border cooperation), to some notions akin to territorial integration, e.g. "cross-border trade", "cross-border water, waste and energy systems and facilities", "integration of cross-border labour markets". Nevertheless, many other activities of a more general nature are also included in the list of eligible operations: encouraging entrepreneurship, supporting links between urban and rural areas, improved access to transport, information and communication networks and services, etc. (European Parliament and Council of the EU, 2006a, Art. 6 [1]). As far as strand B (transnational cooperation) is concerned, four broad priority areas have been defined: innovation, environment, accessibility, and sustainable urban development. In each of them, a wide array of activities is eligible for ERDF funding. Since these activities are not intrinsically conducive to territorial integration, an additional condition must be fulfilled for projects to be eligible: those dealing with innovation are required to "make a direct contribution to the balanced economic development of transnational areas", those addressing environmental or accessibility-related issues must carry out "activities with a clear transnational dimension", and those involved in sustainable urban development must have "a clear transnational impact" (European Parliament and Council of the EU, 2006a, Art. 6 [2]). At first sight, this additional condition may appear rather demanding, but a careful reading of Article 6 [2] of the regulation, including the various examples of eligible operations provided, clearly suggests that a project contribution to territorial integration is not regarded in practice as an eligibility criterion.

This is implicitly confirmed in the section of the regulation dedicated to the selection of cross-border and transnational cooperation projects: "Operations (...) shall include beneficiaries from at least two countries, of which at least one shall be a Member State, which shall cooperate in at least two of the following ways for each operation: joint development, joint implementation, joint staffing and joint financing. The selected operations fulfilling the abovementioned conditions may be implemented in a single country provided that they have been presented by entities belonging to at least two countries." (European Parliament and Council of the EU, 2006a, Art. 19 [1]).

Paradoxically, the so-called "mainstreaming" of INTERREG (i.e. its inclusion as "European territorial cooperation" in the EU regulations relating to regional policy) has been accompanied by the disappearance of any explicit reference to territorial integration in the EU regulatory framework of the 2007-2013 programming period. This does not necessarily mean that no practical progress towards territorial integration was made during this period. However, such progress was not a formal requirement. Despite this, it may have taken place, but this remains to be examined in the framework of the ex-post evaluation of INTERREG IV, still in its inception phase at the time of writing.

Moreover, it should be borne in mind that various important territorial cooperation activities took place outside the INTERREG framework and gathered pace during the 2007-2013 programming period. This important breakthrough is addressed below in a dedicated section.

### 3.4. INTERREG V: better prospects for territorial integration?

The ESIF-funded operational programmes of the current 2007-2013 programming period were approved at a rather late stage. It is therefore premature to analyse the characteristics of operations

supported in this framework. Nevertheless, an analysis of the reference regulations recently adopted for this period provides some useful insights.

First, an integrated approach is explicitly encouraged in many sections of the regulations. New notions have been introduced such as "community-led local development" and "Integrated Territorial Investments (ITI)". The emphasis is however placed on policy (rather than territorial) integration, and even more on the coordination of financial means provided by various sources of funding[23].

Second, little reference is made to territorial integration. The "Common Strategic Framework (CSF)" (Annex 1 to Regulation 1303/2013) includes one single reference to it, under heading 4.9 relating to "Instrument for Pre-accession Assistance, European Neighbourhood Instrument and European Development Fund" (European Parliament and Council of the EU, 2013a.). Territorial integration is not mentioned at all in ERDF regulation 1301/2013 (European Parliament and Council of the EU, 2013b), but this may appear quite normal since a distinct regulation specifically concentrates on ETC, namely Regulation 1299/2013 (European Parliament and Council of the EU, 2013c). Explicit reference is made in this regulation to the issue of territorial integration, but rather incidentally (in Article 2 [2] concerning transnational cooperation) for a document entirely dedicated to the "ETC goal". All the same, the reintroduction[24] of such an explicit reference is good news.

Third, more importantly and beyond these considerations about terminology, the overall content proposed in Regulation 1299/2013 for operations of the ETC goal represents a real progress. There remains a certain lack of focus, but a series of interesting "investment priorities", conducive to territorial integration, are put forward, for example "supporting labour mobility by integrating cross-border labour markets, including cross-border mobility" or "developing and coordinating macro-regional and sea-basin strategies" (Ibid. Article 7, "Investment Priorities"). The reference to these strategies in particular is not fortuitous. Indeed, this makes possible the establishment of a critical link between ESIF-funded INTERREG cooperation and the elaboration of strategies recently catalysed by the European Commission.

Furthermore, Common Provisions Regulation 1303/2013 provides that "the Partnership Agreement[25] shall also indicate (…) the main priority areas for cooperation under the ESI Funds, taking account, where appropriate, of macro- regional strategies and sea basin strategies."(European Parliament and Council of the EU, 2013a, Article 15, 2 [a] ii).[26]

---

[23] This is particularly clear in Article 36 of Common Provisions Regulation 1303/2013, which reads: "Where an urban development strategy or other territorial strategy, or a territorial pact referred to in Article 12(1) of the ESF Regulation, requires an integrated approach involving investments from the ESF, ERDF or Cohesion Fund under more than one priority axis of one or more operational programmes, actions may be carried out as an integrated territorial investment (an 'ITI')." (European Parliament and Council of the EU, 2013a.)

[24] As a reminder, explicit reference was made to "territorial integration" in the INTERREG III Guidelines, but no longer in the regulations of the 2007-2013 programming period. Noteworthy is also the fact that this reference applied exclusively to strand B "transnational cooperation", whereas the vaguer and softer notion of "integrated territorial development" has always been used, surprisingly enough, to present the main objectives of strand A "cross-border cooperation" since the programming period 2000-2006.

[25] The "Partnership Agreement" is the reference document prepared by each member state and approved by the European Commission to provide guidance on the use of EU structural funding during the 2014-2020 programming period.

[26] Further detail about these strategies has been provided in chapter 7 ("Cooperation activities") of the CSF referred to above (Ibid.). In item 7.1.4, it is notably stated that "Member States shall seek to ensure that where macro-regional and sea basin strategies have been put in place, the ESI Funds support their implementation". According to item 7.2.2, "Member States and regions shall, in the areas concerned, seek to draw on cross-border and transnational cooperation to:

These provisions of the regulatory framework applying to the 2014-2020 programming period clearly represent a significant breakthrough and improve the outlook for genuine territorial integration in the coming years, the critical issue examined here.

It must be stressed, however, that the field of cooperation in the framework of macro-regional strategies is sizeably wider than regional policy-related activities supported by the ESIF. Any confusion therefore needs to be avoided between the INTERREG VB ADRION, Baltic Sea Region and Danube Programmes and the EUSAIR, EUSBSR and EUDSR macro-regional strategies, even though ESIF subsidies of the programmes may of course provide a very significant financial contribution to the strategies.

In principle, this should considerably improve the prospects for further and deeper European territorial integration in the coming years. There is a momentum to seize. Nevertheless, there remains significant room for progress to raise awareness in the coming years about the need for territorial integration. This notion is barely touched upon in the three operational programmes concerned, and no specific indicator[27] has been designed to measure progress made in this field (INTERREG VB Adriatic-Ionian transnational partnership and European Commission, 2014; INTERREG VB Baltic Sea transnational partnership and European Commission, 2014; INTERREG VB Danube transnational partnership and European Commission, 2014).

Last but not least, territorial integration should also be regarded as a key-objective of the cross-border cooperation of INTERREG strand A programmes. The focus recently placed on macro-regional strategies must not hide the fact that territorial integration has already taken place, in some case for many years, in the framework of cross-border cooperation. Especially in areas where standing conferences such as "Euregios" were set up, in some cases long ago, a genuine territorial integration process may have taken place. It is not possible to dwell on this in this short paper, but it seems clear that any future in-depth study on territorial integration in the EU should take this other type of cooperation fully on board.

---

(a) ensure that areas that share major geographical features (islands, lakes, rivers, sea basins or mountain ranges) support the joint management and promotion of their natural resources;
(b) exploit the economies of scale that can be achieved, in particular with regard to investment related to the shared use of common public services;
(c) promote coherent planning and development of cross-border network infrastructure, in particular missing cross-border links, and environmentally friendly and interoperable transport modes in larger geographical areas;
(d) achieve critical mass, particularly in the field of research and innovation and ICT, education and in relation to measures improving the competitiveness of SMEs;
(e) strengthen cross-border labour market services to foster the mobility of workers across borders;
(f) improve cross-border governance."

According to Item 7.3.3., "Member States shall promote, where appropriate, the use of ESI Funds in the context of macro-regional strategies, for the creation of European transport corridors, including supporting modernisation of customs, the prevention, preparedness and response to natural disasters, water management at river basin level, green infrastructure, integrated maritime cooperation across borders and sectors, R&I and ICT networks and management of shared marine resources in the sea basin and protection of marine biodiversity." (Ibid.)

[27] Other indicators have been designed to monitor, for example, the "cooperation intensity" in the Danube area, but this does not provide any relevant indication of progress made towards deeper territorial integration.

## 4. The governance / decision-making process in the area of EU territorial cohesion

In section 2 above, a case has been made for the elaboration of a consistent EU territorial cohesion strategy providing a geographically differentiated picture of policy objectives. Obviously, such an undertaking should prove very challenging, both technically and politically. Whereas the ESPON projects 3.2 and ET 2050 have provided a Europe-wide picture with no formal validation by policy-makers (even if some of these were consulted on an informal basis), the reverse took place in the case of the VASAB Long-Term Perspective: the document was formally approved as a guiding reference by an intergovernmental forum of ministers responsible for spatial planning and development, but its geographic scope is limited to a component of the EU territory, namely the Baltic Sea Region (VASAB CSD, 2010, pp. 49-53.)

To take up the challenge, it seems clear that the issue of EU territorial governance needs to be revisited. Little progress has been made on this in recent time. To some extent, the adoption of macro-regional strategies represents a step forward in this respect, but it is not the European Commission's intention to generalise the elaboration of such strategies to the entire EU territory[28].

However, the Greek and Italian Presidencies[29] managed to reach a consensus in informal ministerial meetings on the necessity to secure a more structured and systematic political debate in the Council about EU economic, social and territorial cohesion. It was proposed that this debate be held in regular dedicated sessions of the General Affairs Council. This represents a move in the right direction, to avoid leaving these important issues in the hands of ministers responsible for Finance or European Affairs. Nevertheless, these sessions are not likely to be attended by ministers responsible for territorial development, at least in the short run, but instead by their colleagues responsible for regional policy.

Since the adoption of the revised Territorial Agenda of the EU (TAEU or "TA 2020" / Informal Ministerial Meeting of Ministers responsible for Spatial Planning and Territorial Development, 2011), little has been made to promote its application. Sizeably more attention has been paid to urban development than territorial cohesion. This may seem paradoxical: after all, the involvement of the EU in urban affairs is not quite in line with the subsidiarity principle, but we may assume that the EU is always "competent" to provide subsidies…

Yet in 2011, shortly after the adoption of TA 2020, the Polish Presidency came up with an interesting proposal, namely the elaboration of a White Paper on Territorial Cohesion. According to the Presidency, "several countries welcomed the proposal (…) regarding this as an important step forward in translating the Territorial Agenda into practice and following the Green Paper adopted in 2008. However, it was also suggested that this may lead to rigidity and that an informal Working Paper would suffice." (Polish Ministry of Regional Development, 2011, p.35, §17). The proposal was thus not implemented.

---

[28] "New initiatives should only be launched if there are particular needs for improved and high-level cooperation. These should be of strategic importance for the macro-regions and translated into a limited number of well-defined objectives with an appropriate set of indicators to measure progress. Common challenges (such as environmental deterioration, climate change adaption, impact of natural and man-made disasters, connectivity gaps, striking income disparities) and/or opportunities (such as openings for research networks, expanded markets, modernising administrations) should be evident, as well as agreed geographical identity. It is therefore an approach only to be used in particular circumstances where involvement of the EU is appropriate, and existing EU horizontal policies reinforced." (EC European Commission, 2013, p. 10.)

[29] Respectively during the first and the second semesters of 2014. Cf. Informal Meeting of Ministers responsible for Cohesion Policy, 2014 and Italian Presidency of the Council of the European Union, 2014.

This is a telling sign of a lack of political will. For the time being, neither a majority of planning departments represented in the NTCCP nor the European Commission seem ready to draw the logical consequences of the recognition of territorial cohesion as a fundamental EU policy goal. Among these consequences, the first is that formal meetings of the Council should be held regularly to take stock of progress made in the area of EU territorial development. This could entail a formal approval of TA 2020 or any other reference document as official EU territorial cohesion strategy. In principle, such a decision may be made by the Council acting by a qualified majority, in accordance with the ordinary legislative procedure[30]. Alternatively, owing to the multi-sectoral nature of territorial cohesion, a process similar to that applying to the EU Maritime Policy could be initiated, the first milestone of which would be the adoption of a framework directive in the same vein as the approach adopted in Directive 2014/89/EU on "Maritime Spatial Planning". (European Parliament and Council of the EU, 2014.) In both cases, the so-called "Community method" would apply: decision made through qualified majority voting, on a proposal from the European Commission (the so-called "right of initiative"). To date, the high Commission officials of DG Regio have carefully avoided initiating such a procedure, but it cannot be ruled out that one day they follow the way paved by their colleagues of DG Mare. There does not seem to be any legal obstacle on the road, but the lack of political remains the main stumbling block.

**The State of Planning and Planning Education in Europe 2015**
Paper presented to Track 11 of the *Annual Congress of Planning Education Schools in Prague/Czech* Republic, July 2015.

An earlier version of this paper has been published in disp:The Planning Review, No. 200 , *(1/2015), 86-90.*

**Key words:** Status of planning in Europe, Planning education, European urban policy

**Abstract**
Since planning has become an academic discipline, debates on the role of planning in the post-industrial society and on the right approach to educate and train planners for this society seem to never end. The community of planners across Europe argues constantly that planning (be it urban and regional or spatial or environmental) is always in a crisis and does not receive the required political support from European, national, regional or local governments. The extent to which planning does address social disparities and can contribute to territorial cohesion is a much-discussed theme among planners. There are continuous debates about the right approach to planning education, between architecture, urbanism or geography and planning as an independent discipline. Finally there are ongoing controversies about the role of the European Commission in intervening into local or national urban policies.

Addressing these debates, the paper presents the outcome of a survey among planners and practitioners on the occasion of the publication of the 200th issue of the Swiss planning journal: **disp: The Planning Review.** Randomly selected renowned academic planners and practitioners from 18 countries in Europe have been asked to respond to six questions concerning the state-of-the-art of planning and planning education in 2015. The responses were in English, French, German and Italian the four languages of the only multi-lingual planning journal in Europe. A synthesis of the 34 responses to our questions is given in this paper.

**Introduction and Background**

More than a decade ago *disP – The Planning Review* asked planners in Switzerland, Germany, Austria and Canada to reflect on the future of a discipline that seems to be continuously under challenge (disp 148 in 2002: *Zukunft der Raumplanung*). The response was cautiously positive, though planners noticed the widening gap between ambitions and reality, with contradictions between the rationales of planning and the rationales of democracy and participation rising on the horizon. Twelve years later, times have changed and the concerns have certainly changed. Political developments, such as the global financial crisis, the crisis of economic development in Mediterranean countries, the diminishing appeal of the European project, and trends toward re-nationalism across Europe have changed the priorities of the political agenda. Planning, though an important field to maintain liveability in cities and regions, it seems is not (anymore?) a priority, despite the efforts of the European Commission to launch a European Urban Agenda. Social, economic and territorial disparities are growing at all levels of planning and decision-making. The concern for the environment is losing appeal and is often expressed just to sell new technologies. Land consumption is still moving towards building suburban housing and new infrastructures, and the evolving e-shopping culture is causing excessive logistics all around cities and regions. At the same time, many architects and urbanists are raising their voices and dreaming of building resilient, green, healthy, intelligent, digital, smart, compact or even wise cities. But are they all aware of the reality of city building in times of neo-liberal market led economies? Do they really reflect on the economic and political dimensions of urban development, and do they care about the concerns of citizens? What is the state of the art of planning in Europe in 2015? What is the state of planning education? Addressing these debates, the paper presents the outcome of a survey among planners and practitioners on the occasion of the publication of the 200th issue of the Swiss planning journal: **disp: The Planning Review.**

We had asked a total of 50 randomly selected planners in 18 European countries – Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Spain, Sweden, Switzerland and the United Kingdom – to send us their personal impressions about the state of the art of planning and about planning education. We are well aware that some European countries are not represented in this survey. The selection was neither systematic nor balanced. Not everyone approached found the time to

respond However, we added Turkey to Europe to resonate the strong contributions of the planning community in this country to European research. The participants come from varied institutional backgrounds and include academic planners as well as practitioners. When selecting planners we did not aim to be representative nor did we seek balance between theory and practice. We acknowledge that we received more academic responses than responses from planning practice. Our interest was to receive personal responses from individual planners, who we considered to be representative voices of their country. We did not wish to receive politically correct country reports..

Thirty-four respondents found the time to reflect on our six questions:

*1. What is the present state of planning, whether urban and regional or spatial and environmental, in politics and in the society of your country?*

*2. What themes dominate the discourse about planning in your country? Do the national media, e.g. newspapers and television, report on these planning challenges?*

*3. Is the gap between theory and practice in planning growing in your country? What role does English planning literature play in this discourse?*

*4. To what extent do planners in your country address growing social, economic and spatial disparities? Do they believe that spatial planning could contribute to reducing such disparities?*

*5. Are planning students adequately prepared to pro-actively address future challenges in planning in your country? Should planning education return to schools of architecture or perhaps be offered in geography schools?*

*6. Would you like to see urban and regional planning and spatial planning being regulated top-down by the European Union? Should the European Union formulate a joint European Urban Policy?*

The responses to our questions were given in English, French, German and Italian to reflect the four languages of the only multi-lingual planning journal in Europe. Though the respondents were encouraged to respond in one of disP's four languages (German, French, English and Italian) in order to support the multi- lingual mission of disP: The Planning Review, most responses are in English. This perfectly reflects how much English, as the lingua franca, already dominates the academic European planning community.

The outcome of our initiative is an impressive journey across Europe. A synthesis of the 34 responses to our questions is presented in this paper. We are well aware that the records of this journey are not representative, neither for Europe as a whole nor for any individual country. Summing up the individual responses provides food for thought for a timely discussion on the current state of spatial planning and planning education in Europe. Thereby we first state, why we asked this particular question, before we present our brief analysis of the responses from all over Europe.

1. ***What is the present state of planning, whether urban and regional or spatial and environmental, in politics and in the society of your country?***

*At the turn of the century, the ESDP (European Spatial Development Perspective) thrilled academic planners across Europe because governments – and even planners – seem to have gradually lost interest in spatial planning, especially at the regional level. Is this observation correct, and does it differ from country to country? How is planning viewed in 2015? Do neo-liberal policies dominate urban and regional development in Europe? Do citizens appreciate the role of planners, or do they complain about public regulation and intervention, about large infrastructure projects and a lack of democracy? Do investors argue about overregulation and planners complain about in- sufficient interest in planning matters? Is spatial planning, both urban and regional, finally appreciated for its efforts after so many decades, or still seen as a public sector instrument to control private investment?*

The answers show a bleak picture of the state of planning. Planning in Europe in 2015 seems to be in a state of re-orientation. The majority of respondents complain about the critical state of spatial planning in their countries. More than half of the respondents explicitly expressed the view that spatial planning has a low political profile in their respective countries. Respondents from northern European countries, in turn, seem to be more content with their established planning tradition, which is strongly focused on the community level.

Changing political priorities, modifications in the regulatory system, or organizational changes are seen as the main reasons for the gradual decline of the status of planning in Europe. The responses from Italy, Spain, Portugal and Greece refer to the effects of the global financial crisis of the year 2008. They observe that the crisis has favoured deregulation policies in order to promote market-led economic development. Planning regulations are seen as the cause of time-consuming and cost-intensive urban and regional development processes. Most respondents report that the negative implications of this re-scaling of planning for cities and people are seldom assessed systematically. Though policy documents in most European countries show well-worded support for sustainable and resilient urban and regional development, planning as a national government responsibility and the use of space as a regulated public task seems to have further lost importance in society and day-to-day politics. Only in Switzerland, where challenges of spatial development in cities and regions are widely discussed in the me- dia, does spatial planning seem to have a more positive image.

The predominant political focus on economic growth in a range of European countries has put spatial planning under pressure. Growth at any price – and if necessary, even on greenfields – seems to have priority in many places. As a rule, the financial interests of investors are placed well ahead of the efforts of planners to bring about a sustainable and resilient development of living spaces. In many countries in Europe policy-makers seem to be increasingly convinced that social, economic and ecological challenges can be better solved through sector politics and approaches rather than through overall sector coordination of spatially effective activities. Responses from the Netherlands and the United Kingdom, where planning has a long tradition, state that deregulation in the realm of spatial planning, which is linked to the recent political re-orientation, has to be seen as a dramatic step backwards. Moreover, respondents from Poland, the Czech Republic, Romania and Hungary report that spatial planning is still suffering under the negative connotation of decades of socialist planning economy, 25 years after the political transition. Nonetheless, in post-socialist countries, spatial planning is expected to pave the way for receiving EU subsidies and to orchestrate the spatial

prerequisites for economic growth and public infrastructure development to prepare the ground for private investors.

One issue reported by many respondents is alarming. It is the observation that in most EU countries, in contrast to *urban* planning, the traditional importance of *regional and national* spatial planning is declining. Cabinet shake-ups in Germany and the Netherlands, for example, recently demonstrated the low political interest in spatial planning at the national level of planning and decision-making. Also on the regional level, spatial planning seems to have lost its former significance.

In contrast, many respondents, particularly from Switzerland, Poland, Turkey, Denmark and Germany, assert that in addition to urban planning and the design of the immediate living environment, which is still widely accepted, planning in wider functional city regions has become a new arena of integrated spatial planning. This shows that despite the weakness of a probably methodologically outdated traditional physical regional planning, strategic inter- communal development in functional city regions is seen as an important field of public policy. Their inflexible administrative borders are often replaced by soft functional borders allowing for better management of regional spatial and economic development. Some respondents expressed an additional challenge: the difficulty in implementing large-scale infrastructural projects in city regions when faced with opposition from civil society, such as airport extensions, railway stations like Stuttgart 21 or inner city investment projects. Whether the opposition to such projects reflects a lack of public involvement in planning processes or perhaps democratic deficits, or not-in-my-backyard attitudes, remains open.

All in all, despite all the concerns expressed about the decreasing importance of planning, many respondents still believe in the positive role of planning in local development and hope that planning can positively address socio-economic and environ- mental challenges. However, it has become 'common sense' that planning processes will be more political and less and less technocratic. This in turn will require more strategic thinking and management and much mediation competence to moderate between the interests of political and economic stakeholders and the requirements and expectations of the people.

***2. What themes dominate the discourse about planning in your country? Does the national media, e.g. newspapers and television, report on these planning challenges?***

*The discourse on planning in the European Union is expected to differ from country to country. Our assumption is that it depends largely on the economic conditions of the country, its mainstream national policies, and on the amount of attention planning receives in regional and national media. The availability of jobs, land for development, accessibility by public and private transport, resource conservation, the integration of migrants, the provision of affordable housing in inner cities are all concerns that planners have to address these days. The respective discourse in a particular country reflects the concerns and values of its citizens and their satisfaction with the political system, as well as the impact of influential books on the zeitgeist. However, is the media concerned with or interested in spatial planning? Does the media offer an opportunity to inform people about emerging planning issues or launch debates about the impact that planning has on our living space? Is spatial planning largely ignored by the media except in cases in controversies over of high profile infrastructure projects?*

Planning faces a broad spectrum of challenges and this is similarly true for the many fields of action. Challenges mentioned by the respondents include:

- Implementing large, environmentally-compromising and cost-intensive infrastructure and investment projects
- Managing sustainable development
- Protecting nature and scenic landscapes
- Containing urban sprawl in city regions
- Responding to the erosion of public services, mainly in rural regions
- Addressing social disparities that result from market-led economic policies
- Coping with the implications of growing planning deregulation
- Handling planning failures
- Dealing with gentrification processes in inner cities Providing affordable housing
- Dealing with democratic deficits caused by insufficient citizen participation and insufficient invitations from government
- Reversing declining building cultures
- Providing good design of public spaces
- Anticipating the spatial implications of new smart technologies

In their answers, most respondents confirmed that spatial planning does not play a significant role in the public media of their countries. As a rule, spatial planning seems not to be a concern of radio and television channels or regional newspapers except in a few media, both print and radio, that only target a small group of informed listeners or readers. Most popular media report on planning themes only when it is about particularly controversial local planning projects, complaining about planning failures or related corruption cases. Switzerland seems to be an exception. There, after two decades of absence, spatial planning recently returned to the media when it covered a series of direct democracy votes on several spatial planning initiatives and the revision of the spatial planning law. In Switzerland, recent disasters caused by natural hazards raised people's concerns for the need for building-bans in high-risk zones through spatial planning regulation – an observation that was also reported in Italy.

***3. Is the gap between theory and practice in planning growing in your country? What role does English planning literature play in this discourse?***

*In the international community of planners, there are growing concerns about a widening gap between theory and practice, as there are fewer and fewer bridges between academia and professional prac- tice. In this context, language also plays a key role. While the quest for more participation in planning requires the use of the local language to communicate with citizens, English has become the language of the international scientific community. It would be worthwhile to explore how this gap could be narrowed again. Another observation should be mentioned: depending on regional traditions, planning theory has quite different roles in planning cultures across Europe.*

All over Europe, a growing gulf between theory and practice is being reported, between planning practitioners and planning academics and researchers respectively. The answers suggest that in at least some European countries two processes apparently play a role. One explanation given is that practitioners are less and less involved in teaching at planning schools, thus the exchange between educational institutions and professional practice is dwindling. In the last two decades, the practice of

bringing in professionals to teach at universities has declined enormously. Practitioners are not appointed as planning chairs or have no interest in entering the world of theory-dominated academia. Accreditation and internal university evaluation processes seem to add further to the theory or practice controversy in spatial planning. However, there are exceptions to such observations: voices from countries such as Italy and Po- land, where architects still dominate the planning profession and many planners at universities are involved in planning practice as policy advisors and consultants, are less concerned about the drifting apart of theory and practice.

Some respondents have expressed the observation that theory and practice in planning education are drifting further and further apart as a con- sequence of the growing importance of publishing scientific articles in international, refereed journals, preferably in English, in order to secure appointments to academic positions. The necessity to publish in high-ranking specialized journals, which are mainly in English, while the political arenas communicate in a local language, and the necessity to participate in the international discourse, is distancing planning academics from the planning milieus of their own country. There are two views on this issue. One is to understand that planning processes in more and more complex political, social, economic and ecological environments requires further explorations into the theoretical dimensions of spatial planning. The other is that coping with local planning challenges, calls for more practical experience and managerial and communication competence.

The language barrier as regards the influence of predominantly English-language journals is frequently named as a problem. Planning practitioners among the respondents criticize the strong position of international academic journals and the limited relevance of these articles to planning practice in countries such as those in Eastern Europe, where the challenges are different to the experiences reported in journal articles, and where, moreover, English is not widely spoken in professional planning milieus. Only in countries with a high affinity for the English language, such as Sweden, Denmark or the Netherlands, are planning practitioners actively interested in the English discourse. In other countries, for ex- ample, Germany, France, Switzerland and Austria, a high resistance to drawing on English planning literature, especially by planning practitioners, is re- ported. While individual planners working in larger city administrations might be interested in selected English planning literature, practitioners in small cities and communities mostly have no interest in English planning literature. Or have no time or inclination to read such publications.

The growing pressure to publish in international journals in English was frequently criticized. This pressure deters researchers from publishing their research results quickly in their own national professional journals, which would make their research results accessible to planning practitioners. One more challenge in bridging theory and practice is the fact that in some countries, such as the Czech Republic or Slovakia, there is no scientific planning journal available in the national language, making the continuous exchange between theory and practice difficult, even in their own language. Overall, planning in Europe seems to be divided by this language issue. Around half of the respondents state that English language literature has no thematic relevance for the respective national planning practice. They assert that the international world of theoretical planning discourse is mostly irrelevant to the planning reality of their own countries.

***4. To what extent do planners in your country ad- dress growing social, economic and spatial disparities, and do they believe that spatial planning could contribute to reducing such disparities?***

*Numerous research projects have documented empirical evidence of social, economic and spatial disparities. Concern is being expressed in many talks and reports all over Europe. Based on this empirical evidence, more planners are postulating in- creased political action to reduce such disparities in cities and regions, as well as between countries of the European Union, e.g. through transport planning or labour policies. The European Union is spending 25 per cent of its expenses to reduce disparities. Germany, after reunification in 1990, is shifting considerable public money from West to East Germany. Southern Italy has benefitted from more than fifty years of financial support from the North to the South, though disparities have not narrowed. The cohesion policy of the European Union includes contributing to the reduction of spatial disparities, but will such policies actually be able to narrow the growing gaps between countries and regions and within cities? Do different planning cultures across Europe see quite different solutions to such concerns?*

The majority of the answers report that planners are confronted with increasing social, economic and spatial disparities in their planning work on a daily basis. However, not all are convinced that spatial planning can actually contribute to eliminating these disparities, and about half of the respondents believe that the goal to eliminate disparities should not even have priority in planning practice. Actually, in many European countries growth policies, at (nearly) any price, prevail over the elimination of social, economic and spatial disparities, although the general political rhetoric claims on all levels and in many words that this is not true. This position is especially noticeable in post-socialist countries, where the political powers are convinced that the key to eliminating regional disparities lies exclusively in making economic growth possible.
Nevertheless, numerous respondents are still convinced that social disparities can be better eliminated or reduced at the local level than through regional or national spatial planning. This is in line with the responses to the first question above stating that, in contrast to well-established urban planning, regional and national spatial planning is becoming weaker and weaker in Europe. The unanimous trust in local planning is reflected by the answers pointing to the special importance of planning for improving the quality of life at the local or even the neighbourhood level.

However, the impression remains that planners tend to overestimate the influence of their discipline on social and economic development. The recent economic crisis in Europe has clearly shown that economic and social development in a market- driven society, where planning has a low profile, can neither be promoted nor controlled by the comparatively very weak instruments of spatial planning.

***5. Are planning students adequately prepared to pro-actively address future challenges in planning in your country? Should planning education return to schools of architecture or perhaps be offered in geography schools?***

*For half a century, 'appropriate' planning education has been a controversial issue in Europe. Though the planning community agrees that the challenges of urban and regional development require special competence and skills, acquired in a special trans-disciplinary education, the discourse is also influenced by regional traditions, institutional conditions and personal biographies. Each participating discipline is said to have its shortcomings, such as design competence, action orientation, economic shortfalls or methodological or communication deficits. Planning has become a field of action that requires quite different skills and training, such as dealing with the public, being part of a team and solving new kinds of problems, all of which also depend on local, regional and national strategies and traditions. Educational systems and perspectives vary from country to country,*

*as well as professional organisations. AESOP is a bridge-builder in this context, through exchange and communication to understand other national traditions. The Bologna agreement increases mobility and encourages more mutual learning, but it cannot create a common curriculum, as some people had hoped. Moreover, e-learning proposals are knocking on the door. Once introduced by influential planning schools, they will have a considerable effect on planning education in Europe. However, do we know what the expectations for future planning education are?*

Europe has quite diverse planning cultures and different regional traditions when it comes to educating planners. In fact, the very definition of planning still differs across Europe, and the required skills and capabilities necessary in planning differ from level to level, hence from local to regional and to national levels of planning and decision-making. The countries in southern Europe, e.g. Spain, Italy and Portugal, and to a certain extent Germany too, have a long and distinct tradition of training planners as part of an architectural education. In these countries, there is an unbroken dominance of architects in planning practice. Hence the education of planners is very much quality controlled by institutions representing professional architects in the country. In contrast, for example in the United Kingdom, France, Belgium, Luxembourg and the Netherlands, planning education is offered with a strong emphasis on social sciences and geography.

Completely independent from traditional orientation, all respondents agree that a geography-based planning education that provides skills in analyzing and explaining spatial conditions and development does not sufficiently emphasize teaching action-oriented, strategic and creative competences and skills. This certainly explains why many respondents still see schools of architecture as the preferred and best possible location for a planning education. In contrast, respondents in planning schools that are independent from traditional disciplines, emphasize the advantages of this concept. They believe that only this comprehensive combined undergraduate and graduate education prepares planners sufficiently for future challenges in spatial and urban development. Respondents overwhelmingly agree on the importance of studios and workshops in real world planning problems in planning curricula. Almost every fourth respondent pointed to real estate development as a new challenge and as a new subject embedded in planning education. This certainly reflects the diminishing importance of public sector investments in urban development. The last two decades have seen a complete professionalization of the real estate sector and the increasing awareness that real estate professionals are strong players in urban development processes.

The future of planning education in Europe seems to remain a controversial arena. Rooted in national traditions and controlled by national institutions, there does not seem to be much willingness to agree on a best approach to planning education. Only one respondent could imagine that a few universities in a particular country could offer comprehensive planning education at bachelor's and master's degree levels, while other universities would provide, as in the past, combination models for the education of spatial planners in architectural schools.

***6. Would you like to see urban and regional planning and spatial planning being regulated top-down by the European Union? Should the European Union formulate a joint European Urban Policy?***

*The European Commission, represented by DG Regio, convinced that the future of Europe is based on the future of cities in Europe, is increasing its efforts to promote a European urban policy. Cities in*

*Europe, and their regional, national and European lobby institutions, who are expecting financial contributions from the EU for their urban policies, do not openly reject such policies – though they are concerned that guidance of EU regulation from above will intervene in their freedom to build and follow their own development paths. Do they fear that a Europe-wide policy will not respect their specific cultural conditions? Are they afraid that they will have to change their own local priorities and adopt European policy guidelines? Are they comfortable with the administrative requirements they will have to follow? Will it be easier for larger cities and city regions than for small and medium-sized towns to meet the requirements? Are cities in the South, for financial or other reasons, more willing to accept the guidance from Brussels than cities in Germany, France or the Nordic countries?*

All respondents vehemently rejected a top-down regulation of spatial development by the European Union. The majority of answers were sceptical about the increasing regulation and homogenization of spatial planning and urban development in their countries through politics and strategies of the European Commission. However, some respondents from France, Spain, Portugal, Italy and post-communist countries of Eastern Europe definitely see some sense in European policies. They seem to accept EU top-down policies even when assessments show that the positive effects of a EU urban policy remain unclear. EU urban policies, in turn, are mainly rejected to a large extent with reference to the diversity of local city cultures in Europe. Some respondents, however, would like to see and accept more EU influence on insufficient urban policies of national governments. They even pointed to the danger that politicians in national and local governments in Europe are tempted to make superficial adjustments to local and regional conditions when applying for financial funds from the European Commission. Generally, European regional policy is viewed as a spatial strategy with strong social and cultural dimensions. That is why opinions were expressed relating to the fact that European regional policy should have a stronger impact on sector politics, e.g. economics, energy, transport, and competition.

The great importance of mutual learning through European projects and cross-border co- operation was emphasized in many answers. Many respondents stressed the importance of a cross- fertilizing exchange of experiences in the complex multi-level system of planning and decision-making in Europe. They would also accept some European guidelines on social and sustainable urban development.

**Conclusion**

The Europe-wide exploration has given a broad spectrum of answers to our questions. They give a good overview of challenges and problems planners are facing in their countries. And they show some of the concerns they have when doing their work in universities or planning practice. The answers tell much about the present mood of planners towards their discipline. They reflect the enormous path dependency of planning in the different countries of Europe. Planning in the North differs from planning in the South or in the East of Europe. Planning at the local level is fully accepted all over Europe, even though the public sector is loosing gradually its former dominance over urban development, while sharing the power with private investors and developers. Traditional regional (spatial) planning, in turn seems to losing out. The field has no more political support it has no strategic alliances, nor influential supporting lobby groups, apart from environmentalists and water authorities. Why?

The respondents could not elaborate on the reasons for this decline, and it is unclear whether it is just a temporary phenomenon, or the expression of a time, where most public infrastructure has been built and neo-liberal policies dominate the society and political milieus. Maybe regional planners themselves have contributed, too, to this decline having gradually lost contacts to people and investors, when writing their planning poetry loaded documents. Though there is some hope. Focussing on the future of polycentric city regions, regional spatial planning may soon experience a renaissance. In these city regions, where most households live, and most jobs are offered, the responsible political leaders will soon realize that development can only be guided by strategic spatial planning dealing with all the emerging challenges and with the conflicts between people, stakeholders and nature. Such strategic planning would have to be totally different from the traditional land-use-focussed regional planning of the past. it has to be strategic, both visionary and rooted into the city region's territorial potential. It has to be communicative and carried out in close co-operation with all the stakeholders in the city region. Planning for and in such city regions requires a broad range of planners, with quite different competences. Some have to be general and visionary, others have to be specialists in one of the many areas, where action has to be taken, whether in planning for mobility, social inclusion, creative industries or energy conservation, or in urban design and conservation or in other fields, where specialist planning competence is required. In such regions conflicts have to be moderated. Particularly there city region development aims and compromises have to be continuously communicated to policy makers, citizens, investors and media.

This makes clear that planning schools have to prepare for a diversity of challenges in their professional field. They have to build bridges from theory to practice, and from practice to theory. They have to bring practice back to universities to enrich education and research. In the recent past, many disciplines have explored the spatial turn in their research. Their competence is needed as well to raise the knowledge of city building, to create liveable and affordable spaces for cosmopolitan citizens in city regions., and to sustain an endangered environment.

# CROSS-BORDER COOPERATION AND THE SPACE GOVERNANCE RESCALING OF BORDER PROVINCIAL CAPITAL CITIES IN CHINA

Xiaoxi Li[1], Zhenwei Peng[1], Yisha Lu[2]

[1] College of Architecture and Urban Planning/Tongji University, dudoualex@gmail.com
[2] College of Civil Engineering and Architecture/Guangxi University, lysa421@live.cn

Keywords: Cross-Border Cooperation, Border Provincial Capital Cities, Space Governance

***Abstract***

*Border provincial capital cities have achieved more attention from superior governments in the background of Cross-Border Cooperation (CBC), and have been given more national functions of political, financial, trading and cultural exchanging functions. All CBC functions are determined and carried out by all levels of government based on different targets, and reshape these cities' space governance scale by multi-objective and multi-level governments' coordination and cooperation. This paper suggests that there should be multi-level analytical framework for border provincial capital cities developing especially in China, for the reason of the top-down politic and administrative system. First of all, it reviews CBC policies and spatial effect at 3 levels of government (central, provincial and city government) on Nanning (provincial capital city of Guangxi Zhuang Autonomous Region). Secondly, it analyses the characteristics of spatial plan and development, taking Wuxiang New District (WND) as an example, and argues that the spatial development policies of WND was guiding by central and provincial governments which even partly dominated its spatial structure. At last, it holds that local cooperating space emergence is under the control of central government, and local cooperating innovation in policy and space (including provincial and city levels) is the fundamental reason of local space diversification. The space governance of provincial capital cities is an indication of top-down guidance and bottom-up innovation, carried out by central, provincial and city government coordination.*

## 1. Introduction

Cross-Border Cooperation (CBC) is a type of regional governance based on different targets of various participants and shows diverse features because of differences in political, economic and social conditions between subnational districts adjacent to national border (Scott, 1999； Blatter, 2004). In East and Southeast Asia, economic development is a primary objective of CBC, trying to integrate and optimize resources allocation to form a "growth triangle" and improve condition of regional and national economic development (Perkmann, 2007). There are two cooperative modes (Sum, 2002): "the globalization embedding" and "the politics of open regionalism". CBC between China and adjacent countries adopts a more loose approaches (on political and social aspects), and takes "non-institutional cooperation model (Zhu, 2012)" even in economic cooperating process. It is still in the preliminary stage of regional economic integration (Lan, 2006). Therefore, case study is the only way to understand the CBC policies and its influence on the border region.

From late 1980's, with continuous improvement of political relations between China and neighbouring countries, central government carried out Border Opening (BO) policy to promote economic development and social stability of border regions, taking foreign trade and border cities as objects. Since 2000, this policy gradually shows conversion to comprehensive cooperating policy (including political, financial, transportation, legal aspects) and takes border provinces as spatial subjects (Li & Lu, 2014). Therefore, capital cities of border provinces have acquired more CBC functions from central and provincial governments. Space layout of these CBC functions from higher authorities is not determined by city governments, but a result of coordination among all levels. From the perspective of policy implementation, CBC has promoted economic and social development in border provinces and cities (Li, 2005, Brzica, 2008, Hu, 2011), but the impact on space of provincial capital cities remains ambiguity. Nanning, capital city of Guangxi Zhuang

Autonomous Region border with Vietnam, southwest in China, has expanded rapidly both in economy and space under the effect of CBC. Its economic factors, urban space functions and images are showing more characteristics of internationalization. However, these features are not only the appearance of "glocalization" but also CBC regionalization and internationalization (Li & Lu, 2012). In general, evolution of space structure is driven by conflict and coordination among "city government, enterprises and citizen (Zhang, 2001; Shi, 2004)", and city government is the most crucial subject. But in the context of CBC, central and provincial governments play a more important role in Nanning's space evolution. Taking Nanning and Wuxiang New District (WND) as example, which is a developing hotspot in southeast Nanning city, and focusing on CBC policies evolution and their spatial effect from 3 levels of central, provincial and city government, this paper reviews Nanning and WND spatial plan and development, and tries to explicate the mechanism of space evolution influenced by governments at all levels in CBC process.

## 2. CBC Policies at 3 Levels and Spatial Effect in Nanning

City government is undoubtedly a significant subject of local space policy making, but the exclusive perspective from city level neglects the spatial effect of central and provincial policies. Because of the differences of power and obligations, policies proposed by governments at all levels have different spatial effects (Zheng, 2009). In China, city's policies are constrained by higher-level governments. Especially in CBC, all crucial policies (such as tax incentives) are still strictly controlled by central government, and these policies largely determine the content and intensity of cross-border flowing factors and affect spatial formation and evolution of provincial capital cities. Meanwhile, higher-level governments also reserve power of control and coordination in China's urban and rural plan approval system, (some cities' master plan needs to be submitted and approved by provincial government or the State Council). In that sense, it provides a legal basis of central and provincial government's direct intervention in cities' spatial development and plan. In addition, with challenges of globalization, decentralization makes it possible to local space policy innovation from city government.

### *2.1 Central Government Cooperating Policies and Spatial Effect*

After the reform and opening up in 1979, "taking economic development as central task" has been national value guidance. Nanning, as the provincial capital city of Guangxi, should be the core of provincial economic development, but undertakes national military deployment and transportation functions because of military conflict between China and Vietnam. In this period, military preparations had been as dominant goal of Nanning development, and large enterprises or high-rise building constructions are banned. In 1980, instructions from Guangxi provincial government suggest that "In the future, universities, scientific research institutions and new large factories are not to be located in Nanning city as far as possible, and new industrial zones are not established except existing ones." Until 1991, China-Vietnam relations were normalized, and then in 1992, Nanning was approved as a coastal open city, and corresponding beneficial policies was provided. Normalization of China-Vietnam relations not only provides the political foundation for taking Guangxi and Nanning as subjective space of CBC, but also accelerates the growth of economy and space of Nanning (Figure 1). Beginning from 1991, formal dialogue between China and Association of Southeast Asian Nations (ASEAN) was started. In 2002, *FRAMEWORK AGREEMENT ON COMPREHENSIVE ECONOMIC CO-OPERATION BETWEEN THE PEOPLE'S REPUBLIC OF CHINA AND THE ASSOCIATION OF SOUTH EAST ASIAN NATIONS* was signed, and decided to establish China-ASEAN Free Trade Area (FTA) within 10 years. This is a landmark of formal establishment of supranational coordination mechanism. From 2005 to 2009, *AGREEMENT ON TRADE IN GOODS*, *AGREEMENT ON TRADE IN SERVICES*, and *AGREEMENT ON INVESTMENT* had been signed, and *AGREEMENT ON DISPUTE SETTLEMENT MECHANISM* was signed in 2011. A series of agreements provide institutional foundation for cooperation among countries.

Although Nanning is not bordered with other countries, city development is affected by border effect. From the view of economy and space developing history, it can be divided into three stages (Figure 2). Stage 1, fluctuation between China and Vietnam, marked by normalization between two countries in 1991. Economic growth had been slow and volatile, and GDP growth rate was even lower than national and provincial average as capital city of province, down to only 0.2% growth in 1984, and built-up area had been growing 3.8km$^2$ per year. Stage 2, implementation of BO policy from 1992 to 2000, marked by China-ASEAN FTA was proposed in 2000. Nanning economy is in the stage of recovering, whose GDP growth rate surged sharply to the peak in 1993 (23.5%) and dropped gradually below the average of nation and province in 2000. At the same time, built-up area had expanded rapidly at the pace of 5km$^2$ per year. Nanning High-tech Industrial Development Zone and Nanning Economic and Technological Development Zone were set up, and education, research and residence land synchronous expanded. Stage 3, implementation of CBC policy from 2001, marked by Nanning was determined as permanent site of CHINA-ASEAN Exposition (CAEXPO). The speed of economic growth gradually rises and is higher than China and Guangxi average, and Nanning has been the largest economy of Guangxi from 2002. Built-up area grows 11km$^2$ per year.

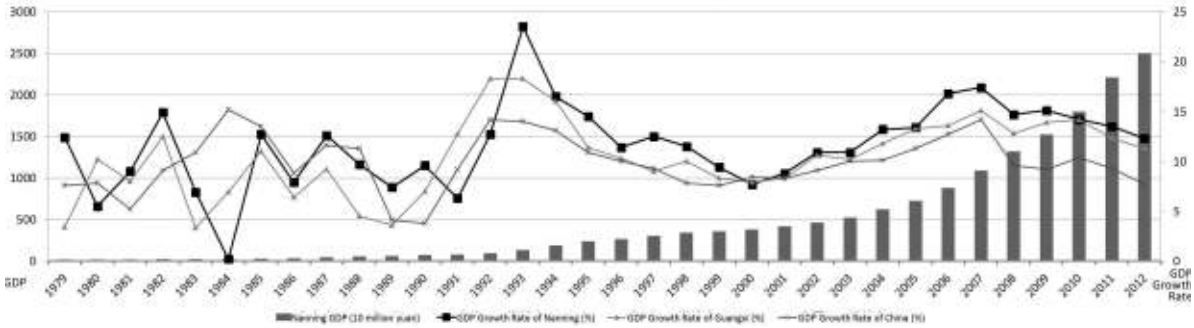

Figure 1. 1979-2011 GDP and GDP Growth Rate of Nanning, Guangxi and China
Data Source: Statistical Yearbook of Nanning, Guangxi and China

Different from border cities adjacent to other countries, provincial capital cities' CBC is not for a single country but a range of countries as capital cities of economic, political and cultural centre of border provinces in China, such as Harbin (Heilongjiang province in northeast) for Northeast Asian, Urumqi (Xinjiang Uygur Autonomous Region in northwest) for West Asian, and Nanning for ASEAN. Nanning has been endowed the platform of China-ASEAN cooperation, and this is also supported by national and regional development policy carried out by central government. These regional development policies, promulgated by central government, advance city function positioning. Nanning was positioned as "the bases of logistics, business, trade and manufacture, and the centre of information exchange (i.e. 3 bases and 1 centre)" of China-ASEAN cooperation – in *Guangxi Beibu Gulf Economic Zone Development Plan (2008)*. Also in "*Pearl River and West River Economic Zone Development Plan (2014)"* proposed to support relevant industries development —"taking advantage of central role in pilot border-financial reform zone, and giving support to foreign financial institutions for opening new branches, international or regional management headquarters, business operation headquarters, backup service centres and training bases". On the other hand, Bonded Logistics Park, political agencies and other cooperation projects etc. (e.g. China-ASEAN Business District, China-ASEAN Science and Technology Park of Modern Agriculture Cooperation) are directly set up in Nanning in national documents. Considering CBC opportunity, the State Council approved to adjust administrative districts (i.e. incorporation Yongning into Nanning) in 2004, and resulted in built-up area sharp expansion in 2005. In general, changes in central government policy – from military conflict to border opening and cross-border cooperation –significantly impact city economy and space of Nanning, especially in CBC period. Meanwhile, central government policy is a fundamental condition for CBC at local level.

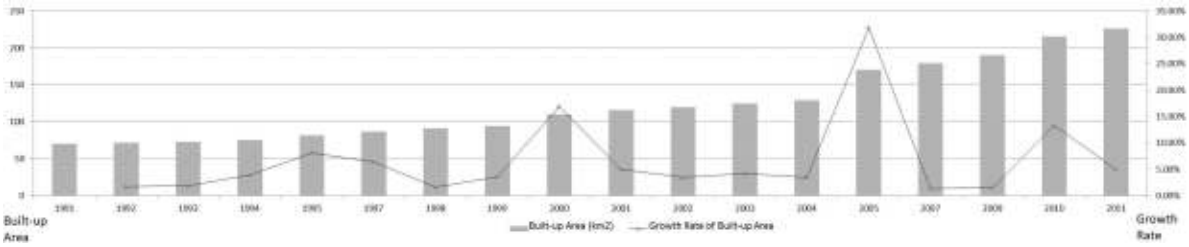

Figure 2. 1991-2011 Built-up Area and Growth rate of Nanning

Data Source: Statistical Yearbook of Nanning, Guangxi and China

*2.2 Provincial Government Cooperating Policies and Spatial Effect*

Because of the sensitiveness of coordination and decentralization in CBC, border provincial government takes more significantly role in coordination and participation which is not merely market-oriented in other cities with the Reform and Opening-up Policy. Decentralization from central government empowers province limited autonomy in CBC and provides some incentive mechanism which formed "multi-level branched institutional arrangements (Su, 2010)". But border provinces mainly concentrate in "lower politics (Wang, 2012)" such as economy and trade, environmental protection, cultural exchanges and other fields. Taking education as an example, the number of international students from ASEAN reached 7400 in Guangxi and 5000 studying in ASEAN countries from Guangxi (data source: Li, 2013). This makes Guangxi as the most important province of exchange students between China and ASEAN.

Under institutional incentives in finance, tax revenue and promotion of local officials (Zhang & Li, 2012), based on implements of central CBC policies, provincial government creatively formulates local CBC policies and tries to stay in CBC pivotal position between countries. In 2007, "China - Indonesia Economic and Trade Cooperation Zone" was established, which is the first state-level economic and trade cooperation zone in Indonesia. This is also the first national foreign trade and economic cooperation park undertaken by Guangxi, and *Guangxi Nongken Refco Group Ltd*, which is a state-owned enterprises located in Guangxi, was selected as the developer. In addition, "China - Malaysia Qinzhou Industrial Park" was founded in 2011, located in south of Guangxi, which is the third cooperation park between China and foreign central governments. With the approval as core space of CBC between China and ASEAN from central government, provincial government has been trying to expand its influence in ASEAN countries (such as "Guangxi Commodities Expo", held annually in ASEAN countries by Guangxi provincial government). Meanwhile, national CBC organizations are set up in Nanning by provincial government, e.g. China - ASEAN Institute, China – ASEAN Culture Research Association, Guangxi China – ASEAN Culture Promotion Association. It is clear that provincial government plays a role of initiator and promoter in a sense (Su, 2010).

As the capital of Guangxi, Nanning is the economic, political and cultural centre of province. And for that, Nanning has been further empowered from provincial government for promoting CBC effect. In "*the National 12th Five-Year Plan (2011)*", it proposed to turning Guangxi into "a highland of China – ASEAN cooperation". Later in 2012, "*Several Suggestions on Accelerating Highland Strategy Implementation of Nanning Inland-Opening Economy of Guangxi*" was published by provincial government, and 24 administration authority, including investment finance and taxation, land management, license and qualification management, price management etc., was empowered to city government to promote Nanning's economy. The decentralization increases autonomy of Nanning city spatial development.

*2.3 City Government Cooperating Policies and Spatial Effect*

City government is truly not a sovereign actor, so its supranational power comes from higher-level government authorization and permission. At present, cities have been one of subjects of regional

and national competition with market-oriented reformation in China. Connection between provincial capital cities of border provinces and neighboured foreign cities and regions has been strengthening by CBC, and city government has strong motivation to participate in CBC in decentralizing context of authority-responsibility adjustment. After Nanning was positioned as "3 bases and 1 centre" by central government, Nanning city government proposed "regional modern logistics base, advanced manufacturing industry base, characteristic agricultural industry base and international centres transportation, information exchange and finance (i.e. 3 bases and 3 centres)". It can be seen that Nanning city government tries to innovate and undertake more important economic functions in CBC countries, based on implementation of national policies.

However, with economy diversity in CBC regions and different central and local policies, border provincial capital cities' internationalization shows both globalization and CBC-regionalization characteristics. From the view of foreign trade and foreign investment development, Nanning shows CBC-regionalization characteristics – ASEAN countries are the most important partners of foreign trading and investment abroad. At the same time, because of insufficiency of economic growth supporting for Nanning from CBC countries, city government actively participates in globalization. For that, globalization characteristics are also shown in foreign trade and foreign investment aspects, especially in foreign direct investment (FDI) – the most important source of Nanning's FDI is from Hong Kong and US. In addition to economic cooperation, local policies are published to strengthen social interaction with ASEAN countries. In 2011, "*Scholarship Management of ASEAN Foreign Students*" was published to encourage and reward foreign students from ASEAN sister-cities in Nanning. In recent years, city governors and industry professionals have been organized to Singapore for learning and training, and Singapore has been an important window for Nanning learning from abroad.

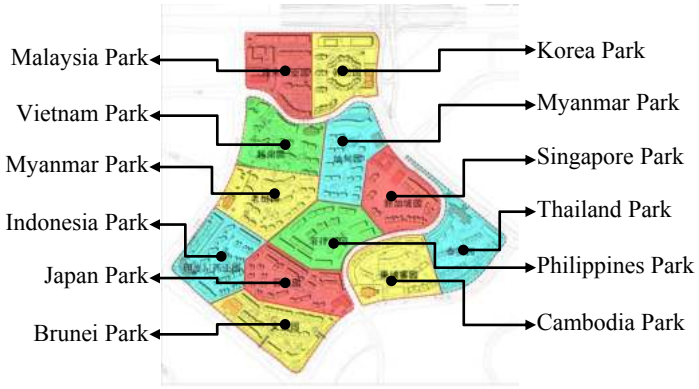

Figure 3. Zoning of China – ASEAN Business District

Source: Development Control Plan for China – ASEAN International Business District

The international behaviour innovation of city government can be carried out only in independent and autonomous space. As the direct subject of city government's public policy, city space is designed and reshaped with some international characteristics of spatial form of CBC countries for city marketing. Because of aspiration of integration into China – ASEAN cooperation, Nanning tries to maintain its status with Southeast Asian's architectural features called "tendency of splendid Southeast Asian (Yuan & Feng, 2010)". For example, in China – ASEAN Business District, it shows collage by buildings of ASEAN countries (Figure 3). In addition, not only central government's CBC projects are located in Nanning (e.g. Modern Agricultural Science and Technology Park), but also local CBC projects are blooming. It can be seen that urban space named by "China – ASEAN" or "ASEAN" increases, such as *China – ASEAN Cultural Products (Publications) Logistics Park*, *China – ASEAN Youth Training Base* and *China – ASEAN Headquarter Base*. Some of these CBC districts involve government, enterprises and non-governmental organizations of CBC countries, but most of all are local projects developed by local government and enterprises.

Although the lower-political projects are still at local level, they are useful supplements to CBC between countries because of the controllability of political and economic risk, and could be approved by central government in some scenarios. Such as "China South City" in Nanning, annually holds *China – ASEAN Expo of Light Industrial Products* from 2009, and approved by China prime minister as "*China – ASEAN Commodity Exchanging Centre (CACEC)* as trading platform and the logistics base" in 2011. After that, CACEC was founded as the first trading and logistics project with national governments of all levels and enterprises, which provided rent free for five years to distinctive products exhibition and trade from ASEAN countries. By now, all local leading policies made by Nanning government, including "*the 12th Five-Year Plan*", "*Master Plan of Nanning City (2011)*" and "*Land use Master Plan of Nanning*" etc., have consider CBC with ASEAN as one of the most important factors about city development, and are eventually implemented with characteristic space.

## 3. Spatial Plan and Development – Wuxiang New District (WND)

WND locates in southeast of Nanning central urban area (Figure 4). From China – ASEAN Expo has been held annually in 2004, "Regional-International City" has been proposed as main goal of city development, and administrative districts adjustment was carried out for spatial expansion and optimization. After that, master plan was started and WND was emphasized as focal point of spatial growth. In 2006, "Concept Master Plan of Wuxiang New District" was published as guideline of spatial development by Nanning city government. The following in the passage is about the spatial plan and development of WND.

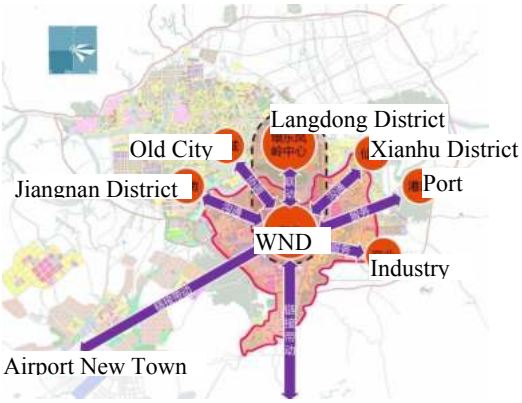

Figure 4. WND location in Nanning central urban area

Source: Concept Master Plan for Nanning WND

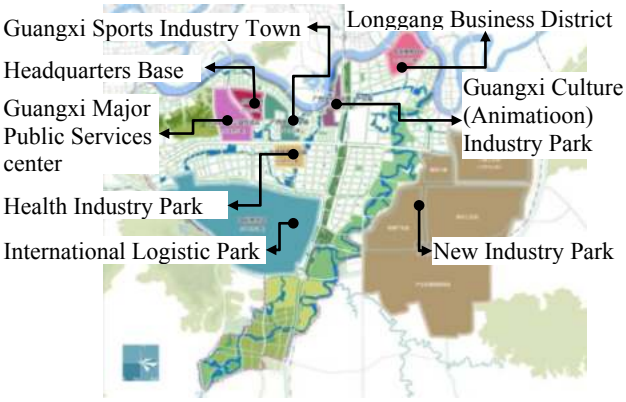

Figure 5. 8 Plates of WND

### *3.1 Spatial Plan and Development of WND*

With the main goal of "Regional-International City", CBC effects on WND economy and space have been highlighted at the very beginning of plan. It holds that CBC projects – cooperation between Beibu Gulf urban agglomeration (including Nanning, Beihai, Fangchenggang and Qinzhou 4 cities) and ASEAN countries, CAFTA and Great Mekong Sub-region Cooperation (GMSC) – will significantly impact economy, technology and culture of Nanning. Therefore, "modern city of influencing ASEAN" is emphasized in development goals, and WNC's functions are defined as "the logistics, trade, manufacturing base and information centre of CAFTA, and new headquarters base of Pan Beibu Gulf (PBG) Economic Zone". Besides, national cross-regional cooperative policies, such as "Go West Strategy" and "the Pan Pearl River Delta Regional Cooperation", and provincial preferential policies are considered. And functions are determined as not only a southwest access to the sea and trading and logistics centre at national level, but also an administrative centre at provincial level. Multi-scale policies and flowing factors have got local government's attention.

In consideration of the multi-scale preferential policies and flowing economic factors, 8 functional plates are emphasized in master plan (Figure 5). These plates not only carry provincial administrative, commercial and public service functions, but also reflect the goal and requirement of CBC participation. For example, provincial sports functions are located in the plate of *Guangxi Sports Industry City*, including *Guangxi Sports Centre*, *Guangxi Sports Education Base* and *Guangxi Olympic Training Base*, and CBC project of *China – ASEAN Sports Communication and Cooperation Experimental Area* are integrated in the same area. It is same in *Guangxi Culture (Animation) Industry City*, *China – ASEAN Cultural Industry Talent Base*, *China – ASEAN Digital Publishing Base* and *China – ASEAN Cultural Products Logistics Park* are integrated into other local cultural and residential functional space. It is clear that provincial government has been actively involved in WND plan and tries to enhance mutual connection with CBC countries.

The plan of International Logistics Park (Nanning China-ASEAN International Logistics Base) started from "Logistics Industry Adjusting and Revitalization Plan" published by central government – Nanning was defined as one of the 21 national logistics node city in 2009. At the same time, "Nanning Bonded Logistics Centre (NBLC)" was checked and started operating in 2010. As a "dry port", it enjoys export tax rebate, import bonded and free transfer policy. In Feb. 2010, Nanning was identified as "the National Demonstration City of Modern Logistics Industry". Under the support of a series of top-down preferential policies, "*Nanning China-ASEAN International Logistics Base Regulatory Plan*" was approved by city government, and positioned as "the comprehensive bonded zone and international modern logistics park for serving CAFTA and southwest China, and the new district including modern logistics, trade, advanced manufacturing industry and residential functions".

As can be seen, the plan of WND is not just an area of city spatial expansion as a result of population growth and only depended on city government, but a target area under the guidance of multi-level policies made by governments at all levels. In WND, NBLC could only be approved by central government, and provincial administrative and public service functional space needs provincial government's permission. The most important functional space of CBC is a result of coordination between governments at different levels and an innovation of local government based on its own overall targets.

*3.2 Development of WND under CBC*

Unlike other districts, led by city government, provincial government has participated in WND plan and development at the very beginning. In 2006, provincial government of Guangxi proposed that Nanning should focus on the goal of regional-international city and prioritize the development of WND. With provincial government support, "Decision on Accelerating Development of WND" was carried out by city government in 2007, which provided a series of preferential policies. In 2013, the administrative level of WND had been promoted by provincial government to accelerate development.

WND built-up area had expanded 3-4km$^2$ annually until 2013, and had been an important area of Nanning city spatial growth – accounting for 25% of total amount. By now, land of public administrative and service facilities accounted for 32.13% of WND's total, just less than residential land 34.24% (including housing development and resettlement of farmers). It is obvious that the spatial expansion mechanism of driving by public facilities. In master plan, WND is defined as the centre of information and headquarter for CBC countries, but spatial agglomeration of regional headquarters has not appeared in WND – business facilities land (including business services, commercial and financial land) accounted for only 8.7% of total. It has demonstrated the features of public-dominated cooperation. Although regional headquarters have not agglomerate in WND, but CBC effect on Nanning has been recognized by market – some enterprises have set up regional logistics centre in Nanning. And some enterprises have transferred customs clearance business from Guangdong to Nanning since operation of NBLC, showing the "arbitrage economies (Altvater, 1998)" features in border areas. At the same time, WND also attracted national large

projects and enterprises such as Yurun Global Procurement Centre of Agricultural and Sideline Products and Beibu Gulf Paper Trading Market, and large manufacturing enterprises such as Good Fortune Heavy Industry CO.,LTD (GFHI) and SANY Group.

Generally speaking, spatial plan and development is driven by all-level policies and market behaviours under the background of CBC. Central government promulgates macro policy of CBC and gives WND possibility of participating in CBC, and directly approves and sets up "Bonded Logistics Centre". So, the central government is the basic impetus of local spatial expansion. No doubt, provincial administrative and public service functions influence capital city's space, and provincial government has powerful influence on site selection of significant CBC projects. Nanning city government proposes master plan and developing goal based on preferential policies of higher levels, and limited cooperating space and activities are innovated to strengthen local cross-border linkages.

## 4. Rescaling Mechanism of Space Governance

Unlike other regional developing and coordinating policies, CBC refers to political, cultural and social cooperation which is strictly controlled by central government. Therefore, the decentralization of diplomatic power to local government is minimal, and city spatial development is firstly influenced by macro policies and must be subordinated to national interest – a frontline of defending and attacking or a gateway and channel of communication between two countries. The former excludes economic, social and cultural space agglomeration in city, and results in smaller spatial scales and slower spatial expansion; the latter brings about preferential policies and CBC projects at different administrative levels, and results in rapid spatial expansion.

Border provincial government has been one of crucial participant of CBC between China and other countries. It organizes and implements national CBC projects, and coordinates cross-border flowing factors among cities in province, and innovates local CBC policies cautiously, e.g. integrates local exposition into CBC Expo, and founds relevant CBC research academies. In china, provincial government could be seen as an ally of central government in the process of CBC (Su, 2012). In general, provincial rarely involves in city spatial plan and development directly. But as political centre of province, capital city's space governance will inevitably be affected by higher-level government activities. In addition, provincial government is a more significant partner than city in CBC process, and some important projects still need its approval and coordination.

The city government is given limited power in CBC, so its main role is to implement the policies and projects of higher-level government. But, participation in CBC is conducive to attracting factors agglomeration and enhancing the level of city economic development. For that, city government can only reshape the image of city by limited authorization, such as naming specific area and introducing distinctive buildings of CBC countries, in order to attract more CBC functions and economic factors. In this process, city government has also innovated cooperating modes in economic, social and cultural aspects to improve city's status. Implementation of higher-level policies provides new impetus for city. As the direct manager of city space, city government integrates multi-level policies and projects into its own developing goal, and specific spatial pattern has ultimately formed.

## 5. Conclusions

For a city, all-level policies impact the evolution of city space to a certain extent, but border province is the most direct region which "territorial logics conflicting with functional logics (Blatter, 2004; Popescu, 2008)" and more sensitive to higher-level policies. Under the background of CBC dominated by central government, provincial capital cities' economy and space is expected to expand, and innovation in local policy and space will be possible to promote to national level if it is approved by central government. Therefore, local government is possible to be the leader and innovator of CBC between countries based on its own interests and judgments. In general, all-level

CBC policies impact space of provincial capital city. The fundamental driving force of city spatial growth comes from implementation of central CBC policies and relevant space supply. With provincial supporting policies, local space is integrated in macro CBC policies by local government's innovation in policies and space. The multi-level CBC policies complicated the content and intensity of flowing factors in provincial capital cities, and rescaled spatial governance. Multi-level space governance of provincial capital cities should be paid more attention for understanding mechanism of spatial evolution.

# PLANNING WITHOUT BORDERS: IMPLEMENTATION OF MARITIME SPATIAL PLANNING DIRECTIVE (2014/89/EU) IN THE ADRIATIC IONIAN REGION

Francesco Musco[1], Elena Gissi[1], Federica Appiotti[1], Irene Bianchi[1], Denis Maragno[1]

[1] University Iuav of Venice, Department of Design and Planning in Complex Environments, Ve
msp@iuav.it

Abstract
Over the last decade, in response to the increasing demand for maritime spaces a
2012), a growing attention has been paid to Maritime Spatial Planning, identifi
promoting a rational allocation of maritime uses and for balancing the demand for
maritime activities with the need to preserve the integrity marine ecosystems (Ehl
tough spatial planning is not a formal EU competence, the European legislator has
develop a common approach to maritime spatial management across all Member States
COM(2008)791 final). In particular, with the entering in force of the new Directiv
be ratified within 2016, all Member States will have to identify competent author
boundary maritime spatial management plans within 2021.

The development of trans-boundary MSP and its integration with existing planning s
of specific challenges, mainly in terms of cooperation efforts, which are required
adaptive planning schemes in marine spaces (Ehler & Douvere, 2009). The first or
boundary cooperation. The adoption of an ecosystem-based approach to MSP (Dir. 200
necessity to stimulate neighbouring countries to embed their marine spatial plan
context that takes into account ecosystem issues beyond their national boundaries
the same time, the cross-border nature of maritime affairs requires a strong
barriers imposed by administrative borders and international framework agreements
also be fostered among subjects with authoritative power on maritime spaces a
planning authorities, in order to promote a multi-scalar approach to MSP and to ov
national and sub-national scale. A second, important, organizational challenge co
coordination: it is indeed necessary to promote the cooperation among public bod
the sectoral development of those maritime activities, whose management has to be
MSP umbrella. Finally, MSP should be based on a continuous process of institutio
based on mixing expert, scientific and sectoral knowledge and ultimately aimed a
planning process.

The guiding question to be answered in this work concerns the role that planners s
On the one hand, it is argued that spatial planners could guide this coordinat
organization of collaborative and adaptive MSP, also contributing to foster the in
existing land planning systems (Smith & Maes, 2011). On the other hand, it is
will have to significantly update their professional skills and competences to p
challenges posed by trans-boundary MSP issues.

As an example, the case of the ADRIPLAN Project (ADRIPLAN.eu) will be presen
supported by the DG Mare - is setting the first example of maritime spatial pla
Ionian Macroregion, involving 6 countries in the basin (Italy, Slovenia, Croat
Greece). It will test a transboundary MSP example for the AIR and for two focus
realistic scenario at 2020 and proceeding with the definition of an actions por
programs 2014-2020, local land and coastal planning, regulative and legal system
planning test for AIR will terminate by July 2015.

## 1. Introduction: towards a common maritime spatial management in the EU

Coastal and marine ecosystems have been subjected to increasing anthropogenic p
fifty years (UNEP MEA 2005). The demand for maritime and coastal spaces for diff
one for natural resources are indeed constantly and rapidly increasing (UNESCO 20

2009). On the one hand, this is leading to an overexploitation of marine and coas
loss of biodiversity in marine and coastal systems and to the consequent decr
ecosystems to produce ecosystem services (see Worm et al. 2006). On the other han
have emerged with respect to the use of marine and coastal spaces. As a consequenc
develop a comprehensive framework capable of promoting the definition of common ma

The need to define policies and tools for the integrated management and planning
areas has acquired an increasing relevance in the European context. The EU l
foundations for the development of an Integrated Maritime Policy (IMP, launched t

Blue Paper), which in general terms aims at conciliating economic developm
have been established by the Blue Growth Strategy (2012/494/EU) – with marine a
requirements, as defined by the Marine Strategy Framework Directive (Dir. 2008/
identified Maritime Spatial Planning (MSP) as a proper tool to be used for the rat
uses. According to the new Directive on MSP (2014/89/EU), all Member States wi
Directive within 2016, to identify competent authorities for MSP and to dev
management plans within 2021.

A functional coexistence of human activities in the marine space and the reduc
marine and coastal environment are some of the main goals of the European polic
Directive 89/2014 identifies MSP, using an approach ecosystem-based (EBA), as t
achieve these goals. Eheler and Douvere (2007) defined Maritime Spatial Planning
analyzing and allocating the spatial and temporal distribution of human activities
achieve ecological, economic and social objectives that have been specified throu
order to be effective, the process must have some key characteristics. It has to
both across sectors and governments, adaptive, thus capable of learning from exp
oriented, and ecosystem-based. The application of an ecosystem-based approach ai
collective pressure of all the human activities is kept within levels compatibl
current ecosystem services and that the capacity of marine ecosystems to respond t
is not compromised. As a matter of fact EBA is defined a process that recognizes t
the ecosystem as a whole and humans as part of the ecosystem and of its dynamics.
of ocean space are thus closely interrelated and need to be considered as a w
ecosystem-based approach are to: (i) balance the increasing number, diversity
activities with the sea s ability to provide services; (ii) incorporate appropria
and cultural perspectives; (iii) support management that is coordinated at the sc
political jurisdictions (Foley et al. 2010).

## 2. Implementing Maritime Spatial Planning: new challenges to be faced

A first important element to be considered when approaching MSP is that it is a
researchers, planners and practitioners. Despite a number of approaches to in
developed, a common methodological framework has not yet been established. Further
have been implementation, so that there is a substantial lack of transferable bes
the development of the different phases which composed the adaptive MSP planni
consideration concerns the difficulty of applying a common framework to a process
place-based, i.e. grounded on the specificity of local economic and ecological dyn

In this framework, a major challenge is represented by the development and imp
within a context the maritime one where borders are often uncertain and fleeti
to the one used in land-based planning. A substantial lack of well defined mar
boundaries is often accompanied by disagreements among involved authorities and st
to the boundaries established. The adoption of transboundary planning in a maritim
at least four significant challenges:

1) Integrating MSP in existing (land-based) planning schemes

The inclusion of maritime spaces within existing planning systems constitutes a fu
at the governance and at the implementation level. It deals not only with the app
MSP, but also with the adoption of a new perspective in approaching both to ma
planning. The integration of MSP in the existing, land-based, planning schemes r

2) Defining shared management and planning boundaries

Notably, the need to adopt a new, sea-oriented, perspective does not only emerge f
specific normative provisions (i.e. to the elaboration of MSP plans within 2021),
necessity to solve both user-user and environment-user conflicts. This need h
local/regional scale, and has been raised by stakeholders involved in the use/ma
coastal spaces. The necessity to define, at different scales  planning and mana
shared by different authorities and involved stakeholders is crucial in order
politically accepted plan.

3) Define boundaries capable of embracing ecosystems

The previously described ecosystem-based approach to maritime spatial planning
planning measures that consider the specificity of local ecosystems and environ
pursue this objective, a significant effort is needed to overcome the definition o
considering political issues related to competence areas (e.g. national boundari
traditional approach to boundary definition should necessarily be based on trans-b

4) Knowledge sharing

Finally, the definition of integrated MSP strategies and actions should be based o
information and, in more general terms, on a mix of expert, scientific, operat
Acquiring data and information from different sources (including relevant sta
overcoming of science-policy barriers and the fostering of cross-border cooperat
acquisition and management.

## 3. A new role for planners

The challenges described in the previous part require a revision of the role that
complex process of decision-making posed by MSP. As a matter of fact, an effective
and coastal areas involves not only technical capabilities of problem solving, bu
building among sectors and economic actors, capacity building between communiti
policy-makers, and sharing of knowledge and technical data as recommended in the E
Policy (IMP). MSP requires a substantial new role of planner as coordinator of
disciplinar competences. In certain sense planner as to anticipate the extensio

include in the planning team planners with heterogeneous knowledge and expertise.

## 4. Lesson learned from the EU experiences

Following the increasing importance attributed to ICM and MSP and within the no
has led to the elaboration of the Directive on MSP, a number of planning exercis
been developed at different scales. Within the EU, the most relevant examples
financed by the European Commision – are the following (see EC  Maritime Affairs

1. BaltSeaPlan – Baltic Sea Region Programme project "Introducing Maritime Spatial
   Baltic Sea" (2009-2012): aiming at identifying MSP strategies for the Baltic
   eight focus areas, the project was strongly focused on cross-border cooperati
   coming from Germany, Poland, Denmark, Sweden, Estonia, Lithuania and Latvia c
   Vision for the Baltic Sea, based on the motto  Think Baltic, act regionally .
   identifies pan-baltic objectives and strategies, while establishing the princ
   according to which spatial challenges have to be dealt with at the lowest mos
   level.

2. Plan Bothnia[ii] – Preparatory Action on Maritime Spatial Planning in the Baltic Sea (2010–2012): transboundary pilot project developed in the Bothnian Sea. The Pilot Plan, jo Sweden and Finland and coordinated by HELCOM, aims at providing a long-term s area analysed, also considering possible developments in the land-sea interfa integration of maritime spatial plans in the existing national planning frame established cover ecosystem integrity; protected areas; maritime traffic; ren regional development.
3. MASPNOSE[iii] – Preparatory Action on Maritime Spatial Planning in the North Sea starting from the identification of specific priority uses and strategic sect the project developed an international fishery plan for the Dogger Bank in th an exploration of the potential for collaboration on the Thornton Bank in the North Sea.
4. TPEA[iv] – Transboundary Planning in the European Atlantic (2012–2014): the proj the DG Mare, the project involves partners from Ireland, Portugal, Spain and focused at developing a transboundary planning proposal for two focus areas, region (within the waters of Northern Ireland and the Republic of Ireland) ar Atlantic (within the waters of Spain and Portugal situated around Guadiana).

Such planning exercises have been developed not only to solve effective confl actual allocation of maritime uses, but also to define possible methodological and used in the definition of integrated and ecosystem-based maritime spatial plans. A planning exercises and studies, the following elements have a crucial role:

- Definition of a common vision for maritime areas of strategic importance at
- Enhancement of cross-border cooperation to support EU cohesion and integrate
- Acquisition of data and information related to local ecosystem dynamics, a economic and political characteristics of the uses analysed;
- Identification of relevant stakeholders to be involved in the definition of Establishing of a dialogue among the stakeholders involved in the use an maritime spaces;
  Increase of the coordination among policy makers and coordinators.

The most recent planning experimentation developed in this context is constitu project, financed by the DG MARE, which is finalized to propose and recommend a pl Adriatic-Ionian Region (AIR) (Fig. 1).

Figure 1. Adriatic Ionian Region (IUAV, 2014)

## 5. Implementing MSP in the Adriatic-Ionian Region: the ADRIPLAN Project

Concerning the AIR, MSP is an important part of EUSAIR (EU Strategy for the A Region), defined as an integrated framework to address common issues of EU Membe Countries located in the Adriatic–Ionian Macro-region. ADRIPLAN (which stands f maritime spatial PLANning) is a 18-months project started in December 2013, a experimentation led in the Mediterranean Basin. It aims at defining a commonly ag border MSP in the Adriatic-Ionian Macro-region, with a particular focus on two a Adriatic and the Southern-Adriatic/Northern-Ionian.

The project, coordinated by CNR-ISMAR, is developed by a transnational partn technical partners (mainly Universities and Research Institutes) which are respo project activities under the steering, the supervision and the support of 9 in regional authorities) and of an external Advisory Board. Through the direct involv and the inclusion of relevant stakeholders in different phases of the planning pro identify key issues to be faced, (ii) define strategic objectives to be set for th and cross-border planning options both in the macro-area and in the two focus are the elaboration strategic recommendations for the development of maritime spatial define a planning proposal for the allocation of uses in focus areas characterized and by high pressures of the identified uses on ecosystems and environmental ADRIPLAN also aims at constructing a solid knowledge base to be used within th available for the elaboration of future plans.

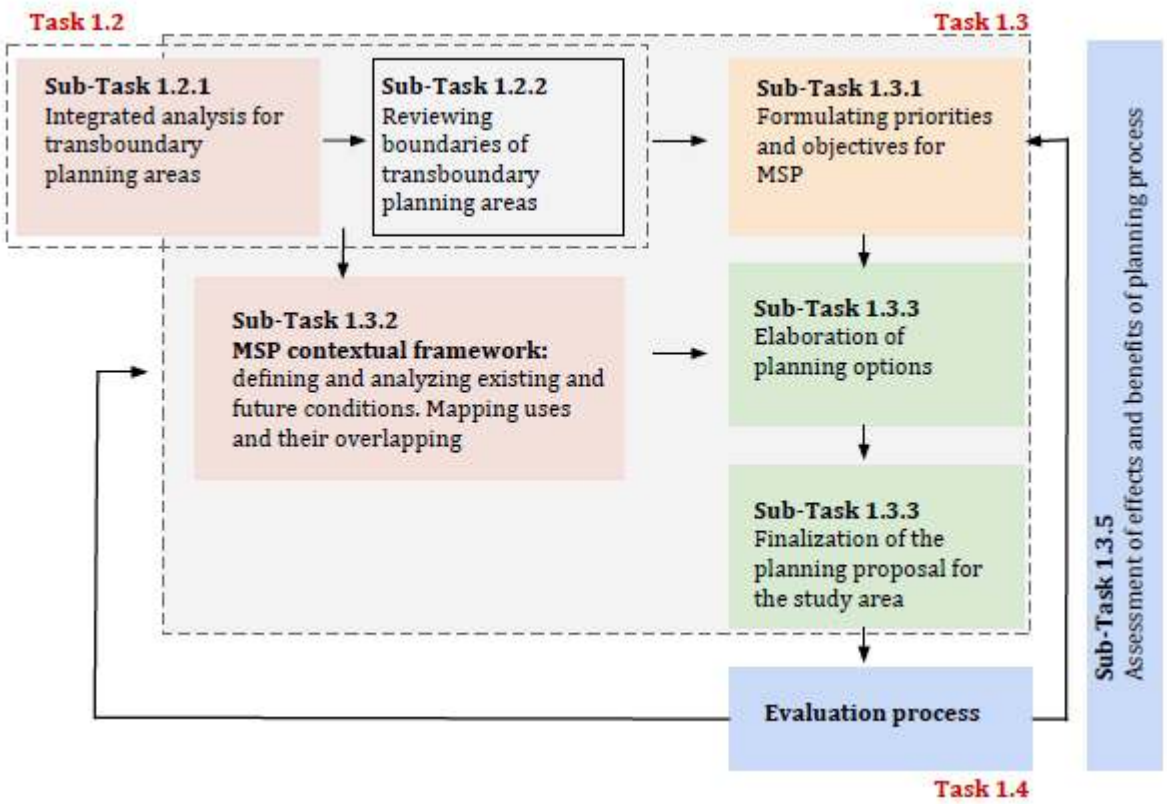

Figure 2. ADRIPLAN Methodology (IUAV, 2015)

Accordingly with the EU Directive on MSP (2014/89/EU), the literature availab
experiences conduced both at European and extra-European level, ADRIPLAN metho
following an Ecosystem-Based Approach. The project methodology is constructed to d
future oriented and integrate plan of the Adriatic-Ionian area and is articulated
First of all, an analysis of the transboundary planning area is structured to col
area s existing conditions, dynamics and current pressures on the environment. Aim

identify human activities present in the project area;
identify the existence of vulnerable ecosystems;
identify the socio-economic issues connected to sea-based activities;
identify planning and governance structures in the different project coun
scales;
identify limitations on current and potential uses;

Secondly, considering that the project aims at developing proposal and recommenda
on the Adriatic-Ionian Macroregion, but also on two Focus Areas (1. Northern
Adriatic-North Ionian), a review of boundaries of transboundary planning areas is
with EBA, the definition of boundaries have to be made considering the different

future uses is aimed at identifying user-user and environment-user conflicts ar
respectively minimized or fostered by properly designed planning actions, but a
planning issues (including management and regulatory issues influencing planning
priorities by stakeholders involved in the process.
In the second phase, all the information acquired are interpreted, also in light
relevant stakeholders, including institutional actors operating at the national a
face the complexity deriving from the intensity of uses in the area, this critica
starting from the analyses of pivotal uses. These can be defined as pivot of
starting points upon which the planning proposal should be developed, always
objective of achieving an allocation of uses capable of minimizing existing and
uses and between maritime uses and the marine environment in a tranboundary pers
uses are not more important than the others, but are the ones with the higher capa
and of allowing for the emergence of existing and potential conflicts that need to
integrated and interdisciplinary approach. This phase will result in some comment

conflicts/synergies, to be potentially addressed by a strategic plan, as well as potentially addressed by specific planning measures. These will provide the bas planning actions, as defined in the following step.
Thirdly, two kinds of planning proposal are elaborated: a strategic, large-scale Ionian macro-region and some operative planning measures ( pilot actions ) for t strategic plan will represent a technical and political statement of policy from area of interest and competences. It will consist in a cartographic part and in a former will identify: (i) boundaries for potential management and regulation in management zones; (iii) Potential development areas for pivotal uses; (iv) Protect non-suitable areas for the development of specific uses, in relation to the environmental components and/or to the coexistence of non compatible uses, etc.). (i) at drafting indications/suggestions for regulating specific uses/maritime acti management schemes; and (ii) at providing indications to support trans-boundary co specific themes. The pilot measures will be developed at the focus-area level, a specific challenges emerged always assuming a multi-scalar and- where applica perspective. Planning measures will consist in a zoning proposal and in a descript the indication provided by UNESCO-IOC (2012), the zoning proposal will consist designing zones based on the underlying topography, oceanography and distribution 2) designing a set of indications to define permits, licenses and use rules withi will be set accordingly three elements: a) the environmental components units at b) the vertical zoning where it is necessary to provide different rules of use w case also on the seafloor; c) the temporal zoning to define a timeframe (both periods) to set boundaries, permits and regulations, where needed.
Finally, guidelines for the evaluation of planning measures will be provided, potential redefinition of proposed actions.
To sum up, Maritime Spatial Plan will include a vision, policies, objectives and relevant both at AIR level and at the focus area level to guide decision make undertake activities or development. Taking into consideration the minimum re Directive (EC, 2014), the planning documents will consist on the minimum of:

- strategic spatial visions for the areas;
- targets for key activities and interests, considering maritime activities a
- guidance for statutory planning activities;
- proposed local and transboundary spatial strategies;
- locational possibilities and zoning proposals;
- good practice / user recommendations.

Where possible, more detailed proposals for areas requiring special attention will

## 6. Conclusions

For too long coasts and maritime space have been seen as sectoral environment mainstream policy regarding land and environmental planning framework. With the approach supported MSP, maritime space will receive the same attentions in terms of land and territorial space. In this sense the expansion of planning processes t connection between land&sea systems with a particular attention to coastal areas t border between the territorial and maritime space. Surely after the approval of EC new perspective in terms of professional skills and competence, is coming for Europ

**Abstract:**

Studies show that, after the urbanization ratio in the Yangtze River Delta exceeded 50% in 2000, the urban construction space in the region continues to expand rapidly, which has brought about such problems as land use and environment constraining the urbanization process. To address the many problems seen in the urbanization process, and stand together against the competition from other city clusters in the world, the Yangtze River Delta has been enhancing the efforts in collaborative development after its urbanization ratio exceeded 50%. To maintain the environmental survival bottom-line and obtain the benefits of joint efforts against the external competition, though it has been lacking in the cultural environment of collaboration and in the strong institutional support, the Yangtze River Delta, since Year 2000, has made considerable practice in the collaborations of environment harnessing, building of infrastructures, land use and development, and knowledge innovation in the region. Studies show that, after the urbanization ratio exceeded 50% in the Yangtze River Delta, the collaborative development among cities, in terms of geographic territory, has been shifting from the collaborative development in the multiple points to that in the belt of neighboring regions and in the network structure with layers. At the same time, it is also developing from the collaborative development of physical space to that of virtual space.

Keywords: Yangtze River Delta, city, urbanization ratio of 50%, Cooperative Development; spatial features

## 1. Introduction（research background）

According to the 1978-2012 statistics of urbanization ratio of permanent population in Shanghai Municipality, Zhejiang Province and Jiangsu Province (Table 1), the urbanization ratio in the Yangtze River Delta in 2000 stood at 49.6% and exceeded 50% in the following year. In 2000-2010, the urbanization ratio of permanent population in the region rising rapidly by 1.6 percentage points annually. Even after it exceeded 50%, it still rose by nearly 1 percentage point after 2010 (see Table 1). The 2012 data show that, the territory in the Yangtze River Delta (1 municipality and 2 provinces) accounted for 2.19% of the total in China, its population took 11.65% (157.77 million) of the total in China and its GDP accounted for 20.96% (RMB 10.8904

trillion)of that in the whole country[1]. The rapid urbanization has triggered the booming economy in the region. At the same time, it has also aroused many problems in the structure of economy and capacity, immigration of population, and harnessing of environmental pollution, which seriously impact on the quality of urbanization in the region. The urbanization ratio in the Yangtze River Delta exceeded 50% in Year 2000 when China entered WTO and the Chinese people began their full awareness of taking joint efforts to address the globalization competition and getting into collaborative development among different regions.

## 2. Scope and methods of the study

Studies of regional collaboration in the Yangtze River Delta have the following focuses: the studies focusing on regional economic integration (e.g., Li Jian, Ning Yuemin and Shi Song, 2006; Han Jia, 2008); studies cored on integration of city clusters (e.g. Wang Guixin, 2005; Yu Hongsheng, 2010); studies centered on empirical city relational degree (e.g., Tang Zilai, 2010; Wang De, 2003); and studies pillared on spatial changes (e.g., Chen Jianjun, 2007; Zhao Miaoxi, 2011). These studies emphasize on analysis of industries, economy, population, space and development of city clusters. Nevertheless, the analysis is rarely combined with the problems and needs of urbanization process. At the same time, because local administrations in China lack the cultural atmosphere and institutional guarantee of collaboration, the integration is really a very difficult target for regional development. And the collaborative development is the ideal choice of making joint efforts to address the negative external factors in the condition of existing policies. The study, at first, states that it is necessary to engage in collaborative development among cities so as to address the problems brought by the rapid urbanization after the urbanization ratio exceeds 50% in the Yangtze River Delta. Then it adopts the method of comprehensive analysis to analyze the process of collaborative development among cities after the 50% urbanization ratio before reaching the needs and means of collaborative development

[1] Source: 2011-2014 Zhejiang Statistical Yearbook, Jiangsu Statistical Yearbook and Shanghai Statistical Yearbook, as well as 2006 China Public Health Statistical Yearbook.

among cities after the 50% urbanization ratio in the Yangtze River Delta. In the end, it uses both the case analysis and GIS analysis to analyze the spatial characteristics of collaborative development among cities in the region after the 50% urbanization ratio.

For the sake of convenience, the thesis mainly studies the statistics of administrative zones and the overall analysis of the Yangtze River Delta is mainly made in the scope of 2 provinces and 1 municipality, namely, Zhejiang Province, Jiangsu Province, and Shanghai Municipality. And the data used in the study are mainly those ranging from 2000 till today.

## 3. Fundamental problems that need to be addressed in collaborative development among cities after the urbanization ratio exceeds 50%

Problems of land and environment are fundamental problems that need to be solved in the urbanization process because land is the carrier of urbanization and environment constitutes the bottom-line guarantee of urbanization. In this section, we will focus on analyzing the problems of rapid land expansion and serious environmental pollution that need to be solved in the regional collaboration in Yangtze River Delta after its urbanization ratio exceeds 50%.

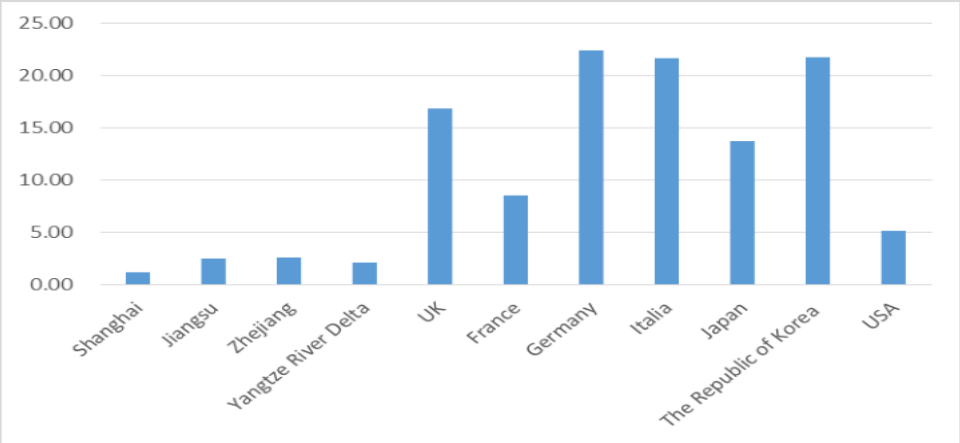
### 3.1 Problem of rapid expansion of urban construction land

Urban construction land in the Yangtze River Delta expands rapidly but inefficiently with limited quantity of new land for construction. (See Table 2) In 1980-2013, the built-up area in the Yangtze River Delta, which is the most important city cluster in East China, grew from 2,260km2 in 1980 to 2,896km2 in 2000, with average annual growth rate of 1.25%. However, after Year 2000, the built-up areas in the cities started to expand rapidly with the annual growth rate in 2000-2013 standing as high as 7.27%. Nevertheless, in the 13 years in the same period, the annual growth rate of urban population in the 2 provinces and 1 municipality in the Yangtze River Delta is only 3.66% (Table 2). It shows the rate of urban construction land expansion is far higher than that of population growth. Evidently, the growth pattern which is oriented towards land development instead of human needs is not sustainable. And the comparison of GDP per area of construction land in 2013 shows the GDP per area in the Yangtze River Delta is far less than that in the developed countries in the world, which demonstrates that urban construction land in the Yangtze River Delta is expanding in an inefficient way (see Graph 1).

Table 2 Urban population and urban built-up areas in the Yangtze River Delta

| Year | Total urban population | Annual growth rate of population | Urban built-up area | Annual growth rate of urban built-up area |
|---|---|---|---|---|
| 1980 | 1568.81 | - | 2260.00 | - |
| 2000 | 6754.47 | 7.57% | 2896.30 | 1.25% |
| 2013 | 10773.01 | 3.66% | 7208.00 | 7.27% |

Source: Statistical Yearbook



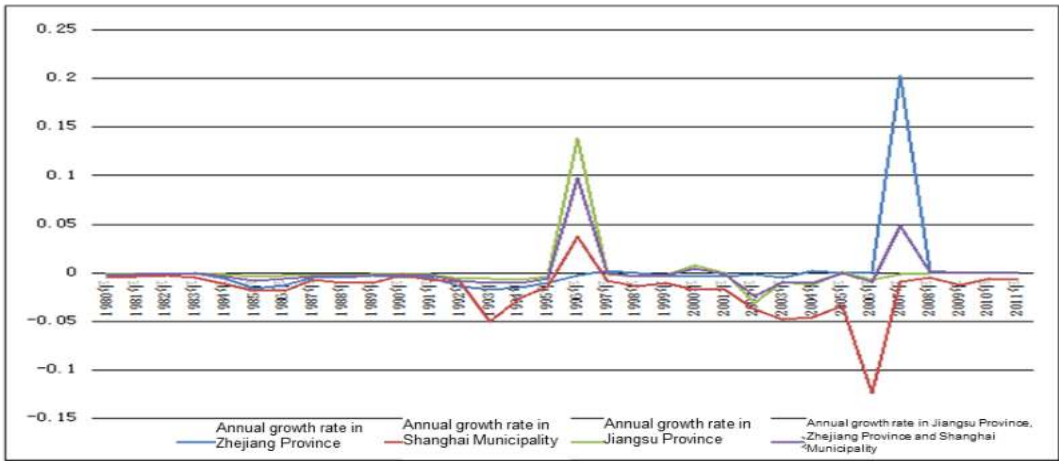
Graph 1 Comparison of GDP per area of construction land in 2013
Note: GDP per area of urban construction land = GDP aggregate/total quantity of urban construction land in the region with the unit at USD100 million per km2. Source: The overseas urban construction land area comes from http://www.demographia.com/calculation of urban areas in different countries; data of GDP of various countries come from WB database; and the data of China come from statistical yearbooks of different localities in China.

At the same time, the urban land expands extensively and rapidly occupies the farmland. According to the studies made by Chen Wen, et al (2007), after Year 2000, the urban construction land was expanded at considerable rate in both scale and speed in the central cities and secondary cities (see Table 3). However, the expansion degree in central cities was evidently lower than that in the secondary cities (county and county-level cities). And we can conclude that construction land expansion not only happened in central cities, but also moved from the central cities gradually to the secondary cities, thus bringing about the spread and expansion of hot points in land use. The spread built-up development environment in the high-density regions has caused problems of life quality and social risks in the region as a whole.

Table 3 Intensity and speed of urban construction land expansion in the Yangtze River Delta in 1980-2007

| | | 1980 1995 | 1995 2000 | 2000 2007 |
|---|---|---|---|---|
| Intensity of urban construction land expansion | Overall | 0.07 | 0.08 | 0.46 |
| | Central cities | 0.16 | 0.11 | 0.91 |
| | County(city) | 0.04 | 0.04 | 0.3 |
| Speed of urban construction land expansion | Overall | 3.20% | 5.80% | 15.85% |
| | Central cities | 2.90% | 3.50% | 11.54% |
| | County(city) | 3.60% | 6.70% | 16.80% |

Though the urban construction land expanded rapidly, the farmland area fell down year by year (Graph 2). In the 31 years in 1980-2011, the farmland area in the Yangtze River Delta fell down almost every year. In particular after Year 2000, the farmland reduction happened at a faster rate.

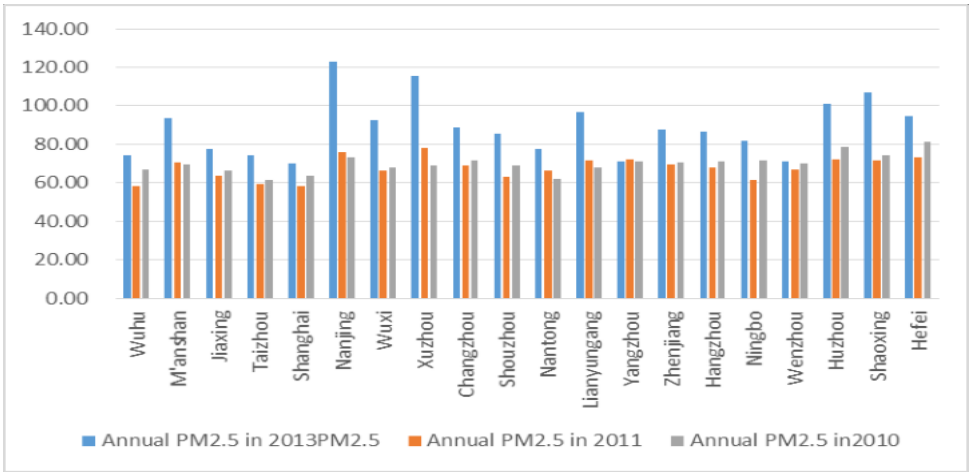


Graph 2 Annual growth rates of farmland area in the Yangtze River Delta in 1980-2011

### 3.2 Problem of regional environmental development

In terms of ecological environment, the environmental problems in the Yangtze River Delta featured by high-density development mainly include the atmospheric and water environmental pollution, as well as the 3 urban wastes (waste gas , waste water and industrial residue) and mammoth energy consumption.

First of all, air pollution in the Yangtze River Delta has been very serious and there is no sign of alleviation in the recent years. In 2010-2013, the annual PM2.5 index in the Yangtze River Delta had been rising considerably. In major regions in the Yangtze River Delta in 2013, the annual PM2.5 index was higher than 60 while that in Nanjing, Xuzhou and Shaoxing stood at above 100 respectively, showing the air pollution had been very serious (see Graph 3). According to the Air Quality Performance of 74 Chinese cities released by the Ministry of Environmental Protection for 2014, in the 25 cities at and above the prefecture level in the Yangtze River Delta, the average period of qualified air quality was only 254 days in that year and 2.9% of days in the year had air pollution rated as serious and above.



Graph 3 Annual PM2.5 index in major cities in the Yangtze River Delta in 2011-2013
Source: Database of China Intelligent Urbanization Co-creation Centre for High Density Region

Second, water pollution in the Yangtze River Delta is serious. The waterfall in the region is abundant because of the Yangtze River Delta. However, as the cities develop and the explosive growth of population, the water consumed for life and production has been rising sharply and producing pollution, thus posing great challenge against water environment and threatening, in an indirect way, the other systems in cities. In 2004, in the 21 monitored points in Taihu Lake, 19% had grade-IV water quality, 24% had grade-V water quality and 57% had bad-grade-V quality. In 2012, the sewage discharges in Shanghai, Jiangsu and Zhejiang reached 2.205 billion tons, 5.982 billion tons and 4.21 billion tons respectively. Besides, the pollution of water systems has led to a few ecological problems such the water eutrophy, sharp reduction in the aquatic species and land subsidence caused by the over-exploitation of underground water in the built-up areas. For instance, in Shanghai, the maximum land subsidence over the past 7 decades has reached 2,630 mm[4].

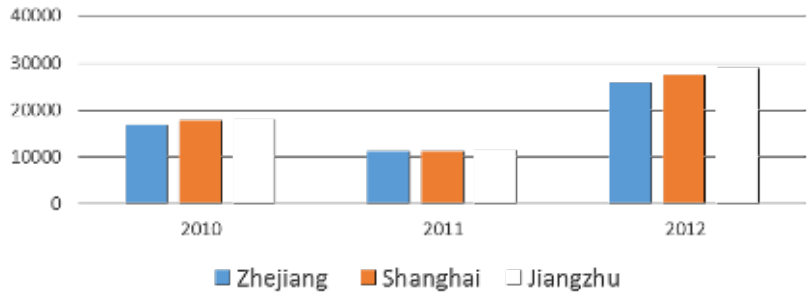
Third, the 3 urban wastes (waste gas , waste water and industrial residue) are discharged in large quantity in the Yangtze River Delta, which are difficult to be disposed of. In 2010-2012, the sewage discharge in the Yangtze River Delta reached 12.3966 billion tons and 1.696525 trillion tons of solid wastes were produced in the same period, bringing great pressure on the infrastructures in the Yangtze River Delta disposing of the 3 urban wastes (waste gas , waste water and industrial residue). Take Year 2011 as an example, the urban sewage treatment ratio in Shanghai was 84.42%, meaning 360.5367 million tons of sewage were not treated. The urban sewage treatment ratio in Jiangsu Province was 85.1%, representing that 319.389 million tons of sewage were not treated. And the urban sewage treatment ratio in Zhejiang Province was 89.92%, meaning 380.892 million tons of sewage were not treated.

Table 4 Discharge of 3 urban wastes (waste gas , waste water and industrial residue) in the Yangtze River Delta in 2010-2012

| Provinces | Year | Discharge of waste gas (in 100 million tons) | Discharge of waste water(in 100 million cubic meters) | Production of industrial solid waste (10,000 tons) |
|---|---|---|---|---|
| Zhejiang | 2010 | 42.2618 | 24435 | 4843 |
| | 2011 | 42.0417 | 24940 | 4529 |
| | 2012 | 42.0960 | 23967 | 4542 |
| Shanghai | 2010 | 24.82 | 12969 | 2448.36 |
| | 2011 | 19.86 | 13692 | 2442.2 |
| | 2012 | 22.05 | 13361 | 2198.81 |
| Jiangsu | 2010 | 55.55 | - | 9063.83 |
| | 2011 | 59.28 | - | 10475.5 |
| | 2012 | 59.82 | - | 10224.44 |

Fourth, high energy consumption in the Yangtze River Delta with low self-sufficiency rate Graph 4 . Graph 4 shows that total energy consumption in the Yangtze River Delta continued to grow and reached 408,009,030 tons of petroleum equivalents in 2012 alone, close to the total energy consumption of Japan in 2012 at 451,500,800 tons. However, the self-sufficiency rate of energies in Yangtze River Delta was relatively low. And the crude oil, coal, natural gas and other major energies consumed in the region were mainly purchased out of the region. Take the coal supply in 2009 as an example, all the crude coals in Shanghai were bought from outside Shanghai. And the self-sufficiency rate of crude coal in Jiangsu Province was only 11.2% while that in Zhejiang Province was 0.1%. The energy consumption per RMB 10,000 GDP in the

Yangtze River Delta had been decreasing year by year. However, in 2012, it still stood at about 0.54 tons of coal equivalent per RMB 10,000, which was higher than the 0.4 tons of coal equivalent per RMB 10,000.



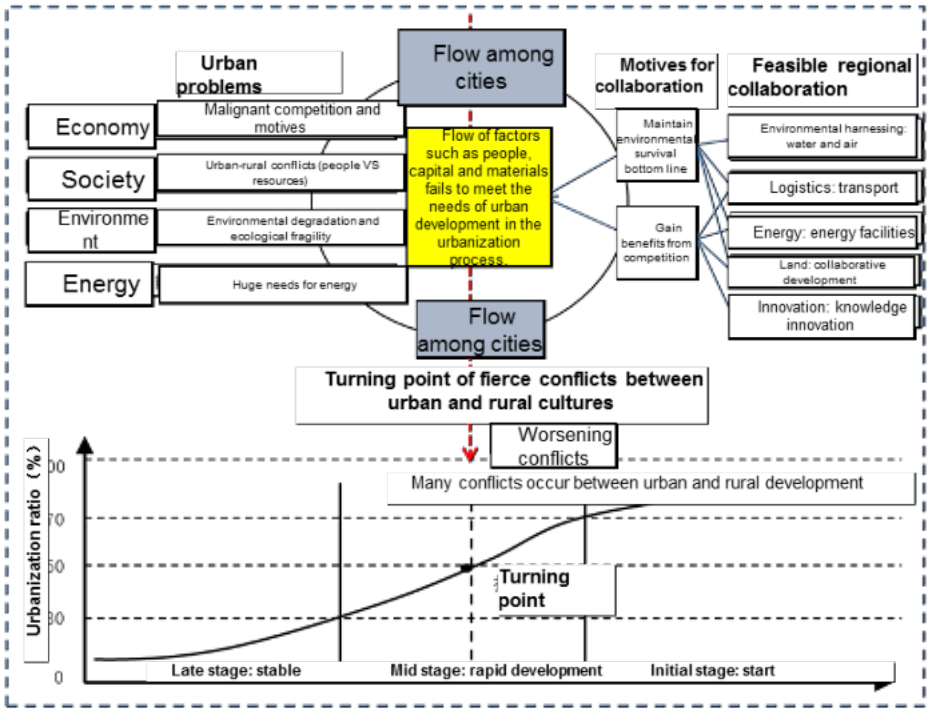
Graph 4 Total energy consumption (in 10,000 tons of coal equivalents) in 2010-2012

## 4. Needs and means of regional collaboration after 50% urbanization ratio in the Yangtze River Delta

### 4.1 Needs of collaboration

As mentioned above, when urbanization ratio exceeded 50% in Year 2000 in the Yangtze River Delta, we have seen the fierce conflict between the urban and rural civilizations. The region had entered the period of intensive conflicts of urbanization (e.g., Gao Peiyi, 1990; Bao Shusong, 2012). Within the region, it is necessary to address the series of problems accompanying the rapid urbanization. In terms of economy, we need to face the malignant competition caused by the assimilation of industrial structures, lack of economic development forces and other problems. In terms of society, we need to face the problems such as the social conflicts and competition for the public-service facilities and resources caused by the excessive cluster of urban and rural population. In terms of environment, we have to face the problems of worsening environment and overload of ecological capacity. In terms of energies, we have to face the problem of huge energy needs and consumption. And these problems are mainly caused by the fact that the allocation of human, capital and materials , the 3 urbanization cannot meet the needs of urbanization in the Yangtze River Delta. It is very difficult to solve the above-mentioned problem of urbanization factor flow within the single city administrative region. As a result, it is urgent for cities to join hands and solve the urbanization problems in the region (see Graph 5).

Since Year 2000, the collaborative development among cities in the Yangtze River Delta has had the following purposes: based on the stimulus for common public or market interest, engage in trans-reginal collaboration; keep optimizing the allotment of people, capital, land, environment and other resources in the urbanization in the region; keep solving problems of rapid urbanization; provide certain guarantee for the healthy urbanization; and work jointly to improve the holistic competitiveness in the region. The study believes that regional collaboration is the major means and inevitable process of regional integration.



Graph 5 Process analysis of cities needing collaborative development after the 50% urbanization ratio

## 4.2 Means of collaboration

Based on the above analysis, the reginal collaboration, after the urbanization ratio exceeds 50%, has the following major motives: to maintain the environmental survival bottom line and gain the common benefits of competition against competitors beyond the region. (See Graph 5), when the Yangtze River Delta now lacks in the cultural environment of collaboration and in the strong institutional support, the Yangtze River Delta has made collaboration practice in the following ways:

(1) Collaboration in regional environmental harnessing. It mainly refers to the collaborative harnessing of regional environment cored on water environment preservation and atmospheric harnessing. For instance, the environmental harnessing in the Taihu Lake waters involve the collaborative efforts of Suzhou, Wuxi, Yixing, Huzhou and Jiaxing.

(2) Collaboration in the building of regional infrastructures. It mainly refers to the development of inter-city transport (including transport hub) major municipal infrastructures and energy infrastructures in the region. For example, the Hangzhou Bay Bridge was built by Shanghai, Hangzhou and Ningbo. And the Inter-city Metro Line 11 was built by Shanghai and Kunshan of Suzhou.

(3) Collaboration in land development. It refers to the collaborative development of land in and close to cities, for instance, the collaborative development of Kunshan and Anting; the collaborative development of enclaves of cities, such as the collaborative development made by Zhangjiang Group in Pinghu City of Zhejiang Province; and the collaborative development made by cities along the Yangtze River and along the East China Sea.

(4) Collaboration in regional knowledge innovation. It mainly refers to the collaboration cored

on talent training, talent free flow and sharing of research results among the cities. For instance, Shanghai Tongji University has established research institutes in Jiaxing and Taicang to realize the collaboration among cities between the industries, colleges and research institutions.

## 5. Spatial Features of regional collaboration after 50% urbanization ratio in the Yangtze River Delta

### 5.1 Neighborhood nature of collaborative development space

In the beginning, the reginal collaboration in Yangtze River Delta was featured by the collaborative development of a few neighboring nodes in the region. Then the collaborative development gradually expanded to larger areas to form the block-shaped and belt-shaped regions of collaborative development.

In the 1990s, Jiangsu Province and Zhejiang Province adopted the development philosophy of collaborating with Shanghai , hoping to stimulate development of their regi with Shanghai. At that time, Jiaxing, Kunshan and Taicang in the adjacency to Shanghai had wonderful opportunities of development. However, they were limited to the point-to-point collaboration with Shanghai. After Year 2000, the cities began to recognize the concept of collaborative development. The regions close to Shanghai, to the Yangtze River and to the East China Sea went into the block-shaped, belt-shaped and piece-shaped collaborative development with the neighboring cities. Kunshang, which neighbors with Shanghai, is in collaborative development with Anting New Town in Shanghai. At the same time, it is connected to the inter-city railway of Shanghai, thus becoming an influential destination for Taiwan investors in China (see Graph 5). In the around-Taihu-Lake region, the neighboring Suzhou, Wuxi, Yixing, Huzhou and Jiaxing have re-positioned their urban functions because of their joint efforts to harness the aquatic environment in the Lake. Most of the regions around Taihu Lake are no longer pillared on manufacturing industry. Instead, they focus on leisure tour. After 1-decade development, the ecological environment in Taihu Lake has been evidently improved. And the around-Hangzhou-Bay city cluster, consisting of Hangzhou, Ningbo, Shaoxing, Jiaxing, Huzhou and Zhoushan, has formed the collaborative development layout in urban economic belt, ecological reserve, transport network and talent flow (see Graph 6).

Figure 6. Kunshan Jiangsu and Anting Shanghai collaborative planning

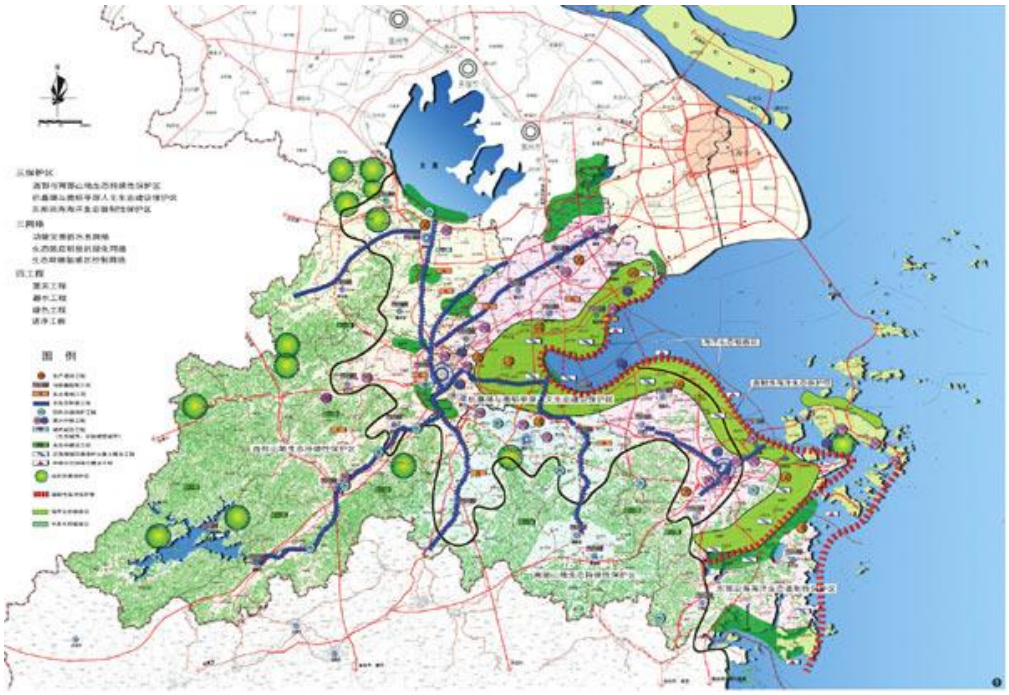


Fig. 7 Schematic diagram of the cooperative development of ecological protection in the Gulf of Hangzhou

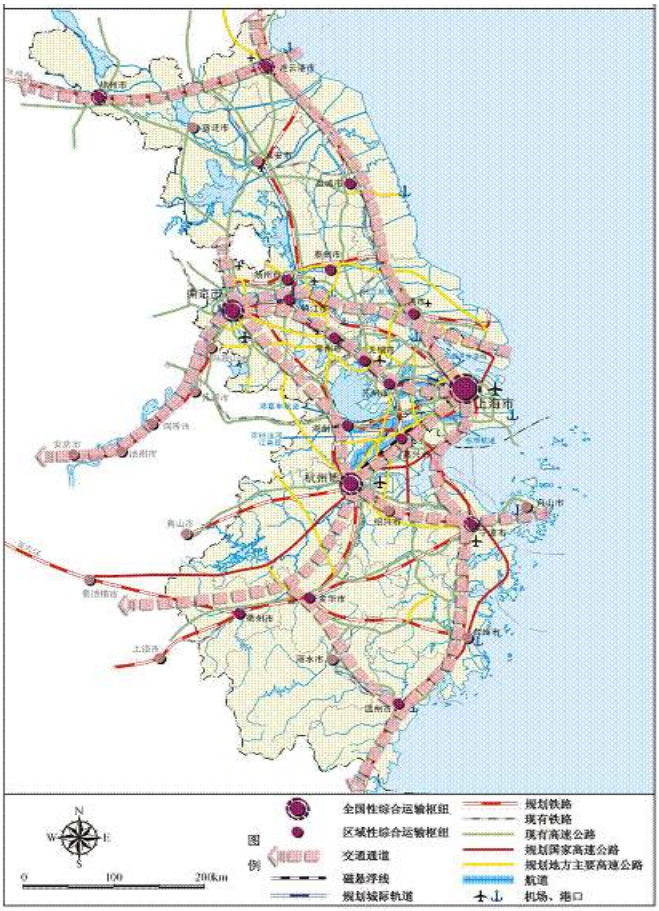
## 5.2 Network feature of collaboration in regional infrastructures

Based on the collaborative development of neighboring regions, the enhanced building of network-shaped facilities has promoted flow and exchanges of people, materials, capital and information in the region. And the accelerated flow of these elements has triggered a few influences such as polarization and expansionary effects. The greater capacity in transport accessibility has extended the scope reached by urban functions, changed the original time-space concept and expanded the scope of collaboration scope among cities. At the same time, the inter-city high-speed railways have enlarged and highlighted the inherent competitive advantages and disadvantages of cities, sped up the formation of new urban networks, promoted the restructuring of regional spatial structures and enhanced the collaboration and collaboration among the cities in the Yangtze River Delta.

Judging from the layout of transport infrastructures in the Yangtze River Delta, the comprehensive transport & traffic system has been basically formed, presenting the urban development axis pillared on four major transport channels, namely, Shanghai-Nanjing, Shanghai-Hangzhou, Nanjing-Nantong and Hangzhou-Wenzhou, which are cored in Shanghai with port cities as the hub. In terms of the length of transport and traffic routes, we have seen rapid growth in various means of transport. In 2010, the total highway mileage, mileage of inland river waterways, operating railway mileage and highway mileage in the Yangtze River Delta stood at 272,458 km, 36,157 km, 4,118.2 km and 8,217 km respectively, accounting for 6.79%, 29.1%, 4.52% and 11.09% of the total in China respectively. Compared with fact that Yangtze River Delta territory accounts for only 1% of the total territory in China, the length of transport routes take a higher percentage in the country and the transport infrastructure network is taking shape in the Yangtze River Delta. In the future, the region will continue to improve development of its transport channels by completing the Shanghai-Nanjing and Shanghai-Hangzhou channels, the along-Yangtze River channel, coastal channel, Nanjing-Huzhou-Hangzhou channel and many other trunk channels within the region. At the same time, it will speed up the development of comprehensive hubs and enhance the network support capacity

for the regional collaborative development.



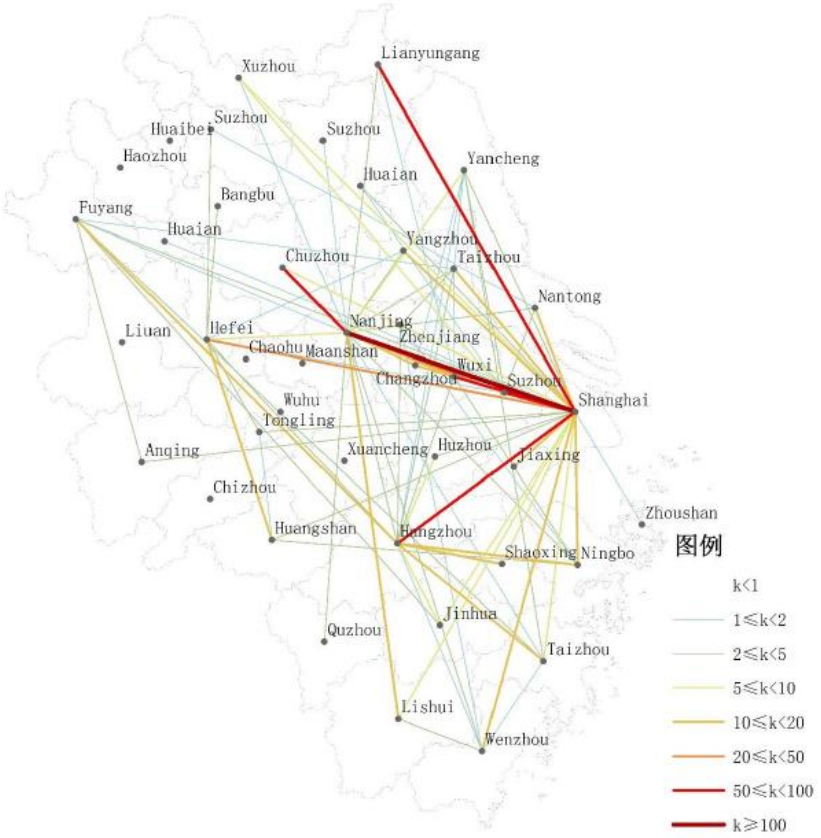
Graph 8 Map of planned transport channels in the Yangtze River Delta 2009-2020
Source: Regional Plan in the Yangtze River Delta 2009-2020

### 5.3 Network feature of collaboration in knowledge innovation

In 2013, the urbanization ratio of permanent population in the Yangtze River Delta reached 67.96%, meaning the region would enter the mature stage of urbanization. As a result, it is necessary to shift from the factor-driven development relying on the bonus of cheap land and labor force to the innovation-driven development. Alfred Marshall once pointed out, Knowledge is the most powerful production force, which ensures we can conqu and meet our own needs . The collaboration in knowledge innovation can promot high-quality talents, improve the research capacity and help shift the physical extension focusing on quantity to the connotation development focusing on quality in the urbanization process in the Yangtze River Delta.

By using the analytic method of GIS partnership and based on the data of 2000-2015 partnership patents (substitution parameter of innovation partnership) applied and publicized by WIPO in the PCT system, the author analyzes the collaboration in city knowledge innovation in the Yangtze River Delta. The studies show that, in the innovation partnership in 2000-2015 in the Yangtze River Delta, the major nodal cities, such as Shanghai, Nanjing, Hangzhou, Hefei, Taizhou, Fuyang, Taizhou, Ningbo and Yancheng, etc., have close and extensive innovation partnership with other cities. Of these cities, we see the highest intensity of innovation partnership between Shanghai and Nanjing, Hangzhou, Suzhou, Wuxi and Liangyun-gang and

between Nanjing and Chuzhou. In terms of space, the grid network has been formed that consists of the core + multiple nodes . Shanghai plays an evident role as th in the innovation in the Yangtze River Delta (Graph 9).



Graph 9 Spatial organizing features of innovation partnership in the Yangtze River Delta in 2000-2015

Prepared by LU Tianzan

## 6. Conclusion

To make joint efforts to address the many problems brought by urbanization and stand against the competition from the other city clusters in the world, the Yangtze River Delta has been enhancing its collaborative development after its urbanization ratio exceeded 50%. The collaboration among cities has shifted from the point-to-point collaboration among neighboring regions to diverse collaboration. Till today, we have seen such major collaborative development as in the environmental harnessing, building of infrastructures, land use and development and in knowledge innovations in the region. And the spatial features of collaboration are represented by the multiple points to that in the belt of neighboring regions and in the network structure with layers. At the same time, it is also developing from the collaborative development of physical space to that of virtual space. It is worth pointing out that, the topic of the study is relatively macro with each section having the potential to make further explorations and empirical studies. Besides, the integrity of collaboration and regional differentiation in the Yangtze River Delta are worth in-depth studies. The thesis only summarizes the needs, means and spatial features of regional collaboration in the Yangtze River Delta after the 50% urbanization ratio, thus providing certain reference for the people wishing to learn about the urbanization and regional collaboration in the Yangtze River Delta.

# TRACK 12

# Responsibility for Social Cohesion in Housing, Cohousing and Neighbourhood Planning

## Track description

Co-chairs: **Nikos Karadimitriou**, **Roelof Verhage**

Favouring socially mixed neighbourhoods has been a cornerstone of cohesion policies for the last couple of decades. The assumption behind the promotion of the spatial mixing of social groups in a residential area is that it improves upward social mobility and favours social integration. Thus planning and housing policies promote a mix of uses, tenures and housing types for a variety of social strata in both new and established neighbourhoods.

Is the policy objective of socially mixed neighbourhoods worth pursuing further? What exactly are the links between spatial organisation and social cohesion? What evidence is there to show that we can improve social cohesion by altering the spatial organisation of a neighbourhood? Should policy put more emphasis on horizontal social policy measures instead?

If creating socially mixed neighbourhoods contributes to a more cohesive society, then a key challenge is to identify and reach an effective compromise between individual and group preferences, interests and resentments, keeping the public interest in mind. How housing policies contribute to the pursuit of this goal? What legitimacy do these policies have and what are the rights and responsibilities of different stakeholders involved in the making of socially cohesive residential spaces?

The track would welcome papers focusing on theoretical reflections and applied analysis of urban policies and projects dealing with the relation between spatial organisation, social mix, social cohesion and housing and planning policy.

# NEO-LIBERAL AFFORDABLE HOUSING POLICIES THROUGH PROJECTS OF HOUSING DEVELOPMENT ADMINISTRATION OF TURKEY

Sezen Aslan„ and Ozge Erbas†

„ Research Assistant, Department of City and Regional Planning, Gazi Uni
sezensavran@gmail.com
† PhD Student, School of Architecture, Planning and Landscape, Newcastle University, United Kingdom ozgeeerbas@gmail.com

**Abstract**

*After 1980, a notion of neoliberalism has also been appeared in Turkish urban planning laws and policies as the rest of the world. One of the major implementation of these policies was the establishment of Housing Development Administration of Turkey, hereafter HDA, in 1984. The administration has been shaped as providing social housing for low-income households in the first place. However, since 1984, while the main aim of the administration stays as same as the first day, its mission has been modified. The administration has started to generate luxury housing projects to transfer their profits to the social housing fund. The study aims to compare ongoing and completed* affordable and luxury housing projects according to their residences income payment methods/plans for buyers. Report analysis of the administration and *reviews become main sources for the study. According the literature review; one affordable and one luxury project is selected to compare. In the conclusion, report analysis, and website reviews and will convey the findings and discussion.*

**Keywords:** Affordable Housing, Urban Transformation, HDA

## 1. Neo-liberalism and its Impacts

After the Keynesian regime went into crisis in the early 1970s, the global economic system has neo-liberalized (Brenner & Theodore, 2002). As Forrest and Hirayama (2009, p. 998) state, neoliberalism is a political project involving reduced state intervention in economic and social affairs and the assertion of the superiority of market processes. Reduced state intervention and superiority of market processes are the key points of neoliberalism. This system predicts a new emphasis on markets, minimal states and individual choice in contemporary political-economic formations (Larner, 2009).
Neo-liberalism is a process which has led to drastic changes in the political, economic and social structures. These changes in community structures affect each other, and some contradictions might be seen in some cases. In the economic dimension, neoliberalism includes loosening of the various institutional constraints on behalf of markets, commodification, excessive exploitation of workers, etc. (Brenner & Theodore, 2002). On the other hand, the global economy has experienced to associate with the concept of globalization. The new organization of the global economy includes decentralization of the industry economy from developed countries to developing countries and expansion of finance and service sector on a global scale ( ktem, 2006). These changes in the economic structure also leave marks on cities. In the context of neo-liberalism and globalization, there is a shift from the nation-state formations to the global cities. A lot of cities have risen in every aspect worldwide, and cities have new roles as spheres of economic, political, and social areas in the neo-liberal world (Larner, 2009). After this point, urban space might be accepted as the most profitable investment tool and must be evaluated in the best way.

Neo-liberal urbanism adopts entrepreneurial urban governance, supports private sector participation in urban projects, and has self-regulating structure (Leitner, Peck & Sheppard; 2007). The most common neo-liberal urban interventions are to provide privileges to personal property and property rights and to realize urban reconstruction projects via loosely regulations (Waley, 2013). Neo-liberal urbanism undertakes the task of the division of property rights between public and private sector actors. Neo-liberalism has affected every perspective of urban planning as housing policies worldwide (Candan and Kolluoglu, 2008; Forrest and Hirayama, 2009). Neo-liberal housing policies have been implemented as various types around the world. For example, countries which have a wide range of public housing stock have begun to privatize their housing stocks. This process has been experienced in Turkey as a different way. Before moving on the neo-liberal housing subject, in the following part, neo-liberal policies and the structure of housing stock in Turkey will be summarized.

In 1950, 75% of the population in Turkey was living in rural areas (TUIK, 2015). Since 1950s, with the mechanization of agriculture and the Marshall Plan, a chaotic pattern of urban development has emerged based on uncontrolled immigration from underdeveloped countrysides to urban areas of Turkey (Lovering, 2011). While the Turkish cities were growing with illegal settlements in the 1960s and 1970s, the housing policies have not been influential to solve the chaotic urbanisation problems. In 1980, an important turning point was marked in the social history and neo-liberal globalizati Turkey as in the rest of the world (Din er, 2011).

The neo-liberal reconfiguration in Turkey is usually conceptualized in three different stages as 1980s, 1990s and after 2000 (Temizel, 2007). The first phase envisages an outward-oriented national economy and integration into the global capitalist economy ( oban, 2012). Several a granted by the Government in the 1980s. In the second stage, national and international investments were encouraged via legal and institutional arrangements. Privatization programs and the encouragement of investment laws in tourism can be given as examples on the issue.

The last period, after 2000, neo-liberalism has reached its highest level in Turkey. The new conservative-democratic government came to power after the economic crisis that occurred at the beginning of 2000s. The most important features of the period are; the rise of the construction industry, privatization of public institutions and services, foreign direct investments, poverty policies based on charity and so on ( avu o lu, 2014). Neo-liberal policies impose global scale competition upon countries. Accordingly, Turkey has chosen to compete in the construction industry via public and private sector cooperation. In the same time, the State has increased its power and dominance in the sector. Also, the private sector became capable of contributing the sector due to the States' policies. For this purpose, several areas like illegal settlements, ecologic and historic areas have been re-zoned for construction purposes. Prevailing urban practices of the last period support mega-projects and urban transformation projects especially in metropolitan cities. The Third Bosporus Bridge and the Third Airport projects are given as examples for mega-projects in Istanbul, which have undertaken a mission about attracting investment and capital to the mega city of Turkey. Mega housing projects can be evaluated in the same category. Construction companies of mega housing projects claim that they provide safe and privileged life to their inhabitants. Thus, a new consumer group has been arising with a great support of the finance sector in Turkey. Also, urban transformation projects have been accepted as one of the main implementation tools of the construction industry. Especially, the illegal squatter settlements have begun to be seen as potential areas to transform. The State puts the emphasis on disaster risk of those areas as a main reason for these projects and numerous urban transformation projects have been implementing one after another. Housing Development Administration has been the institutional tool of the Government in this process. After all, it can be said that a new housing sector has been appealing to upper income groups, and this has been creating conflicts with poor social housing policies of the State. This issue will be discussed also in the following sections.

## 2. Affordable Housing

The failure of accessing housing by low-income households is one of the most important problems in the worldwide. The main reason of this problem is the inability of the low-income households to afford housing market prices. Stone (2006) states that for some people, all housing is affordable, no matter how expensive it is; for others, no housing is affordable unless it is free. According to social governments, housing must be provided by states for those who in need. Harvey states that markets do not exist (in areas such as land, water, education, health care, social security, or environmental pollution) then they must be created, by state action if necessary (Harvey, 2005, p. 2). Accordingly, Affordable Housing can be defined as housing which supplies provided and balanced according to their incomes of low- and middle-class households (Sengupta, 2013). Bramley (2006) refers that even though affordability concept accepted easily, applying the concept to a real world due to possible changes in conditions of households in time. Furthermore, countries experienced this process in different times and ways. But there is a common approach to the affordability concept accepted by everyone. This approach is the ratio of housing costs to income.

Kutty (2005) states that affordability is usually measured by the ratio of housing costs to income. UN-Habitat (2012) clarifies this affordability parameter as the allocation of maximum 30% of household income. Paris (2007) states analogously that the main challenge of defining affordability is based on diversity of affordability parameters, and usually, ratios approaches are relationship between income and housing cost.

Affordable housing is the concept that has taken place in an international conventions text. The article 11/1 of the Covenant on Economic, Social and Cultural Rights states that as: *"The States Parties to the present Covenant recognize the right of everyone to an adequate standard of living for himself and his family, including adequate food, clothing and housing, and to the continuous improvement of living conditions".*

The Committee on Economic, Social and Cultural Rights (CESCR) is the body of 18 independent experts that monitors implementations of the International Covenant on Economic, Social and Cultural Rights by its States parties. This Committee has been released General Comments about contract clauses. General Comment 4 explains what adequate housing is and its principles. Affordability is one of the principles of adequate housing. A lot of countries have been adopted the concept of Affordable Housing and made practices in this direction. Paris (2007) states that governments in many countries have explored ways of using statutory land-use planning systems to influence the provision of additional affordable housing, especially in localities with relatively high house prices and rental costs. Turkey also has some experiences in this regard.

### 2.1. Affordable Housing in Turkey

In metropolitan cities of Turkey, the main reason of deficiency of housing stock might be linked the rapid population change in these cities due to immigration from rural areas. For example, Istanbul s population increased from 1.17 million to 4.74 million between 1950 and 1980 (DIE, 2000). The percentage change between these years is more than 350%. In parallel with this population change, the quantity of housing was increased via illegal squatter settlements, especially between 1950s and 1980s (Karaman, 2012). These illegal squatter settlements have been seen as solutions to the housing problem in Turkey which are produced by occupants. Sprawling of the illegal squatter settlements, which are called gecekondu in Turkey, has been emerged due to lack of government policy o housing. Aru (1970) states that Turkey did not have any social housing policy from the founding of the Turkish Republic to 1960.

1960s are the breaking point for Turkey because a new constitution was ratified and five-year development plans were begun to prepare. The constitution and first plans aimed to provide social housing stock for the citizens. During this period, cooperative dwelling associations have been adopted as a method of the social housing. However, cooperative housing concept was usually embraced by middle- and upper-income groups up to 1980s (Tekeli, 2010). 1980s are considered as another breaking point because of the last and current constitution was ratified and neo-liberal government policies have begun to dominate the country as mentioned in the preceding sections of the article. Mass housing law also came into force in 1981, and these changes in Turkey required an institution to provide housing stocks. For that reason, mass housing stocks have been producing by one of the state organization that founded with the current constitution as the state-owned social housing supply agency, HDA.

## 3. Housing Development Administration of Turkey (HDA)

The 1982 Constitution stipulates mass housing as a social housing policy. After the constitution had come into force, a new institutional structure has required realizing the policies. Therefore, Housing Development and Public Participation Administration was established in 1984. The Mass Housing Fund has been created in the same year under the Mass Housing Law (Law No: 2985). The institution is divided into two administrations in 1990 as Public Participation Administration and Housing Development Administration (HDA). Some problems have arisen due to transferring the funds, so the mass housing fund was repealed in 2001. Real estate sale, rental returns, credit, and interest income returns were issued after the repeal of the mass housing fund option. HDA was separated from Ministry of Public Works and Settlement and has become an institution directly under the Prime Ministry in 2004. Since 2000, the authorization of HDA has been extended many times (Table 1).

Table 1: Authorization of HDA[1]

| Year | New authorizations |
|---|---|
| 2003 | Establishing housing companies or being one of the partners of it,<br>developing projects for profit,<br>building housing in disaster areas, giving credit |
| 2004 | Transferring authorizations of Land Office to the HDA |
| 2004 | Having power of expropriation and making plans in illegal settlements |
| 2005 | Having power of making urban transformation projects |
| 2007 | Transferring authorizations of ministry in illegal settlement,<br>free acquisition of land belonging to the Treasury,<br>having approval authority to determine rehabilitation, liquidation and prevention areas in local regions |
| 2008 | Having planning authorization of the lands belongs to the Treasury |
| 2008 | Having authority over the Transformation of Areas Under Disaster Risk |
| 2012 | Having authority over reconstruction of places which declared as "Areas Under Disaster Risk " (not only in urban areas, but also in forests, military areas, and so on) |

[1] Savran, S. (2014) Evaluation of TOK Low Income Housing Areas Within The Perspective C Housing : The Case Of Ankara Kusunlar, Master's Thesis, Gazi University, Graduate School Applied Sciences

In the current status of the institution, its authority has been broadened, and it is out of any control mechanism. The initial purpose of establishment of the HDA was to build housing for low-income households. Mass housing projects are currently being built for low-income households, but the HDA is moving away from its initial goal. The main reason of this situation is funding methods. Therefore, the current housing policy of the HDA is frequently discussed in academia.

The HDA provides various types of housing and publishes the percentages of each housing type on the official website (Table-2). The institution produces a significant number of housing stocks, and it can be seen on the table that 85% of the housing is social housing. The ratio of social housing is quite high. Since, the institution accepts all housing groups as social housing except profitable housing supplies.

Table 2: Type of Housing Constructed by the HDA[2]

| **Type of Housing** | **Number of Units** | **Percentage** |
|---|---|---|
| Middle-income groups | 267.229 | %41,15 |
| Low-income groups | 146.546 | %22,57 |
| Transformation of slum areas | 97.997 | %15,10 |
| Disaster housing | 37.613 | %5,80 |
| Rural houses | 5.658 | %0,86 |
| **Total of Social Housing** | **555.043** | **%85,48** |
| Housing for funding (Upper-income groups) | 94.266 | %14,52 |
| **Grand Total** | **649.309** | **%100** |

HDA set income criteria to make public benefits from its affordable housing projects. The household income threshold for projects in Istanbul is 3100 TL and 2600 TL for the rest of them. The payment scheme is shaped as 100TL down payment and 25-year-mortgage plan (TOKI, 2015). As you can see Table 3, there is no info about average cost of luxury houses so we could not calculate possible profits can be transferred from luxury houses to social housing development projects.

Table 3: Cost and Sale Price Comparison of HDA Projects [3]

| | **Average cost per square meter** | **Average Price per square meter** |
|---|---|---|
| **Affordable Housing** | 700-800 TL | 700-800 TL |
| **Low-Income** | 800-930 TL | 900-1050 TL |
| **Middle-Income** | 900-1050 TL | 1000-1150 TL |
| **Luxury Houses** | No info | 1000-9500 TL |

The Housing Development Administration provides housing options not only for low-income but also middle-income households. Therefore, the institution has become one of the leading actors in the housing market of the country. This situation leads us to questioning how much the institution can fulfill its fundamental mission. The case studies help us to answer the question mentioned above.

### 3.1. Urban Transformation Projects Produced by the HDA

The legal basis of urban transformation process in Turkey has begun to be shaped in 1984. Since then, four laws have been issued which allow urban projects; Mass Housing Law (Law No. 2985), Law on the Protection of Deteriorated Historic and Cultural Heritage through Renewal and Re-use (Law No. 5336), Municipality Law (Law No. 5393), and Law on Restructuring of Areas Under Risk of Natural Disasters (Law No. 6306). As a result of these four laws, especially in metropolitan cities, urban transformation projects have initiated. These projects are realized with the collaboration of the HDA, Ministry of Environment and Urban Planning, municipalities, and private sector. In addition to these actors, sometimes local groups involve to projects. One of the criticisms of these projects, even though these projects are planned and implemented to increase the quality of urban life, these do not cohere with integrated urban planning. On the other hand, these projects are the symbols of neo-liberal policies as explained in earlier sections (Acikgoz, 2014).

The most criticized aspect of urban transformation projects by the HDA is that they disregard unique social and cultural characteristics of spaces, and the projects consist of physical features. The aim of the projects is to use land for annuity instead of solving problems in slum areas (G ze most important reason for this criticism is displacement of populations which occurs in transformation areas (Baysal, 2010; Lovering and T rkmen, 2011). Figure-1 indicates the areas which have a potential of eviction, experienced eviction and second wave of eviction in Istanbul.

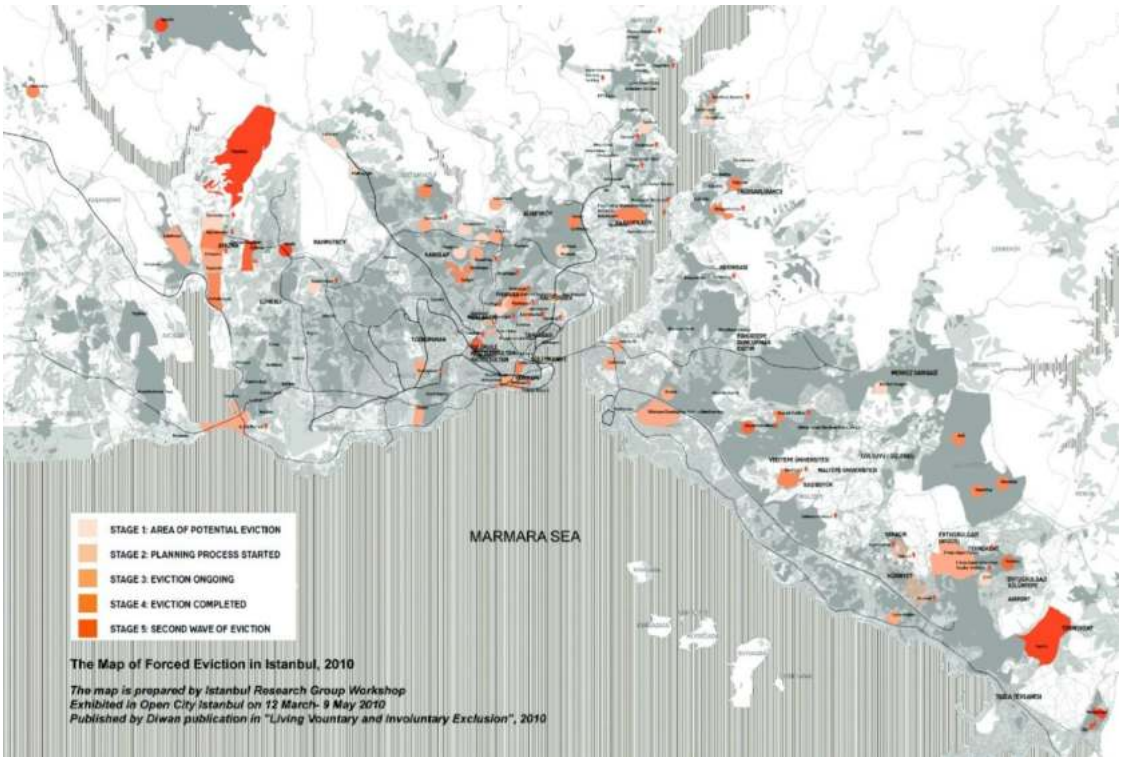

Figure 1: Eviction Areas in Istanbul, 2010[4]

[4] The map is prepared by stanbul Research Group Workshop Exhibited in Open City stanb May 2010

It is expected that urban transformation projects should be built in situ. The HDA states, on all occasions, that their goal is to achieve in situ urban transformation[5]. However, the HDA claims that some areas have earthquake risk and should be evacuated. Nevertheless, these areas are transformed instead of evacuating them. After the transformation, the initial inhabitants and new inhabitants in the projects live together. Either way (in situ or displacement), many households hand over their units. Even if a project is built in situ (or nearby), the population which lives in the transformation area is forced to relocate because of external factors. These factors are mostly based on the increasing cost of living in the region, socio-cultural differences from new buyers, and so on.

As one of the consequences of the urban transformation projects, the forms of housing stocks all over Turkey have been changing (Candan and Kolluoglu, 2008). Both upper- and low-income households have been losing their sense of place and neighbourhood culture. While upper-income households hide themselves behind the boundaries of gated communities , the State forces low-income households to live in high-rise mass housing.

The case studies help us to evaluate how much the Housing Development Administration can fulfill its fundamental mission as mentioned before. Several academics study the adequateness from various aspects. The aim of this study is to examine an urban transformation project within the concept of Affordable Housing. The selected cases experienced the urban transformation that is not built in situ.

## 4. Comparative Study: Sulukule and Tasoluk Housing Projects of HDA

UNESCO (2015) describes displacement as the forced movement of people from t environment and occupational activities . The urban transformation projects of resulted with displacement have some commonalities. Usually, after determining a district as an urban transformation area, the process continues with a demolition procedure. The institution offers three main options to the rightful owner; to pay the compensation of demolished house, to provide a social housing unit which is already completed, to wait for a new unit in-situ. However, the third option is not usually taken into account by the owners as contraction process of the new buildings takes long time and they cannot afford to move out during demolition and construction. Eventually, many of them are obligated to purchase a social house which is usually far from their initial settlements. Furthermore, compensations of their demolished shelters / houses do not cover prices of suggested social houses. At the end of the transformation, these people experience a second wave of eviction or displacement due to high payment scheme of social housing. In this perspective, Sulukule Urban Transformation Project and Tasoluk Social Housing have been selected as case studies to evaluate their transformation processes. Sulukule district is handovered from low-income to upper-income households through urban transformation process and the initial inhabitants evicted to Tasoluk Social Housing as described above.

### 4.1. General Info

***Sulukule:*** Sulukule is located on the borders of historical peninsula of Istanbul (Figure-2). The project area covers Neslisah and Hatice Sultan neighbourhoods. This area is designated as World Heritage Site by UNESCO. Population of the Sulukule project area is approximately 5000 with predominantly Romany population. There were formal and informal constructions in Sulukule.

[5] http://www.toki.gov.tr/haber/toki-baskani-mehmet-ergun-turan-kentsel-donusumde-amac-yerinde-donusum

Figure 2: Sulukule before demolition[6]

***Tasoluk:*** Tasoluk is one of the social housing projects of HDA. The inhabitants of Sulukule have right to buy a unit from social housing projects in Bezirganbahce , Kayabasi and Tasoluk . In this paper, we examine Tasoluk housing project to examine its affordability. Tasoluk is 30km away from Sulukule and one of the newly developing areas of Istanbul. Tenants only have a priority to have a unit from these social housing projects. HDA and municipality have not given any options for them like the homeowners.

Figure 3: Distance between the Initial Settlement and an Offered Social Housing

We should shortly explain the key dates about the transformation process of Sulukule. In 2005, Istanbul Metropolitan Municipality, Fatih Municipality and HDA signed a protocol for transformation project. In 2006, the Ministry passed the urgent expropriation decision (Dincer et al. 2008).

| November 2007 | The renewal plan is approved by the Board for Renewal Areas |
| February 2008 | Chamber of Architects of Turkey - Istanbul Branch sued to cancel the transformation project |
| May 2009 | Demolition has been started (before the court case has been resulted) |
| June 2009 | 4th Istanbul administrative court declined the request of cancellation without any reason,<br>Chamber of Architects of Turkey - Istanbul Branch objected to the decision |
| May 2010 | The construction of Osmanli Konutlari was started |
| April 2012 | The project was canceled because it does not meet with the public benefit |
| June 2012 | Drawing of lots was hold |
| April 2015 | Council of the state approved the cancellation of the project |

## 4.2. Analysis

As mentioned above, affordability is based on the ration between income and housing costs. Therefore, the discussions about affordable and luxury housing projects supplied by HDA are centred on two main aspects. These are to compare ongoing and completed affordable and luxury housing projects according to their residences income levels and suggested payment meth understand difference between selected communities daily lives in Tasoluk and Sulu income, housing prices in market, payment method are adopted as parameters to compare housing affordability.

[7] (Din er et. al, 2008); http://www.radikal.com.tr/turkiye/sulukulede_proje_iptalini_dani Updated: 14.05.2015

Table 4: Features of Sulukule and Tasoluk Projects

| | **Affordable Housing** | **Luxury Housing** |
|---|---|---|
| **Name** | Tasoluk | Osmanli Konaklari[8] |
| Location | Arnavutkoy, Istanbul | Fatih, Istanbul |
| Closeness to City Centre (Taksim Square) | 38.2 km | 8.3 km |
| Project Start Year | 2005 | 2005 |
| Housing Diversity | All blocs are threefold<br>Units: 2+1 and 3+1 | There is 2,3 and 4 floor blocks<br>Units: |
| Project Area m† | 380.000 m† | 91.496 m† |
| Number of Units | 1356 | 620 |
| Average Housing Size (m†) | 85 m† and 110 m† | 68 to 153 m† |
| Property Values | 58.000 75.000 TL | 125.000 TL |
| Current Property Value | 180.000 220.000 TL | 400.000 - 450.000 TL |
| Payment method/plan | 150 month payment without down payment | No info |

The existing owners had three options: compensation, a social housing unit or a new apartment unit. We should clarify that most of the existing owners have not had any regular income. Not having a regular income and limited budget makes harder to apply for the mortgage plans. Their mortgage plan for a social housing unit has been set as 15-year payment scheme between 280TL to 425 TL monthly payments without any down paymen. Only the half of the households moved in the social housing, the rest sold off their units with prices starting form 3000 TL (Daglar, 2009).

If they choose to have a unit from the new project, Osmanli Konutlari , Fatih Municipality offers a housing benefit with a condition: *the new apartment units will be sold to the existing owners if they accept to pay the difference between the current value of their property (that is calculated by the municipality) and the cost of the newly constructed unit by monthly payments of around 200- 250 Euros that last for 15 years* (Dincer et al. 2008). If the existing owners do not prefer moving to a social housing unit or buy a new unit from new apartments, the Municipality offers to pay 500-600 TL per square as compensation for their land (Yilmaz, 2009).

## 5. Conclusion

Current discussions about Turkish affordable housing policies and stocks are of affordability.

Tasoluk units were sold between 58.000 and 75.000 TL price ranges when they made an agreement with the municipality. The reason of this price range is related to units sizes. A agreement, their mortgage plan was 150 months and the households required to make 400TL to 500TL monthly payments. Their minimum household income should be more than 1333TL to accept the unit as an affordable housing option. However, this is more than 30% of household income according to the existing researches. Based on the survey which has finished before the area had been evacuated, the average monthly income of households is categorized under five groups; 24% less than 300TL, 20% between 300 and 500TL, 22% between 500 and 750TL, 17% 750-1000TL and 17% over 1000

[8] Osmanli Konaklari is the name of the new development in Sulukule. However, the project is known as Sulukule in academia and media.

TL (Yilmaz, 2009). People could not afford the social houses due to their limited income, even though there is a long-term mortgage plan without a down payment.

The owners had compensation for their properties in the project area between 50000 to 80000TL but tenants could not have any housing benefit from any authorities. However, we need to take an attention to that a couple of family were living in the same unit. Therefore, the adequacy of these payments is controversial. As mentioned before, these people do not have a regular income, so this mortgage plan is not acceptable as feasible. If we specifically look at the Tasoluk social hosing stock, it is far away from the city centre. In addition to that, we need to clarify that a lot of the Sulukule residence find temporary jobs in the city centre. Thus, there is a tendency to move back nearby neighbourhoods of their initial settlements.

In this point, we should clarify the displacement process in order to conduct an unbiased research. Even though, all of the residences have not moved out to Tasoluk, currently, just one of them lives in there. Although fifty out of nine hundreds of the households have had an agreement to have a unit in the new housing project in Sulukule, only one household lives in the new development. There are two reasons for that. First, they could not get a unit in their blocks as they are obligated to draw lots to designate the units. The second handicap for them was the change of price per square meter that is doubled from 1250 TL to 2500TL (Ince, 2012). The current property values of Osmanli Konutlari is between 400.000-450.000TL. These property values indicate that these are not affordable even for middle-income households.

As can be seen the Figure 4, Sulukule is planned as denser than original neighbourhood and luxury residences with recreational facilities. However, Tasoluk does not have same features. Besides, the characteristic feature of Sulukule, courtyards, has not been used in Tasoluk plan (Figure 4). It made their lives harder and more challenging while adapting a new neighbourhood and life style because they prefer to communicate with their neighbours in their daily lives. Apartment style life is not suitable for that. According to Daglar (2019), 300 of 900 households have decided to have a social housing unit from Tasoluk. However, only one of the households still lives in there.

Figure 4: Sulukule before demolished and Tasoluk

Figure 5: Tasoluk Social Housing[9] and Osmanli Konutlari in Sulukule[10]

Overall, the urban transformation phenomenon is a multi-dimensional process that affects the economic and social structures of not only the project area but also the periphery of it. The households, who are affected from eviction, aim to move back near the neighbourhoods of their initial settlements. Due to the high relative cost of 30% of households income, Tasoluk social housing stock cannot be defined as an affordable option for low-income household, Osmanli Konutlari cannot be even considered for them.

In addition to that, market-driven problems can be summarized as that: the housing market in free and open market economic systems without any government supply for low-income households might cause shanty towns and unhealthy urban environments. A low-cost payment scheme should be guaranteed by the HAD.
Based on Turkish cases and the literature review about affordable housing, we suggest that the Government should consider the following points to promote affordable housing stocks in Turkey through HDA policies.

- The current payment method should be improved.
- Population displacement should not be an option during the urban transformation process.
- Transfer of ownerships of properties should be restricted to eliminate possible second wave of eviction.

Abstract

In a world driven by information and knowledge, considering the privilege of un also its key role in process of physical and social change, this study aims to universities on the process of urban development and transformation. Within the not only the differentiations in the built environment, but also changing so environments after hosting a university will be discussed.

As a result of legal regulations, starting from 1990s there has been a signi number of state and foundation universities in Turkey and Istanbul in particula the purpose of the paper, after evaluating the spatial relationship between u Istanbul, the analysis conducted to determine the level of spatial and social selected foundation university neighborhoods of Istanbul will be evaluated.

## 1. Introduction

Modern-day understanding, adopting knowledge based production of goods and se forward by neoliberal policies at the international level has brought univer production. While the fundamental function of universities used to be creatio producing and sharing knowledge in the past; new functions such as cooperation and industries, creation of innovations and contribution to the environment hav traditional roles of universities.

While universities contribute economic development on one side, they also prepa social/cultural conditions of development. Besides social development, unive influential factor in development of physical environment of their surrounding a physical, economic and social/cultural infrastructure of the province also p realization of the above-mentioned contributions of universities (Benneworth et campuses also make use of the social, technical and economic opportunities of t close to them in order to meet the spatial and social requirements they need universities have significant influences on urban development with this feature.

Since the beginning of 1980 s, significant changes started to occur in politica structures with the influence of outward oriented economy policies, which start in Turkey as well. Necessary regulations were introduced both for state univers universities to provide service in Turkey, with metropolises in the first insta serving the need to increase the education and training level of the young popul goal of eliminating the imbalance between regions. Within this framework, consi

most significant factors of economic development, an attempt has been made to
universities in the country.

The campuses of Beykent, Istanbul Bilgi and Kadir Has Universities, located i
Istanbul, were observed with the purpose of evaluating the spatial and soci
universities on spatial and socio-cultural environment of cities; the locations
city, their spatial relations and social influences on the environment were
dimensions in the process of urban transformation.

## 2. Relationship Between a University and a City

In addition to the spatial and functional interaction of a higher education in
which it has been established, it also has social, economic and cultural intera
and location of the university campus, the size of the university and the cit
established are significant factors.

Universities create numerous opportunities to determine the economic future of
their country. When these opportunities are utilized correctly, universities pr
contributions to their cities in addition to their contributions to the developr
contributions can be summarized as follows:

> Urban income, improvement in the economic structure and labor force mob
> Physical infrastructure contributions such as improvement in residences,
> communication and transportation,
> Social and cultural contributions such as increase of cultural activities
> life as well,
> Educational and demographic contributions such as increase in the ratio
> education, decrease in the rates of birth and death, decrease of migrat
> 55).

The physical and spatial form of higher education institutions their discipl
activities, the relations that they establish with the residents and business co
of academic settlements should be the object of careful planning and manager
integration and synergy in local development (Russo,et al., 2007).

Universities also provide significant contributions to the social life of the
located. Arrangements such as seminars and conferences open to the public, spec
and continuous education centers and consultative committees in which different
are represented play effective roles in integration of higher educational inst
and increasing social contribution. Higher education institutions are expe
development as a whole in order to contribute spreading science and scientific
tolerance in the area in order to find solutions for the local community, which
problems. For this reason, it is not a coincidence that the goal of development
universities and the industry has become one of the most emphasized goals of
today s world.

Since the university is also one of the social institutions of urban economy; it
physical, economic and social/cultural development of the city with its legal
academic personnel and students and is also in continuous interaction with po
circles. Within the process, these contributions are spread throughout the
provides contributions to the city for social and economic development such as p

mobility, quality of life, personal development, increase of productivity, fle
decrease in crime rates, development of citizenship consciousness, social orga
2007).

The number of universities, which have significant contributions for developmen
cities, has increased after 1980 s and gained momentum after 1990 s. The higher
Turkey has been undergoing a process of rare expansion and structural change du
of century.

3. Development of Higher Education Institutions in Turkey and Istanbul

The number of state universities was 21 in 1981 in Turkey. During this perio
strengthen the identities of the city and to contribute to the socioeconomic dev
by taking into consideration of the levels of development between regions when
for universities outside Istanbul and Ankara.

During this period, considering regional development differences in Turkey, whil
locations outside Istanbul and Ankara, to strengthen the identity of the host
the socio economic development of the region was aimed (Sarg n, 2007).

The Higher Education Law with number 2547 ruled in 1981 (YOK, 1981) is one of
milestones of Turkish higher education system. Following the legal regulations a
of Foundation Universities , the first foundation university was established in

The majority of 24 universities in 1992, of which 1 was a foundation universit
universities, were established in medium sized cities (Sarg n, 2007). The perio
when the idea of establishing a university in each city and the concept of foun
gained importance gradually ( zt rk, et al,2011).

# A Preliminary Study on Re-examining Housing Demand from a Homeownership Perspective in Taiwan

Ping-Geng Huang[1], and Tzu-Yuan Chao[2]

[1] Department of Urban Planning, National Cheng Kung University, morionst@gmail.com
[2] Department of Urban Planning, National Cheng Kung University, tychao@mail.ncku.edu.tw

Keywords: Housing Demand, Homeownership, Tenure Choice

## Abstract

*Since the last decade, the peculiar phenomenon of high housing price, high va homeownership rate has occurred due to the changes of housing market and socio-economic conditions in Taiwan. On one hand, the housing supply keep increasing while on the other hand, the housing demand from middle-income families remain unsatisfied due to the ever-increasing housing price. The unbalance between supply and demand in housing markets result in the queries about how homeownership affects the housing market and how we could adjust housing policies.*

*This study re-examined the correlation between housing demand and homeownership, and analyzed its influence on housing market from institutional and economic aspect. Findings show that housing policies in Taiwan have a fundamental stand for advocating homeownership during every developing period, causing the unbalance of housing tenure of choice. From economic perspective, it is concluded that high homeownership rate in Taiwan is affected by anticipation of high house price increment as well as the low taxation of owner-occupied housing, and form a self-reinforcing cycle along with housing price and vacancy. It is expected that further study would use a tenure choice model to estimate the change of the factors to housing demand so as to provide evidence for the theoretical argument.*

## 1. Introduction

Since 2000, the homeownership rate in Taiwan has climbed to 85 percent in 2013, which is one of the highest homeownership rates in the world (Figure 1). Nevertheless, the housing market has both high housing prices and a high vacancy rate. This peculiar phenomenon reveals a doubt that the housing supply does not meet the housing demand.

What role does the government play in the housing market under the circumstances? The conventional notion of where there is soil, there is a wealth has affected the civic perception of homeo the past. Most people considered buying a house as an objective over a lifetime. Policy making, however, was supply-driven, fortifying the preference for homeownership. After the 1990s, real estate was considered the pioneer industry that promotes economic growth. In order to keep real estate active, lenient housing policies stimulated housing supply and demand by market mechanisms, causing the deterioration of housing commodification and an imbalance between housing demand and supply in Taiwan. Not until recently has the government advocated social housing and by enacting the Housing Act in 2011, showing the housing policy s change to demand-oriented development (Huang, 2013).

Past reviews of research indicate that homeownership has positive impacts on society. Roche (1997) pointed out that higher homeownership means a sounder housing finance system, which give citizens easier access to mortgages to purchase their own houses. Coulson (2002) concluded that homeownership has a positive impact on living environment, child rearing, and civic behaviour. However, these arguments are from European and American perspectives. Moreover, their building types, housing

demands, and social environments are significantly different from those in Asian countries.

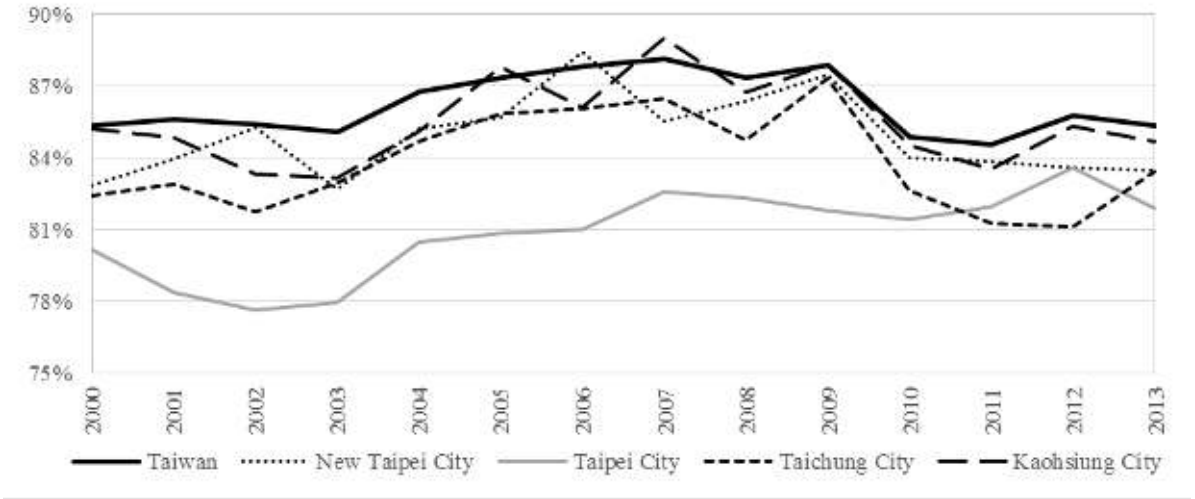

Figure 1. Homeownership Rates, 2000-2013.
Source: Income and Expenditure Survey of Taiwan, 2000-2013.
Note: Before 2010, homeownership rates were considered as the percentage of self-owned houses considering housing tenure. The term "self-owned" means owned by household members and their lineal relatives . From 2010, the term is amended to owned by household members who usually live in this house in accordance with the definition of 2010 Population and Housing Census.

This study raises the argument that high homeownership in Taiwan neither has a positive impact on the housing market nor is the only target that policies should follow. In order to verify this argument, our study provides a conceptual framework for re-examining the housing demand from a homeownership perspective. In the first section, the literature on the development process of housing policy and homeownership is reviewed. Then we explore the economic context for homeownership in the second section. As the relation between homeownership and housing market is presented, we conclude with a judgement on whether or not homeownership brings benefits to Taiwanese society.

In the last section, a discussion on how homeownership applies to the evaluation of housing demand in Taiwan is presented. According to the regulations of central, municipal, and county housing plans, the basic concern within housing policy change is the evaluation of housing demand. Nevertheless, the current method using households as the amount of demand does not take demand reality into account. Moreover, the non-equivalence between supply and demand became apparent after the reorganization of Taiwan administrative regions in 2010, which turn five counties into municipalities (Hsiao et al., 2012). This study seeks an objective method to establish a better understanding in homeownership. Using tenure choice as a mathematical model, it constructs a housing demand model and provides evidence for housing policy making.

## 2. The foundations of Housing Policy and Homeownership in Taiwan

A nation s housing policy is the foundation affecting housing demand and supply. Homeownershi also depends on regulations. In 2013, only 43% of people owned their houses, while 57% choose to rent (Statistisches Bundesamt, Wiesbaden, 2013). This low homeownership rate, compared with most European countries, comes from heavy property tax and a reliable rental market that the government provides. On the one hand, the rate of homeownership in U.K. was 64.6% (Eurostat, 2013). But the

government hindered housing supply over a long period of time, and supply fell short of demand, making it more difficult for citizens to have a home of their own.

The development of homeownership in Taiwan differs from other countries. The conceding housing policy and the conventional notion of owning a house is better may make homeownership a better choice of the housing tenure in Taiwan, leading to a situation that leasehold market is of little account to the housing market. Following are the four major development periods in Taiwan:

## 2.1 1950s-1970s: Provisional Housing Supply Policy

This period occurred when the R. O. C. Central Government retreated to Taiwan. Almost 2 million people flooded into Taiwan. On top of that, a military conflict between China and Taiwan arose from political tension. The R. O. C. Central Government did not take the initiative in formulating housing policy, but only provided shelters (becoming the so-called military dependents villages ) as a temporarily handling the military immigrants.

Due to this method of dealing with insufficient housing, the National Government enacted the Loan for Constructing Public Housing Act in 1957, serving as the predecessor to the Public Housing Act. Before it was annulled in 1975, the government built around 12.6 thousand public dwellings and sold them to low-income households at cost price (Lin W. I., 2006). Overall, the shelters was merely a way to settle the military immigrants down regardless of their living quality. As for the other citizens, the lack of a comprehensive housing policy was not the major concern.

## 2.2 1970s-1990s: Economic-oriented Development

After the aforementioned conflict ceased, the R. O. C. Central Government emphasized economic development. In order to stabilize the rise in housing prices and inflation due to the Oil Crisis of the 1970s, the government enacted the Public Housing Act in 1975, and promoted a Six-Year Economic Development Plan, which provided at least 10 thousand public dwellings. In 1979, the Housing and Urban Development Bureau was established to process related business.

The government revised the Public Housing Act in 1982, given the lack of public housing funds. Construction conducted by the people themselves with government loans , and encouraging private investment were added, hoping to release the government s bu private capital. On the one hand, the government also expected to build public housing on a large scale to stabilize housing prices, making it possible to achieve the goal of every d their own (Mii F. K., 1988). The government constructed 4.7 thousand dwellings

Compared with the previous period, the government took more active actions to stabilize the economy, formulating policies on housing supply and subsidy. It was at this period that homeownership gained political and legal support. But the practical considerations behind the policy were economic development rather than balancing the housing market. The essence of the housing policy was still indeterminate, and a preference for owning a house had begun to change housing supply and demand.

## 2.3 1990s-2000s: Non-interference with Housing Market

In the 1990s-2000s, Taiwan faced further negative impacts on the housing market. Public housing accompanied by urban construction was planned as a solution to handle the rocketing housing prices since 1985. However, problems eventually emerged, such as an excessive supply of social housing and

high housing prices, leading to a suspension of providing public housing in 1999 (Lin W. I., 2006). During the same period, the government tried to increase incentives for private sectors and to expand housing subsidies, which became the trend in the following housing policy (Chen Y. L., 2013).

This period became a turning point in housing policy, since property industry grew rapidly, posing a threat to the housing market. In 1999, policy on public housing failed. By late 1990s, the government tried a pilot scheme of leasehold housing (based on superficies right) in Taipei City. About 416 dwellings were transacted, with usufruct for 50 years. Nevertheless, the purchasers advocated for the right of owning their houses by statement, appeal, or administrative petition. The government, on the contrary, compromised with those purchasers on transferring the ownership of the leasehold housing. Housing policy during this period still had no subject, but it let private sectors take control of the development of the housing market. The government s compromise indicated non-interference in the housing m Homeownership rate in Taiwan thus surpassed 80% in 1990 due to the rapid growth in the property market.

## 2.4 2000s-Now: Form of Comprehensive Housing Policy

After 2000, a wave of protests from social welfare organizations and local citizens arose. The problem of rising house prices remains, forcing the government to face the problem with new strategies. The Comprehensive Housing Policy was enacted in 2005. It was the first comprehensive and long-term housing policy, and an overall review of past housing policy, too. Its context included: improving the housing market, establishing a fair, efficient housing subsidy institution, and enhancing living quality. The concept of social housing was added to the statement for the first time. The importance of the Housing Act (draft) was also noted. But not until 2011 did the government en setting a clear goal for Taiwan s housing policy.

Huang (2013) used path dependence theory to analyse the context of affordable housing policy, and concluded that the context of affordable housing policy fall into a lock in situation, which means that the Public Housing Act has not changed its regulations from the basis in the process of revises over the years. While the Public Housing Act was replaced by the Housing Act in 2011, it showed a transition pattern of layering. In the lock in process of revises, institutions would f reinforcing.

This study agrees with the argument of Huang (2013). A lock in situation proves that while the Pul Housing Act has dominated housing policy over the past four decades, homeownership has consistently affected housing supply and demand. Housing policy was based on the idea of homeownership. From providing public housing, stabilizing economic development, to the failure of public housing, the housing policy has continuously reacted passively. The government tried to promote leasehold housing, but failed to lead the housing market. Housing policy and social culture encourage the owning of houses, causing a high homeownership rate.

## 3. The Economic Context in Homeownership and Housing Market

In the last section, it was noted that high homeownership in Taiwan derives from unbalanced policy, leading to a preference of housing consumption in the society. What role homeownership plays, then, is the main focus of this section.

Past studies often discuss homeownership from the perspective of tenure choice. Lee and Trost (1978) were the first ones to study a joint estimation of tenure choice and housing demand model; Hsueh and Chen (1999) also pointed out that homeownership is the sum of tenure choice of an individual household,

and it is feasible to analyze different factors affecting housing tenure of choice. From the perspective of tenure choice, the following are major factors to be discussed so as to analyze the role that homeownership plays.

### 3.1 House Price and Income

House price and income are two of the factors used to evaluate the ability to purchase a home. Usually the house price to income ratio has been regarded as an index of housing affordability. Figure 2 shows a rapid change of house price to income ratio, from 4.5 times in 2002 Q1 to 8.4 times in 2014 Q3. The rate has almost doubled the number in the ten years, especially in Taipei (15.2 times) and in New Taipei City (12.8 times), where transactions are most thriving. Since the homeownership rate has a slightly drop in 2009, does there exist a directly proportional house price to income ratio?

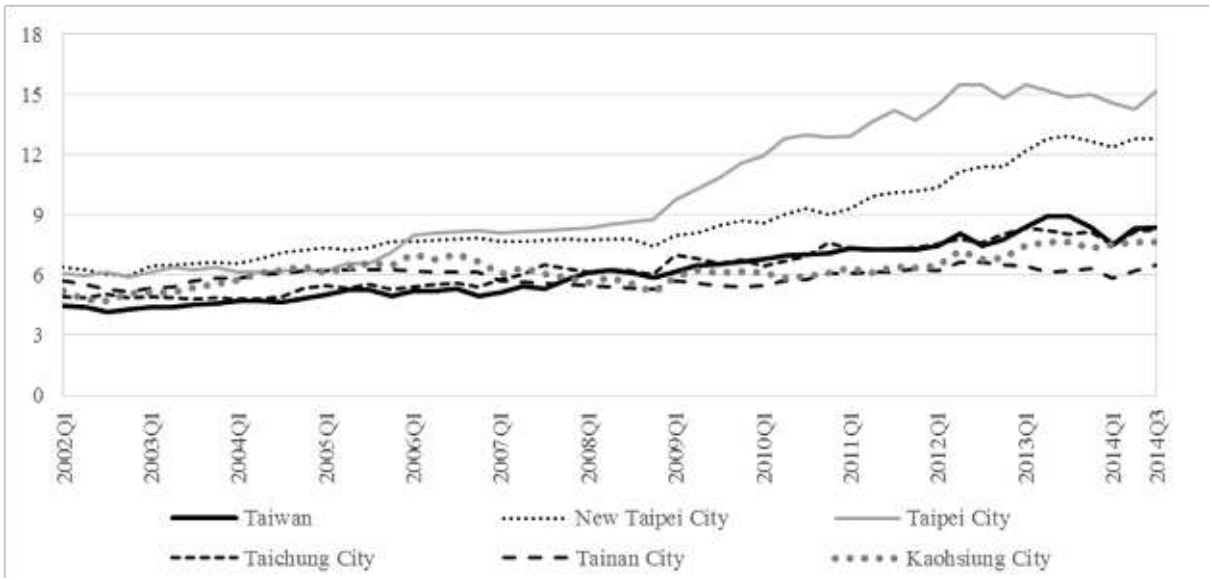

Figure 2. House Price to Income Ratio, 2002-2014
Source: Construction and Planning Agency, Ministry of the Interior, 2002-2014.

There are different aspects for house price and income available to evaluate the effect on tenure choice. Hsueh and Chen (1999) indicated that when housing prices increase, the user cost of owning a house relative to renting also increases. An individual household would lean towards renting rather than owning a house. On the one hand, income is the major factor in the category of household attributes (Hsueh and Chen, 1999; Shieh and Lin, 2000; Peng and Tsai, 2012). Higher income represents a better ability to pay off a mortgage. A permanent income in particular has better accuracy of evaluation than a current income (Goodman, 1988).

Nethertheless, the expectation of house price appreciation has a more positive impact on housing tenure choice than house price and income. Goodman (1988) and Hsueh and Chen (1999) both considered the expectation of house price appreciation increase regarding the expected utility of buying a house. An individual household would choose to own a house if housing becomes a favourable investment. Peng and Tsai (2012) had a further point of view on the argument stating that a continuous rise in homeownership derives from the excessive expectation of house price appreciation, especially in an area of high expectation of house price appreciation, where house price and income have a relatively low impact on homeownership. This may explain the fact that homeownership in Taipei City has stayed at

the current level since 2009 while housing prices keep increasing.

There is a similar consideration between the expectation of house price appreciation and the property ladder. Based on the investment potential and the desire of owning a house, first-time buyers get on the property ladder and then use the capital gained to move up as quickly as possible (Earley, 2004). However, there are other significant factors affecting the housing market, so as to make people have easier access to buying houses despite high housing prices.

### 3.2 Taxation of Homeowners

Taxation is also a major factor. Shieh and Lin (2000) indicated that increased property tax would make individual households tend to rent to reduce the cost instead of owning a house. Property tax has an even bigger effect than income.

In fact, many preferential treatments in housing demand were formulated to encourage homeownership. Take Income Tax Act for instance. The interest payable on a loan from a financial institution by a taxpayer, one s spouse and dependent for the purpose of a house for one s own u from one s consolidated income, with the deductible amount not to exceed NT$ 30 tax return. Another instance shows a subsidy on repurchases of a self-use residence. If the cost of the new building exceeds the original sales price, it may be deducted or refunded from the consolidated income tax payable. The provisions also are applicable to the taxpayer who buys first and sells later. In the current tax system, the higher the marginal tax rate, the more subsidies one can apply, and hence reduce the relative cost of owning, thereby encouraging owning a home (Shieh and Lin, 2000).

Other studies show that taxation has a more significant effect on homeownership rate. Bourassa and Peng (2011) explained that through simulation of change in tax policy, a percentage of increase in the property tax rate or a percentage of decrease in expectation of house price appreciation reduces the homeownership rate by about 12%. Besides, the low user cost contributes to high homeownership, indicating that the cost of owning may count for much in tenure choice.

As the subsidy on buying a home and taxation deduction has been in place for years, the low cost of owning may provide a suitable environment of encouraging homeownership. On the contrary, subsidies in renting market seldom get much attention, making this option less favourable for households.

### 3.3 Housing Vacancy Rate

In addition to the factors mentioned above, it is necessary to take vacancy into account, which represents practical demand and supply in the housing market. This section also sums up the peculiar phenomenon of high housing price, high vacancy rate and high homeownership rate, acquiring the current situation the housing market face.

Hua (2001a) discussed the relation between vacancy, homeownership rate, and housing price, finding that the positive impact on housing price homeownership rate exert is stronger than the negative one that vacancy exerts. Although the government could formulate a subsidy policy to stabilize housing prices, encouraging homeownership would also increase vacancy at the same time.

Besides that, the consumption of a second home in Taiwan could also be a possible factor increasing ownership rate and vacancy rate. The rate of owning two or more houses was around 16% in Taipei City and New Taipei City in total (Yang and Chang, 2001). Peng (2005) evaluated the difference between the equilibrium vacancy rate and the practical vacancy rate in Taipei City and New Taipei City, respectively.

It turned out that the difference was much closer than expected, and the equilibrium vacancies were both on the high side, indicating that a certain amount of second homes was not involved in the housing market. Thus, this would not affect housing prices even if the vacancy rate rises. Nevertheless, surveys on second homes in Taiwan have not been completely established compared with other countries, so the amount of second homes remains uncertain.

The current situation of the practical vacancy rate in the housing market has shown a contradictory phenomenon. The housing vacancy rate in Taiwan has keep rising in the recent 20 years, from 13.3% in 1990 to 19.3% in 2010 (Figure 3). This high vacancy rate shows a serious problem of vacant dwellings, compared to 13.5% in Japan, and 2.6% in the U. K. It seems that the past theoretical statements are in accord with the current situation.

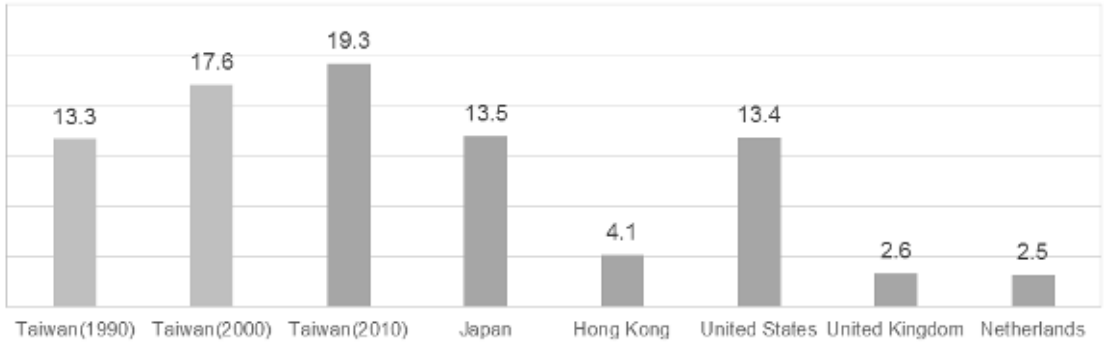

Figure 3. Housing Vacancy Rates for Selected Countries
Source: Population and Housing Census, Accounting and Statistics, Executive Yuan, R.O.C., 2010; Ministry of Internal Affairs and Communications Statistics Bureau, Japan, 2013; Department (R&VD), Hong Kong, 2013; U.S. Census Bureau, U.S., 2014; Department for Communities and Local Government, England, 2014; Central Agency for Statistics, Netherlands, 2014.

It is suggested that Taiwan belongs to the first quadrant of high homeownership rate and high vacancy (Figure 4), representing the condition of excessive housing supply and consumers being obsessed with buying houses (Hua, 2001b). From the analyses of house price to income ratio, taxation and vacancy, it is concluded that high homeownership has become an endogenous variable rather than the outcome of housing market operations. High homeownership also causes a negative impact on the housing market. Thus, the argument mentioned in the introduction is supported by the reviews of research.

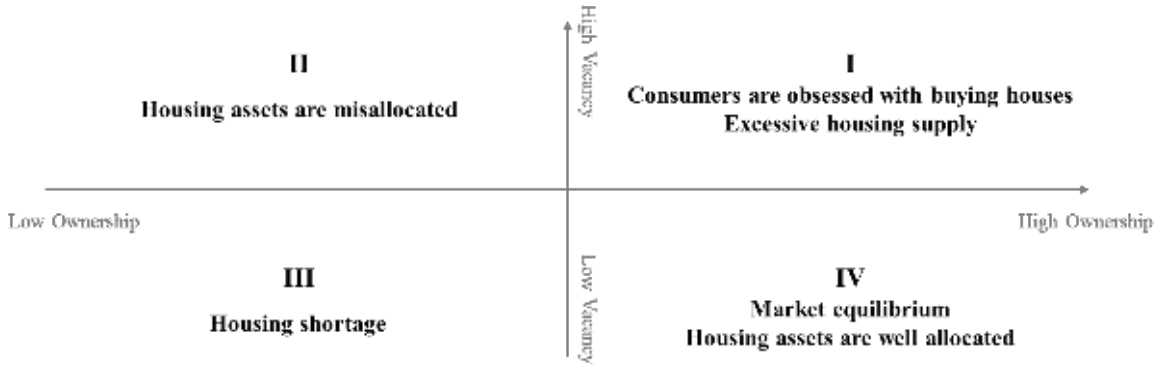

Figure 4. Relationship between Homeownership and Vacancy
Source: Hua, 2001b.

## 4. Empirical Hypothesis and Methodology

### 4.1 Empirical Hypothesis

In this section, an empirical hypothesis is constructed based on the argument that high homeownership in Taiwan may not have a positive impact on the housing market. Figure 5 shows a brief diagram of a housing market cycle in Taiwan. All factors in the study mentioned above form a self-reinforcing cycle. The plus and minus signs represent a positive or negative relationship between two variables at both ends, respectively. Since there are even minus signs in the cycle, the cycle tends to reinforce itself through a feedback loop, and never tends towards equilibrium.

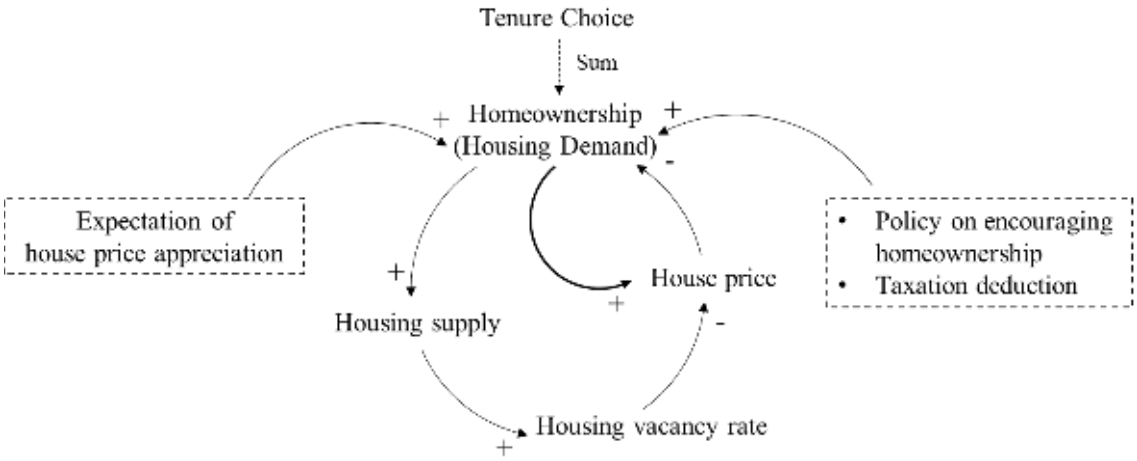

Figure 5. Diagram of Housing Market Cycle in Taiwan
Source: Hua, 2001b; Modified by author.

It is assumed that individual households would follow these factors when making a tenure choice decision. Under the influence of high expectation of house price appreciation and policy on encouraging homeownership, most people choose to become homeowners. But after the Housing Act was enacted in 2011, more social housing projects will change the housing supply and housing prices. According to Social Housing Advocacy Consortium (2015) statistics, the total amounts of social housing stock in Taiwan are 7,312 dwellings, while 6,641 dwellings are in Taipei City. New Taipei City and Kaohsiung City, the largest and second-largest cities in Taiwan, also take part in the construction of social housing. Besides, appropriate housing sells at a price that is lower than the market price; the rent of social housing is 70% of the market price, indirectly restraining the rise of housing prices.

Although the concept of social housing is at a preliminary stage, it is the key construction project of housing for other cities and counties with a legal basis. The quality of the renting market may be improved, since housing policy directly affects tenure choice from the supply aspect and puts emphasis on homeownership. How would the cycle vary if the condition of housing supply changed? Would homeownership tend to decline due to the change? Most important of all, would housing demand meet housing supply in the long term?

Hence, the empirical hypothesis of this study was designed to evaluate the change in homeownership when taking social housing into account. The housing market cycle would function in a slightly different way. More changes in percentage of renting derived from tenure choice may lead to a decline in homeownership, especially for those areas having more amounts of social housing.

## 4.2 Methodology

Because homeownership is based on tenure choice, past studies had wide discussions on how individual households act when making a tenure choice decision, apart from the aspect of theoretical basis of behavior, and apart from the econometric perspective, describing possible factors which may affect tenure choice (Lien, 2009). This study used a probit model as the tool for empirical analysis. This can be seen in the following formula:

$$P(OWN = 1) = F(a_0 + \sum a_j X_j)$$

OWN=1 refers to the condition that household has one house of their own. The formula of P(OWN=1 f(X)) indicates the conditional probability of homeownership. The individ possibility of owning a home (OWN*) can not be observed in practice (Hsueh and Chen, 1999), so it can be described as OWN=1 if OWN* > 0; otherwise, OWN=0. F refers to a cumulative distribution function which complies with normal distribution, while $a_0$ is a constant term, and $X_j$ is for explanatory variables.

The empirical model was expected to acquire the impact of those variables on homeownership, and to find the implicit housing demand. The current evaluation of housing demand only uses households in Taiwan as the amount of demand. It is suggested that the difference between housing demand and supply can be observed when a comparison of current evaluation and a housing demand model from homeownership perspective is made, and the empirically analyzed results can also provide a policy feedback.

## 5. Summary

This study re-examined the correlation between housing demand and homeownership, and discussed whether there is a phenomenon that shows higher homeownership provides better social or external benefits in Taiwan. From the literature review of housing policy, we concluded that there is a fundamental stand for advocating homeownership in most policy making. Thus, housing policies during four major developing periods in Taiwan only reinforce the preference of owner-occupied housing, and cause the insufficiency of renting market mechanism.

As for the role that homeownership plays in the housing market, we indicated that homeownership, housing price, and vacancy form a self-reinforcing cycle. High homeownership, which correspond closely to the anticipation of high house price increment and housing policy, brings along high housing prices and high vacancy rates at the same time, leading a deteriorated housing market. Thus, we concluded that high homeownership may be one of the factors that cause the unbalance in the housing market. While social housing is an ongoing policy, it may haves a chance to get involved in the cycle, and it may moderate the high homeownership impact from the supply aspect. Hence, there is a need for understanding the practical housing demand on the basis of tenure choice to adjust related housing policy. Further study would use a tenure choice model to estimate the change of the factors to housing demand so as to evaluate the impact on homeownership considering social housing supply, and provide evidence for the theoretical argument.

# Affordable or unaffordable? A Preliminary study of a reasonable social housing rental price range in Taipei City

Tzu-Han Hung[1], Tzu-Yuan Chao[2]

[1]Tzu-Han Hung (Department of Urban Planning, National Cheng Kung University), annyna49@gmail.com
[2] Tzu-Yuan Chao (Department of Urban Planning, National Cheng Kung University), tychao@mail.ncku.edu.tw

Keywords: Affordability, Social Housing, Pricing of social housing rent

**Abstract**

*The central government in Taiwan enacted the Housing Act in 2011, in which social housing was firstly well-defined in the housing policy history. In the Article 3, social housing built by the government or private sector with subsidies from the government that is primarily rented. Hence, each local government is required to develop the pricing model based on the housing demand. However, Taipei City for instance, the average rental price of social housing is unified by 30% off market price and apply to any income levels households. It is questionable of whether certain standard could really meet the affordability of the disadvantaged groups. The past researches were mostly concentrated on the quantity and the distribution of social housing provision. There are few studies discussing about the rent setting system, which is probing whether the pricing is actually affordable or not.*
*Therefore, this paper intends to examine that the social housing in Taipei City was unaffordable no matter in the past or now by using rent-to-income ratio. Furthermore, this research will review the target group, rent setting and providing mechanism in different countries. Through the case studies, Taipei City can learn the practice of other countries, and improve the problem of unaffordable social housing. According to above, this paper would practice one rent setting system of the countries, which is considered by similar economic and society structure to Taipei City, as a preliminary study of reasonable social housing rental price.*

## 1 Background

In order to solve the housing problem, most states protect people s housing rights, which seen as basic human rights through the enactment of legislation. However, in Taiwan, housing rights is not a constitutional right (constitutional interpretation no. 558). Until the Housing Act was passed in 2011, housing rights was accepted as a basic human right, which entitled people to improvements in the quality of housing, and thus allows all citizens to enjoy suitable housing and a dignified living environment.

Although awareness of housing policy counselling subjects has become more and more common, it is still impossible to provide housing rights, which are aimed at helping all citizens enjoy suitable housing, especially the economically disadvantaged. In addition to the small amount of social housing available, the other reason this policy is not valid is because the policy does not consider the affordability of housing in the case of those who are disadvantaged.

In the Cold War (1950 s), Taiwan was subsumed into the anti-communist policy that was led b United States. At the time, the society and economy of Taiwan was unstable, and the government was unable to solve existing problems. One of the reasons for this was that almost 85% of the government budget had to be used for military expenditures, and only 15% of the budget could be used on housing supply, education, public infrastructure, and so on. The only way to solve the problem was to use the United States plan to provide loans, which was entitled the Construction of Public Housing Lending Regulations (1957-1975), to stimulate the housing market and promote economic development (Mii, F. K., 1988). At that time, the social housing (also meaning public housing in Taiwan) policy in Taiwan was a contingency system aimed at accommodating a large number of post-war immigrants and homeless citizens.

In the 1960 s, Taiwan for the first time successfully entered a period of interr
and economic development was based mainly on external trade, which kept the domestic economy growing and the national income increasing. Due to the growing economy, the housing filtering process improved the national ability to enter the housing market and solve the housing problems existing at that time.

However, in the early 1970 s, as a result of the global economic downturn and c
stagnation made the housing supply system inoperable. Upper middle class household incomes could not keep up with housing prices, and the low-income households could not afford basic living needs. In response to the situation, the government enacted the Public Housing Act in 1975, which was an attempt to build a large number of public housing projects to protect the housing rights of the disadvantaged (Mii, F. K., 1988).

According to Article 16 in the Public Housing Act, the public housing price was set in reference to the market price of nearby properties with specific deductions. In this period, public housing prices were lower than general housing prices, but there was still a gap between public housing prices and the affordability of housing for low-income households. According to the population based on a housing survey, vacant public housing stock rose to 820,000 units, which highlighted the problem of unaffordability (Executive Yuan, 1994). As a result, the housing policy involved the consumption of a large amount of public housing stocks, and private investment was no encouraged in the construction of public housing after 2000 (Lin, W. I., 2003).

After the Housing Act was announced in 2011, the government began to supply social housing that was primarily rental housing, which was built by either the government or the private sector with subsidies from the government. In the draft of the Regulation on Lease of Social Housing in Taipei, the rents for social housing were to be set in reference to the market price of nearby properties with specific deductions just like the price setting for public housing. Due to the increasing housing prices in Taipei, rent, which was deducted from the market price, was limited to protect the housing rights of low-income households.

## 2 Literature review

### *2.1 Social housing in Taipei City*

In order to meet the housing needs of low-income households and to make housing affordable to citizens, after the Housing Act passed in 2011, the administration in Taipei City began to promote acquiring a house by leasing rather than buying. The government combined the resources from the government and private sector to increase the supply of social housing; on the other hand, the government improved the affordability of housing for low-income households through providing subsidies to them.

Government properties are the key to driving the modes of supply of social housing in Taipei City, including construction directly by the government, reconstruction or renovation of a public building, and coordination with urban renewal (Department of Urban Development, 2012).

The operation of social housing involves the government retaining ownership of the land and buildings, where applicants for social housing can enjoy use rights during the period of the lease. To maintain quality of living, the government entrusted the private sector to with the management of maintenance of these properties. The Taipei City government established a housing fund to ensure that the operation was successful, which involved the use of subsidies from the central government and social housing revenue as the funding sources.

In order to protect the housing rights of low-income households, the applicant qualifications set a limit to age, household composition, household income, and so on. On the other hand, the rents were set according to the local rent standards, with the social housing rent being set at usually 30% less than the market rent (Liu, H. S., 2014).

Table 1 Taipei City social housing statistic

| Social housing Program | Dalongdong | Dunhuang | Hsingtien Temple | Wanlong | Jingwen | Yongping |
|---|---|---|---|---|---|---|
| Households | 110 | 3 | 30 | 41 | 39 | 51 |
| Average living area ($m^2$) | 137.09 | 109.09 | 42.98 | 70.18 | 111.83 | 155.37 |
| Applicant qualification | Household income at the first and second quintiles: annual income under 1,190,000 NT dollars ➔ monthly income under 99,167 NT dollars | | | | | |
| Average rent | 16,600 | 21,900 | 12,150 | 14,785 | 19,375 | 12,050 |

| Social housing Program | Longshan Temple Station | Gangqian Station | Taipei Bridge Station | Xindian Depot Station |
|---|---|---|---|---|
| Households | 11 | 14 | 327 | 218 |
| Average living area ($m^2$) | 80.10 | 39.67 | 49.59 | 42.98 |
| Applicant qualification | Household income at the first and second quintiles: annual income under 1,190,000 NT dollars ➔ monthly income under 99,167 NT dollars | | | |
| Average rent | 23,100 | 24,600 | 20,300 | 18,000 |

Source: Social Housing Advocacy Consortium (2015)

According to the Taipei City Family Income and Expenditure per Household Survey conducted in 2013 (Table 2), qualified applicants accounted for 38.48% of all households in Taipei City whose monthly income ceiling was 100,000 NT dollars. While the household income was in a range between 67 to 75 thousand NT dollars per month, the affordable resident expenditure was under 22.5 thousand NT dollars, which is lower than the 30% rent-to-income ratio. Although these households were qualified to apply for social housing, they may not have been able to afford it, such as the social housing at Longshan Temple Station and Gangqian Station. These kinds of households, who qualified to apply for social housing without the ability to afford it, accounted for 28.11% of all households in Taipei City; on the contrary, the households who both qualified and could afford the housing made up only 10.37% of all households in Taipei City.

Table 2 Taipei City Family Income and Expenditure per Household Surve

| annual income (thousand NT dollars) | monthly income (thousand NT dollars) | households | percentage | Accumulated Ratings |

| Over 4,000 | Over 333 | 30,009 | 2.94% | 100.00% |
| Total | | 1,021,434 | 100.00% | --- |

Resource: Taipei City government DGBAS (2013)

According to the Health and Welfare Department of the Taipei City government, middle-income and low-income households are identified by the monthly income per person, which is 19,461 NT dollars and 14,794 NT dollars, respectively. By using these values to multiply by the average number of household members (3.21), lower-middle-income households can be identified by a household monthly income of under 67 thousand NT dollars. Thus, the household monthly disposable income can be calculated as 20,100 NT dollars, which is lower than some social housing rental fees. Therefore, unaffordable social housing is a concrete actuality in Taipei City.

*2.2 Case Study*

According to the preceding discussion, the major reason that social housing is unaffordable is that the rent is set based on the peripheral market price rather than the affordability of the applicants. Therefore, this research is an attempt to use experiences, including the use of target groups and the rental systems of other countries whose social housing development background and supply are dealt with in a manner similar to those in Taiwan.

Governmental participation in social housing can be divided into 4 types according to different supply modes and the degree of involvement. The first type is absolutism, where the housing supply relies entirely on the government such as is the case in some communist countries. The second type of social housing supply is mainly provided from the government such as is the case in Singapore. The third type of supply mode is similar to a public  private partnership in which the government shares the burden with the private sector; for instance, in the Netherlands and Japan. The last one is a mode inducing the private sector to participate in the social housing supply through urban planning, housing standards, and the encouragement of development that is controlled by the government, for example, the United States (Chang, C. O., 1990).

By integrating the operation of social housing in Taipei as discussed in Section 2.1 with the classification used by Chang (1990), the supply mode, including the provider, the supply method, and the management of social housing are the third type, which is approximately the same as that used in the Netherlands and Japan. On the other hand, the funding and provision of social housing in Taipei tends to be the forth type and are similar to the mechanism in the United States. Therefore,

the following table provides an analysis of these three cases for supply operation, target group and rent setting for social housing.

Table 3 The form of governmental participation in social housing in

| **Taipei City** | | | |
|---|---|---|---|
| Target group | Social housing provider | Land provider | Funding |
| lower-middle-income households | Local government<br>Private sector | government property (local government) | Housing funding (local government) |
| Supply modes | Property | Management | Rent setting |
| 1. Build directly by government<br>2. Participate in urban renewal | Local government owns the ownership.<br>The applicants own the use right. | Private sector | 30% off the market rent |

### 2.2.1 The Netherlands

After the Housing Act passed in 1901, the government paid a great deal of attention to formal housing associations (HAs) which had the authorization to privatize, and entitled the HAs to funding and basic rights. Social housing was supplied by the cooperation of the government and the institutions for which the government was responsible for providing financial support, including subsidies, long-term low-interest loans, or providing cheap land for building sites, and the HAs took charge of the construction.

Because of housing shortages and the fact that a lot of houses had to be renovated or rebuilt after the Second World War, extensive construction of rental housing was promoted, and the rent was set at a lower price to provide social housing to all citizens with housing needs durin 1950 s. To maintain the lower rent, the government regulated the setting of re and loans, which made the supply-demand relation between the HAs and the tenants more dependent on the government. As a result, the subsidy burden on the government became higher in the late 1980 s (J. van der Veer, D. Schuiling, 2011)

In the national policy report Housing in the 1990 s , a regime shift, in whic social housing and subsidies changed from including all citizens to only low-income households, social housing was announced, which has now been implemented for years. In response to the change, the HAs had to transform into financially independent self-financed social enterprises.

The new cabinet after the 2010 election suggested a gradual increase in the limit on the social housing applicant qualifications. The suggestion was enacted in the new regulation announced in 2011, and the most important measure was that 90% of all new lettings of social housing had to be allocated to households whose income was below the annual income standard at the time. The rent of all rental housing including social housing was set by a governmental rent point system. The system scores the housing points using a scale, location, structure, form, furnishings and so on. A higher score indicates better housing conditions which are allowed to charge a higher rent. The minimum score is 40 points, corresponding to an annual minimum rent of 19,466, and the marginal price is point.

### 2.2.2 Japan

After the Second World War, the Japan government started to improve housing quality for low-income households. Thus, the government established the Government Housing Loan Corporation for the purpose of providing low-interest loans starting in 1950. The next year, the government enacted the Public Housing Act. In 1955, the government empowered the Japanese Housing

Corporation to manage construction and planning. These acts and corporations are the three pillars of the Japanese public housing system (Liu, D. W., 2007).

In the early 1990 s, Japan experienced a severe financial crisis, which was a turn housing policy. The Prime Minister, Hashimoto, raised the need to curtail public spending in 1997; therefore, the private sector took the initiative to promote a public private partnership, and enacted the PFI Act in 1999. Since the PFI Act passed, social housing activities have integrated public assets and private funds; that is to say, while the private sector builds and owns the social housing, the management and contracts are controlled by the government.

The Public Housing Act mandated that social housing be provided by the local government and housing corporations. The central government was only responsible for providing capital subsidies, which were separated into two kinds of subsidies. One included the construction or acquisition costs, and the other type of subsidy was for the landlords to subsidize the difference between the rent benchmark price and the market price.

The operational mode of Japanese social housing is determined by the local government, who manages the social housing allocation procedures, including the announcements, acceptance of applications, qualification assessments, rent setting, and so on (Mao, S. J., 2010). In addition to the household income level, there are more factors to be considered in the rent setting system, such as the family composition and the characteristics of the housing in different locations (Maruyama, G., 2013). The formula for setting the rent is shown below.

Rent = The rent benchmark price  Urban land price coefficient

Area and scale coefficient  The life time coefficient  Convenience coefficie

The target group for social housing is households whose income is under the first quartile (25%) of all households, and the monthly income is under 200,000 yen. The rent benchmark price is set by 70% off the monthly income. The urban land price coefficient is set by the land price index variation, which reflects the urban land price fluctuations. The area and scale coefficient is the ratio of living area to the standard housing area per household. The life time coefficient considers the depreciation and age of housing, which is different from the building composition and materials. Lastly, the convenience coefficient reflects the influence on pricing from location, transportation, and surrounding facilities.

### 2.2.3 The United States

Affordable housing programs in the United States are carried out through a partnership among the federal government, local housing associations and private property owners.

During the Great Depression, the Housing Act of 1937 allowed the state governments to establish local public housing authorities (PHAs) as a provider of social housing to promote more employment opportunities and satisfy the housing needs of low-income households. In the Second World War period, the housing issue was not taken seriously until the war was over, and housing demand was inflating. To solve the problem, the Housing Act of 1949 was passed and revived the social housing program.

The government turned the concept of eliminating urban poverty using social housing into a living purpose-driven program which was aimed at improving the housing quality of the lower-middle class and reducing urban recession (Huang, Y. M., 2013). With this in mind, the federal government handed over the responsibility of the social housing program to the US Department of Housing and Urban Development (HUD) in 1965.

However, members of the US Congress and the Nixon Administration amended the Housing Act of 1937, creating a new Section 8 Housing Assistance Program, which is responsible for providing affordable housing for households whose income is under the local median income, to replace Section 23.

J. Gresley (2011) pointed out that Section 8 makes use of a private market investment and ownership structure. Two of the important programs in Section 8 are the Housing Choice Voucher (HCV) program and the Project Based Section 8 program, which are coupled with HUD morto

In the HCV program, social housing applicants have to examine the qualifications according to their household income and then set a part of their income as rent (usually 30-40% of their total income). The difference between 30% of the household income and the fair market rent announced annually by HUD decide the value of the HCV. The households pay their rent directly to the owner, while the housing associations make a payment to the owner monthly which covers the difference between the household rent and the fair market rent.

The Project-Based Section 8 program allows HUD to set secured credit for developers, who can get a low-interest loan from banks and reduce the cost of construction to provide housing within a lower rent range. The operational mode of the Project-Based Section 8 program is similar to that of the HCV program, which sets 30% of the household income as the social housing rent, and the difference between the social housing rent and the fair market rent is covered by HUD.

As the subsidy standard, the fair market rent is usually set at the 40% quantile of the market rent. The fair market rent, which can be impacted by the scale, quality, location, age, and the furnishings of the house, is adjusted in accordance with the annual Consumer Price Index.

#### 2.2.4 Summary

According to the cases from different countries, housing associations in the Netherlands are the main planners, providers and operating units for social housing. Cooperation between local governments and corporations is the key to operating the social housing system. The federal HUD in the United States guides the supply of social housing with abundant funding through both market mechanisms and subsidies.

Table 4 Case study in the Netherland, Japan, and the United St

| Countries | The Netherland | Japan | The United States | Taiwan |
|---|---|---|---|---|
| Target group | lower-middle-income households | the household income under 25% of all citizens | the household income under 50% of all citizens | lower-middle-income households |
| Social housing provider | HAs | local government private sector | associations and developers | local government Private sector |

| Property rights | rent from HAs | rent from the local government or corporations | rent from the house owner | rent from the government |
| Management | HAs | corporations and private sector | house owner | private sector |
| Rent setting | rent point system | The formula (1) | 1. 30% of the income<br>2. Fair market rent | 30% off the market rent |

Relative to Taiwan, there are neither social entrepreneurs as large as the housing associations in the Netherlands, which are able to assume the supply of social housing independently, nor is there a public sector as rich and influential as HUD is in the United States. As a result, the most similar case to Taiwan is the Japanese social housing system including a societal structure, provider and operational mode. Because the system of social housing rent setting is unfinished in Taipei City, this article is an attempt to use the rent setting formula and coefficients in Japan to assess the affordable rent price range in Taipei City as a preliminary study.

## 3 Empirical research

### *3.1 Research Design*

In this paper, Taipei City is taken as the research field, and the household income and expenditure survey conducted in 2013 is used to discuss the low-income household affordable rent range for the

2 social housing programs under construction, which are the Dongming and Xinglong social housing programs.

First, parameters are set, including income grading, the urban land price coefficient, area and scale coefficients, and the convenience coefficient. Income grading is used to ensure the applicant qualifications for social housing, for instance, the households in Japan whose income level is less than 25% of all citizens. The urban land price coefficient is used to react to the urban land price fluctuations and is set by the Land Price Index from each region. The area and scale coefficients refer to the concept of standard household housing areas from the social housing in Japan. The lifetime coefficient refers to building depreciation and differences among structures. Because the social housing in Taiwan has been developed recently, take a social housing program founded in 2011 in Taipei City for example, the life time coefficient would be 0.996. The convenience coefficient is mainly used to react to the impact of location and building characteristics. After setting the parameters, the affordable rent is calculated using the coefficients and the rent benchmark price.

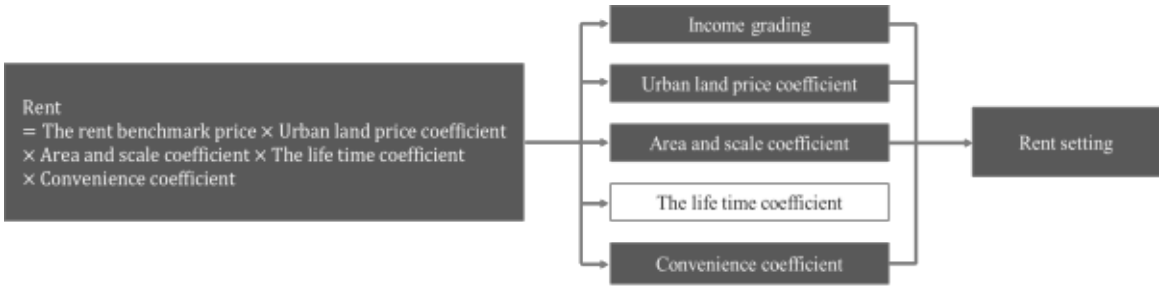

Figure 1 Research lifetime

*3.2 Research Procedure*

3.2.1 Income grading

The applicant qualifications for social housing in Japan include households whose income level is less than 25% of all citizens and a limit on monthly household income is set at 200,000 yen; 70% off the household monthly income is set as the rent benchmark price.

According to the household income and expenditure survey in 2013 in Taipei City, the monthly disposable income is divided into five equal parts. The target groups for social housing in Taipei City are in the first and second quintiles, namely the households whose monthly income is under 78,061 NT dollars, and the rent benchmark price is under 23,418 NT dollars.

Table 5 The household income and expenditure survey

| Quintile | 1st (0-20%) | 2nd (20-40%) | 3rd (40-60%) | 4th (60-80%) | 5th (80-100%) |
|---|---|---|---|---|---|
| Average annual income | 572,682 | 936,732 | 1,315,989 | 1,800,832 | 3,100,837 |
| Average monthly income | 47,724 | 78,061 | 109,666 | 150,069 | 258,403 |
| rent benchmark price | 14,317 | 23,418 | 32,900 | 45,021 | 77,521 |

Resource: Taipei City government DGBAS (2013)

3.2.2 Urban land price coefficient

The urban land price coefficient is intended to react to urban land price fluctuations and is set according to the land price index from each region. The larger the city, the higher the coefficient. The value is announced yearly by the Ministry of Land, Infrastructure, Transport and Tourism

(MLIT) in Japan. Due to the narrow range of land price changes after 1996, the coefficient is in an area within 0.7-1.7.

Relatively, the measurement of the coefficient in Taipei refers to the fluctuation rate of the land price index. The higher the fluctuation rate is, the more concentrated the development is. According to Table 6, the urban land price coefficient in Taipei City is 1.0406.

Table 6 The fluctuation rate of land price index in 5 municipa

| | **Taiwan** | **Taipei City** | **New Taipei City** | **Taichung city** | **Tainan City** | **Kaohsiung city** |
|---|---|---|---|---|---|---|
| 2014 | 110.38 | 108.84 | 116.72 | 112.45 | 107.85 | 111.71 |
| 2013 | 105.79 | 104.59 | 108.55 | 110.00 | 104.36 | 105.51 |
| fluctuation rate | 1.0434 | 1.0406 | 1.0753 | 1.0223 | 1.0334 | 1.0588 |

Resource: Taipei City government DGBAS (2013)

### 3.2.3 Area and scale coefficient

The area and scale coefficient is assessed by the ratio of living area to the standard housing area per household, which is 70 m2 as announced by the Public Housing Enforcement Order in 2006.

Due to the high urban density, the expensive land prices, and the similar forms of housing, the standard housing area uses the average living area of an apartment or studio apartment per household. According to the residential and real estimate statistics in 2013 in Taipei, the standard housing areas for apartments and studio apartments are 96.41m2 and 41.30m2, respectively.

In order to respond to the applicant s family composition, there are four different social housing provided in Taipei. Therefore, as Table 7 shows, there are 4 coefficients in each case of social housing in Taipei.

Table 7 The 2 developing programs of social housing in Taipei Ci

| | **Dongming social housing** | | | | **Xinglong social housing** | | | |
|---|---|---|---|---|---|---|---|---|
| Room type | Apartment | | | Studio apartment | Apartment | | | Studio apartment |
| No. of Rooms | 1 | 2 | 3 | | 1 | 2 | 3 | |
| Living area ($m^2$) (A) | 36.36 | 56.20 | 76.03 | 29.75 | 41.32 | 54.55 | 69.42 | 26.45 |
| Standard housing area ($m^2$) (B) | 96.41 | | | 41.30 | 96.41 | | | 41.30 |
| Coefficient (A) (B) | 0.38 | 0.58 | 0.79 | 0.72 | 0.43 | 0.57 | 0.72 | 0.64 |

Resource: Taipei City government DGBAS (2013)

### 3.2.4 Convenience coefficient

The convenience coefficient is intended to mainly react to the impact of location and the building characteristics, which is different from transportation convenience, peripheral facilities, furnishings in the building, and so on. The relation between the factors can be formulated as:

$$\text{Convenience coefficient} = \frac{\text{site condition}}{\text{Urban land price coefficient}} \quad \text{furnishings condition} \tag{2}$$

The site condition in Japan is the ratio of the social housing asset price to the surrounding real estate asset ceiling, which can be formulated as:

$$\log_{10}\frac{\text{social housing asset price}}{\text{surrounding real estate asset ceiling}} \quad (3$$

Two cases in Taipei City that are under construction are used for assessment, and the site condition value is shown in Table 8.

Table 8 The convenience coefficients of the 2 program

| Program | Social housing asset price (NT dollars) (A) | Surrounding real estate asset ceiling (NT dollars) (B) | ( ) | ( ) | Site condition |
|---|---|---|---|---|---|
| Dongming | 3,421,052 | 44,500,000 | 6.5341597 | 7.6483600 | 1.1705193 |
| Xinglong | 10,909,090 | 31,500,000 | 7.0377885 | 7.4983106 | 1.0654356 |

The furnishings condition in Japan is similar to the rent setting scoring system in the Netherlands. In Japan, the furnishings condition is used to check whether the provider supplies the basic furnishings or not. Contrary to Japan, both of the cases in Taipei City provide bedding, sink and other basic furniture to allow people to easily move in. Therefore, the rent setting in Taipei City eliminates the furnishings condition.

### 3.2.5 Summary

To integrate all of the coefficients and bring the different household income levels into consideration, the formula for the rent setting system is shown below.

$$\text{Affordable rent} = \text{The rent benchmark price} \times \text{Urban land price coefficient} \times \text{Area and scale coefficient} \times \text{Convenience coefficient} \quad (4)$$

In response to the four types of rooms for Donming and Xinglong social housing, and the two levels of household income, we can obtain 16 affordable rent prices calculated from the formula.

Because Donming and Xinglong social housing is still under construction, the government only indicates that the rent is unified by 30% off the market price. According to the surrounding housing rent through transactions from the period 2011-2014, the average rent of the housing nearby Donming social housing is 19,250 NT dollars per month, which means that the Donming social housing rent could be 13,475 NT dollars per month. On the other hand, the average rent of the housing nearby the Xinglong social housing is 45,000 NT dollars per month; that is, Xinglong social housing rent could be 31,500 NT dollars per month.

In one respect, some of the affordable rents are higher than 30% off market price, which means the government can set a lower price as the social housing rent. In addition, when the affordable rent is lower than the reductive market price, the government should provide subsidies from housing funding in Taipei City to cover the difference or cut the social housing rent to meet the affordability of the applicant.

Table 9 The coefficients and affordable rent range in Taipei City

| | Income level | Room type | | rent benchmark price | Urban land price coefficient | area and scale coefficient | Convenience coefficient | Affordable rent |
|---|---|---|---|---|---|---|---|---|
| Dongming social housing | 1st quintile (0-20%) | Studio apartment | | 14,317 NT dollars | 1.0406 | 0.72 | 0.854322 | 9,164 |
| | | Apartment | 1 room | | | 0.38 | | 4,837 |
| | | | 2 room | | | 0.58 | | 7,382 |
| | | | 3 room | | | 0.79 | | 10,055 |
| | 2nd quintile (20-40%) | Studio apartment | | 23,418 NT dollars | | 0.72 | | 14,990 |
| | | Apartment | 1 room | | | 0.38 | | 7,911 |
| | | | 2 room | | | 0.58 | | 12,075 |
| | | | 3 room | | | 0.79 | | 16,447 |
| Xinglong social housing | 1st quintile (0-20%) | Studio apartment | | 14,317 NT dollars | | 0.64 | 0.938583 | 8,949 |
| | | Apartment | 1 room | | | 0.43 | | 6,013 |
| | | | 2 room | | | 0.57 | | 7,971 |
| | | | 3 room | | | 0.72 | | 10,068 |
| | 2nd quintile (20-40%) | Studio apartment | | 23,418 NT dollars | | 0.64 | | 14,638 |
| | | Apartment | 1 room | | | 0.43 | | 9,835 |
| | | | 2 room | | | 0.57 | | 13,037 |
| | | | 3 room | | | 0.72 | | 16,468 |

## 4 Conclusion

Through the calculation, the social housing rent can be turned into a quantification formula, which considers not only household income level, but also residential location, convenience and other factors affecting the rent. Compared to the deduction from the market price, the rent calculated from the formula is more able to prove that it is affordable.

However, the formula in this research is still rough and limited to data acquisition; for instance, income grading. The income grading should be subdivided into more levels, and household monthly income per person instead of average monthly household income should be used to take household structure into consideration.

To maintain affordable rent, the rent setting formula is not adequate. There also needs to be subsidies from the government to keep social housing management operating. Taking the United States as an example, one of the methods used to achieve affordable social housing has been to cover the difference between the rent and market value rent for the landlords.

In conclusion, to make social housing in Taipei more and more affordable, besides bringing refinement to the formula, the related policies and mechanisms should be collaborated on.

# A MIXED METHODS APPROACH TO MEASURING NEIGHBOURHOOD SOCIAL CAPITAL: A CASE STUDY IN SOUTH EAST QUEENSLAND, AUSTRALIA

Caroline Osborne*, Claudia Baldwin & Dana Thomsen

University of the Sunshine Coast, *caroline.osborne@usc.edu.au

Keywords: social capital, neighbourhood, urban planning

## 1. Abstract

This paper investigates how a mixed-methods approach to measuring social capita urban planning contexts to enhance best practice outcomes. Literature in the c capital, health, participation, resilience and sustainable development suggest capital at the neighbourhood scale can increase community cohesion, trust, recip capacity, civic participation and resilience. Exploring how bonding, bridging capital is expressed in a middle class coastal community on the Sunshine Co Queensland, Australia, a mixed methods approach to measuring social capital benefits of qualitative methods in particular provided an in-depth and understanding of social capital at the neighbourhood unit of analysis. Further fluid construct, where growth in one dimension of social capital, such as bo contribute to growth in bridging social capital, and vice versa. The authors social capital is often invoked in an urban planning context to identify socio the social capital construct and its comprehensive measurement holds far greate planners and developers when applied to urban planning best practice in neighbou

## 2. Introduction

High levels of social capital are said to contribute to a wide range of po individuals and communities, including higher income, life satisfaction, soc community welfare (Middleton et al., 2005; OECD (Organisation for Economic Co-O Development), 2001). In particular, stocks of social capital are considered e communities from a range of stressors through enhanced social participation and of diverse networks which contribute to community cohesion, trust, and feelin security (Kirkby-Geddes et al., 2013; Ziersch et al., 2011; Lyons and Snoxell, 2009; Bromell and Cagney, 2013; Magis, 2010; Poortinga, 2012; Smith et al., 2012

The relationship between urban planning and positive human health and wellbei well acknowledged, with equitable access to resources, distribution of power a and physical wellbeing positively correlated with the presence of social capi (Jackson, 2003; Borgonovi, 2010; Baum et al., 2011; Leskosek, 2012; Wakefiel 2005; Szreter and Woolcock, 2004; Rogers et al., 2008). Nevertheless, Cuthill persistent and negative social outcomes associated with contemporary developm Australia and internationally for the past 10-30 years. Cuthill argues that thi a weakening of family, community and democratic values and relationships, and towards political processes can be attributed to a combination of interrela declining infrastructure provision, structural changes in the economy and wor demographic and social changes (Cuthill, 2010). This requires empirical insigh capital can contribute to best practice urban planning outcomes. Consisten observations, Baum et al. (2011) suggests there is a need for planning approa social outcomes (such as trust, social and civic participation, bonding and bri

development outcomes (including community and retail services and recreational
et al., 2011). Case study research in South Australia demonstrated that integr
and physical planning considerations had contributed to better than expected o
capital and mental health in at least one community; suggesting that the quali
physical environment in the local neighbourhood can have a positive impact on m
and social capital in the longer term (Ziersch et al., 2011).

In this paper, we contend that social capital holds great potential for u
mechanism to deliver improved best practice planning outcomes. However, as
evidence, comprehensive analysis of social capital using mixed methods is cr
relevance to local residents and context. This paper uses a case study approa
contrast the benefits of using quantitative and qualitative data to measure
neighbourhood unit of analysis. The findings from the quantitative data are co
key themes elicited from the qualitative data to provide not just the status
neighbourhood, but insight into ways of improving it. This is the key strength
approach in overcoming limitations present in studies employing a narrower
generation and analysis techniques.

## 3. Key Concepts and Measures

A lack of consensus on how the social capital construct is defined, the elemen
construct, and the absence of a suitable conceptual framework for an urban pla
made measurement difficult, resulting in limited practical application in an ur
(for a synthesis see Authors, forthcoming). Consequently, it has been sugg
planners must strive to understand the different facets of social capital if
practical use of it (Rohe, 2004). One approach to understanding social capita
the dimensions of bonding, bridging and linking social capital. Despite the ch
definition and measurement of the social capital construct, research by Stanley
found that there is likely to be significant dollar benefits where policies and
bonding and bridging social capital networks, thereby reducing the risks of soc
a result, improve personal well-being. Bonding social capital is defined
relationships that look inward and reinforce exclusive identities and homogenou
family, close friends and neighbours (Putnam, 2000; Hutchinson et al., 2004).
that these types of social networks contribute to enhanced sustainable developm
focuses on trust and reciprocity to build relationships between people (Rosela
and de Groot, 2003; Cuthill, 2010; Bijl, 2011; Dale and Newman, 2010).

Bridging capital is defined as the links and relationships that are outward lo
people across diverse social divides accessed through participation in local or
interest or volunteer groups (Putnam, 2000). Several authors suggest that th
networks allow for greater diversity in the individual s social network, a great
for novel information to flow (Portes, 1998; Granovetter, 2005). Further, it is
relationships between people enhance civic participation and resilience (Baja
2010) and that civic participation (a characteristic of strong bridging socia
communities to adapt to the effects of climate change through social processes
Flora, 1998). In addition, it is suggested that social capital is the most
buffering against the detrimental influences of neighbourhood deprivation (
Hutchinson et al., 2004), with bridging and linking social capital emphasis
(Middleton et al., 2005).

A third dimension of social capital, linking social capital, can be defined as networks of trusting relationships between people who are interacting across institutionalised power or authority gradients in society (Szreter and W Strengthening bridging and linking social capital is recognised as one of the poverty and disadvantage, as social capital can overcome multi-scalar barriers silos and structural holes in communities to access decision makers, and it diverse connections that enables community resilience (Dale and Newman, 2010). been suggested that cities and regions with strong social networks can facilita (Carillo, 2004; Yitgitcanlar et al., 2012). However, in a review of the urban social capital is largely invoked in studies to identify and regenerate low-soci example, Middleton et al. (2005) observes that the World Bank suggests a causal between social networks and economic wealth, and as a result, focuses on increa linking social capital in developing countries to increase social networks and welfare of communities. A review of the related literature revealed limited regarding how social capital is measured in communities that are not soci disadvantaged. In addition, the review identified limited use of the concept (authors, forthcoming).

Measurement of social capital at the neighbourhood unit of analysis in publi generally concerned with either qualitative (Kirkby-Geddes et al., 2013; Kingsl 2006; Wood et al., 2013) or quantitative approaches (Middleton et al., 2005; Z Cabrera and Najarian, 2013; Poortinga, 2012). However, singular method studies neglecting the intricacies of the social capital concept and omitting contextu For example, a quantitative study by Middleton et al. (2005) found that examini unpacking it into the dimensions of the construct did not always match the suggested by the academic literature in relation to age or socio-economic acknowledged that the use of quantitative methods only, may have methodological therefore use both qualitative and quantitative methods to provide a broad overv social capital in a neighbourhood, as well as a deeper understanding of reason solutions to practical improvement, particularly from a planning perspective.

## 4. The Case Study

The findings in this article are based on research in a coastal suburb on t Queensland, Australia. Part of the rapidly growing South East Queensland region is an emerging suburban area consisting of a number of subdivisions built in situated in close proximity to the regional centres of Caloundra and Maroochyd beaches, and highway access to the State capital of Brisbane 1 hour south. kilometre area of Little Mountain the total population is 9,045. The age coh population is 5-14 years (1,576 17.42%), followed by 35-44 years (1,418 15 years (1,092 12.07%), with a median age of 39 years (Australian Bureau of Limited housing diversity is evident, with 2,410 predominantly detached homes compared to 252 townhouse/unit dwellings. A large proportion of residents are (2,309 dwellings), with 605 public and private rental dwellings. The median income per week is $1,113 with a median rent of $380 per week and a median mortg of $1,983 per month. Of the 6,891 persons over 15 years of age, there was a 6. rate with about 37% not in the labour force, made up of retirees and stay (Australian Bureau of Statistics, 2011). One of the reasons for studying this factors that might contribute to social capital in the face of major future deve the area. These include a residential subdivision, a residential and mixed use

around a future railway station, and a potentially innovative development incor
affordable housing and community facilities, the latter of which will also be av
the broader community.

## 5. Methods

The study utilised a mixed methods explanatory sequential design in three phas
gain a deeper understanding of what might contribute to social capital in the
community. It provides empirical evidence of the factors arising from a mixed
using quantitative data from an adult residents Neighbourhood Survey, with
deepened by use of qualitative data from adult residents focus groups. Inter
residents were conducted at a local shopping centre to triangulate a portion of
This research forms part of a larger study that includes quantitative reside
between 15–17 years, qualitative focus groups with youth residents and planning
staff at the Local Council, reported elsewhere (authors, in prep).

### 5.1 Phase 1

A quantitative survey instrument was used to measure social capital at the ne
The sampling strategy invited 2,000 households in a delineated catchment area
participate by letterbox drop in an online neighbourhood survey, or to request
copy survey. The neighbourhood survey returned 102 adult respondents (n=102
possible households (0.051%) between April–June 2013. Due to the low respons
contribute to random sampling of the data set, Intercept Surveys were also
neighbourhood social capital survey instrument was developed based on existin
tools found in the literature to test the dimensions of bonding, bridging and
(Bullen and Onyx, 1998; Rohe, 2004; Olsen et al., 1985; Middleton et al., 2
Woolcock, 2004). These included elements that are understood to positively c
presence of high levels of social capital, such as subjective wellbeing and he
and variables are detailed in Authors (forthcoming), where the qualitative ph
investigated in detail. Further, five open ended questions were posed about soc
neighbourhood, including frequency and preferences regarding participating in
neighbourhood, the features they like best about their neighbourhood, and wha
most improve the neighbourhood. The results of the neighbourhood social capit
analysed by statistical relationship between variables in SPSS. The data from
questions for focus groups conducted in Phase 2 to explore in greater depth
meaning behind the survey results.

Due to the low response rate to the Neighbourhood Survey, Intercept Surveys were
further random sample of resident perspectives about the neighbourhood and
Intercept Surveys (n62) were conducted at a local small scale shopping centre
location. Of the participants, 37.1% were aged 18–35 years old, 43.55% were
11.29% were 51–70 years old and 8.06% were 70+ years of age. The demographic
participants generally matches the community age profile , however there was a
female participants in the Intercept survey than the community gender profile w
male to female compared to 48.41% male and 51.59% female in the broader populati

The intercept survey instrument focussed on asking residents about the types
facilities needed in the neighbourhood, including a range of community and c
firstly unprompted, and then followed up by prompting participants to select
answers to a range of community and commercial uses for the neighbourhood.

survey also probed for bonding, bridging and linking social capital linkages
community or commercial uses were important to the participant, and how the use
help the broader community. The Intercept survey results were entered into Sur
ended questions were thematically coded and the quantitative results were analy
using graphs and percentages. It is important to note that due to the s
Neighbourhood Survey (n102), the Intercept survey (n 62), and the nature of
community and social capital construct, this research should be considered an e
social capital at a neighbourhood scale of analysis. These survey findings
generalised, not just because of the low sample size but because the social
contextual and unique between spatial locations.

### 5.2 Phase 2

In Phase 2, two adult resident focus groups were conducted to explore in greate
and meaning behind the survey results (n-12). Focus group participants self-se
through completion of the neighbourhood social capital survey, where respondent
option to participate in a focus group. The results on bonding, bridging and
from the neighbourhood social capital surveys were reported to focus group part
were asked if they could confirm if the results matched their perspectives in
the findings. The focus group participants were then asked if they could pro
local examples of their perspectives and the findings to provide a deeper un
context of the findings and of the neighbourhood. The focus group sessions wer
and content was analysed using thematic analysis in Nvivo. The addition of
component was included to provide greater understanding of social capital, whic
relative from the perspectives of an individual in a community and between locat
This qualitative phase is an important methodological contribution to the
understanding of social capital at the neighbourhood scale.

## 6. Results

The number of participants was: neighbourhood survey (n-102), focus groups (n-1
surveys (n-62). To facilitate a comparison of the quantitative and qualitative
we report the results of each method of data collection together under the t
bridging and linking social capital, aspects of community life (such as sense
and safety) and local meeting places.

### 6.1 Bonding social capital

The neighbourhood social capital survey found evidence of bonding social c
reasonably large social networks and familiarity with neighbours. The survey fou

39% of respondents counted more than 12 close friends;

41% knew more than 12 people to speak with in the neighbourhood and
respondents socialise with their neighbours or people in their neighbourh
times in a one year period; and

Almost 70% had neither friends nor family living in the suburb prior to
40% had friends and family located in other areas in the Sunshine Coast re

Length of residence varied, with the largest cohort (36%) of respondents indica
residents in Little Mountain for between 4-7 years. The constraint on using only
it can overlook a deeper understanding of the reasons for these characteristic
do not indicate if there is a desire to socialise with neighbours or if exis
neighbours are sufficient.

Results from the residents focus groups illustrate the benefit of includi
Participants identified potential isolation from their growing new neighbourhoo
often do not have friends and/or family already living in the neighbourhood. Fo

> People can't move to be near their mum or their friends because they were
> the first place. So if they come here they're coming into virgin territo
> Resident 1)

When asked what the barriers were to developing connections and interaction
capital) between neighbours in the community, participants observed that bar
physical determinism of homes and neighbourhoods, and how patterns of casual i
neighbours have changed over time. To illustrate:

> I think the way that the community has been built leads directly to
> situation. You've got houses instead of . apartments [where] you bump
> . at the mailbox, in the driveway, putting the bins out, collecting the
> laundry. You see them; then you get to know your neighbours a lot better
> isolated in your own little cocoon you drive into your garage and shut it
> the shop or you drive to the supermarket in another suburb to get your bo
> don't walk to the shop and meet someone on the way. Yeah, so it's death
> (Male Resident 2)

Contrary to the limitation of the findings in the quantitative survey where the
socialise or get to know neighbours could not be determined, the interce
demonstrated that there was interest in building bonding and bridging social
residents in the neighbourhood. For example, when participants were asked why
chose could benefit the broader community, more than 58% of residents sugge
provide opportunities to meet others in the community (58.06%), to enhance c
(32.26%), and to give kids something to do (24.19%). The importance of bondi
was demonstrated by intercept survey participants as a method of contributing
the community and fostering a greater sense of community through interactions w
neighbourhood:

> ..it would bring people together. Most people are good in the community; p
> houses nice. Community facilities would provide a local place to meet. (
> participant)

> ..if you know each other you care for each other. If you don't know each
> give a hoot. (intercept survey participant)

> ..allowing people to bond, friendships. (intercept survey participant)

### 6.2 Bridging social capital

In terms of bridging characteristics, the neighbourhood survey results found tha

> 42% of respondents participated in a local organisation or club between 1 month period;
>
> Almost 64% had not taken part in a local community project in the past ye
>
> 85% of respondents stated that they did not often participate in neighb When asked 'why'? as an open ended question, 47% were not aware of any a 30% stated that other commitments were an issue. When asked what kind o participate in by open ended question, 55% said community events, 36% er care and 35% social groups.

Almost 29% of respondents volunteer in the Little Mountain community and 41% other communities. This is a reasonably high rate compared with Sunshine Coas participating in voluntary work observed in the 2011 Census (20.2%), Queenslar across Australia (17.8 %) (Thomsen et al., 2012).

One of the key impediments for growing bridging social capital identified by resident focus groups was the lack of an identifiable centre or activities catchment for residents to meet and socialise in their neighbourhood. Furthe groups suggested the neighbourhood does not provide a sustainable or affordabl access to most facilities such as groceries, coffee shops, shopping, restaurar required a car or bus trip. Those relying on public transport found it cont isolation.

In the Intercept survey, when participants were asked by open ended questior activities, services or facilities they would like if they were available for t thematic responses were activities for children and teenagers (46.77%), a c (20.97%), and a coffee shop or restaurant (16.13%). When participants were aske important to them, the top 3 thematic responses were: to give kids things to d opportunities to meet others in the community (46.77%), and to provide a h (22.58%). The results of the intercept survey further clarified how improved within the neighbourhood could contribute to bridging social capital through p generational interaction. For example:

> ..it would bring all ages together and help [contribute to] sense of cor survey participant)
>
> ..everyone wants to feel part of a community – especially older people wh (intercept survey participant)
>
> ..anything that gives people things to do and purpose and meaning. Also special needs kids to meet others in their neighbourhood. (intercept surve

In addition, participants in the adult resident s focus groups suggested that t to begin to access information about what was going on in the community and/or volunteer or participate. This is despite the fact that schools, church gr organisations and others in the community have a range of activities available participate in if they were interested. This evidenced a gap in access to info happening in the community and opportunities for civic interaction at the neighb

> ... schools and sport but churches too, they have multiple community proje
> time. So there are lots of opportunities around that people have got to be
> to know about and things that would interest them. (Male Resident 1)

There was also an acknowledgement that the tendency and desire to participate
differed between places, people, and their lifestyle. For example:

> We have gotten to know a lot about our older neighbours, and get help for
> the other side there's a couple who just don't want to talk. So you don
> needs are. I guess the answer is communication, interaction, doing
> community, getting to know each other. (Male Resident 1)

It could also be evidenced bonding social capital had led to bridging soci
community action against development in the past. For example:

> we would never have met (Male Resident 4) if it wasn't for responding to
> community action here and that segued into being here. (Male Resident 2)

The focus groups found that in addition to community organisations, sporting
faith based organisations, children are also an important facilitator of social
families, where adults may not have participated otherwise. One participant sai

> I know personally from my experience that I've gotten to know other p
> wouldn't have known if my children weren't playing soccer. (Male Resident

> We put out 1200 flyers, stick them in the mail and ask people to come alo
> day or a Clean Up Australia day. You don't see a lot. What we found is
> schools; you have to get the kids. If you can convince the kids then you
> and pa!. (Male Resident 3)

### 6.3 Linking social capital

Results on linking social capital were drawn from the neighbourhood survey and
as the intercept survey did not directly engage with questions relating to link
did any issues (other than traffic congestion) arise from discussions with
intercept surveys. The neighbourhood survey found that while 78% of responde
would contact Council or their local Councillor if they identified a problem o
there was less clarity regarding the extent that residents can have input an
issues. For example, while 49% of respondents agreed that they had been as
communities needs were and how to address them, 40% disagreed and 13% were unsu
43% of residents agreed that they could influence what happens in their communit
and 30% were not sure.

In the focus groups, barriers to linking social capital were attributed to a l
work collaboratively with local Council about local issues, such as traffic
schools and low use of public transport due to infrequent service and poor c
resident participant suggested a more flexible alternative to the significant
mass of residents required for good public transport:

> nobody catches it anyway ... buses are empty .if you had a private enterp
> come in and establish little vans you're away (Male Resident 2).

Focus group participants also identified opportunities for building better link
Council and other institutions, need for greater integration of community facili
greater involvement and capacity building at the neighbourhood level. One reside

> .... a multi-dimensional approach is needed. We need to work in conjunct
> and other groups to get some help here and there, land, plants, signage, c
> ... Help the community get groups up and running and then drop in to se
> going as a group in terms of support. (Male Resident 4)

## 6.4 Aspects of community life

While the quantitative results appeared to indicate some sense of community, the
among respondents about whether it was a close-knit community. For example,
respondents indicated that they are proud to live in the neighbourhood, 64% agr
the neighbourhood seem to share the same values, 76% agreed that most pe
neighbourhood can be trusted and 61% agreed that most people in the neighbourhoo
help their neighbours. More than 57% of respondents indicated the sense of con
moderately strong or very strong, and while 42% of respondents agreed it
community, 32% disagreed and 26% were not sure. Sense of community in Litt
appears to be lower than the Sunshine Coast region where 75.3% of respondents
level of agreement with the statement I feel part of my neighbourhood or comm
expressed high agreement with the statement My neighbourhood is a friendly
(Thompsen et al. (2012). Results from the intercept survey suggest that resi
have greater opportunities to meet and get to know people of all ages in their
suggested a range of community facilities and places to congregate would allow
youth to access activities and opportunities for social interaction without the
travel to nearby suburbs.

Further insights also emerged from the qualitative data derived from the foc
respondents provided a greater depth of understanding about what contributed
community; which was largely associated with the quality of the surroundings,
parkland and natural amenity, perceptions of safety, security and shared co
Residents indicated they were attracted to Little Mountain by the quality of
amenity; affordable housing compared to older housing stock closer to the beac
lifestyle a short drive away. However, there was also some ambivalence by resi
communities were changing and becoming more socially fractured and in particu
sense of community, visual amenity and safety and security. Residents also ir
that natural amenity is increasingly under threat by development, with clea
bushland particularly affecting residents' sense of place.

## 6.5 Local meeting places

While the survey found almost 50% of respondents used local parks and facilit
times per week, they were not the predominant meeting place for residents to
family. 36% of respondents met at a private home, a cafØ (16%) followed by lo
The quantitative data does not indicate if this is due to insufficient me
neighbourhood, if respondents prefer meeting at private residences or wheth
contributed to this result. However, responses to the short answer question a
services or facilities were missing or need improvement in the neighbourhood
roads paths and public transport (40%), community facilities (30%), communit
(23%), more retail shopping (21%), and better parks and facilities (21%).

The rationale for outcomes of the quantitative survey became clearer through th absence of an obvious hub or community space is problematic for residents. Th the emphasis of any future community facility should be on a community gather than commercial premises (i.e. restaurant, coffee shop). This suggests that the inclusiveness and accessibility for all age groups is important. Adult focu particularly supported the idea of a not-for-profit coffee shop run by hig undertaking business or hospitality vocational training courses through the ne The type of place that would be most valuable would be one that offers someth regardless of age and ability, and a space that is adaptable to offer some activ

## 7. Discussion

One of the challenges in measuring social capital is that it is unclear how the capital are inter-related, and whether certain factors influence the growth whether they are a flow-on effect (Woolcock, 2010). This study demonstrates t elements of social capital are inter-related, and can grow cumulatively. relationships developed through a previous neighbourhood response to a develo (bonding social capital) were used by locals to help recruit people to particip focus group, which exposed them to other residents from different backgrounds). with the spiralling up phenomenon described by Emery & Flora (2006), (where a form of capital advances the performance of another capital in the framework, phenomena similar to the mutual metamorphosis described by Light (2004) and Bo

Quantitative results showed a high level of bonding social capital due to large and family, although these networks were often outside the spatial proximity of The addition of qualitative results revealed that some residents considered approaches to housing and neighbourhood design, with an emphasis on privacy, exclusivity, as elements that may inhibit opportunities for casual interaction Further, a lack of information about events occurring in the neighbourhood opportunities for casual interaction within the local community. This suggests and other urban professions, can contribute to best practice urban planning by social infrastructure within a neighbourhood coupled with strategies to assist build on bonding, bridging and linking social capital through community even promotion of neighbourhood organisations, and participation and increased colla local government organisations, local business and local community organisations and financial resources to address neighbourhood issues.

The neighbourhood survey revealed low bridging social capital based on 85% r participating often in activities in the neighbourhood. The inclusion of qual provided insight to a solution: a central community space within a walkable ca beneficial for residents to meet each other, thus fostering greater bridging neighbourhood. This concurs with the research of Kirkby-Geddes et al. (2013) Woolcock (2004) who suggest that that in order for social capital to grow, ther kind of physical structural environment in place, where individuals can meet, a ties essential for bridging social capital can flourish. The intercept survey d were interested in building bonding and bridging social capital, and felt t particularly effective through the provision of community facilities and pl congregate in the community; in particular to provide activities for children study found that children were an important facilitator of civic participati

community, which is consistent with the findings of Wood et al. (2013) who found important role in facilitating relationships for their family members in the com

Further, it was found that there was a lack of coordination among institution about events happening in the neighbourhood. Research by Kirkby-Geddes (2013) presence of respected people or organisations who can provide skilled and c leadership is just as important as the provision of physical infrastructure in to grow. The implications for urban planners suggest that the provision of phys not a panacea for social capital growth. Programs which foster greater capacity self-organise or are supported by a facilitator to encourage community develop by Baum et al. (2002) are suggested to have greater success in fostering social Wood et al. (2013) found that environments that cater to children and famili contribute to building and strengthening of social capital and neighbourhood adults

Quantitative data in the neighbourhood survey indicated that linking social cap respect to resident perceptions of their ability to influence decisions concerni 43% of residents agreed that they could influence what happens in their communit and 30% were not sure. This is consistent with a study examining sustainabili found 31.6% of respondents on the Sunshine Coast indicated a high level of ag statement I have opportunities to participate in and contribute to local decis study even fewer respondents (27.7%) indicated a high level of agreement with believe my feedback influences Council strategies, policies and decisions (Tho compared to this study (43%). However, qualitative data revealed that there wa residents to build their capacity to respond to local issues by working collabo municipal Council, which is an opportunity to increase positive perceptions influence decisions in the neighbourhood (linking social capital). Residents f spoke of the need for greater innovation and in particular, the need for great uses and community facilities for the benefit of all residents to minimise c facilities and inefficient land use.

As a middle class suburb, Little Mountain exhibits lower bridging and linking would be expected from the academic literature. Research by Middleton et al. (2 differences in bridging and linking social capital between low and high socio-e to inequalities in wealth and power, but little difference in the bonding socia areas. We contend that as a solution for addressing socio-economic disadvanta holds some application for urban planners, by increasing housing diversity e income approach to development. Moreover, the opportunities for contributing urban planning outcomes through reducing impediments to accessing community infr programs and fostering community capacity building would contribute to equitab communities. In this case study, qualitative data illustrated that the inc community spaces and facilities and opportunities to work collaboratively with on local issues would assist in developing bridging and linking social capital.

While research by Middleton et al. (2005) suggests that bonding, bridging and li have limited application as a measurement tool, their research does acknowledg limitations exist in using quantitative techniques only. Further, a review of forthcoming) found limited examples of mixed method approaches regarding soci urban studies. We contend that a mixed methods approach to examine bonding, linking social capital can elicit the unique local context which quantitative articulate This research builds on the work of Middleton et al. (2005) to illu

notwithstanding, the social capital dimensions of bonding, bridging and linkin

## 8. Conclusion

In this study, we investigated how a mixed-methods approach to measuring social
in urban planning contexts to enhance our understanding of how to develop
communities. Exploring how bonding, bridging and linking social capital is ex
class coastal community on the Sunshine Coast, Australia, qualitative methods i
deeper understanding of social capital at the neighbourhood unit of analysis.

However, some of the limitations of this research must be acknowledged. First
make broader claims about generalisation to larger populations. The low re
neighbourhood survey is suspected to be a result of the letterbox invitat
participation through a weblink. This process relied on the self-selection of
the research. Second, focus group participants self-selected following
neighbourhood survey by indicating their interest to participate in a focu
unintentionally include residents who are predisposed to participate and/or wh
capital themselves, and may not be representative of the socio-demographic prof
a factor pointed out by Stanley et al. (2012). The study however did aim to
response rate to the neighbourhood survey, by introducing the intercept survey
from a random selection of residents. Future research investigating social cap
scale may wish to give consideration to the applicability of the methodologica
here. However, this article does illustrate the strength of a mixed methods
social capital and provides valuable information useful to urban planners o
findings are particularly applicable to a local scale context and additional
required for extrapolation to larger scale development or a broader spatial cont

Paper presented at AESOP 2015

Track 12: Responsibility for social cohesion in housing, cohousing and neighbourhood planning

**Keywords:** social housing, inclusionary housing policies, *Special Social Housing Zones – SSHZ*, Brazil

## Abstract

Since the 1980s in Brazil there s a recognition of irregular settlements struggle for their urban integration in a way that transformed public action on these spaces, creating a new way to intervene in order to qualify the urban settlements and environment and city and housing rights, guaranteeing l settlements tenure . In this context, emerged the instrument of Special Social Housing Zones (SSHZ), designed initially focused on the recognition of the struggle of the residents of informal settlements and their integration in the city in the 1980s.

In 1990s, another strategy was chosen using the same instrument over subused of empty areas: to overcome social territorial exclusion models through urban regulation. The hypothesis was that to intervene in urban regulations can produce the opposite effect zoning historically promoted: exclusion, segregation, gentrification.

This paper shows some Brazilian experiences that tried to combine SSHZ with land value capture in Master Plans to combine resources captured in Urban Operation (public + private partnership), to spent in social housing projects to promote inclusion and avoid segregation. B circle: not always the resourses are enough to support the housing deficit in the area, the exclusion happens inside the urban project by defining big areas as the perimeter to receive resources, and often, we can find more public budget funding housing and transport interventions that should be the aim of land value capture.

Highlights that the slum upgrading is not used on these strong market contexts, and points to the hypothesis that it can be also a part of a strategy to overlook the gentrification process that can happen, considering the characteristics of the relocation process.

But yes, Brazil is using land value capture traditional instruments to be combined with slum upgrading, although, it s more often used the more expensive option: public budget to fund slum upgrading, outside the market driven context of urban operations.

# ACHIEVEMENTS AND CHALLENGES ON INCLUSIONARY HOUSING AND LAND VALUE CAPTURES INSTRUMENTS IN BRAZIL TO PRODUCE SOCIALLY MIXED NEIGHBOURHOODS

## 1. Slum isn t (more) a problem

Since the 1980s in Brazil there s a recognition of irregular settlements struggle for their urban integration in a way that transformed public action on these spaces, creating a new way to intervene in order to qualify the urban settlements and environment and city and housing rights, guaranteeing l settlements tenure . Slum upgrading projects that respect their spatial and social organization, ensuring security of tenure to occupiers, became the keynote of urban interventions in the 1990s, mainly at metropolitan region. These, people living in slums exceeds half of the total population in cities like Recife, and although Rio de Janeiro and São Paulo presented smaller percentage, the population living in the house irregularly exceeded one million.

Changed the vision of the slum as "problem", which is expressed through a social construction which considered: (i) critics about the distance between formal projects and settlements urban realities; (ii) vision against industrial and massive house projects, usually at peripheral areas; (iii) understanding that people can produce their own housing projects, more diverse and less unive housing projects use to be; (iv) adding value to self-construction project as a contribution to local economy; (v) observation of housing policies results and its effects like people who can·t pay urban services return to slums ; (vi) dwellers resistance wanted to stay, don´t want to be removed, wanted to keeping social nets and practices (Valladares, 2005).

It was in this context that the instrument of Special Social Housing Zones (SSHZ) was designed initially focused on the recognition of the struggle of the residents of informal settlements and their integration in the city in the 1980s.

After that, another strategy was chosen: to overcome social territorial exclusion models through urban regulation. The hypothesis was that to intervene in urban regulations can produce the opposite effect! The approval of City Statute (Federal law n. 10.257/01) and its requirement that municipalities need to do their master plans until 2006 was seen as opportunity to disseminate and implement the Special Social Housing Zones instrument.

The use of this instrument in Brazil has initiated before City Statute Law approval, in cities like Recife, Pernambuco State, and Belo Horizonte, Minas Gerais State, in the late 1970s, initially as a tool to facilitate urbanization and regularization of areas already occupied irregular and with low income population.

It was after its inclusion in City Statute Law, that Special Social Housing Zones started to be included in cities master plans and zoning laws, becoming one of the main instruments of land policy adopted by municipalities that are designed to help the implementation of social housing programs and projects (Rolnik & Santoro, 2013; Cymbalista, 2005; Bentes & Trindade, 2008; Reali and Alli, 2010).

## 2. Squatted and empty Special Social Housing Zones

### 2.1. Concept

Special Social Housing Zones (SSHZ) means inclusion, in urban plans and zoning, of social housing zones that aims priorize affordable housing projects production. In Brazil, there are two typologies that are more often used by municipalities:

i. Squatted Special Social Housing Zones aim to do slum upgrading in urban popular informa settlements, with the objective of recognize informal settlements and integrate them to the city.

ii. Empty Special Social Housing Zones aim to reserve urban land that s consi used or sub-used land in urbanized and infrastructured regions with the objective of increase infrasctructured land offer to produce new social housing projects.

The idea beyond urban land reserve in areas with good urbanization was also to amplify affordable land to families that can t afford market prices, under market rules.

The areas that they should be designed were conceived to produce the opposite of the zooning effect, that is to concentrate high income families together and push low income families to cheaper places, usually periferical ones where the land is affordable, or even, where they don t can not be urbanized or even that can be environmentaly preserved, promoting irregular settlements.

As a zoning, the empty SSHZ aims to overcome the best and better use dictatorship imposed by the market that looks for higher profitabilities, throught proposing social housing use in well located and central areas. At the same time, reverses the role of zoning as a land reserve of urban conditions for elites widely discussed in the literature (Villaça 1998, 2011; Rolnik, 1997), ensuring that the place for the poors is in the city is in an area already urbanized, well infrastructured and with equipment, and not outside it. Would thus avoid urban segregation. Therefore its defended that its demarcation on the map should be strictly directed to promote socially mixed neighboors.

It is a key instrument to build a housing policy since it aims to produce affordable housing in advance (*ex-ante*), through an urban policy in order to avoid the high extent of urbanization costs (*urban sprawl*) and processes regularization and urbanization retrospectively (*ex-post*), usually traumatic and time consuming.

According to Municipal Indicators Survey (MUNIC) conducted by Brazilian Institute of Geography and Statistics (IBGE) in 2009, 1,489 cities across the country have specific legislation on Social Housing or Social Interest Zones, which corresponds just under one third of Brazilian municipalities, but also, the most widely used instruments among others available by City Statute Law. These results give support the hypothesis that there was a great spread of Special Social Housing Zones by municipalities, although the instrument has been used much longer to recognize the existence of informal settlements and facilitate its consolidation as Squatted SSHZ that Empty SSHZ that changes the land market expanding land offer for the production of HIS.

### 2.2. Main achievements experienced by Brazilian municipalities

The main achievements with municipalities uses of the instrument Rolnik & Santoro (2013) founded in a compilation of cases and in literature on the subject were grouped in five spots:

**(i) to increase land offer to produce social housing**. Diadema municipality was the experience more documented and evalutated. Started in 1982, with the election of an opposition government supported by a coalition of workers and popular movements, that begins an slum urbanization process. Its Master Plan creates Empty SSHZ on former industrial sites that were going into disuse, increasing from 3% to 6.5% of the municipality total area for legal production of new social housing developments.

This effort to urbanize the slums and provide the basic infrastructure, was effort that resulted in 20 years of continuous investments that reached in 2010: 219 former slums areas of which 152 fully urbanized, reducing the number slum dwellers from 30% to 3% of the total population and providing 90% of paved and water and sewer served, tripling the 30% identified in 1982 (Filippi Jr., 2011).

**(ii) to recognize housing rights and avoid evictions**. Special Social Housing Zones have been widely used as a tool for recognition of ownership, guaranteeing the right to housing, avoiding forced evictions, often violent. Some municipalities have recorded Squatted SSHZ next Empty ones trying to articulate housing needs with opportunities (under or sub-used land), making possible to enable, in many cases, families resettlement of population in risk areas in the same region, due to urbanization works in the settlements.

Salvador, at Bahia State, is a municipality that tried to articulate slum upgrading with new housing projects near by or inside the informal settlements in peripheral areas. Salvador also brings this articulation in Pelourinho, its historical center, in a experience that although is under construction, is trying to mix heritage with housing policies, and promote social inclusion.

Another emblematic case is Jardim Edith Special Social Housing Area, in São Paulo municipality, São Paulo State, which will be detailed later on in this text. In this example, being an area of ZEIS make possible that the squatters obtained in court the necessity of municipal government produce new social housing in the area to receive the former residents. The case is groundbreaking because the court used the fact that the area be a SSHZ to argue and decide about the permanence of this population.

**(iii) to offer and put land on market, through strong mediation, negotiation orchestrated by public government, that had to do an active management of local housing policy**.

This is a condition to the instrument work. The most successful experiences of implementing the instrument demonstrate that the mere provision of SSHZ in municipalities zoning is not able to induce a social interest residential use. Cases like Diadema, Taboão da Serra and São Paulo, all in São Paulo State, show that the existence of subsidized housing resources through programs to fund the production, as well as a pro-activity on the part of local managers is essential to enable its implementation.

The achievements mapeed showed that SSHZ that had active participation of public government as a mediator: have implemented more projects or have negotiated more land, avoiding land speculation (ex. Diadema have more than70% of land negotiated); had better project qualities, architectural and urban quality; used a more diverse option of housing projects funds (subsidized or not) municipal, state or federal.

**(iv) trying to get scale production, with the combination of instrument use with a huge Federal Housing Program**.

São Paulo `s case` is illustrative of the effect of the combination of SSHZ with a subsidy policy for new social housing (subsidy to demand) and the heating of the housing market. This is a complex case , best developed in Rolnik & Santoro (2013 ) , from which its possible to highlight some points.

Their analysis sought to differentiate what social housing was being produced in Special Zones of Social Interest BEFORE (2002-2009) and AFTER the Federal Program called My House, My Life (2009-2012), which gave grant to people who demand social housing in Sao Paulo. In summary:

(a) before the Program, most of new social housing developments in SSHZ were made bypublic government (69%) (Caldas, 2009), which is reversed in the second period studied. According to the Real State Union, SECOVI, before subsidies, "the bill didn t close" and needed other gains in profitability associated with the inclusion of a mix of uses in SSHZ (which was possible at certain percentages, according São Paulo zoning 2004), including commercial uses or housing supply for higher income families.

(b) after My House My Life Federal Program there was a real estate market heating, including social housing production in SSHZ, the production of new social housing unitsincreased from 45,000 units were produced between 2003 and 2007 to 68,000 units between 2005 and 2010.

(c) as a result, from the total of 1 million square meters of ZEIS , 51% were occupied and received new projects, 23.8% of these homes were produced by the government, other 22.1% by the private sector. Also there was a distortion of the instrument: 22.2% of the production were not social interest housings and 31.9 % were public and social equipments.

(v) the instrument as more of the same . Happened to find examples of bad uses of the instrument like using it to permit less infrastructure exigencies or to allow small plots or unit areas, etc.

## 3. Possibilities of Special Social Housing Zone (SSHZ) as inclusionary housing instrument or combined with land value capture instruments

Debating with international urban literature, Special Social Housing Zones i housing intrument in strictu sensus although it could be used combined with land value capture instruments that exists in Brazil.

### 3.1. ZEIS is not an inclusionary housing intrument in *strictu sensus*

Special Social Housing Zones is not an inclusionary housing instrument in strictu sensus, if we look to literature this concept is associated with capturing resources from market. Inclusionary housing is a means of using the planning system to create affordable housing and social inclusion by capturing resources created through the marketplace (Calavita & Mallach, 2010, p.1).

Inclusionary housing is a program, regulation, or law that requires or provides incenti developers to incorporate affordable or social housing as part of market-driven developments, either by incorporationg the affordable housing into the same development, building it elsewhere, or contributing money or land for the production of social or affordable housing in lieu of construction (Calavita & Mallach, 2010).

Special Social Housing Zones is not necessarily produced by land value capture instruments, moreover it s rarely produced with these resources, although it could be! This paper intends to pr experience of existing slums in areas that could use land value capture instruments, recognizing that Brazil have lots of land value capture instruments that could be used to produce social housing projects of slum upgrading.

The experiences described, focused in São Paulo municipality, will show that sometimes the housing policies used resources that come from founds that received money from land value capture instruments**.**

### 3.2. Brazilian land value capture instruments

Brazil has laws and experiences of implement land value capture instruments and this idea is growing popular in a context of fiscal decentralization policies; growth of urban planning and management; the strength of neoliberal agenda centered in privatization associated with the idea of efficiency, that helped to reduce ideological resistance to value capture. Smolka (2013) approaches to Latin America also points the influence of multilateral agencies in stressing their arms to cost recovery of public investments as good practices and other pragmatic considerations, like the macroeconomic stabilization of some countries, clearly addressing to Brazil s case, where pr value increments and also inflation mixed, bringing trouble to differentiate one of another.

But is the motivation of having resources extra municipal budget, increasing directly covered by regular taxes and revenues, that makes governments realize the gains in terms of implementing land value capture instruments. Like Smolka points: value capture often pragmatic substitute for the poor performance record of property tax collections and other instruments (Smolka, 2013, p.12). We can add to what Smolka brings to Latin Am there s a concept of redistribution involved when you look to City Statute princ 2o, IX until XI).

The most usual Brazilian instruments are fiscal ones, like taxes the most used is Property Tax , Betterment Contributions, and extractions and other negotiations for changes for building rights or for transfer and development rights, with two more often founded in Brazilian municipalities: Charges for Additional Building Rights (*Outorga Onerosa do Direito de Construir – OODC* in Brazil), also translated as Selling Building Rights Permits, and Urban Operations, also known after City Statute Law as Jointed Urban Operations.

Nevertheless they exist and are used, the critics reinforce the idea that it s p and capture more resources of plenty of them by overcoming: the weak design and implementation, that may demolish the instrument; ideological resistances, more than logical ones, that are based on the idea that land value capture is insignificant or can t be justified if you consider administ costs; the conception that is convinced by the need of local legislation and understanding national legislation can be sufficient to allow some jurisdictions to use this potentially powerful funding mechanism to implement a variety of tools adapted to their local needs; and others (Furtado & Smolka, 2004; Smolka, 2013).

### 3.3. Charges for Additional Building Rights

City Statute, Brazilian Federal Law 10.257/01 brought principles that allowed municipalities to value capture, like the idea of a property has to fulfill its social function determin the separation of building rights from land ownership rights, concept that are the basis to the instrument Charges for Additional Building Rights.

Charges for Additional Building Rights is an urban regulatory instrument that allows a owner of some property to buy building rights form the government to construct more than basic construction limits until maximum. Basic and maximum coeficients have to be established oriented by infrastructure support and determined at the municipality master plan. The money obtained goes to a Special Fund,

usually called as Urban Development Fund, that must have social and participatory processes to decide where the resources will be invested.

City Statute determines that the resources can be used to: slum upgrading and regularization, social housing programs and policies; land bank; urban sprawl regulation; urban equipments; leisure areas; environmental conservation policies; and historical, cultural and landscape protected areas. As we see, it s possible to use these resources do promote social housing projects and po few Brazilian experiences used Urban Development Fund to produce social housing, and more rarely to slum upgrading. It s often used to produce new houses that usually reproduce patterns of social exclusion and ghettos of powerty in perifercial areas. One example is Curitiba, Paraná State, that produced almost 41 thousands of social housings (houses, plots, land tenure/slum upgrading) in 5 years (between 1991-1996), all in periphery areas (Briceño, 2004).

São Paulo city had a Urban Development Fund that raised almost 1 billion of reais (R$ 1.087.674,00) in five years (between 2007 and 2012), almost 220 million a year (São Paulo City Hall, 2013). Only28% of the total (R$ 304.889,00) were used to urban regularization of informal settlements in these five years 8 areas used to regularization and 2 used to slum upgrading, always at peripheral areas, where there s a concentration of informal settlements.

### 3.4. Urban Operations

Urban Operations can be designed at municipalities master plans to promote structural changes of large urban areas through land-based incentives offered from public-private partnership (Castro, 2006; Montandon & de Souza, 2007). The idea was to have a specific instrument to urban transformations, as renewal projects, large areas with land uses transformation (de-industrialization), and others.

Before City Statute some municipalities have experienced instruments that originated the actual conception. The former formulas started in 1985 in São Paulo, and were reviewed after its approval, in 2001.

The Federal Law determine also that a Jointed Urban Operation (also can be translated as Consortial Urban Operation) needs a urban plan definition, it defines with interventions will be done to transform structurally the area and the infrastructures and urban improvements that will be founded with land value recover.

Selling building rights permits to get resources to fund the investments established in the Urban Operation law. Resources are located apart from Public Budget, has a special account and Fund which resources have to fund interventions.

Brazilian law don t previewed the use of land readjustment, but some experiences like Faria Lima Urban Operation stimulate joining parcels.

The main differences from Jointed Urban Operations to pure selling building rights concern: value is produced and captured at the same area, in re-valuating processes; and Urban Operations can use Building Rights Certificate (CEPACs), a kind of bonds. These bonds are purchased by competing developers through public electronic auctions regulated by the *Comissão de Valores Mobiliários* (CVM, the Brazilian equivalent of the U.S. Securities and Exchange Commission).

A critical view based on what were experienced in São Paulo pointed that land value is produced and captured at the same area in re-valuating processes; the Urban Operations had no urban plan, only a list of interventions, mainly mobility and transport ones; there s no relation between t costs and the benefits achieved with selling of building rights; and, no Urban Operation had a period of time to finish, some started on 1991 and some interventions were done, some don t.

## 4. CASES of slums in Urban Operations

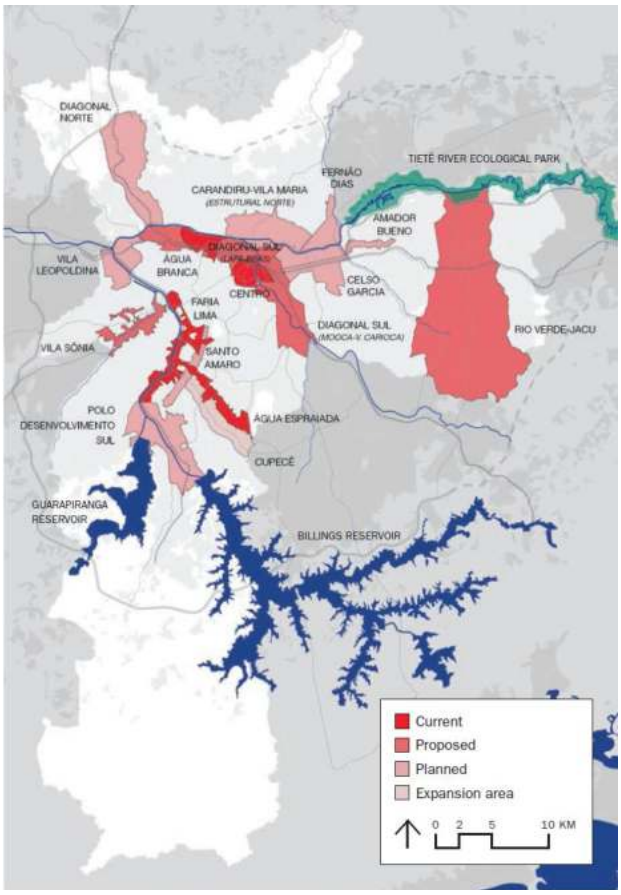
As seen, Brazil has and uses land value capture instruments. But there s no dir land value capture and social housing investments. If we focus in São Paulo s case, however, is possible to see that there are lots of informal settlements in Urban Operations areas, but the investments on social housing project doesn t reach barely 10%: Faria Lima reached 8%, Águas Espraiadas 7% e Água Branca didn t spent a peny (see table above). And these investments h happened very recently.

Table 1. Social housing in Joint Urban Operations Sao Paulo

| Joint Urban Operation | Number of houses (built or under building) | Planned houses | Financial resources involved | | | |
|---|---|---|---|---|---|---|
| | | | Social rental assistance | Expropriation | Executed | Planned |
| Faria Lima | 807 | 1167 | R$ 7.410.329 | R$ 7.810.807 | R$ 181.000.313 | R$ 163.000.000 |
| Agua Espraiada | 534 | 4000 | | R$ 155.454.195 | R$ 124.294.012 | |
| TOTAL | 1341 | 5167 | R$ 7.410.329 | R$ 163.265.002 | R$ 305.294.325 | R$ 163.000.000 |
| **Overall total expenditure** | | | | | **R$ 475.969.657** | |

Source: São Paulo City Hall, 2013.

Figure 1. São Paulo Urban Operations 2013.



Source: Municipal Secretary for Urban Development, São Paulo, 2013.

Although the focus of Sªo Paulo s Urban Operations were to make structural transformations through interventions in transport and mobility, almost all the Urban Operations that existed in São Paulo had slums into their perimeter.

Some authors inclusive believed that the best formulation of an Urban Operation should involve urban problems, in a way that the resources obtained with selling of building rights could be used in interventions that had a social impact, more than the traditional economic land.

The major part of Urban Operations recognized the existence of slums and previewed some sort of resolutions like relocation at the same urban perimeter, construction of new social housing units, but just a few of them previewed slum upgrading.

The **Faria Lima Urban Operation** (1995 ) was one of the first to preview slum upgrading. This is considered on their specific goals and guidelines: the need to build social housing considering the squatters families, admitting the need of their relocation. It also previewe that would be expected to spent 10 % of total investments in slum upgrading. On occasion, were identified the slums within the perimeter: Coliseum Street Slum, Real Park Slum, Panorama Slum and one at the corner of Av. Luis Carlos Berrini and the extension of Av. Águas Espraiadas, which later will be part of another operation, Jardim Edite Slum, that will be treated as a special case in this paper (Law 11.732 of March 14th, 1995 and its attachments).

The operation was partially reformed in 2004 (Law no. 13.769/2004) and in 2011 (Law no. 15.519 of December 29th, 2011).

According to Castro (2006, p. 110), in March 2004, EMURB and COHAB, both Municipal Urbanization Company and Housing Company, planned the removal of Coliseum Slum and a partial removal of Real Parque slum, to the construction of 480 new social housing on land expropriated from the Jockey Club at an estimated cost of about 14 million. The author also mentioned that Jardim Panorama Slum had no provision of public investment.

However, although this decision may have been issued in 2004, the Coliseum Slum remains in the area until now, enduring various threats of removal and offers to buy their properties. The Real Parque Slum in the last administration of Mayor Gilberto Kassab (2009-2012) was partially removed and received the construction of new 1.135 units with funds from Urban Operation.

The **Urban Operation Água Branca** (Law n . 11,774 of May 1th8, 1995), again, although essentially foresaw road interventions, also recognized in its initial objectives the need to intervene in areas occupied by slums, foreseeing the "financing and construction of housing social interest to the settlement of slum population residing in the region" (objective), through financial returns from Selling Building Rights or Betterment Contributions that would be invested in FUNAPS - Fund for Assistance to people living in substandard housing, a public fund that produced social houses by the public administration between 1979 and 1993 (Gomide & Tanaka 1997 *appud* Castro, 2006) .

Its revision in 2006 included the specific objective "to build in appropriate places, located within the perimeter of the Urban Operation, housing for the low income population residing in the area of Urban Operation , in precarious conditions" and sets a maximum of 630 housing units for new social houses to receive the residents (Law 11.744/95).

Until today nothing has been invested to social housing under this Urban Operation.

Recent discussions about this Urban Operation revision advanced towards recognizing that exist precarious slums in the nearest region of the Urban Operation. The law approved predicted that these would integrate this expanded perimeter, which would not generate resources by selling of bulding rights but could use the proceeds from the sale of building potential for social housing in these areas, involving up to at least 22% of the funds raised.

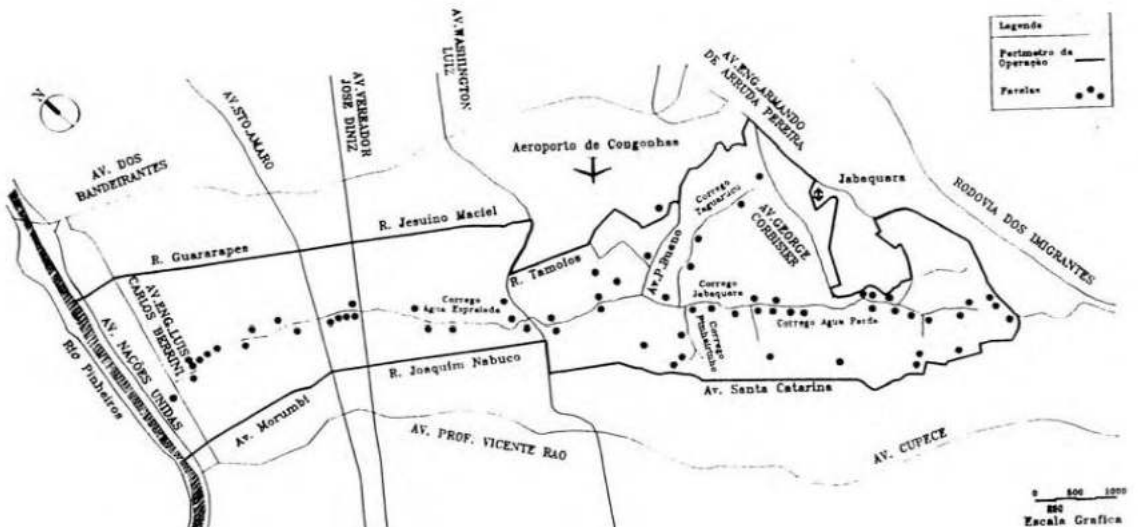
The new Urban Operation Água Branca, approved in 2013, also forecast the segregation of this percentage of resources under a separate account, seeking to prevent that the resources for social housing were not left aside, to be used later, not the last of a priority list, as it used to happen in the experiences studied. However, there are fears that the segregation of these resources will mean a delay in housing production, since the operation will have to be raised considerably until it reaches the value of a work in its entirely to be started. This proposal differs from other proposals that appeared in the public debate that suggested establishing housing as a top priority list, and commitment that 100% of the initial resources would be used to this theme, which can be spent quicklier than at the segregated fund.

The case of **Urban Operation Águas Espraiadas** is relevant case to note the existence of slums and the solutions proposed for them, because, since its inception has been identified the existence of a substantial slum population in the Urban Operation perimeter.

Many years before the aproval of this Urban Operation, in 1984, the Railroad Department (Departamento Estadual de Rodagem DER) had planned to open a mini ring of roadways and to do that had started to expropriate some properties around Água Espraiada River. As the project didn t started up, the legal situation of the properties were fragile and until now some expropriations are on course, didn t ended yet, creating an instability.

The first study to do an Urban Operation considered to open one avenue on the border of Água Espraiada River identified 6.481 families in slums in 1987 (first perimeter was smaller than actual).

The Urban Operation Environmental Impact Study, that started in 1987 and have been formalized in 1991, the existence of 6.500 families in informal settlements that had to have a housing solution. The study estimated that 23% of the money obtained by selling rights to built was going to be used to produce housing solution to these 6.500 families, but also part of the money obtained with housing finantiation.



Map with slums areas identified along Água Espraiada River in 1991. Font: Castro, 2006.

In 1994, the Sªo Paulo s Major Paulo Maluf (1993-1996) started to open Águas Espraiadas avenue, making a river canal and a considerable part of the slum had been evicted. Fix (2007) summarized the housing solution adopted as: approximately 15% of the families were evicted and relocated in new social housing in Jaguaré, 10 km from original place; 5% were to East Zone, 30 km from original place; and the majority received money to come back to their original city (São Paulo metropolis had a strong inter-state migration in 1970s) (Fix, 2007).

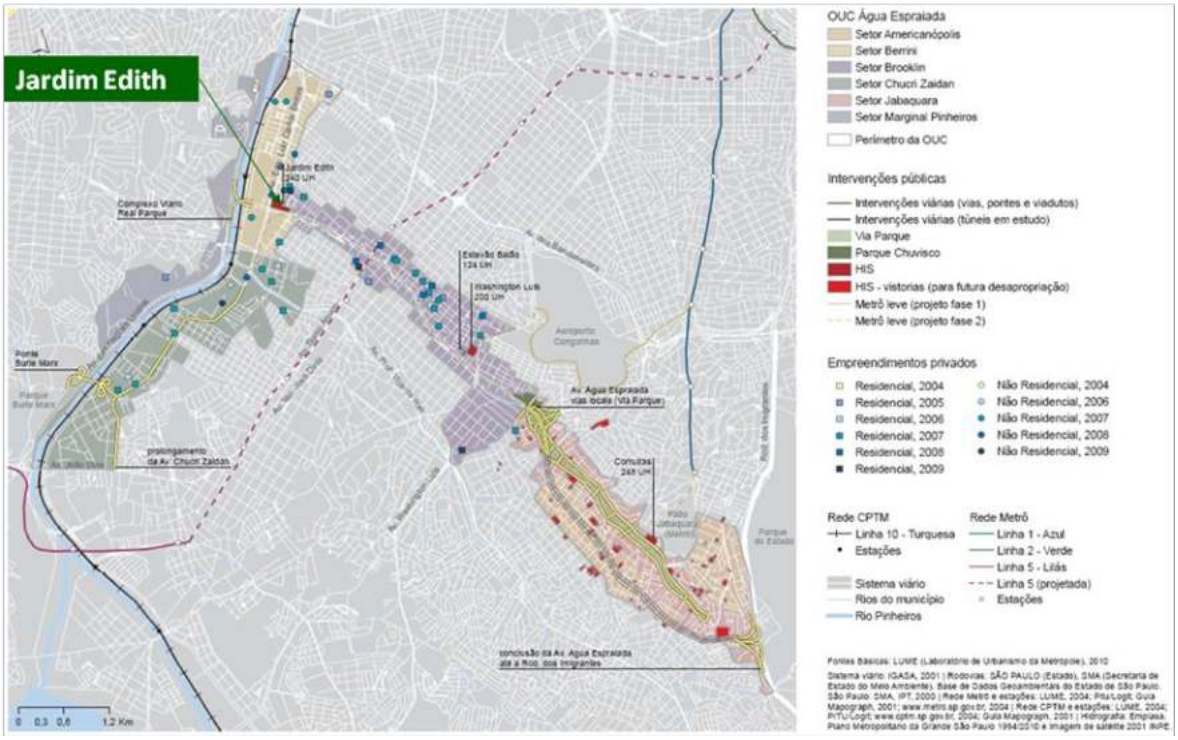
None of these solutions used resources from Urban Operation Fund, because it wasn t approved as law, so social housing solution, however precarious and just a few, were finantiated by the Municipal Budget.

It was only in 2001, that the Urban Operation law revision (Lei 13.260/01), stimulated by the City Statute approval (Federal Law 10.257/01), included 24 perimeters of Special Social Housing Zones recognizing informal settlements and permitted that the resources obtained with the selling of building rights could fund the construction of social housing projects as betterments, slum upgrading or new social housing projects, given definitive relocation for the families that were affected by the interventions inside the Urban Operation perimeter. This revision included also the creation of a Group that monitorate this Urban Operation.

Years later, in 2011, were included in the Urban Operating new projects as a new avenue Roberto Marinho Avenue , a Linear Park over a Tunnel and this demande a partial amendment of the law (Law 15.416/11).

These projects Environmental Study, in 2009, pointed out that, for these works (avenue, tunnel plus park) would be expropriated 8,194 properties, 1,104 of these formal and 7,090 informal former squatters of 14 slums: Alba (700 properties), Americanópolis (50), Babilônia (650), Beira Rio (540), Fonte São Bento (250), Guian Corruíras (600), Henrique Mindlin (750), Imigrantes I (236), Muzambinho (300), Rocinha Paulistana (814), Taquaritiba (1.000), Vietnã (1.200). Most informal properties that should be expropriated were located in the linear park, 6,040 real estate project. Some of these slums are demarcated as Special Social Housing Zones, and will not receive housing under the argument that it is possible to predict social housing allocation to green areas and social facilities (Law 13.885/40, art. 139, § 1 , II).

Actually, this Urban Operation already has begun to work in social housing projects on four areas Jardim Edite (252HIS + área institucional), Corruíras (241 HIS), Washington Luis (200 HIS), Rua Estevão Baião (124 HIS) totaling 817 housing units (Urban Operation Group, 22nd Sept. 2011). Moreover, according to the same Group presentation, 47 areas were enacted for expropriation order deployment of HIS, which would total 115,000 $m^2$ and potential care housing units 6,500 in Jabaquara and Americanópolis Sectors. It is seen that this option transfers the resident population of the most valued areas of Urban Operation to less desirable areas, even within this huge Urban Operation without realizing fully meet the affected population, excluding the population that has already been removed when the opening Águas Espraiadas Avenue.



Jardim Edite at Urban Operation Map. In red, social housing perimeters. Fonte: Maleronka, 2010, p.136, based on EMURB and Urban Operation Group until 2009.

Although there were the recognition of these slum areas in terms of law, designing SSHZ in municipal zoning and in Urban Operations, eviction was a very common process.

Jardim Edite is one example of that, it was one of the 24 perimeters included as Special Social Housing Zones in `guas Espraiadas Urban Operation Law. It s a special and very case because it was included as SSHZ as a recognition of housing rights, but it didn t avoid evictions. Eviction happened in a huge and intense conflict, that need to articulate a strong social net and mobilization against it that ended in court, with the decision that the families that were evicted had to be relocated at the same place.

Jardim Edite location in on the corner of Águas Espraiadas Avenue and Luís Carlos Berrini Avenue, a business and office region and one of the most evaluable areas of São Paulo. The promise of implementing a most rentable use in Jardim Edite land pressured for the eviction of the slum families. And it was the fact it was as Special Social Housing Zone that imposed this use for the area. The judicialization involved a Civil Process against Public Government ordering to promote a Social Housing Project at the same place where there was a slum, arguing it was a Special Social Housing Zone. Between 2010 and 2013 the project were conceived and built to 800 families.

The project was made by one of the best architectural offices of São Paulo, with a very interesting mixed used program.

The families that can pay for the fund housing program are moving to the new apartments, what pointed some questions about the housing solution: Why the option was for a new project, and not to urbanize? How difficult will be to manteing poors in the inner city and evaluated areas like this one?

The same Urban Operation had two different social projects **Estevão Baião** and **Corruíras** that didn t needed evictions, were done previously and will receive relocated popula

projects at the area. The Social Housing were produced by the municipality government using finantial resources of the Urban Operation.

A third experience, at the same Urban Operation, happened with the slums **Comando** and **Buraco Quente**. Although they were inside the Urban Operation, there were no housing project planned to urbanize, upgrade or produce new units to these slums. They were evicted for the construction of Monorail that been done for the 2014 World Cup. The majority of families received for the tenure land and for the benefits constructed, but some of them could opt by staying at the same area after the social housing construction. These new housing were going to be payed by the State Housing Company, with State budget, without using Urban Operations Fund, because this transport intervention was not planned by the Urban Operation Law when it was conceived.

In a summary, three different ways of intervening in slums could be found in these three studied Urban Operations Faria Lima, Águas Espraiadas and Água Branca: (i) evictions and relocation at the same place, as a result of a strong conflict and negotiation that finished on court recognizing the area as SSHZ (Jardim Edite case); (ii) construction of new housings near the slums, with future relocation, without conflict; (iii) evictions with expulsion for other areas, or waiting for new houses payed with other budget, not with Urban Operation Fund.

## 5. Final remarks

These three examples of slum intervention happened in a context of a value capture instrument Urban Operation of a strong and active land market.

By these descriptions it s possible to consider that not always informal settlements, like recognized as permanent, and had its rights considered, and listed as one intervention that should be financed by resources obtained by Urban Operations, used on Special Social Housing Zones.

Also is very usefull (although it was little discussed in this paper) that people assume the pressure for better uses, better achievements as a goal, guaranteeing bigger private rentability, logic over public interests/needs, what usually promote evictions.

The re-valuation processes that happen in Urban Operation increases land prices, trying difficulties or turn unfeasible the social programs implementation, such as social housing programs. Or the land is very expansive and, even if much is spent for housing production, are just a few units being produced (the money goes to pay land), distancing themselves from the care of the housing deficit. Or the people who s relocated doesn t have conditions to stay in the area, after the taxes, paying mortgages, and starts to happen a gentrification process. To avoid that, some authors defend the social rent and public property as a goal to be achieved.

The use of land value captures instruments in a strong land market in São Paulo is one example of how do NOT guarantee the production of socially mixed income neighbourhoods. On the opposite, the market rental logic imposed promote evictions and usually concentrate higher family incomes at the housing projects, in a gentrification process promoted by the market logic.

This paper tried to show that, Brazil have instruments to do land value capture; have money/resources obtained by these capture in Urban Operation, but not always we spent these to social housing projects, not always the money is enough to support the housing deficit in the area, and often, we can find public budget funding housing and transport interventions that should be the aim of land value capture.

Highlights that the slum upgrading is not used on these strong market contexts, and points to the hypothesis that it can be also a part of a strategy to overlook the gentrification process that can happen, considering the characteristics of the relocation process.

But yes, Brazil could use land value capture traditional instruments to be combined with slum upgrading, although, it s more often used the more expensive option: public budget to fund slum upgrading.

Some cases showed tried to sign that it s central to a housing policy to do anticipating demand, avoiding high pos-urbanization costs, including social ones! The Corruíras case is a example that no conflict in the relocation process, because families weren

# Transport Planning and Mobility Policies: Available and Affordable Transportation

## Track description

Co-chairs: **Angela Hull**, **Morten Skou Nicolaisen**

Spatial mobility is key prerequisite for access to space-related opportunities like jobs and facilities for education, health, services and leisure-time activities. Our urban systems evolved in ways that count on mobility to increase. New transportation infrastructures allow for faster and higher-capacity services but they often also increase the disparities between those places and people that are served and those not served. Is the ESDP idea of equal access to opportunities and facilities for all citizens of EU countries still viable? Is it economically sustainable? Is planning still responsible for it?

# Mapping Barriers and Solutions for Coping with Uncertainty and Complexity i Planning

Sheila Binesh[1]

Abstract

Uncertainty is a phenomenon that is ever present in planning transportation projects. As c are intertwined, dealing with them appropriately for the right type can be difficult. Alt have been proposed for coping with uncertainty and complexity in academic literature, impl seems to stay far behind. There is little research on if and why this is the case. Insigh understanding of (coping with) uncertainty in transport planning and our understandings o practices. This paper reports followed a three tier approach along the following questions planners in the Amsterdam Metropolitan Region (MRA) currently cope with uncertainty, such what are their barriers in appropriately coping with uncertainty, and; (3) what are possib barriers. These questions were answered through a review of the relevant literature and involved in transport planning within MRA

## 1. Introduction

Uncertainty is a phenomenon present in all aspects of life and is inescapable. It considering the future and in transportation planning. The way transport uncertainty mysterious and fascinating. Uncertainty represents the human vulnerability of the control over happenings, which can be frustrating for planners. This desire for co a desire that cannot be reached and is not acknowledged. In the same line of thoug planner s core function as the provision or appearance of provision of future cer unstable, dynamic and inherently uncertain world (Gunder, 2008; 189).

Unpredictability in transport planning (and in general) can be costly, not only in time, energy and people as well. As the globalization and interrelationships betwee importance of conscious decisions becomes crucial. In the Netherlands, billions of traffic and transportation projects. Meaning, a great amount of money is involved i in times of economic crisis should be used efficiently. The problem here is how to and complexity in the most appropriate and efficient way.

However, it is still unclear how transportation planners are coping with uncertain their projects, if at all and what the barriers are. Their approach depends on the interpret uncertainty. With the different definitions of uncertainty comes along d approaching it. The research question is: What are the barriers for dealing with u complexity different transport actors face in the Amsterdam Metropolitan Region an overcome?
And it will be addressed in the following sub-questions:

1. What are the theories about uncertainty and complexity and how to deal with planning?

[1] University of Amsterdam, sbinesh1@gmail.com

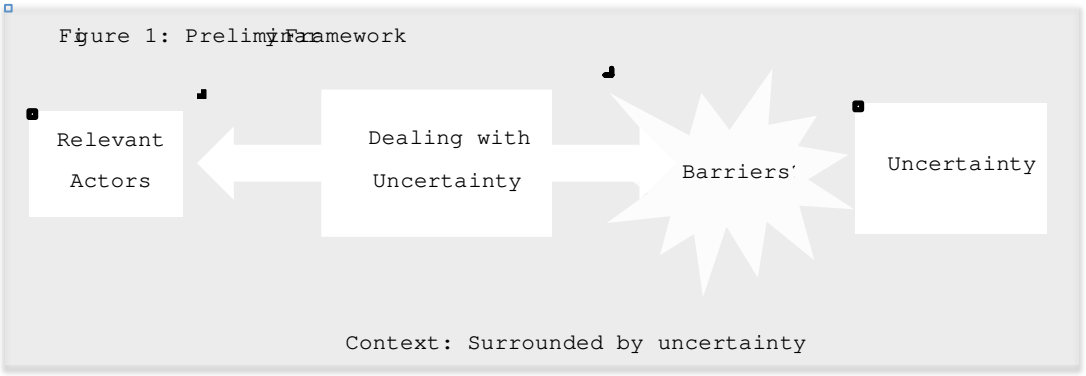
2. What complexities and uncertainties do transport actors in the Netherlands f
3. What are transportation actors approaches in coping them in practice?
4. What are the barriers to adequately addressing uncertainty in practice and s

This question was answered in the exploratory methodology through theoretical revie
literature and interviews with those involved in transport planning

Uncertainty is something commonly feared, not welcome and an uncomfortable place fo
be in. In planning for the future, many uncertainties may be present. The initial
question 1) served the purpose of gaining insights, background and familiarity on c
uncertainty, as well as creating a grounded theoretical framework of the issues sur
The theoretical context clarified the existing concepts, which were tested in compa
gathered from answering the rest of the questions through interviews.

The next questions (2, 3, 4) directly targeted Dutch transport actors use of copin
they approach unknowns. Their responses were studied and compared to the various ap
from the literature. Accumulating this information lead to identifying the barriers
uncertainty and complexity in transportation projects.

It was appropriate to take on an explorative research to delve into the lack of aca
topic. This included creating a preliminary framework of the key research elements,
figure 1.



This shows how the relevant actors work within their context of uncertainty in deal
reach their objectives and the barriers preventing them. There are two main assumpt
framework: that individuals working in transport function within a context of uncer
are barriers existing between managing those uncertainties. It will be expanded and
added insights from literature and then interviews.

## 2. Methodology

The first question was answered though theory development. The rest were through se
interviews with different actors involved in the transport planning and projects to

information. The units of the analysis were the beliefs and actions of those involv
to paint a clearer picture of both what is actually taking place and how these indiv
concepts directly from the field (source). Their views and ways of managing uncerta
variables. The interviews were combined with the theory to draw grounded conclusio

Although presented as a linear, step-by-step procedure, the research analysis was a
reflexive process.

## 3. Theory

### 3.1 Defining Uncertainty and Complexity

To understand uncertainty, what is encompassed by it needs to be established. Re-e
of certainty in relation to uncertainty points out the assumptions surrounding certa
knowledge, which is considered known-knowns ( i ek, 2008). Knowledge is usually
(especially scientific knowledge) and seen as objective and superior (Van der Slui
level of certainty could be dependent on the representation of it, which is rela
1991). Certainty is prized and craved, thus it is strived for. Uncertainty (and c
system, meaning they are interpreted based on the cultural and contextual value sy
uncertainties there will be human and technological limitations preventing com
uncertainty (Christensen, 1985).

The concept of uncertainty can be difficult to grasp since it is about the poss
Walker et al. (2003) define it as  any deviation from the unachievable ideal of c
knowledge of the relevant system.  The possible natures of uncertainties are l
variability, as the root attribute of the uncertainty. For the location, a majorit

the context of the project (Walker et al., 2003). This happens from internal and/
the different levels of uncertainty, risk is essentially statistical uncertainty b
Structural uncertainty is more uncertain than scenario uncertainty; the occur
possibilities cannot be predicted. Recognized ignorance is a deeper level of unce
thing known is that ignorance is present (Walker et al., 2003). All the above
(statistical, risk, scenario, structural and recognized ignorance) fall under
unknowns. The deepest level of uncertainty is an unknown-unknown, which is essen
unconceivable unknowns and total ignorance. However, outside of the linear spectru
the unknown-knowns. These are also unrecognized and can be potentially more harmf
unknowns (Mohammadzadeh, 2012).

Complexity breeds uncertainty and uncertainty contributes to complexity in project
relationships and interactions we do not fully comprehend or of which we may not
(Salet et al., 2012; 3). Furthermore, complexity is a relative concept, based on e
Scarcity of space is the context. An increased amount of interests involved create
plans bringing more opinions, which can have positive and/or negative effects (c
inertia and chaos). Previously made political or management decisions set up the
plan. EU regulations have slow time cycles of change, making them a context of unc

There are three areas of complexity found in transport projects: technical, or
contract types) and environmental (stakeholders, perspectives) (Bosch-Rekveldt et al., 2009). The
newness of technology serves as a source of complexity due to the unfamiliarity of
organizational category, trust is an influential factor.

Common sources and outcomes of complexity are time and cost overruns, decen
privatization, geopolitical trajectories and politicians desire to leave a legacy
to the sources of complexity, some outcomes have introduced more complexities in
Optimistic thinking, strategic misinterpretations, and desired representations o
complexity in a more layered way (Flyvberg, 2008).

The characteristics of uncertainty and complexity outlined in this section illu
difficult to get a hold of, especially when precious funds are involved.

3.2 Dealing with Uncertainty and Complexity

For the contextual issues, similar to the idea of evolutionary planning is that the
definition arises simultaneously. That is when a problem is defined a solution is
limited resources usually decide the end of a project despite other factors. Imple
continuous and irreversible. Finally, space for experimentation is limited because pla
accountable for their decisions. This way of dealing with uncertainty is through a
being alert and open. Communication of the certainties and uncertainties also gene
throughout those dealing (Rittel and Weber, 1973; 164).

For managing complexity, institutional change and commitment are important in build
consensus as well as creativity. To bring about this change, a right moment in time
spark the energy as a catalyst for change. Finding possible options and narrowing t
Actions at the individual level can be taken: creating a learning or safe environme

can address some social and contextual uncertainties. Having experience or a needed set can be useful in dealing with different locations and natures of uncertainty. The comb cooperation and competition that includes variation rather that uniformity is good

Planners take on various roles when dealing. The manager role evaluates, the pragma incrementalism, the resource allocator uses tactics such as facilitating and power charismatic leader provides public confidence. There are different responses to dea ends and/or means. When both technology and goal are known programming and monitori to keep up to date. When the goal is unknown bargaining and compromise is needed. U technology used is unknown research and experimentation can be used. For both unkno finding is needed (Christensen, 1985).

Four ways of coping with the monster of uncertainty are exorcism, adaption, embrac assimilation. Exorcism extracts uncertainty by reducing it or covering it. Adaption to make it fit within the scope. Embracement of uncertainty lets fascination and wo reality of it. Lastly, assimilation judges uncertainty based on cultural values (Va

As for planning methods, incremental planning takes plans and pieces then into smal Evolutionary planning realizes that transportation systems are evolutionary and con use reliance and adaptability (Bertolini, 2007). Resilience active, as in using i it, and adaptability is a way of reacting to unforeseeable change in a system. This system functions and is still able to change in the case of uncertainty. Adaptive p robust rather than optimal solutions. It includes goal finding and monitoring to ke hedging and flexing to cope with unknowns (Marchau et al., 2008). Implementation is enough information is available to progress. In addition, the plans are continually new events and technology that may arise.

More technical ways of approaching uncertainty is using scenarios and models. Forec fulfilling scenario, predictive sets out what is most likely, the explorative looks normative sets up with a goal in mind. In using models, the lens used should be related openness/closure of the system: strategic is wide and operational is detailed (Naes

Various ways of coping with uncertainty and complexity have been presented. Obvious tactics, in general and in terms of transportation and planning.

## 4. Results

### 4.1 Areas of Uncertainty: Deductive

The most (repeatedly) agreed upon code of the entire research was financing as a so Money is one of the three major sources of uncertainty that creates the triangle of two corners being scope and time (S). Most risks have consequences for one or more categories. The focus/priority depends on the political decision makers. The second agreed upon code was political factors as a source of uncertainty. Political uncert outside of their realm of influence, thus uncontrollable. The repetition of this co transport planning actually is and the need for coping methods, which is expanded u

Changing roles of government creates new working contexts; Privatization and redistribute power, particularly responsibility, but not always money (J). Howeve responsibility requires a structure and knowledge base to understand how to dea involved in the transition. With privatization the image is that responsibilities groups however, without proper regulations, private groups do not fulfill their ne practice, privatization is pushing responsibilities of dealing with uncertainties of government onto the private level without private actors fully being aware of must deal with, nor the repercussions of being responsible. Delays and failures of may be pushed back onto the public.

Since transport is traditionally a result of a public-public cooperation, it is hi privatization of transport companies, their actions, projects and decisions are sti more compared to urban planning.

Elections are known to bring change every 4 years, resulting in discontinuity in th times there are discrepancies between the goals of political actors and the opinion latter of which, in the end, don t have the final say. However, new politicians can catalyzers; this happens when a new politician is elected and takes a stagnate proj the influence and power from her or his position (Q).

4.2 Dealing with Uncertainty: Deductive

The simultaneous identification of issues and solutions can be problematic. The mindset is geared towards thinking in terms of projects and not in terms of chall are identified first and separately, solutions that relate to the context can be s (P). When solutions are already in mind, they do not leave space for innovati unidentified problems, which can be costly. However, this point of view appro scientific problems because the systems-approach of understand then solve unnatural for the type social uncertainties transport planners face (Rittel and W other hand, goal and problem defining (through research) are useful to gain coherence understanding the uncertainties involved. Open means and solutions help prepare fo make it easier to adapt to them.

One crucial, yet unpredictable, tactic is creating or using a moment as a catalyst the moment of inertia makes timing a crucial factor in uncertainty (P). This point as momentum: the right moment in time to take advantage of an act or timing, des aspects/information being available (B).

Research studies are widely trusted and esteemed, especially scientific research, as deal uncertainties; this may be because the initial impression of uncertainty is thought uncertainty. Conducting a risk analysis can be used for lower levels of uncertaint scenario and structural. At times the risk analysis occurs early on when some parts worked out (B, C), but it is used to get a clearer picture of the situation and mir (E/F). Although risk analyses identify possible risks, they do no always propose ac control them (E/F).

Creating a learning environment for an open attitude is important to learn from one persistently and actively, is a way to continually deal with uncertainties by continua information to battle unknown-knowns (B). This also includes having a better unders context of political and social uncertainties through political awareness session grasp a better understanding of the elements and their complexities involved; exper members bring a sense of confidence or safety.

Innovation and experimentation are other ways to deal with uncertainty to open up t way a range of options can be openly developed and narrowed to the most-suited. Dra wisdom of the city.

From adaptive planning, identifying certain and uncertain vulnerabilities can creat for realizing the uncertainties involved. Vulnerabilities are forecasted early in t scenarios and in the overview (C, D, E/F, I). They look at what can go wrong and w the way (E/F) and to distinguish the known-unknowns and unknown-unknowns (G). T for finding new uncertainties and realizing that the identified ones will never b to take action for needed information helps to link to current progress, demand and that a point in time (J). Adapting information with technology, growth and events, deadlines can is more attuned with reality and points reached. Determining the mon through monitoring to keep track of trends, progress and failures for balanced lear evaluation allow for adjustments and improvements to be made when needed; however t be reactionary rather than proactive. Monitoring should be clearly communicated whi convincing tool

Institutional change, as a process, is a way of solving systematic barriers (C). C reorganization of planning teams and departments, which integrates different ways while N mentioned to need for Institutional change from the top down culture (espec Decentralized decision-making can address imbalance power relations and the existin in (planning) (N). Offering more opportunities for citizen s decisions (C, J) can uncertainties and have larger implications of institutional power restructuring (N). Di is needed to bring new ideas, opinions and perspectives for a fresh approach to unc decision-making and power restructuring can help but the change brings complication

Keeping an open mind towards uncertainty creates alertness and awareness. Being (personal) expectation management for uncertainties in projects. Many recognized awareness of the existence of uncertainties; uncertainty can keep people sharp aware of the possibilities by identifying, categorizing and giving them a place limitations puts the project and uncertainties into perspective. Building trust with open dialogue and no secrets to build personal relationships though learni work (C). Building trust can loosen tensions when involving many different pa interest and is good for image and reputation (C).

4.3 Barriers: Deductive

4.3.1 Institutional

Path-dependency structures are not always conducive for dealing with uncertainty a and regulations take very long to adjust, meaning policy from 10 years ago is still in use surrounding the process and the ways power, money and decision-making are divi barriers (C, Q). Legislation requirements are hard and strict while uncertainly i difficult to match them. In addition, lack of political support and stability c project (B, I) since major decisions are political ones. When there is no amba support or influence a method, is it difficult to initiate new tools being use influence can act as a catalyst or a barrier.

4.3.2 Social

Representation of issues can affect the way they are perceived and approached. Effi can help gain influence over uncertainty, because planning involves people not only of issues, such as for problem finding, is influenced by political ambitions, espec high (B). Planners find it difficult to shape research and deal with political expe transparency and presentation (B). Political influences on framing act as a barrie representing uncertainty.

Fostered connections between different parties involved are important in building t tensions, and understanding each other s work (C, G). Putting in time for one-to-on understand perspectives, expectations and interests creates a safe environment for weak points (because different people react differently) (G, L). Working out disagr only project participants, but also users and residents can address social uncertai early, less prestige, emotion, money and time is invested which makes room for thos together and form a sense of joint ownership (G). Connections are affected by mana and lack of integration (structurally, inter-personally, and with other disciplines seamlessly with others (B). Without involving others early on, projects can be halt secrets, and bad experiences (C).

Lack of communication about the way others work and not keeping others updated (shari can cause many problems in projects (G, B). Understanding others assumptions early openness of knowledge flow can help to tackle blame. Continuously meeting to share create a combined knowledge inventory to address unknown-knowns and recognize known Without transitions and clear direction from communication, separation and dissecti people and phases, especially when different people are involved at different phase with many involved, it is difficult to communicate every detail so a level of trust (B).

4.3.3 Individual

Personalities are pertinent because planning includes working with people and their louder than planning theories (G). Human behavior determines how people step into c situations. A tunnel mindset can be destructive and prevent understanding between p technical mentality is part of the reason that infrastructure ideas don t fit well Different working cultures (i.e. strict requirements in transport where uncertainty lead to different goals Traditionally, transport planning follows of the spatial de look to transport planners to ensure their future development will be accessible, a

look to developers to ensure their transport networks are supported with enough use
different heartbeats for different functions.

The mentality of fearing change is a result of not having a fluid perception of p
people to get attached to predetermined views. Mind set change begins at schooling

4.4 Areas of Uncertainty: Inductive

The distribution of responsibility in large transport projects can be crucial
uncertainty if not clearly detailed. Responsibility between building companies
government is often blurred (L). Dividing responsibility becomes a struggle of
money lies (J). When great amount of funds are involved, responsibility becomes a
determine early on. Transport planners feel the responsibility to meet all imposed
responsibility is slowly being shifted to the market (Q).

As responsibilities are changing, the involvement of consultant s and contracts a
source of uncertainty. This transition period comes with uncertainties, such as
contracts that can add complexity to the process by bringing parts together (E
contract is that it s fixed, with strict details, so changes to be open are co
lawyers. This provides difficulties for dealing with uncertainty in an open adapt
tension (Q). Large long-term contracts involve high stakes in interest and money
availability of contracts, the details become more crucial (Q). The problem occu
multiple options are not clearly discussed beforehand to allow for the company to
to uncertainties (Q). There is a lack of understanding between the pressures each
each develops decisions, and works with uncertainty.

4.5 Dealing with Uncertainty: Inductive

The use of rhetoric in presentation skills is referred to in planning theory and
uncertainty. This includes methods of proving, explaining and giving reasoning to back u
The way information is presented influences how it is perceived and in this case
of convincing others involved (decision makers, stakeholders, etc.) of her/his s
explaining in a manner that allows for others to understand the context (whilst
expectations) of the situation and be slowly led through the process together (es
(M). This allows for others to get more comfortable with uncertainty when they a

Although reports alone no longer suffice, using convincing power, accurate and up-
gaining importance because reports are given meaning though people (M). Even wri
political act, especially when planners have to sell their stance in a game like
servants are realizing their role in such political decisions and they receiv
accordingly to political context.
Prioritization is a response gaining popularity as available finances are cut. A
plans are rated on necessity and level of relevance in order to prioritize the m
initiatives. Prioritizing projects helps deal with most importance issues first, w
uncertainties since they are more needed. Prioritizing, however beneficial for de
can also have negative drawbacks for completing projects.

Money, a source of uncertainty mentioned by everyone interviewed, can also be used with uncertainty. Many uncertainties are costly and functioning in a highly budgeted transportation, it is a scarce resource. Solutions can be to adapt to the budget sources of funding, to be active rather than reactive and relying on spatial dev Gathering a surplus of funds for a project can make uncertainties less threateni stability (O). However more realistically, saving money by making projects cheape soberly is way of managing monetary uncertainties. Prioritizing helps in reduc money is spent on what is really needed, which is why all who mentioned money as uncertainty, also mentioned prioritizing. Spending more cost-effectively can be th for coping with uncertainty such as through research and monitoring (M). The prog exemplifies cost efficiency by better utilizing existing infrastructure (Q). Cre extra un-programmed money helps deal with the financial uncertainties.

Related to being cost efficient in light of uncertainty is downsizing the scale of are realizing (from forced circumstances that pressured them into changing) large longer feasible (L, J, C, E/F). Large-scale development are complex and costly, th towards small-scale to humanize infrastructure (T). Usually politicians and co projects (maybe to leave their mark or political legacy) however those are too e realistic (L). Despite the more manageable scale to reduce complexities, is also Due to the fact that transport planning traditionally follows spatial planning an needs density and higher user-ship/ ridership in order to function and sustain it (spatial) developments do not offer this stability. This lack of stability caus transport despite the de-complexifying of spatial developments. This results in ev other to make a move.

The Multi-Year Investment Programme (MIRT), which combines infrastructure, spati goals for 10-15 years, offers a structured strategy (T). At the regional level, with advisors from all substantial regional parties and Rijkswaterstaat to give framework lays out the standard steps in conducing basic project research for p options while excluding the variable of cost to bring creative solutions. Once all co narrowed down and divided into phases, each ending with a go/no-go decision (P) attempt to de-complexify and rationalize decision-making processes to deal with po do not enjoy deliberation (T). Developed in a top-down format from the national sc processes are invented to manage complexities and gain power over them (P, T). T that uncertainties do not fit easily into such structures; they are dynamic.

# ¿Mobility for the urban poor? Cable-car systems in Latin American cities

Peter Brand
Universidad Nacional de Colombia (sede Medellín), pbrand@unal.edu.co

**Keywords**: Cable-cars, public transport, Latin America

**Abstract:** The first cable-car system as urban public transport was introduced in Medellín (Colombia) in 2004, and attracted much interest. Medellin now has three cable-car lines in operation, and there are two working in Caracas, two in Rio de Janeiro, and three in La Paz; all four cities have plans to implement more lines, and several other cities in Latin America are planning similar systems. The first generation of cable-cars was novel in the sense of introducing old tourist technology as public transport systems in poor urban areas. Cable-cars co inaccessible hilly areas where conventional solutions such as road or rail systems were unfeasible. By offering better accessibility for geographically and socially marginalised sectors of the population, cable-cars posed the question as to what extent this new mobility option could contribute to poverty alleviation and social inclusion. This paper presents an overview of the topic, the results of ongoing research on the urban and social effects of cable-cars in the cities of Medellin (Colombia), and the perspectives for the cable-cars in Caracas (Venezuela), Rio de Janeiro (Brazil) and La Paz (Bolivia). It is argued that whilst the mechanics of cable-car systems is identical, once put in context each system is highly different in its urban implications and social effects. There appears to be a typology emerging based on different urban functions, each of which has particular consequences for social inclusion in city life for the urban poor, mediated by public/private ownership, integration to existing mass-transport infrastructure, tariff policies, and political conjunctures.

## 1. Introduction

There has been a fast-expanding interest in cable-cars as part of urban public transport systems since the introduction of the first one in Medellín (Colombia) in 2004. There are now two operating in Caracas (Venezuela), two in Rio de Janeiro (Brazil), and three in La Paz (Bolivia), and all four cities have plans to implement more lines. Colombia s capital Bogotá is about to start work on the first of three lines and more recently the Chilean government announced cable-car systems for Antofagasta and Valparaiso.

This represents a startling innovation in urban public transport, and not only in the sense of the recycling of old, ski-slope and tourist-site technology into everyday use in urban areas. The most striking thing is the implementation of such systems in the poorest and most inaccessible sectors of cities. Cable-car systems have the obvious advantage of being able to reach steeply inclined areas otherwise difficult to access by conventional road-based means. Such areas are generally inhabited by the urban poor, often through historical processes of informal development. The topographical challenges to road access are therefore combined with basic infrastructure limitations and dense development. Significant road improvements in such areas would be extremely costly not just economically but also in political terms due to the population displacements involved.

Cable-car systems therefore have a positive social dimension denied to road-based transport. Major road improvements or urban motorways frequently cut aggressive swathes through poor urban areas, restricting local communication and deteriorating the environment. Cable-cars, on the other hand, sweep quietly and

cleanly over residential areas. They have a completely different aesthetic, and tend to attract visitors even to dangerous areas rather than provoke abandonment and decline. The sense of social inclusion which a cable-car can bring is therefore more than a simple act of improving mobility and facilitating fuller access to the city; it also operates at the symbolic level.

Cable-cars do, of course, have their limitations. They are not mass-transit systems, with their capacity effectively limited to around 30,000 passengers/day, and whilst they are convenient for moving people they are of limited use for transporting goods. They do however have considerable political attraction, being relatively cheap, quick to build and with a high impact factor.

This paper firstly provides a conceptual introduction to the question of mobility and its relation to poverty reduction and social inclusion. Secondly, it describes the growth and future projections of cable-car systems in Latin American cities, and the analyses the social and political issues that existing projects have brought to attention. Thirdly, the paper concludes with a provisional typology of cable-cars as urban infrastructure projects, and some practical recommendations concerning the implementation of cable-car systems and the direction which further research might take.

## 2. Mobility and cable cars: ideas and experiences

This section introduces briefly some of the ideas and arguments which help explain the attractiveness, and limitations, of cable-car systems. Beyond the obvious advantages of connecting poor communities in inaccessible areas, it poses the question as to what extent a cable-car can extend the reach and efficiency of a public transport network and contribute to poverty reduction and increase social inclusion.

Much contemporary discussion hinges around the multiple understandings of the term mobility. In general terms, mobility is understood as a defining characteristic of flexible, globalised economic organisation, within which the ability to be mobile, real or virtually, is a social requirement for individual participation in economic and social life. Mobility has been hailed as the new paradigm for the social sciences (Sheller and Urry, 2006; Urry, 2007), replacing the solid structures of institutions as the foundational principle of social organization. Mobility, it is argued, is a new form of capital, thereby raising the stakes of the transport question from a functional to a structural level. For Kaufmann et al. (2004), transport infrastructures and *access* to them (in terms of availability, cost and other constraints) is just one dimension of motility, the others being the *competences* required (whether physical, cognitive or organisational) and the mode of *appropriation* or the needs, plans, aspirations, motives, strategies of being mobile.

The extent to which the sociological understanding of mobility/motility is shared by transport planners and city administrators is questionable. Certainly accessibility is an increasing concern, albeit in a limited form. On the other hand, the complex and overlapping rhythms of contemporary life, in which mobility patterns are individualized and fragmented, makes coordination across physical and social space a major challenge, for individuals and experts alike. Modeling multi-modal and multi-purpose journeys, as well as the qualitative factors influencing trip decision-making, is a major technical challenge for transport planning. Understanding the mobility patterns of different social groups is of vital importance (Avellaneda and Lazo, A. 2011; Ureta 2008; Jensen, 2009; MacDonald and Grieco, 2007), and failure to do so can lead to serious problems in major public transport system implementation (Jirón, 2014).

Perhaps the most problematic aspect concerns the social assumptions behind transport planning. Whilst regular movement patterns clearly exist, this does not necessarily imply uniform or common mobility

goals and aspirations. Transport modeling tends to assume a standardised social structure and normatised mobility behavior or, at least, that transport planning can be undertaken reasonably on such a basis.

The above has important implications for poverty reduction and social inclusion, on which there is a broadening literature (Kenyon and Lyons, 2002; Preston and Rajé, 2007; Ohnmacht, Maksim and Bergman, 2008; Jiron, Lange and Bertrand, 2010). Access to transport facilities is deemed a condition for the full participation in urban economic, social, cultural and political life, yet this high moral pretension tends to underestimate the fragmented and increasingly unequal nature of contemporary urban societies. In transport planning practice, this complex question tends to be reduced to the question of transport costs (in time and money). Whilst this is undoubtedly important, especially for the urban poor whose transport costs can be a high proportion of total family income, it does not necessarily follow that poverty will be reduced and social inclusion increased. Research on the effects of the Medellín Metrocables ( Davila, 2013), for example, reveals that over the first 5-year period of operation there was little increase in non-essential trips and that the rise in living standards in the area of influence was inferior to that of the city average.

Transport and mobility studies tend to focus on the demand side and the recipient population, yet transport infrastructure provision has a long historical association with the exercise of government power and state spatial control. Accessibility is bi-directional. The Medellín study (Brand and Davila, 2011; Davila, 2013) highlighted the phenomenon of increased institutional presence and state control via the city s Metrocables, over what was a largely a no-go area for the rest of the city, and a highly restricted and conflictive field of action for local government operations. This aspect can be seen in subsequent cable-car systems in other cities, most notably Rio de Janeiro, increasingly associated with slum tourism .

At the same time, this state presence, as expressed through capital investment, the innovative application of technology, institutions working in permanent and close relation to local communities, figuration on the urban agenda, and national and international attention, all contributed to the de-stigmatisation of the area, and the creation of authentic *sensations* of inclusion on the part of residents. For their part, city administrators could also enjoy national and international recognition, further enthused by the fact that a cable-car system can be designed, contracted and built within the mayoral period of office.

In short, the politics of cable-cars is a complex issue involving many factors. Whilst the Medellín case was technically-led and carefully administered within an overall plan for the development of an integrated public transport system, this has not always been so in other cities which have adopted cable-car technology. Without due regard to the basic questions of natural topography, urban morphology, effective social demand, inter-modal connection, tariffs and so on, there is no guarantee that a cable-car will function effectively even in the most basic sense: as a simple transport system. The importance of these issues, explored initially in the case of the Medellín Metrocables, will be evident in the description of the introduction of cable-cars that followed in other Latin American cities.

## 3. The growth of cable-car urban transport in Latin American cities

This section outlines the expansion of cable-car systems across Latin America, highlighting the different politico-administrative conditions, technical characteristics and urban implications that cable-cars have acquired in the process.

### 3.1 Medellín: the pioneering experience

The first cable-car system was built in Medellín and came into operation in 2004. Known as Line K, it became the reference for future projects, and as such its origins deserve special attention. Medellin is located in a steep sided valley, and the main metro system had been completed in 1995, running along the valley bottom and through the city centre along an elevated section. Initial use was far below projected levels, with a little over 200.000 passengers/day compared to a capacity of well over 900.000. The metro project had experienced severe delays, legal disputes and over-costs, and there was an urgent need to get more passengers on to the metro.

These potential passengers were located on the steep hillsides, usually with very limited road access. As chronicled in Dávila (2013), the metro company began developing the idea of a cable-car system to bring passengers down the hillsides. When the idea was presented to mayoral candidates in the year 2000, it was received with incredulity and some ridicule. However, the only candidate to give outright support to the project turned out to be the electoral winner, and work began immediately with the technical backing of the French group Poma. There are four points worth emphasising:

Firstly, although boldly pioneering in style, the cable-car was based on coldly calculated transport engineering and financial considerations. An agreement was reached under which the metro company would finance that portion of total capital costs which could be recuperated over a ten-year period (45%) through increased passengers, whilst the city authority would finance the rest (55%) as social investment.

Secondly, the metro company is publicly-owned, property of the Medellín city authority and the Antioquia province. This facilitated the articulation of the cable-car into the integrated public mass transport system; it was, de facto, part of the metro system itself. Not only was there a functional articulation but also one of tickets and tariffs. The metro operates on the basis of a single fare for any journey, and as the cable-car was part of the metro (Metrocable), its use involved no extra cost for passengers who would use the main metro itself. This meant considerable transport cost savings for users involved in long journeys previously involving bus-bus or bus-metro trips, especially low-paid workers in the formal sector.

Thirdly, it was only after the completion of the project that its urban-upgrading potential was realised. As mentioned earlier, the first Metrocable was built in the poorest and most infrastructure deficient sector of the city. With its origins in informal development and land invasions in the 1950 the century it was also the most densely developed sector of the city (reaching 440 dwellings/ha), and although well serviced in terms of basic public services, it was severely lacking in terms of housing quality, public space, education and recreation facilities, environmental protection, and so on. Describing new urban interventions as part payment of the city s historical debt to the sector, subs administration used the Metrocable as an axis for more integral urban upgrading, and the area became the experimental ground for what was termed social urbanism . Over the period 2004-2010 investme complementary urban projects was seven times more than the cost of the Metrocable itself.

Fourthly, the urban sector was the afflicted by extreme violence, centre of the Pablo Escobar cartel, and substantially outside state control. The Metrocable not only increased mobility options for the urban residents but also improved accessibility to the sector from outside . What impenetrable and stigmatized sector of the city suddenly became more accessible for public sector officials of all kinds, facilitating a gradual formalisation of relations to the city and the extension of state control. The Metrocable also became an instant tourist attraction for city residents, who could now glide securely over a vast area of the city completely unknown to them before, and this tourist element became consolidated with the later construction of a second cable system linking the terminal station to a new

public park above the hillside. The Metrocable and associated upgrading projects were the civic complement to increased police and military presence (Brand, 2013).

The above points are key considerations for understanding the success of the first ever cable-car as part of an integrated public transport system in poor urban areas. Its impact was considerable, attracting huge interest in specialist journals, the international media and among city administrations. The Metrocable and Medell n model received recognition from the Organisation of American States, and numero delegations arrived from other cities. For city mayors, the cable-car was seen as a relatively cheap and politically attractive way of addressing the problems not just of transport and mobility, but also of social inclusion and the integration of marginalized sectors into city life; and all within the political time-scale of an electoral period.

Medellín itself went on immediately to build a second line but with some import differences. The Line J was completed four years later in 2008, involving the same principles of co-financing, ticket and tariff integration (increasingly extended to connecting bus services), the complementary upgrading projects of social urbanism , and implementation in what had then become the most violent and out-of-control s of the city. However, the close relations with the local communities weakened, and more significantly, the line connected to the main area of expansion for social housing. The various possibilities of cable-cars became evident.

### 3.2 The first follow-up: Caracas

Caracas was the second city in Latin America to implement a cable-car system, in early 2010. Undoubtedly influenced by the Medellín experience, the troubled relations between the Colombian and Venezuelan governments probably explain the lack of direct consultation with Medellín and the presence of a new technology supply company Doppelmayr of Austria and a Brazilian company responsible for the civil engineering works. Nevertheless the technology itself is essentially the same, although the nature and effects of the Caracas Metrocables show some distinct characteristics.

***San Agustin Metrocable 2010***

The San Agustin Metrocable was led by central government rather than the city administration. President Hugo Chavez, who s Socialism in the 21st Century government was still fuelled by high oil decided on its implementation in the San Agustin neighbourhood, historically famous for its militancy against earlier dictators and corrupt capitalist governments. It was, in short, a political decision, but also one that what have serious practical disadvantages. The San Agustín neighbourhood occupies a small hill in central Caracas, bordering a main road. Its population was relatively small and although steep sides made access difficult, it was questionable, from a technical viewpoint, whether such a small neighbourhood justified such a large capital outlay. In the event capital costs soared over the construction period. Passenger numbers have remained low, around 6,000 per day, compared to the operating capacity of 15,000 (Naranjo, 2013).

The cable-car system has a U-shaped form, starting and finishing at the same major road, connecting with a metro station at one end and bus services at the other, with three stations on the top of the hill. The main complementary urban project is a large cultural centre serving a wider population. As with all public transport in Caracas, the cable-car is publicly owned and operated, and heavily subsidised.

***The Mariche express cable-car***

The second Mariche cable-car has vastly different characteristics. Inaugurated in 2013, it consists of a 4.5 km line connecting the city centre to the outlying suburbs, with no intermediate stations. The Mariche cable-car enables efficient access to hilly areas above the city centre which are otherwise poorly served by existing road infrastructure, cutting travel times considerably. A second almost parallel line is planned in the future to provide access for more in-lying areas. Capital costs per kilometer were considerably less than the earlier San Agustin line.

The publicly-owned transport system facilitates articulation to the integrated mass transport system via a metro station in the city centre terminal. The current options are a steep stairway or a short shuttle bus service, but works are underway to provide direct lift access between the two terminals. Use has been high, with an estimated 25,000 passengers/day.

### 3.3 Rio de Janeiro

The first urban transport cable-car in Rio de Janeiro, completed in 2011, was undertaken in close cooperation with Medellín. The Medellín Metro company acted as consultant and the cable technology was supplied by the same Poma Group. It was built in the Complexo do Alemão favela, as renowned as the Comunas 1 and 2 of Medellín for its violence, drug-trafficking and conflict with the city authorities. Its success, however, has been much more limited than that of Medellín.

The Complexo do Alemão has similar origins and urban characteristics to the Medellín case, but with poorer levels of basic service provision. Population density is high (over 300 inhabitants per hectare) and the street network narrow and tortuous on steeply-sloping hillsides. Public transport was largely informal vans and motorcycle-taxis. The city authorities began developing an urban upgrading project in 2007 known as the Programme for Accelerated Growth (PAC) inspired by the Medell n exp urbanism , initiated in the Complexo do Alemão en 2008 (Amorim da Silva, 2013). The area seemed ideal for the replication of the Medellín Metrocable, but the practical experience has been plagued with difficulties. Designed with a capacity similar to that of Medellín (30,000 passengers/day), use by residents remains low (6,000 passengers/day initially and currently around 12,000 passengers/day on average, more than half of which are estimated to be non-residents, principally local and national tourists (SuperVía, 2013).

- The importance of topography. The Complexo do Alemão, consisting of fifteen informal neighbourhoods, is built on a sequence of hills known as the Sierra de la Misericordia. The cable-car stations are situated on the top of each hill, so that users are restricted to the population on the upper part of the peaks; access further down involves walking long distances or climbing steep stairs paths.

- Transport system articulation. The main terminal of the cable-car links with a station of a suburban rail line. In principle this is positive but the suburban service is inadequate. The Complexo do Alemão is close to a major road, so that the motorbike-taxi and bus alternative is still an attractive one. Furthermore, the cable-car is run on the basis of a private concession. Residents of the sector have the right to two free journeys per day, extra journeys have a preferential cost (R$1) compared to that for non-residents (R$5). A municipal public transport system also means that integrated fares and ticketing is limited, and the cost of public transport in general is a very sensitive political issue in the city.

| **Integration to mass transport system** | Yes (suburban train station) | Partial (Central train station) |

- Inconsistent urban upgrading. The PAC programme, of which the cable-car forms part, has received considerable criticism. It is argued that the cable-car, which accounted for more than a quarter of the overall budget, did not respond to community priorities and like many projects, was carried out with insufficient community participation. Evictions caused by project construction, although in most cases involving aided relocation in new nearby housing developments, also caused widespread concern. Many small-scale projects suffered delays and incompletion.

- State presence/pacification. Despite Brazil s progressive urban legislation (Cities Statut conflict continues to dominate most of Rio de Janeiro s favelas. The Pacificatio conceived as a way of community policing, has come under intense criticism for its militarization of the favelas, corruption and human rights violations.

The Rio de Janeiro experience highlights the importance of urban context in a number of ways. Whereas the first Medellín cable-car had an important effect of creating sensations of social inclusion, Rio s first cable-car has, if anything, accentuated local discontent and conflict. The wider urban context also needs to be taken into account. Rio de Janeiro s commitment to mega-projects such as the World Cu Olympic Games has provoked widespread protest over their social consequences. The fact that the Complexo do Alemão cable-car is becoming more of a tourist attraction than a local transport facility offering greater mobility to local residents only serves to accentuate local discontent.

Rio de Janeiro s second cable-car became partially operative in September of 2014. Less than a kilometer long, it connects the main railway station to a major redevelopment project in the old port area of Porto Maravilha, passing through one of the oldest favelas of the city. Opposition has been fierce.

### 3.4 High stakes in the high Andes: La Paz/El Alto

President Evo Morales inaugurated La Paz s three new cable-car systems in July 2014. Two of Red and Yellow lines) connect central La Paz with its municipal neighbor El Alto, which stands on a plateau high above the rocky valley in which sits the country s capital. The president had vis and was apparently enthralled with the cable-cars there. His closer political ties with Hugo Chávez in Venezuela were probably influential in enabling a quick contract with Doppelmayer.

Certainly the daunting topography of La Paz is ideal for cable-cars, and the very limited road connection between La Paz and El Alto (3,660m and 4,070m above sea level, respectively) were an inviting prospect for cable-car transport. The airport is located in El Alto, but this was not the principal motive. El Alto is a bustling town of 850,000 people (100,000 more than the de facto capital), with close relations to La Paz in terms of the local labour force and an extraordinarily diverse and substantially informal retail market. Each line has one or two stations on the way up, with parts of the terrain is so steep and densely built that even cable-cars stations are difficult to fit in. The third (Green) cable line is but an extension of the Yellow line which leads fairly flatly to the fast-growing middle class and business centre of the capital.

La Paz cable-cars were built in record time. As in Caracas, they were a presidential initiative, and on this occasion the city mayor, of a different political party, was opposed to the project, having his own RBT as an alternative transport programme. The combination of these two factors fast construction, uncoordinated planning, and policy differences between central and city government implied little policy coordination and poor articulation of the different transport modes. Even connection to major

| **Tariff integration** | No | No | No |

highways and conventional bus routes is weak, whilst integration into the existing urban fabric and future urban development or the upgrading of low-income settlements is precarious.

The cable-cars are run by the public Empresa Estatal de Transporte por Cable - Mi Teleférico. After a short period in operation passenger numbers are encouraging but show some particular characteristics. By December 2014 the Red Line had an average weekday use of 17,800 passengers/day and the Yellow Line 36,800 passengers/day. The Red Line figures for Thursdays and Sundays market days in El Alto rise to an average of 28.600 passengers/day and 41.200 passengers/day, respectively (Mi Teleférico, 2015a). The Yellow and Green Lines also have the highest use on Sundays, Thursdays and Saturdays, in that order, though to a much lesser degree than the Red Line. Another curiosity is the absence of marked peaks in early morning and late afternoon, indicating once again the importance of the El Alto market and suggesting a range of journey motives beyond the typical journey to work.

The existing lines have been sufficiently successful in technical, financial and political terms as to justify central government s commitment to the construction of a further five lines in the combined total length of nearly 20 kilometres, the longest 4.9 kms. This second stage includes complementary urban projects for better articulation to urban context and other transport modes, including for the three existing lines (Mi Teleférico, 2015b).

## 4. Conclusions

The analysis of Latin American cities indicates a considerable diversity of urban experience with cable-car systems. The pioneering Medellín projects quickly developed into a strategy for more integral urban upgrading of poor areas. This strategy, however, has encountered limitations and opposition among community groups, even in Medellín itself. Subsequent projects in Caracas, Rio de Janeiro and La Paz/EL Alto have adopted weaker or less defined urban development aims.

A typology of cable-cars seems to be emerging. Whereas the technological component is identical in all cases, this standardized technological system acquires vastly different connotations according to the urban context within which it operates. This can be partly explained by the planned intentions behind the introduction of such systems, but the fuller implications the integral effects on the areas of influence is emerging through practical experience over time, a learning curve which can produce unexpected outcomes, especially in the face of experimentation and sometimes improvisation in the planning process itself. Four different but sometimes overlapping urban characteristics can be identified:

- Urban upgrading/pacification/tourism: This is the case of the earliest cable-car systems built in Medellín, Caracas and Rio de Janeiro, where the urban upgrading and social aims of cable-car were combined (though to a lesser extent in Caracas) with security issues and the re-establishment ( pacification ) of state (police/armed forces) control. Slum tourism has been an ironic off-shoot.
- Urban expansion/suburban transport: the second cable-car systems in Medellín (Line J, 2008) and Caracas (the Mariche Metrocable, 2013), and the Green Line (2014) in La Paz/El Alto, are basically suburban transport systems related to urban expansion plans with little or no social or urban improvement pretensions.
- Intra-metropolitan connectivity: the Red and Yellow lines (2014) in La Paz connect the m12unicipalities of La Paz and El Alto, dominated by labour market and street market considerations in this increasingly diversified and segregated metropolitan context.

- Property development/large-scale projects: The latest (Providencia) cable-car system in Rio de Janeiro, although combining the pacification pretensions of the first (Complexo do A project, is closely related to the major Porto Maravilha waterfront redevelopment project.

Within this diversity of urban intentions, the rationale of transport seems to be replacing the more socially-centred logic of mobility. This is not to imply, however, that cable-car systems have been implemented within the systematic development of an integrated urban transport system. Cable-cars are politically attractive, having an important novelty factor, a high aesthetic impact and are developable within the time-scale of a city administration. Public transport oriented cable-cars have often been built without adequate planning. Furthermore, the two technology companies present in Latin America have clearly seen new market openings, having established regional offices (Poma has subsidiaries in Colombia and Rio de Janeiro; Doppelmayr has regional offices in these two countries plus Argentina, Chile, Venezuela and Bolivia) and are clearly keen to develop this market potential not only for urban public transport but also on visitor sites within a growing tourism industry in Latin America.

As existing cable-car systems consolidate and new ones come into operation, the monitoring and evaluation of their spatial, social and political implications provide a compelling area for further research.

# Ethics and Transport Policy: a working paper

## ABSTRACT

This paper outlines the ongoing work of a partnership between UCL s Transport Public Policy. This is a multi-disciplinary project intended to bring together academics from disciplines such as moral and political philosophy, civil engineering, geography and transport and town planning combined with contributions from policy makers. The project has explored the hypothesis that, whilst transport decisions may have considerable distributional effects, ethical considerations are rarely explicitly considered in the policy making process. Unacknowledged ethical assumptions such as those implicit in decision support tools like cost benefit analysis have been examined in order to understand their impact on policy decisions. The paper considers three different ethical theories through the lens of transport policy making utilitarianism, the capabilities approach and the work of John Rawls. The paper concludes with a snapshot of one of the positions developed and the argument that if transport is treated as part of the welfare state then this opens policy making up to the consideration of a wider range of values than is the case under current practices.

## Introduction

This paper sets out an initial report on a work in progress. This is an initiative Institute in partnership with UCL Public Policy. The Transport Institute works across the University to foster cross-disciplinary transport research and increase the policy impact of that research. UCL Public Policy is an initiative from the Vice Provost again aimed at enhancing impact and the engagement of policy makers in UCL research. This particular initiative aims to examine the role of ethics in transport policy making with the aim of producing a series of policy recommendations. Our contention here is not that current practices are unethical *per se* but rather that ethical considerations are in the background or worse still unacknowledged. The aim of the paper is to set out, first, the approach and second, some of the ethical theories examined and positions developed by the multi-disciplinary group of practitioners, geographers, moral and political philosophers, civil engineers, planners and transport specialists. In examining the different ethical theories it is hoped that this may contribute to a process of bringing ethics and the ethical implications of transport policy to the fore, something we would hope would enable policy makers to become more aware of the frameworks they are using and the limitations of different ethical theories. In place of a conclusion this paper closes with one of the positions currently under development as an example of the approach taken.

**Work in progress**

As this is a work in progress we are happy to invite comment from fellow academics. To begin with it is useful to set out the approach we have taken as there are some differences from one that a conventional study might adopt. The first major difference is the lack of what would n starting point of a piece of research, a systematic review of the literature. This does not mean that no use has been made of academic literature, something that will be discussed in more detail later in the paper, but rather the starting point of the enquiry has been the intuition that ethics has been poorly addressed in current UK transport policy making. This approach stems from the way in which philosophy with its emphasis on argumentation and conceptual clarity appears much more comfortable working from a much smaller evidence base than many of the more empirical disciplines involved.

This intuition has been largely confirmed in interviews conducted with practitioners and academics involved in transport policy making and research. Whilst it is possible to find individuals that are open to or interested in the ethical implications of their work or their research it was hard to find anyone who believed that current practice conceived of transport policy making in explicit ethical terms. Responses, such as the quote below, suggest that whilst the ethical *content* of transport decisions were sometimes acknowledged there was resistance to considering transport decision-making as an area where the explicit consideration of ethics has a role to play.

> I don t consider it ethical its just the right thing to do ethical is not use (Academic Interviewee)

This may well reflect the commonly held view that value positions are in some way a matter of personal preference and that practice and policy making ought to, in some way, remain value free. Something that from a philosophical perspective is in itself a value position (Wolff, 2010). This is not to say that different issues that could be considered ethical are not under consideration in transport policy making. The group has heard evidence from the UK Department of Transport (DfT) on the way in which distributional issues are considered part of the WebTAG (DfT, 2014) transport appraisal process. This indicates there is certainly more than the conventional cost benefit analysis methodology at play in policy making. Where, as discussed below, this creates a problem is when the normative positions inherent within tools such as cost benefit or distributional analysis are unacknowledged.

There has been little in the way of consideration of transport issues in the work of philosophers contributing to public policy, this may be as the moral philosophical issues are not as interesting to philosophers as, for example, the clear ethical questions that surround issues such as abortion, assisted dying and drugs policy. Indeed with its emphasis on argumentation, the identification of novel, even irritating positions that are resistant to refutation (Wolff, 2011) the probl transport policy making present difficulties for philosophers and those working with philosophers. In particular the trade-offs between what is technically possible, environmentally desirable, fundable or politically acceptable create a gulf between the reality of policy decisions or project implementation and the absolute positions reflected in different ethical theories. For philosophers inconsistency in positions is often seen as refutation, undermining the position adopted, in contrast inconsistency in public policy is common and does not necessarily provide a justification for alternative policy (Wolff, 2010). Yet from the perspective of researchers in transport policy there has been some interest in philosophical frameworks for transport decisions (Tyler, 2004; Martens et al., 2012; Van Wee and Roeser, 2013). One feature of some of this work is a tendency to seek to replace one ethical framework with another (Tyler, 2004; Martens et al., 2012). From the perspective of this enquirey it is probably the work of Van Wee and Roeser (2013) that is most interesting as it considers selecting different ethical theories and how they might be incorporated into existing practice.

**Role of Philosophy in Public policy**

In contrast to those that seek new ethical models for transport decision-making the aspirations of this project are, less overtly ambitious. The aims are not to convince policy makers that they are in some way wrong or that the positions they adopt are in some way *un*ethical. To do so would risk confirming the worst stereotype of academic practice in explaining to hard pressed practitioners that what they are doing is wrong based on a process of abstract theorising. Notwithstanding t

practitioners has confirmed the belief that there are aspects of transport policy making and practice that make the implementation of measures to which they are committed, difficult. These commitments, although as the above quote suggests, are often not expressed as such, take the form of ethical positions. These are questions of what is the right thing to do about the ratio of cyclists right thing to do in increasing mobility and making public transport more accessible. Wha thing to do in managing the distributional effects of transport infrastructur born by the most vulnerable.

The aims of the project are also, on the face of it, more modest than the top-down theorising characterised (or possibly caricatured) above, what is adopted here is a more bottom-up problem-driven approach to applied ethics. One where the task is to;

> try to understand enough about the policy area to be able to comprehend moral difficulties, and then to connect those difficulties or dilemmas to patterns in philosophical reasoning and reflection. (Wolff, 2011)

The multi-disciplinary nature of the groups has been invaluable in gaining the necessary understanding of the policy area. In addition to this there has been empirical research such as interviews, focus groups and review of policy tools. Yet in seeking to connect dilemmas, such as the ethical dilemmas, identified by practitioners, discussed above, the project aims go beyond simply making the connections. We contend that in making these connections overt we are contributing to making more transparent what is often implicit in transport policy making.

This practice of seeking to make explicit what is implicit is of particular relevance to the interaction between philosophy and public policy. This is a practice and application of philosophy that can be seen in the work of Michael Sandel who, in his teaching on *Justice* seeks to draw out the ethical and value positions that underlie current political debates on issues such as the valuation of human life, property rights and same sex marriage (Sandel, 2011). Policy problems do not begin from a blank sheet; there is always a bias towards the *status quo* with changes requiring justification. Therefore it is worthwhile to both draw out the implicit value positions within the *status quo* and to examine the justification, in terms of values, for any changes.

This is one possible contribution of philosophers, or at least a philosophical approach: the examination of different arguments, distinctions and ways of reframing questions. This may not be restricted to philosophers, as many academics are capable of adopting a similar approach, yet it is seen as something that senior decision-makers and public figures often struggle with (Wolff, 2010). Whilst this is a valuable role played by any academic involved in the policy making process, and something that fits well with current expectations of academic impact, this does not necessarily discount the role of philosophical positions in longer term shifts in values. Pointing out that a situation is unjust or ethically inconsistent may not bring about its immediate resolution. However it may contribute to a wider shift in values. If one takes the example of slavery, an economic justification is now inconceivable in almost all societies yet prior to abolition contemporary arguments certainly weighed costs of compensation against extending principles of individual freedom to all. In the same way it may be that in exposing the inconsistency and intolerable conditions that are currently accepted in transport policy making a contribution can be made to future debates where cyclist fatalities, pollution or unequal distribution of costs and benefits are considered as intolerable as we now consider slavery.

**Ethical theories examined**

The following section of this paper sets out the ethical positions examined as part of this research. It is far from an exhaustive review of different possible ethical theories but rather an examination of key ethical positions that appear to have some relevance to transport policy dilemmas. In each case a full analysis of the philosophical position considered is beyond the scope of this paper. Rather each position is considered through the lens of transport policy with the discussion hinging on the value or difficulties created by adherence to or ignorance of the ethical framework that underpins policy. The first of these frameworks considered is utilitarianism, as one would expect there is a long history of its application via cost benefit analysis (CBA) and an equally long history of criticism of its use in transport policy

making. Following this there is a discussion of the essentialist positions that are currently associated with the work of Nussbaum and Sen and their application to transport policy via the establishment of minimum standards of, for example, accessibility. Finally there is a discussion of the work of Rawls and the way in which transport can be treated as a means of accessing primary opportunities and self-respect, crucially these are the type of goods distributed by government and have a bearing on the design of public institutions.

**Utilitarianism and Cost Benefit Analysis**

The prominence of utilitarianism in transport policy making is through its provision of the foundations for the commonly used practice of CBA. Its basis on the principle that the total benefits of a decision ought to outweigh the total costs was conceived, in its early use in infrastructure decision-making as an alternative to decisions where benefits accrued to a small minority or interest group (Shapiero and Schroeder, 2008). Indeed Bentham s original concerns that government s role was total of happiness or utility was similarly a challenge to decisions taken in the interests of an, then aristocratic or wealthy, elite. In this light it is clear how Bentham s utility principle has as self-evident. As its application through the techniques and practices of CBA has been developed and refined it has increasingly become seen as a value neutral decision support tool (Mackie, 2010). It is useful to first deal with the fundamental criticisms of utilitarianism and its application through CBA and then to consider why and how it has come to be seen as in some way value free and the consequences of this.

One important fundamental criticism is of the utility principle itself. As an alternative to the benefits of government action accruing to an already wealthy elite the idea that the benefits ought to be maximised across the population has an in intuitive appeal. However the wholesale adoption of this principle may conversely make it harder to argue for costly measures that benefit a *dis*advantaged minority as, in some cases, greater utility could be achieved if the same resources were used for improvements that benefit the majority. *In extremis* the adoption of the utility principle can allow, what are from an alternative ethical perspective, major injustices. In the case of transport this could be the loss of property or even life. The response to this is that in reality CBA never quite functions in this way as it is contained within a range of alternative moral positions. For example one could not conceive of a justification for a transport intervention that resulted in the death of even a single named identifiable individual, no matter how great the benefits were. While it is true that the cost of human life is often included within CBA it is in a highly abstract form such as the increased risks of death or injury distributed amongst a large group.

Even if we accept that the fundamental objections to utilitarianism as permitting injustice are addressed in the practices of actual CBA there are further problems with the utility principle. The way, in current practices, money is taken as a suitable proxy for utility shows up some of these objections. The economic models on which CBA relies assume the maximisation of economic benefits is a self-evident good. As Frank (2001) points out everyone, rich and poor alike are seen as having an interest in maximising the economic pie as everyone will get a larger slice. Yet this ignor and the potentially corrosive effects of high levels of inequality (Wilkinson and Picket, 2011). Indeed it may actually be better for economic benefits to be evenly distributed even if this is at a cost to overall economic growth. Overall utility or economic growth may actually have to be reduced if distributional fairness is to be achieved. The monitisation of benefits is also, potentially problematic due to the inherent biases that may occur. As it has been noted the value of a unit of currency is not the same to everyone (Self, 1970) and the use of money as a proxy for value may well entrench existing inequalities in wealth as costs to the wealthy, measured in financial terms, tend to be greater than costs to the poor. There is also some criticism that this ignores externalities by favouring costs and benefits that are monetisable, however unless we accept that there is some fundamental objection to seeking to place a value on some things then this objection, at least theoretically, can be overcome. The response from advocates and practitioners of CBA is that in real life decision-making values are always assigned and weighed against each other. The limitations of the tool are acknowledged yet it is still seen as a better alternative than anything else on offer. One response from practitioners was to ask what alternative there was to CBA. These justifications are in many ways compelling, also as Sen (2000) points out so

to is the language of costs and benefits. It would be hard to argue the reverse, a course of action with high costs and little benefit. Therefore it is possible to find quite broad acceptance of the, albeit contentious basic principles (ibid) without acceptance of all of the current practices.

Examining some of the other claims made for CBA is necessary if we are to understand why it has come to be seen as in some way value neutral and the consequences of this. It is claimed to be a means of preventing inefficient decisions (Sunstein, 2001) and overcoming the rational failings of political institutions (Richardson, 2000). This establishes efficiency as a key value in decision-making, possibly to the exclusion of others such as justice or fairness. The implication that other (political) forms of decision-making are in some way inefficient is important here. In the practice of CBA this can be seen in the blurred distinction between CBA as a decision *support* tool or as a decision-*making* tool. The argument here is that if, as those advocates of CBA argue, the solution to the problems are more and better data (Vickerman, 2007) then there comes a point at which, when all relevant values have been included, it becomes hard to claim that it is supporting decisions. If one assumes that all relevant values have been calculated and weighed up then it becomes hard to argue for any conclusion other than the one reached by the analysis. This lends governmental authority to the tool and the principles embedded within it (Dean, 1999), in addition it creates a privileged and arguably undemocratic position for the technical experts whose role it is to administer the tool (Dahl, 1989; Fischer, 1990). The practical implication of this is that the judgment of decision-makers is removed or reduced due either to a lack of trust in that judgement, an undue faith in CBA, or both. Where those decision-makers are democratically elected this becomes even more problematic.

The removal of judgement certainly does not remove value judgements from CBA. As Kelman (1981) points out the calculation of values may in itself be a mathematical exercise however it is the decisions about what values to assign, and the equivalencies between values where judgements take place. The practices of discounting and reaching conclusions about values based on economic methods such as willingness to pay or willingness to avoid are suspect here, in part due to the reasons discussed above with reference to the way this can favour the more affluent. There are further criticisms of these tools as simplistic and not representative preferences which are often complex with individual preference often shaped by the role or the conditions under which it is expressed. For example I may choose not to donate to the victims of some disaster as an individual but that is very different from stating publically that I do not care about the victims or for that matter electing a political representative who says they would ensure the state does nothing to help those same victims. The strong criticism of CBA here, or at least as it is generally practiced, is that it allows no room for the deliberation of values. Nussbaum argues that this allows us to lose sight of the tragic nature of decisions; some of the i by the application of the utilitarian principle. Deliberation over values has intrinsic worth that is neglected by CBA, something of particular relevance to the planning and delivery of transport infrastructure.

> Awareness of the wrongness inherent in the chosen course of action, ev justified, should not be lost as this can motivate policy-makers to make amends in some way to those wronged, and to try and change the overall situation so that less of these tra arise in the future

The conclusions reached in our study of utilitarianism and its application through CBA are useful in the sense that they illustrate the value of the approach taken to our examination of ethics in transport policy making. Our findings here are that whilst there are flaws within a tool such as CBA the basic principles have considerable justification when its application supports decisions and sits within a wider ethical framework. Where it becomes problematic is when the ethical assumptions and value judgements inherent within the practice of CBA are unacknowledged and it is presented as value neutral. This leads to an assumption that efficient, potentially undemocratic, decision-making and economic maximisation are the dominant values in transport policy. This may be the case however these values would be better acknowledged. This would allow challenges to these values, the consequences of adopting these over other values to be acknowledged and possible alternatives to be suggested. A situation that, if it facilitated deliberation of and some agreement over values, could then allow for CBA or variations on the same, essentially utilitarian, theme such as social cost benefit analysis or multi criteria analysis

(MCA) which claims to bring a wider range of values into calculation (Thomopoulos et al, 2009; OMEGA Centre 2010). Whilst the debate on whether different forms of CBA or MCA are inherently superior is one we have sought to avoid, the question our analysis poses to any such proposed tool is; to what extent does it make the ethical assumptions that are embedded within it transparent.

***Wellbeing***

Before considering an alternative to the utilitarian ethical framework reflected in CBA it is of value to consider another iteration of utilitarian thought with particular relevance to transport policy making. Former London School of Economics economist Richard Layard seeks to update the ideas of Bentl utilitarianism bringing together recent insights from psychology and economics. He calls for policy to be based upon the greatest happiness principle (Layard, 2011) and that actions should be desi increase happiness. Evaluation ought to be against this principle with actions judged on their consequences in increasing happiness or reducing misery for those who are affected with every individual equal in this respect. He argues this offers an alternative to economic principles that establish growing GDP as the ultimate aim and measure of government policy. This is based on a wealth of data that, beyond a certain point, increasing income does not appear to increase happiness. The consequences of this focus on growth, combined with the individualism and restlessness of modern societies have had a negative impact on what he identifies as the big 7 factors influencing happiness (ibid). These a defined, in order of importance as;

1. Family relationships
2. Financial situation
3. Work
4. Community and friends
5. Health

The last two, personal freedom and values are not ranked implying they are of a different order.

The evidence he cites is the declining reported rates of trust, particularly in America and the UK, participation in community organisation and activities, rising job insecurity and rates of mental ill health. He argues that advances in psychology and neuroscience now enable us to treat happiness as something objective and measurable through the observation of brain activity and its correlation with self-reported happiness. Economics, he believes is still valuable in providing a basic framework for evaluating costs and benefits based on the idea of individuals as self-determining agents. However on its own it is limited requiring the input from other social sciences. Layard favours the northern European social democracies as performing better on many of the measures he cites as well as offering greater stability in terms of employment, housing and community. The policy predictions that flow from this analysis are quite radical in some respects. The first is that, as it is measurable governments ought to be in the business of measuring the average national happiness (ibid), something t now undertaking to do (Office of National Statistics, 2015). Taxation has an important role to play and needs to be rethought less as a burden and more as a means of dealing with the externalities produced by economic activity. Here he mostly talks about status seeking behaviour and the negative effect it has on relative social status. However under this he also identifies many of the negative externalities produced by increased mobility, the damage to communities, family life and mental health.

In relation to transport Layard s arguments provide a, somewhat superficial, justification for priva over public transport, for the reduction of long-distance commuting that may have a negative impact on family and community relationships and action on more active travel in order to promote health. However when it is applied to real policy making the question of measurement of happiness becomes apparent. In order to apply Layard s views in the context of transport policy, we still need a universally accepted technical solution of how precisely interpersonal comparisons of utility can be made. Even if it was assumed that it was as possible to objectively measure happiness and unhappiness, for the purposes of transport decision-making there would still be similar objections to those faced by CBA. For example it may have the same bias towards the *status quo* making it harder to subject regular commuters to the misery of disruption in order to carry out upgrades. It may also favour investments to existing infrastructure to reduce the misery of congestion at the expense

may offer regional economic benefits or long-term environmental benefits to future populations for whom levels of happiness can only be inferred.

**Capabilities**

An alternative approach to that of Layard that avoids these criticisms is the focus on capabilities. This approach to human well-being is not merely concerned with achievements (for instance being happy), but rather argues that freedom to choose to live what Aristotle termed the good life importance to a person's quality of life. The emphasis, under the capability approach, is not only on how human beings actually function, but also on their having the capability, which is a practical choice, to achieve outcomes that they value and have reason to value (Sen, 2001). Drawing upon the Aristotelian tradition that posits essential features without which human life Nussbaum (1992) defines ten basic human functional capabilities of these the particular, clear, relevance to the examination of transport policy making.

> 1. Being able to live to the end of a complete human life, as far as i prematurely, or before one's life is so reduced as to be not worth living.
>
> 2. Being able to have good health; to be adequately nourished; to have adequate shelter; having opportunities for sexual satisfaction; being able to move from place to place.
>
> 3. Being able to avoid unnecessary and nonbeneficial pain and to have pleasurable experiences. (ibid)

She states that all are of central importance and all are distinct in quality . Something she argues limits the trade-offs it is possible to make and the scope for forms of cost benefit analysis. A deficit in one cannot be substituted for by an increase in another essential capability. As Sen points out, the freedom to choose is central. Likewise for Nussbaum the role of government is not to push individuals towards choosing to act in certain ways but rather to provide them with the nece establishing minimum thresholds and conditions for individuals to act in ways consistent with their choices. If one takes the first of Nussbaum s capabilities and applies it to tra would be no objections to someone choosing to use a form of transport that was inherently dangerous to the user alone even though it may result in premature death. However if all forms of transport were associated with high risks of death or life altering injury (due to poorly maintained infrastructure, lax safety standards or inherently unsafe transport technologies being the norm) then government would be deficient. It would have failed in ensuring citizens have the necessary resources and conditions and would have in effect removed choice. This is given that the option not to move does not exist, movement being another essential human capability rooted in the experience of embodiment. A concrete example is failure to provide sufficient cycling or pedestrian infrastructure to ensure that there was not an undue risk associated with these modes. Here not moving is not an option, and given that these forms of transport, in contrast to more sedentary modes, also generate good health this provides a strong justification for more investment and a reduction of rather than acceptance of road deaths for pedestrians and cyclists.

One feature of the capabilities approach that proved particularly challenging for the members of the group familiar with transport planning and decision-making was the need to establish minimum thresholds and the inability to trade-off between capabilities. Trade-offs are a well-understood feature of the decision-making around transport infrastructure where it is acknowledged that there are, by definition winners and losers in any transport decision. Furthermore when this is applied to transpor infrastructure the costs of ensuring everyone is above a certain threshold can appear to be prohibitive. To use another real life example there are many rail and underground stations that are not fully accessible to people in wheelchairs, something that appears to violate the principle of allowing everyone the capability to move from place to place. Inaction is justified on the basis that there is insufficient resources to achieve full accessibility and fulfil other priorities for the rail network. In reality there are other mechanisms (mobility vehicles, subsidised taxies etc.) to allow the vast majority of people in wheelchairs to move freely, indicating that capabilities are not usually the responsibility of a single

institution. However if this were not the case it would, under a capabilities approach, be impossible to justify not spending what may be very large amounts of money on a relatively small group.

On the face of it, it may appear that an ethical framework that states that each individual possesses capabilities that cannot be negotiated or reduced has little to offer policy making where resources are often limited and trade-offs must be made. A framework that requires vast expenditure on a small group may result in situations where there are few resources available to meet the needs of the majority. However a closer examination reveals situations where basic thresholds have been established. In most developed countries now, regulations stipulate full disabled access as a planning condition of new transport infrastructure and it would be hard to conceive of this being argued against on grounds of cost. The example of existing infrastructure, if anything, confirms an acceptance of much of the capabilities approach as the alternative mechanisms provided to people in wheelchairs are often resource intensive yet these costs are not born by the infrastructure owners and operators but other parts of the welfare state. Finally, there is value in an ethical framework for addressing situations such as unacceptable road deaths due to lack of cycle and pedestrian infrastructure even though this may not instantly bring about change. As Wolff points out, it may underline the essential injustice of the current situations. Something that denies those responsible the ability to claim that their failure to act is in any way justified

**Rawls**

The final ethical theory considered by the group has been that of John Rawls who, with his difference principle, argues that actions that improve the situation of the most well-off in society are only justifiable in so far as they also improve the situation of the least well-off. This principle has been used to justify a greater emphasis on public transport and, beyond a certain point restricting car use as a means of prioritising the needs of groups who require accessibility over those who require ease of movement (Tyler, 2004). This is the point at which car use begins to impinge upon groups, such as people with disabilities, who benefit from mobility and access to public transport. It has also been suggested as an ethical principle with which to guide transport policy making. This is as a means of ensuring that any attempt to improve average levels of accessibility still ensures the gap between the neighbourhoods or areas with the greatest and the lowest levels of accessibility remain within predetermined limits. In short it ensures that any attempts to raise overall levels of accessibility must improve accessibility for those with the least, consistent with Rawls differe 2012). Whilst this is seen as requiring a shift in current practices of equity analysis conducted by transport authorities the introduction of a different ethic is seen as a contribution, made by Rawlsian principles, to wider shifts in values (ibid).

The other relevant component of Rawls theory, discussed by the group, has been his use of the origin position in relation to the design of society s public institutions (Rawls, 1999). I we are asked to identify principles that should regulate our society s public in the original position are supposed to be representative of you and I. They are mutually disinterested and aim to secure as large a set of primary goods for the people they represent as possible. Rawls defines primary goods as, rights, liberties, and opportunities, income and wealth and the social basis of self-respect. In the original position the parties only have general knowledge. R ignorance such that the parties cannot exploit any personal knowledge about how will be affected by any agreement. Among other things, they are denied knowledge of the personal preferences, the economic and social position, and the talents of those they represent.

The veil of ignorance is justified on the grounds that knowledge of how any agreement will affect different individuals will bias the parties towards certain agreements and aga view, this would be unfair. Broadly, the parties in the original position reason as follows. Initially, they agree to an equal division of goods. They cannot agree to an unequal division because, as they do not know whether those they represent would benefit or lose from an unequal division of goods, there is no rational basis for agreeing to unequal division of primary goods. However, given well-known arguments about the benefits of inequality the parties *do* consider unequal distribution. If it is the case that, inequality generates more in absolute terms of a certain good, then we have a reason to depart from equal distribution. Rawls explanation of this is based upon the idea that politica justified to those whom power is exercised over. His solution is the difference principle (discussed

above) on the basis that if inequality can be justified to the least well-off, as, to use Frank s terminology, their piece of the pie gets bigger, then inequality can be justified to the rest of society. The implications of incorporating Rawls theories into the *design of public institutions* related to transport is discussed in the following, final section of the paper.

**Ongoing discussions**

It would be wrong to present the final section of this working paper as a conclusion as it is, in reality, a snapshot of an ongoing discussion. However there is some value in drawing together the different strands that have coalesced around a developing position that has emerged from the work we have conducted so far. This position comes from the Rawlsian emphasis on rational design of public institutions taking the position that transport is not currently seen as part of the welfare state despite evidence that there is, in some areas, acceptance that the state has a role in assisting citizens to meet their transport needs. The argument here is that this is inconsistent and that considering transport as part of the welfare state will engender increased sensitivity to values that are currently neglected, yet considered in other areas of state provision.

**Transport and the welfare state**

The position being developed here is that transport most obviously connec opportunities and their income and wealth, Rawlsian primary goods . Citizens need access to get to work, and to change job when they want to or when this becomes necessary. This is particularly important in countries where there are regional disparities in economic opportunities. Yet transport also facilitates other opportunities such as seeing family, engaging in cultural activities, attending sporting events, and more generally to exercise what Rawls called individual s conception of the good . When we consider the UK Department of Transport s definition of their own role, it is clea acknowledgement of a role in helping people meet their transport needs.

> We [the DfT] work with our agencies and partners to support the transport the UK s businesses and gets people and goods travelling around the count invest in transport infrastructure to keep the UK on the move (DfT, 2015)

Yet in other areas there is an acknowledgement that the state does have a role, the provision of additional facilities for wheelchair users discussed above or policy that sees over £1 billion spent on free bus transport for pensioners (Mackett, 2014). Whilst this appears inconsistent many of the measures, such as the provision of vehicles for people in wheelchairs, are not provided by the DfT. In theory this could lead to situations whereby the actions of the DfT, in not funding measures to increase mobility for all, may inadvertently increase the claims on other departments who are required to fund these supplementary mobility services.

The case for treating transport as part of the welfare state is twofold. First it is the case that transport facilitates citizen s access to primary goods, certainly opportunities, income and wealth, and there is also an acceptance of the role of the state in enabling some citizens (the elderly and those with disabilities) to access those goods. Second, there is clear evidence of market failure. In areas where markets provide for basic needs there is general acceptance that these activities can, largely, be left up to the market. If one takes the provision of food, the state may have some role in regulation and ensuring standards but by and large the business of feeding the population is left to market actors. In contrast transport, as with health, education or policing is an area which, if it were left purely to market forces would result in serious inequalities and injustices. It may seem contradictory to be suggesting transport be treated as part of the welfare state at a time when neoliberal conceptions of the state appear to be seeking to reduce its scope. However this neglects the evidence that even in states, such as the UK where there has been a prolonged period of neoliberal governance there is still considerable public expenditure, in the UK it has hovered around 40 per cent since the late 1980s (HM Treasury, 2015). Whilst this expenditure may have been dictated by different values under neoliberalism, liberty as opposed to equality for example, from a philosophical perspective there are still value positions associated with this particular form of public expenditure.

The questions raised by treating transport more overtly as part of the welfare state are potentially interesting ones. As discussed above some distributional analysis is already part of transport appraisal but were values such as the equality of opportunity, that is reflected in the aims of the Department of Education, to drive the provision of transport then this would have to shift to the fore;

> The Department for Education is responsible for education and children s s
> We work to achieve a highly educated society *in which opportunity is equal for children and young people, no matter what their background or family circumstances*. (Department for Education, 2015 emphasis added)

If other areas of the welfare state are considered then, for example, in health it is established practice to consider quality of life issues in appraising the outcomes of medical interventions. In the UK the measurement takes in both quality and length of life expectancy offered by any medical interventions. These are measured in terms of QUALYs or quality adjusted life years. One year at full health is measured at 1 QALY, death is 0 with minus scores possible for some health states which are considered, effectively worse than death. Estimates of willingness to pay are between £20,000 and £30,000 per QUALY (Philips, 2009). This enables the development of a cost/utility ratio as a means of measuring the value of, or comparing the benefits of different interventions. Whilst this is by no means uncontroversial it does represent a systematic attempt to include values other than simply the valuation of time which is the dominant feature of CBA used in transport appraisal. One final observation of the implications of considering transport as part of the welfare state comes again from the field of healthcare. Members of the group, trained philosophers, are currently working on medical ethics boards, groups made up of physicians and philosophers. Something that is common practice and can result in the need to provide ethical advice at very short notice in the event of an emergency. This raises an interesting question of whether or not the treatment of transport as part of the welfare state might not see similar, more overt, consideration of the ethical dimension of transport policy decisions and even the establishment of transport ethics boards.

Key words: traffic hub system design, interaction and urban vitality, strategy generation

*Abstract: With the high-speed intercity passenger transportation gradually entering peo definition of intercity railway transportation has been changing. Meanwhile, high-speed intercity passenger service station and the surrounding areas are still stuck in outdated facilities and chaotic image. The essay focus to figure out what is the positive interaction between transportation hub and urban space. It aims to provide people available and affordable transportation not only with traffic and infrastructure planning, but also with outstanding urban design quality and its Social Dimension. As the rapid development of China's mega-cities, Shanghai has a dominant role in transportation in the Yangtze River Delta region. Through the description of current situation between urban space and transportation hub at Shanghai West Railway Station, the redesign intends to put forward the challenges that Shanghai West Railway Station will face at present and in the future development, evaluate the transformation of the old city with concrete examples, design and bring forward the corresponding strategies in six aspects: space, transportation, function, form, ecology and the connection to the surrounding area, determine a more appropriate and more extensive updates and development from multiple angles on the basis of a variety of factors so as to improve the vitality of the region gradually. On this basis, this paper will make an objective analysis on how to enhance the quality of the environment around the station and along the railway and improve the split urban space caused by the rail lines, thus creating a more effective system design mode to make sustainable development in Shanghai West Railway Station area.*

## 1. Introduction

1.1 Background

High-speed railway features in Shanghai West Railway Station transportation. Therefore, how to enhance the quality of the environment around the station and along the railway and improve the split urban space caused by the rail lines has become station designer and urban designer s common concern (Figure 1).

Figure 1. Current situation of Shanghai West Railway Station and its surrounding urban space

1.2 Research object

Formerly known as Zhenru Station, Shanghai West Railway Station is 5km west from Shanghai Railway Station, 196km from Hangzhou Railway Station, and 1458km from Beijing Railway Station. It is an integrated transport hub of intercity rail transport, urban rail transport and urban public transport. With the two functions of external transport and urban transport, it plays an important role in the transport network planning of Shanghai and the Yangtze River Delta region (Figure 2). Due to the above mentioned reasons, it is in urgent need of urban design from the city functionality, accessibility, connectivity, etc. Urban designers should make full use of the constraints and opportunities in railway and station reconstruction, think about how to improve the overall environmental quality of the region, enhance the links and transfer between the railway station area and urban rail transport, give guidance and make control of urban form so as to build up the overall image of Shanghai Zhenru area as the city s sub-center.

Figure 2 .Shanghai West Railway Station land plan and the major functions of its surrounding area

1.3 Situation analysis

1.3.1 Current situation of transfer efficiency

Through field research, it has been found that Shanghai West Railway Station transfer lines are very complex and inconvenient to connect urban public transport. Pedestrians often have to go across the entire West Railway Station area to transfer (Figure 3), which forms a certain impact on traffic efficiency.

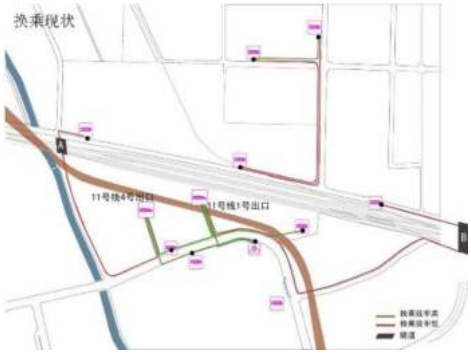

Figure 3.Shanghai West Railway Station Transfer Situation Analysis

1.3.2 Current situation of urban space

Most of Shanghai West Railway Station surrounding area is occupied by residential district and the commercial is underdeveloped. But it plays an important role in boosting the development of Zhenru sub-center. It has the advantage of making high-end talents gathering and circulating. In addition, Caoyang Road is now the focus of commercial zone. So it is worth considering the possibility of the urban space replacement for business functions or mixed residential and commercial use so as to promote the interaction between traffic space and urban space.

1.3.3 Current situation of surrounding commerce

Shanghai West Railway Station External Commercial is arranged around the station and is quite dispersed. Some business is proposed in the underground passage, but the planning commercial proportion is not large. Compared with Shanghai Railway Station and Shanghai South Railway Station, Shanghai West Railway Station hasn t formed an effective commercial space. Bec business once was used as a cargo terminal and near the industrial area, the surrounding businesses are mainly some large building material and agricultural products market, thus forming a citywide logistics center (Table1).

Table1.Surrounding commercial comparison of Shanghai Railway Station, Shanghai South Railway Station, Shanghai West Railway Station

| site | Shanghai Railway Station | Shanghai South Railway Station | Shanghai West Railway Station |
|---|---|---|---|
| Internal business | Corridor type layout, waiting to buy, easy to use | Around the layout, purchase before the waiting, more convenient | Not available |
| external business | Scattered layout, popular feeling, more chaos, traditional business model, ground-based business | Concentrated layout, popularity decreased, feeling clean, modern business model, underground business | Scattered layout, less popular, feeling cluttered, traditional business model, ground-based business |

## 2. Problems raised

2.1 Immensity of passenger flow between urban transit and rail interchange

The passenger flow between urban transit and rail interchange at Shanghai West Railway Station is important. If not organized well, it can easily lead to crowd congestion. When the train arrives, there will be a large number of passengers evacuating from the station to different directions in a short time. There will be very long queue of passengers buying urban transport tickets at this time and thus cause the congestion of the channel (Figure 4).Concourse level should be set up at urban transport station to solve the problem of too many passengers buying tickets and the organization of passenger flow. In addition, the setting of concourse level at urban transport station can also reduce the impact of convergence between railway and urban transport.

Figure 4. Zhenru sub-center traffic demand forecast

2.2 Lack of convergence in transfer modes

At the area of Shanghai West Railway Station, traffic problems are embodies in the following aspects: first, the public transport station is very dispersed and the waiting area is too small; second, the subway station is set away from the street; third, the social vehicle parking spaces are insufficient to cope with the future railway passengers; fourth, the taxi drop-off area is too crowded and in disorder; fifth, the current setting of tunnel cannot meet the needs of residents on both sides of the railway; sixth, illegal operation vehicle control deficiencies.(Table 2)

Table 2. Shanghai West Railway Station area travel choice proportion

| Travel mode | Travel proportion | Travel times (million/d) | Converted into trips(PCU/d) |
|---|---|---|---|
| Public transport | Rail transit 30% | 14.4 | 9.4 |
| | Ground public transport 20% | 9.5 | 6.2 |
| Passenger car taxi included | 25% | 7.8 | 5.1 |
| Walking and Cycling | 25% | 7.8 | |
| Total | 100% | 31.2 | 5.1 |

2.3 Lack of vitality in city nodes

Either at the Square or in the waiting room of Shanghai West Railway Station, the green landscape is more focused on the flow of distribution, which makes the urban space lack of a pleasant, attractive environment for people to stay, thus leading to the low urban vitality (Figure 5).Because Shanghai West Railway Station originally featured in cargo transport, the flow of people is low, the surrounding commercial is underdeveloped and the commercial node is not obvious. There are food square and seafood market, but they are not closely linked to Shanghai West Railway Station. The author believes that setting up a number of commercials in such areas as Shanghai West Railway Station will play a good role in enhancing the city s vitality.

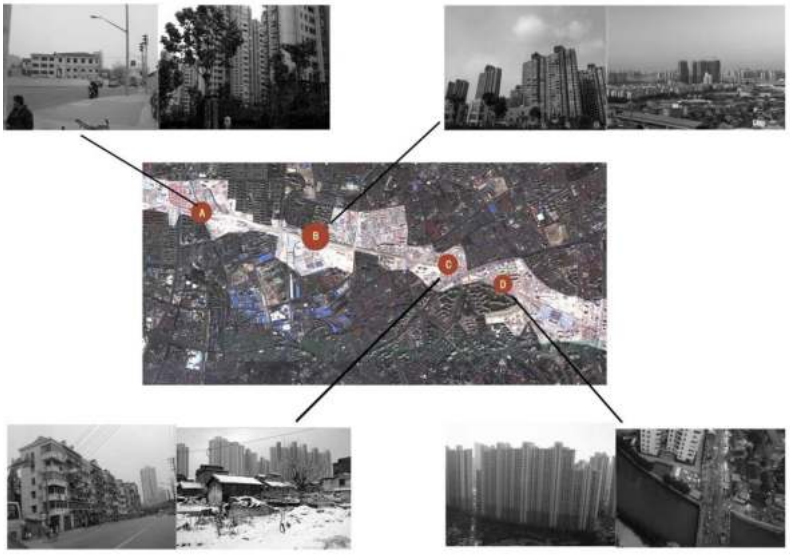

Figure 5. Insufficient urban vitality near railway station area

2.4 The issues of split urban space by railway

Railway Station Square is an endpoint of urban space. The square and the train station are generally separated by the closed façade of the station. Urban space comes to an end at this place. This will cut the continuity of the urban space and the railway line will link to another city. The train track set results in the uneven development on both sides of the track at the urban station area, which split the balance around the line (Figure 6). In north part of the West Station area, traffic is heavy, small plants and small-scale shantytowns creates noise, pollution and harsh environments. The West Station area, the supporting station and hotels are in the south part. The status quo is that the north and south channels are not convenient enough to meet the needs of the residents living on both sides. In the city the railway station area cuts the connection of different regions bluntly, which is not conducive to the common development of the surrounding area; meanwhile the surrounding areas near the train station also become the forgotten space, which deepens the barrier effect of railway lines. The expectation of the design is by redefining the railway lines around the functional space (cultural, recreational facilities), to establish a moving platform which links north to the south, to achieve a balanced development of the north and south. Meanwhile, the flow of people brought by railway and the future

subway can activate the surrounding areas, including commercial and cultural facilities.

Figure 6. Impact of rail lines on the city  uneven development on both sides

2.5 Lack of consideration for future traffic circle development

Shanghai has come to a stage of urban rapid development. There are more and more exchanges between Shanghai and other Yangtze River Delta cities; the people in some medium and small cities in the surrounding areas also expressed the integration requirements. As the central city, Shanghai s radiation on the surrounding area has been further strengthened. However, the railway system of Shanghai metropolitan traffic circle bears very low flow of passengers, which is far below the level of international metropolis. Due to the limitations of administrative divisions, comprehensive transportation planning of the overall urban planning in Shanghai is only confined to Shanghai city administrative area. Yangtze River Delta is lack of regional development planning agency; transport system connection is poor, and lack of integration. Through the development of commuter rail, breaking through the limit of traditional administrative divisions, achieving the regional linkage, it is very necessary to guide Shanghai metropolitan traffic circle to healthy and orderly development. With Shanghai to metropolitan development, urban space expands. Shanghai will be integrated with its surrounding cities and form a new large metropolitan area. It is very necessary to have a fast transport in the process of Shanghai s developing into metropolis. Obviously, public transport transport is lack of adequate capacity in supporting Shanghai s metropolis ext rapid rail and commuter rail will be the inevitable choice for the large city to develop into metropolis[1].

## 3. Design

On the basis of planning, Zhenru area will integrate regional resources, establish Shanghai Zhenru sub-center at Cao Yang Road and Zhenru rail cargo terminal area, which will focus on the

[1] Compared with other international metropolis, the railway at Shanghai metropolitan traffic circle only borne the flow of passengers into the center 1.4% of that in Tokyo, 19.4% of that in Paris, 10% of that in New York. If calculating the number of travelers per capita, it is only 0.001 times/person, less than 1% in Tokyo, 2.73% of London, 4.95% of Paris, 3.62% of New York, even lower than Los Angeles.  International Metropolis traffic circle railway traffic statistics, 2010

development of modern logistics industry, construct business office area, large logistics enterprises, hotel service area and low dense cultural facilities. Core area of Zhenru area is located in Caoyang Road and Zhenru freight yard. The land area is about 144 hectares. The vision of total gross floor area of commercial office will be limited within 1.8 million square meters. The planned construction features in resource allocation centers with modern logistics services, international trade procurement, and new-element market. Regional headquarters of large enterprises, market centers, R & D Centers, purchasing centers, investment centers and settlement centers from domestic and foreign companies are introduced and developed. Pedestrian Street is an important part of urban space and a concentrated expression of the city s geographical features. The commercial and financial center axis of the sub-center will be extended from Caoyang Road to the South Square of West Railway Station, and the commercial and financial viability of the sub-center will be spread to the north of West Railway Station through the setting of commercial axis at West Railway Station area. At the same time, this will create a good commercial atmosphere at eastern plots, thus forming a three-dimensional business climate.

The strategy of Zhenru sub-center planning horizontal and vertical axes, north-south double should be continued; the development of West Railway Station area in the sub-center future planning position should be strengthened; Treating West Station as the support center so as to spread the vitality to the northern urban areas (Figure 7).

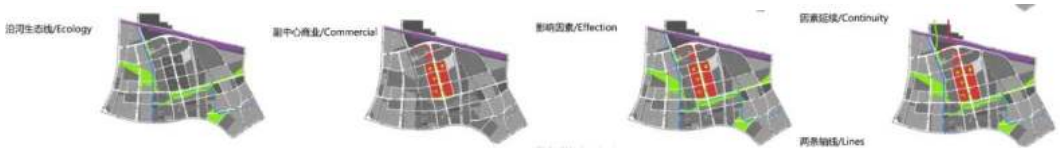

Figure 7. Spatial form analysis at Zhenru area

## 4. Strategy generation

Facing the market, railway station should not only make full use the advantage of its speed and safety, but also improve the comfort of traveling and efficient travel route so as to increase its competitiveness. Meanwhile, as part of the city, the railway terminal in urban development should also play a promoting role in enhancing the city s openness and sharing.

The author conducts practical investigation on China s major railway terminal and areas and makes strategy analysis, comes up with the following improving strategies and preliminary design conception.

4.1 Space: Design strategy of urban spatial structure

4.1.1 Convergence of split urban space caused by rail lines

In urban spatial structure design strategy, designer should find the urban problems and impact on the design of the station area traffic brought by the rail lines. First it is the split of urban space by rail lines. Suture will be the way to deal with the split. In addition to the existing planning, design helps to suture the spatial texture of the city. Design of transit elevated line mainly provides the passage for taxies and private cars.

The vehicle will unload the passengers and leave at 15m layer. Passengers who will get off from north to south should go through 15m layer and check in at 10m layer to the waiting room, through the business district and then check in. So entering the station separately from both sides can help to avoid the confusion of crossing the line, and traffic can be more efficient (Figure 8).

Figure 8. Suture the split of urban space by rail lines

4.1.2 Improvement strategy of urban vitality

(1) Public space

The setting of elevated walking path provide means of crossing for the leisure people along the ecological leisure axis in the west (Figure 9). Meanwhile, this viaduct not only has traffic function, but also has been set many ecological vegetation and gathering points according to its own leisure characteristics. Such as the viewing leisure platform along the rail lines. Ecological axis is also connected to many public buildings and hotel buildings. Functional combination of this compound will attract different crowd, probability of occurrence of sporadic behavior will also increase.

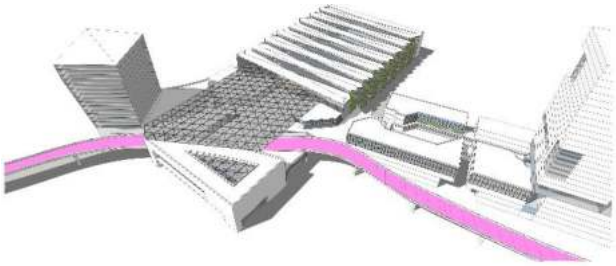

Figure 9. Elevated walking path

(2) Commercial cluster

The main commercial factors that will influence the development of railway station are:

First, flow elements. The flow of people at large railway station include the flow of arrival, departure, transit, the flow of people who meet passengers, surrounding residents and none-passenger flow. Second, traffic elements. Large railway stations are also the distribution center of buses and taxies. Railway stations, together with light rail and subway, form an urban traffic switching center; third, cultural elements. As the doors and windows of the city, large railway stations landmark and are bound to reflect the city features and city culture. Fourth, regional characteristics. Different positioning of the city in railway transportation will also lead to the difference of commercial space at railway stations.

To develop the railway station area, more importantly, government should base on the location of the

station in the city, combine with the foundation of regional business, the flow of passengers and actual level of demand, with excellent consumer environment and convenient traffic condition, form commercial centers which can not only attract passengers but also urban civilians. This is the most fundamental driving force to turn transport hub into economic hub, so as to integrate the railway station into the city (Figure 10).

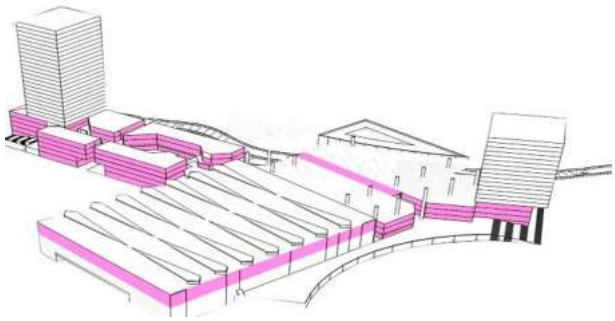

Figure 10. Commercial integration

4.1.3 Generation strategy of urban spatial structure

(1) Leisure eco-axis to increase the vigor of Taopu River on the west, set the boat dock, art industrial park, increase the spatial quality along the river, set ecological platform across the railway line and establish a continuous pedestrian system. Thus form a leisure eco axis which connects north and south(Figure11).

Figure11. Ecological axis plan

(2) Commercial viability axis extend the sub-center business climate, set 10min walking laps throughout Taopu Road to West Station North Square. In the north, the City Square is the endpoint of the axis. The sub-center commercial viability will be radiated to the northern regions.

(3) Office financial axis  set centralized office and financial area on the eastern side of the railway, improve the regional competitiveness and vitality of Zhenru sub-center. Establish close ties between centralized office area and Zhenru sub-center by the elevated setting (Figure 12).

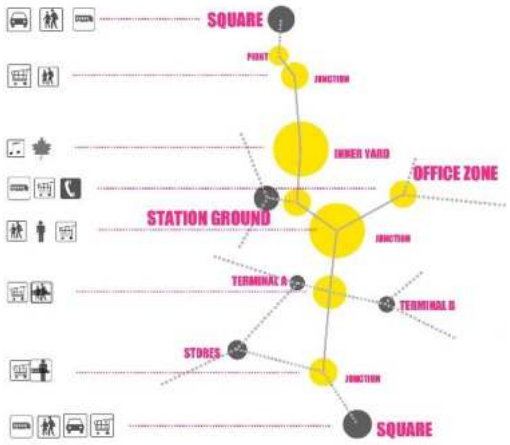

Figure 12. City functional integration strategy

4.1.4 Urban function integration strategy

In planning, the concept of multi-functional and three-dimensional concept will be used. Not only function layout will be done in the horizontal level but also functions will be superimposed in the vertical space. The commercial and office functions will be integrated in the planning and arranged in the highest value of the land plots in the south and east side, consisting of a series of commercial office building. Due to the focus on the development of high-capacity commercial and business office space, a portion of green space is preserved. Green belts will be set along the city s main ro open Green Park will be set in the promoter region, thus forming density space and increasing environmental quality. As the growth ridge 3-D commercial Pedestrian Street is throughou commercial buildings. This street starts from subway station R3 line terminal, including ground floor, first floor and basement commercial pedestrian shopping space. Community-based street layout will be set along the street to gather popularity and create living atmosphere. This layout fully reflects the value of the land, so that the overall value of land development will reach the maximum in the permitted plot ratio, while maintaining the high quality of the urban environment (Figure 13).

Figure 13. City functional decomposition

4.2 Transport  transportation system design strategy

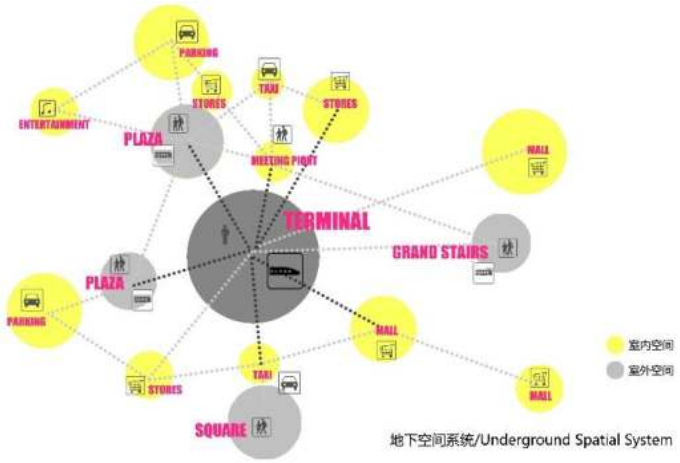
4.2.1 Zero transfer strategy

Efficient transfer is critical in railway station design. We have been very profitable in the previous data collection. In this design, we focus on the efficiency of transport interchange.

4.2.2 Spatial design strategy for highly dense passenger flow

From a large number of case studies[2], we can see that the design of underground space in urban railway station area is crucial, because the arrival floor of the train and subway is located underground (Figure 14). The crowd here will disperse to their destination, so enormous flow of people will be gathered here. Because of this, three main sunken plazas and two secondary ones are set. North-South Railway Station Squares and the sunken plaza which is directly connected to the station are the core area to evacuate the flow of people. So it is very important to set vertical guidance to guide the flow of people. Meanwhile, enormous flow of people can also become the potential consumers. Surrounding basements are also connected with the underground throughout the whole station. So the garage use and functional links are also highly integrated (Figure 15).

Figure 14. Shanghai West Railway Station city design floor plan



[2] Such as the Paris transfer center at the Paris North Train Station, Berlin central train station in Germany, the author notes

Figure 15. High-density space design strategies and spatial integration

4.2.3 Regional transport integration strategy

Planning through 3-D transport network will separate various traffic flows in different channels and levels, especially the traffic and vehicle separation (Figure 16).On the basis of this, encryption will be done to the road network density. The dense road network can bear it without having to increase the burden of high-grade roads. High-grade road only needs to take the transit and distributed passengers, so as to improve the traffic situation.[3]

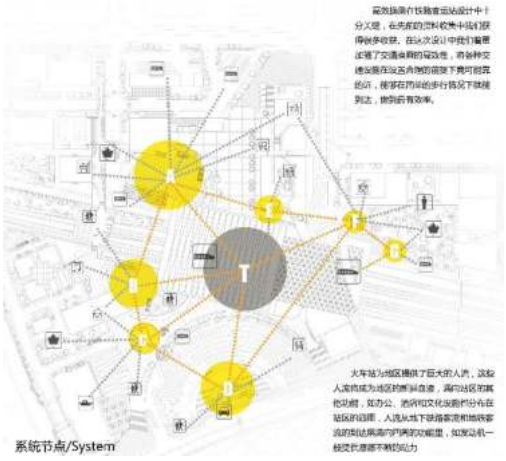


Figure 16. System nodes and urban complexes

4.3 Ecological aspects: people-oriented

Good ecological environment is not only an important constraint to the urban transport development, but also constitutes an important part to the railway station landscape space. In this regard, Shanghai South Railway Station provides a good reference: large green setting not only increases the vitality of the city, but also makes the scale of the entire South Station area closer to people s promotes the vitality of the entire region.

4.4 Contact with the surrounding area: giving full play of the leading role of the city s sub-center

The transition of traditional railway station to transport complex and a variety of modes of transport agglomeration has the geographical advantage and high accessibility which has a strong guiding role to the development of the surrounding area (Figure 17).

4.4.1 Impact on the form of the land layout

According to the circle theory, within 600m around the public transport spots, mixed development of high strength can be achieved, showing Business-Hotel-Residential layout stru railway station complex is different from a general public transport station. The developing model has

[3] In domestic city center railway station area road network, the secondary roads, especially the branch roads are of low ratio. At the central area of China cities, the ratio of secondary and branch roads with main roads in railway station area is far inferior to that in foreign countries. The road density at railway station area in the urban central district in China is comparatively low. The total road density in China is only 1/3 1/4 of that as in Europe, Japan and South Korea. China Urban Planning and Design Institute, Beijing, 2000

its own characteristics. For example, a large number of railway plots are scattered around, which split the city greatly; it is difficult to form very upscale business hotels or residential areas due to the large flow of people around.

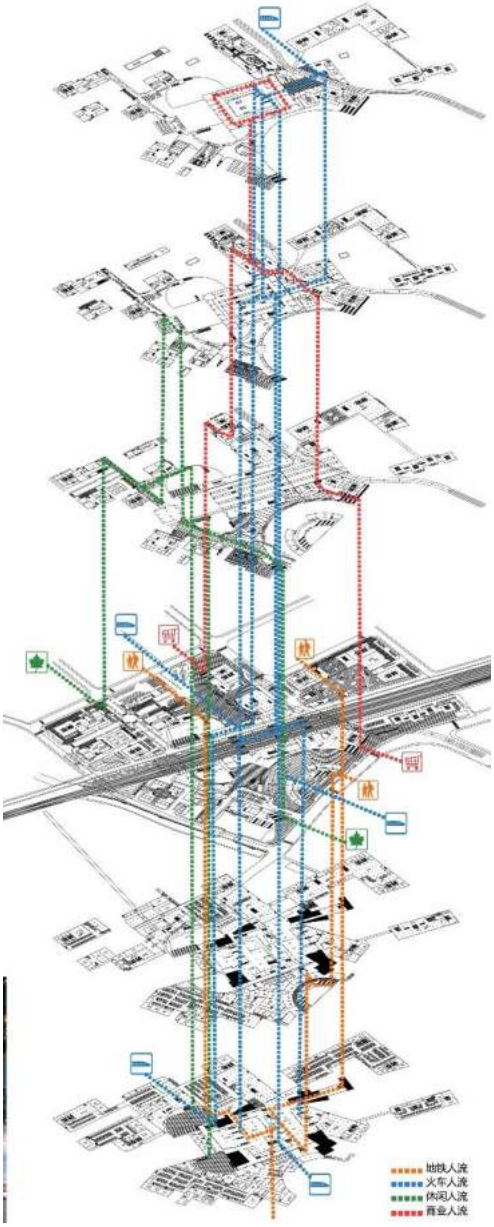

Figure 17. Vertical space planning

4.4.2 Impact on the state of agglomeration of the development

There is a high correlation between means of transport and land use. Bearing capacity of infrastructure is an important measurement of redevelopment strength around the railway station complex and traffic distribution capability is one of the key evaluations. A high density land use can promote the development of public transport, while low-density land use will promote the popularity of cars.

Meanwhile, different transportations will play a strong reaction to urban land use. Large-capacity public transport has the most significant influence on land development.

4.4.3 Railway station becoming the extension of urban space

The interior design is an organic part of city design, so city activities should not stop outside the station elevation. From the city s aspect, contemporary large railway station interior by the visitors.

Although the establishment of railway station complex has a significant impact on the surroundings, using the station project to help urban development is a complex process. Research shows that the successful development of the station area also depends on many other basic conditions, such as a vibrant local economy, idle land, healthy capital market, developed transportation network, strong public investment, etc. Only when these factors are complete, construction projects as a catalyst can really play a role. To achieve successful catalysis, perfect hub functions and rational planning of the surrounding areas are only part of the conditions, the development in reality will also depend on local conditions and improve continuously.

## 5. Conclusion

It is a systematic and complicated process to transform the traditional railway station which splits urban space to a comprehensive transportation hub which creates a positive interaction between traffic space and urban space. The author makes a case study on the generation of urban design strategies at Shanghai West Railway Station in order to illustrate the possibility of realizing a positive interaction between railway station traffic space and urban space (Figure 18). The highly integrated complex of urban business and traffic architecture will make more traffic activities occur. Meanwhile, in this highly integrated system, the surrounding areas of the plot will also be vitalized.

# Exploring Equity Dimensions of Rail Transit Impact: A case study in a Chinese large city

Lixun Liu
Bartlett School of Planning, University College London, UK lixun.liu.12@ucl.ac.uk
Key words: Rail transit; Urban regeneration; Equity

*Abstract*:
With both regeneration and development aims, public rail transit systems are continuing to be built or upgraded especially in those rapidly developing Asian cities with problems of congestion and decentralization. As it is widely acknowledged, the rail transit provides travel convenience (as its direct effects), and potentially also leads to land development, property price increase, economic and social changes (as its indirect effects).However, the regeneration effects of rail transit aggregate to exert different impacts on geographic locations and population groups. Disparities in social equity, in relation to public transport provision, arise because of different levels of accessibility. Moreover, value uplift of land and property price, change of physical and social environment, living cost and employment opportunity etc. also have diverse impacts on population groups. Transport provision can often fail to meet specific or even minimum needs in terms of social characteristics, ability, affordability, preference and attitudes. When distribution of impacts across spaces and groups has disproportionate benefits or burdens, the problem of inequity emerges. This research is applied in a newly emerging large city, Chongqing, in China. It aims to understand how the impact of rail transit on development and regeneration differs by location, assessing who gains and who loses from the value uplift associated with the transit investment, exploring the equity dimensions arising from the transit investment.

## 1. Introduction

With both regeneration and development aims, public rail transit systems are continuing to be built or upgraded especially in those rapidly developing Asian cities with problems of congestion and decentralization. There is a substantial body of evidence suggesting that rail transit system tends to benefit certain locations rather than others. Moreover, it is put forwards by plenty of research that regeneration effects of rail transit aggregate to exert different impacts not only on geographic locations, but also on population groups. Previous evidences have also made it clear that transit s effects on land and property value uplift, physical and social environment change and employment opportunity increase etc. have diverse impacts on certain groups. Disparity in social equity arises because different groups disproportionately benefit or are affected from the effects of transit system.

This research is applied in a newly emerging large city, Chongqing, in China. A brand new rail transit system is being built in recent years stretching from the core to the fringe of the city region, in order to stimulate growth in both mature and undeveloped areas. The research aims to understand how the rail transit effect on development and regeneration differs by locations and population groups, and to what extent groups are disproportionately benefited or adversely affected from the transit system. It then assesses who gains and who loses from the value uplift associated with the transit investment, exploring the equity dimensions arising from the transit investment.

The research is based on a comparison study among locations and population groups. Time serial census data was collected to explore the changes across time in different locations, and a questionnaire survey was carried out to explore transit impacts on different groups of people.

In contrast to the previous empirical studies, as a conclusion of this paper, there is no viable dichotomy of population groups such as the users and the affected by the transit impact. In fact the most frequent transit users are the lowest income people and at the same time receive most adverse impact from the regeneration caused by the transit. It makes the benefit and compensation issues complicated. Meanwhile, income level is a potential threshold of benefit distribution. The effect of rail transit tends to benefit a certain group of people most. The mid-low income group exhibits highest evaluation of transit impact on themselves.

The rest of the paper is organized as follows: Section 2 outlines the literature and highlights the critical social equity issues in transport investment. Section 3 describes the methodology, research framework and data resources of this paper. Section 4 presents the analysis results. Section 5 summaries the key finding and discusses the implications.

## 2. Literature review

In the local scale, the general regeneration effects of the rail transit consist of four widely recognized aspects. These are the direct aspect of travel convenience, and the indirect aspects of economic, urban, and social effects.(BANISTER and HICKMAN, 2003) In actuality, they are internally connected and all the other three aspects have their social effects.

In the society with great mobility, in order to figure out how transport disadvantages contribute to social inequity, it is necessary to extend the understanding of transport advantage to include the concept of motility, which consists of access, competence and appropriation. (Lucas, 2012, Cass et al., 2005, Kaufmann et al., 2004) It is proposed that transport disadvantage can be understood as an outcome of a lack of a series of criteria, such as access to basic resources, skills and abilities, and cognitive knowledge. (Lucas, 2012, Schwanen et al., 2015) It means that transport disadvantage among individuals will not result in social inequity only because of disparity of transport provision or spatial accessibility. What makes the situation significantly worse is when the disadvantage interact directly or indirectly with other dimensions relating to individual characteristics, such as a lack of opportunity, competence and appropriation.

Previous literature indicated that the benefit of the rail transit system in the city is distributed disproportionately in terms of geographic locations and population groups. (Feitelson, 2002) However, it has also been argued that research on the relevance of social impacts should not only focus on geographic inequity, but also address aspects of disproportionate distributed benefits and accumulated social impacts across population groups. This is because not all groups, as is suggested, for example differentiated by income, gender, race, ethnicity, age, geographical region, etc., will be affected by

specific transport policies or investments. (Geurs et al., 2009)

Therefore, it is necessary to disintegrate the process of how transport investment generate its social impacts and result in social inequity. Social impacts of transport are argued to exert both positive and negative influence either on individuals or collectively on population groups, social categories and society. Individual sensitivity to social effects from transport varies. When the effect exceeds their sensitivity level, it turns into social impact. People belonging to a certain social category tend to bear similar impacts. If the impacts are unacceptable according to the values and standards of society, it tends to bring about social injustice problems. (Geurs et al., 2009) It provides a reference for carrying out analysis exploring whether social inequity from transport investment exists.

## 3. Methodology:

As is introduced, this research adopted a comparison study among locations and population groups. Changes across time in transit station catchment areas are compared to those in reference and control areas. Data from both census data and questionnaire survey is analysed.

### 3.1 Context of case study areas:

As shown in *Figure 1,* three reference regions were selected according to the demographic census boundary. The reference regions are quite typical to reflect the trends of both regeneration in the built up regions and development in the rural or undeveloped lands. Within these reference regions, four station catchment areas and one non-station affected area were selected. A radius of around 500m catchment area was identified. Statistics gained from the community level is averaged according to its proportion within the radius boundary.

One of the reference region is in the old city region, just west of the old city centre, which is called Daping Sub-district (DPSD in short). The sub-district resides many old residents in a poor living condition, who are either redundant workers or once farmer years ago. It is also a popular destination of migrants to the city. Now it is experiencing massive urban regeneration with the refilling trend to the city centre. Within Daping Sub-district, the transit station catchment area Daping locates at the junction of two rail lines going across the reference region. It is called DP for short.

The other two reference regions are in the new developing region on the north bank of the river, which are called Longxi Sub-district (LXSD in short) and Longta Sub-district (LTSD in short). With the towards north developing trend in Chongqing, the once farm lands have become prosperous new city centre within just 20 years. Most of the residents are new well- offs moved from the old region or outside the main city area along with the urbanization trend in China. The two catchment areas in LXSD are called Jiahzhoulu (JZL) and Huahuiyuan (HHY). JZL located along Line 3 on the main transit corridor linking north and south of the city. Now it s a fast developin
a huge commercial centre being built just at the station. The catchment area in LTSD is Hongtudi (HTD). Both HHY and HTD are long Line 6 but off the main transit corridor. They are both mature

residential areas, which are developed respectively in the 1990s and within the last 10 years. The control area is also located in Longta reference area. It is a large residential area called Luneng (LN). Though off the transit corridor, it is a comparatively wealthy residential area.

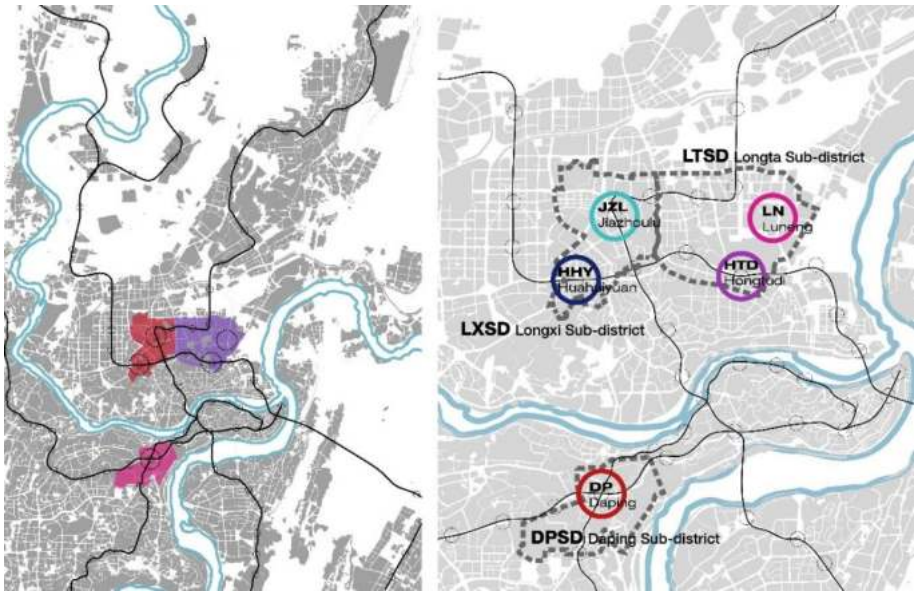

Figure 1: Reference regions, station catchment areas and control area

### 3.2 Survey research framework

In the questionnaire survey, 1100 questionnaires in total were sent out. About 30-40 questionnaires were sent to each community in the station catchment area. 1000 questionnaires were returned and 752 were reliable after checking. In the survey result, 50.1% of the respondents were women. When compared with the proportion of 49.38% in annual census data of Chongqing, the sample appears fairly representative of the population. People above 65 years old are slightly under sampled, with the percentage of 5.5% compared to 11.9% in the 2013 census data. Migrants from outside the City are slightly over-sampled, with 9.4% in the survey versus 4.83% in the 2013 census data. The survey sample of car ownership around station catchment areas is fairly representative when compared to the 2014 citywide travel survey.

People can be categorized into groups according to their social attributes. Potential vulnerable groups were identified as low income groups, migrants, elder people (age), and those who do not have access to private cars. This paper especially focus on the impact on different income groups, as it is the most straightforward criteria to distinguish population and relate to social impacts. As shown in *Table 1,* the respondents of the survey are divided into four groups according to their chosen income level in the questionnaire. People are divided into the lowest income, the middle low income, the mid high income and the highest income groups. Notice that the three kinds of name shown in the table below may appear in the whole paper from now.

Table 1: Income group identification

| Group number | Group income level | Annual household income (RMB_yuan/year) |
|---|---|---|
| Group1 | Lowest income group | Below 50,000 |
| Group2 | Mid low income group | 50,000-100,000 |
| Group3 | Mid high income group | 100,000-200,000 |
| Group4 | Highest income group | Above 200,000 |

In the questionnaire below in *Table 2*, questions can be categorized into well recognized dimensions of transit impact as economic, urban, social and travel. Respondents were asked a series of questions in the following two facets. One facet aims to explore their perceived transit effects in their living area in thirteen aspects. The other one aims to explore impacts of some transit effects on themselves or importance of some changes potentially caused by transit to themselves in the same 13 aspects. Respondents were asked to choose the degree from -2 to 2.

Table 2: Question list

| Perceived transit effects in this area | Individual impacts or importance of changes caused by transit effect in this area |
|---|---|
| Q23 Property price | Q20 Impact of property price rising |
| Q24 Property rent | Q21 Impact of property rent rising |
| Q25 Living cost | Q22 Impact of living cost rising |
| Q36 Land development, urban image and open spaces | Q26 Importance of land development, urban image and open space improvement |
| Q37 Pedestrian environment | Q27 Importance of pedestrian environment improvement |
| Q38 Noise | Q28 Impact of noise |
| Q39 Neighborhood Safety | Q29 Importance of neighborhood safety improvement |
| Q40 Employment opportunity | Q30 Importance of employment opportunity increase |
| Q41 Commercial and service facilities | Q31 Importance of commercial and service facilities improvement |
| Q42 Community population change/floating population | Q32 Impact of community population change/floating population increase |
| Q43 Community harmony | Q33 Importance of community harmony improvement |
| Q44 Daily commuting convenience | Q34 Importance of daily commuting convenience improvement |
| Q45 Weekend travel convenience | Q35 Importance of weekend travel convenience improvement |

## 4. Exploring social equity issues among different groups of people:

### 4.1 Social equity in different geographic and social contexts

Comparison study is based upon the four widely recognized dimensions of transit impact, which are economic, urban, social and travel impacts. Among different geographical locations, data are collected at two time periods before the opening of transit in 2011 and two periods after the opening. Their related impacts on individuals explored in the survey are also presented together to show the disparities in different social contexts.

As shown in *Figure 2*, for those mature station catchment areas, such as HHY and HTD, though a slight faster increase was seen after the opening in 2011, the increase rates are still slower than their corresponding reference regions. In the old city region, there was a significant increase in 2010 in the catchment area DP but returned slow again after that, which was due to a new residential property development. However, for those developing areas, such as catchment area JZL, there is a strong increase right after the opening. Therefore, in maturely developed areas, the effect of transit on

population accumulation is not so patent in a short period of time. However, in an area with a strong developing trend, the population accumulation effect is quite obvious.

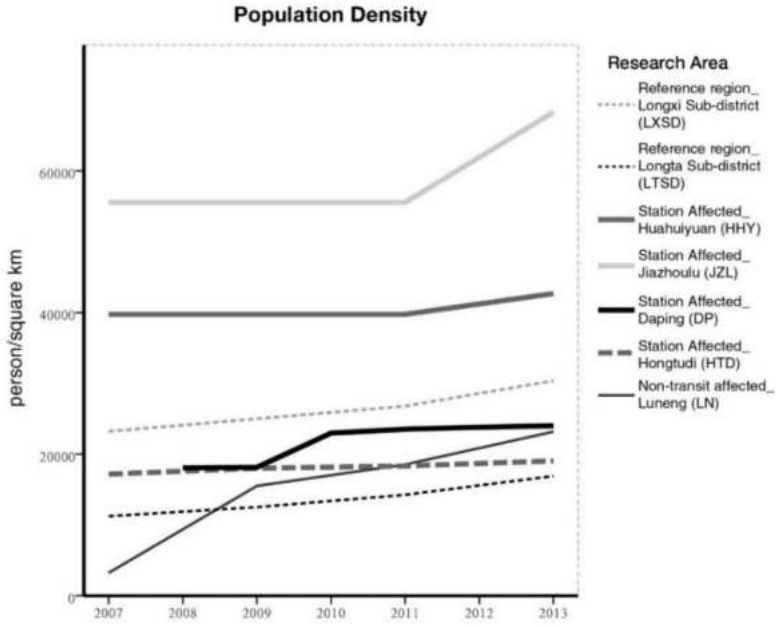

Figure 2: Population density in research areas

Source: Chongqing census data

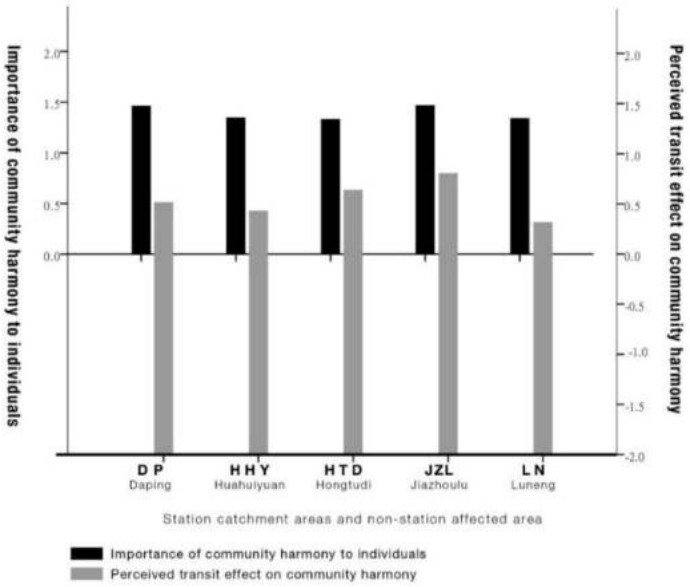

Figure 3: Perceived transit effect on community harmony and its importance to individuals

Source: primary survey data

In the survey (*Figure 3*), in relative aspect as perceived transit effect on community harmony (the grey columns), residents in mature developed area such as DP and HHY shows a lower evaluation of transit

effect on community harmony. Meanwhile residents in DP exhibits a higher importance of community harmony to them (the black column). However for fast developing area as JZL, residents tends to present a more positive attitude towards the transit effect on their community as well as a higher level of importance to themselves. Looking back at the census data, the population increase in the mature developed areas is actually much lower than in the fast developing area. That is to say, the survey result suggests residents in the mature developed area are more sensitive towards the community harmony change brought about by the transit. At the same time, the residents in the old city endowed more importance of community harmony to themselves.

As is shown in *Figure 4*, in catchment area as DP, employment increase is indeed obvious, although its population increase is not distinct. It suggests business and economic development in the old city is promoted by regeneration trend in the area. However, there is a great disparity of correspondence of residents and local employment. (see, *Figure 5*) It means lower proportion of residents in the area actually work there, and most of the new residents work in other parts of the city. Meanwhile most of the increased employment are provided to employees not residing there. On the other hand, as expected, in the developing region, in station catchment area as JZL, the employment increase is promoted greatly. However, for station catchment area as HHY, which is maturely developed but off the main transport corridor, both employment and population increase there is not so distinct.

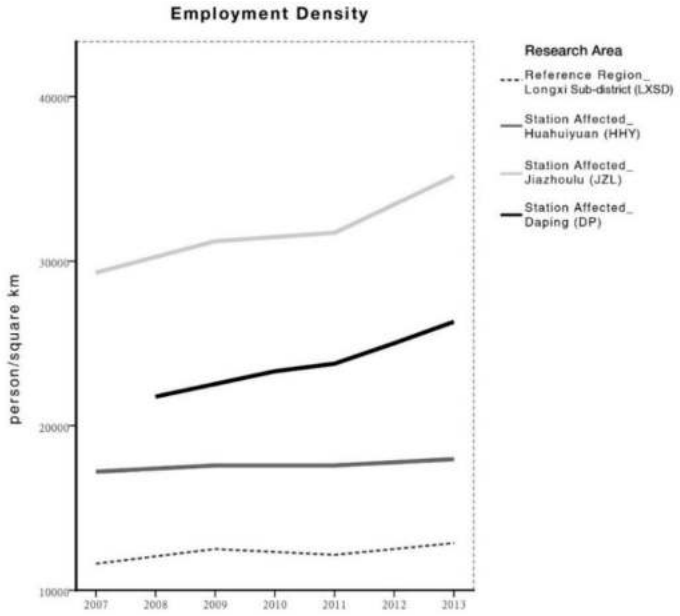

Figure 4: Employment density in research areas

Source: Chongqing census data

There is a disparity between the perceived transit effect on local employment increase in station catchment areas and importance to residents, across mature developed area and developing area, as well as across the old city and the new city. (see, *Figure 6*) Generally, residents in mature developed areas as DP, HHY, and HTD endowed relatively higher importance to local employment opportunities (black column) than developing areas such as JZL and LN. HHY exhibits the most disparity of highest

demand of local employment (black column) and lowest recognition of transit effect on its increase (grey column). In contrast to the fast employment increase in DP, the relatively high demand of local employment indicates the increased jobs are mostly not for the residents.

On the other hand, as shown in *Figure 6*, new developing catchment area JZL has lowest demand for local job compared to other station catchment areas, and highest recognition of transit effect on this aspect, which is consistent to the actual fast increase shown in the census data. The low importance of local employment for residents in this developing area indicate they are not restricted to work in the local area as others might be, because of higher car ownership or social privilege.

## 4.2 General individual impact evaluation

*Table 3* shows correlation analysis of income groups and transit use frequency, which is statistically significant. The table below shows the lower income level the groups belong to, the higher percentage of them choose transit as frequent travel mode and thus the more they depend on transit for their daily travels. What to be noticed is, though the low income group exhibits higher percentage of frequent transit use, it does not mean they have higher travel demand than other groups. The paper will analyse later in actuality their travel demand is much lower due to their opportunities and competence.

Table 3: Household income groups and transit use frequency

**Household Income Groups( Yuan/Year) and Transit Use Frequency**

| | | Transit use frequency proportion | | | | | Sum |
|---|---|---|---|---|---|---|---|
| | | at least once every day | at least once every week | at least once every month | once several months | less than once last year | |
| Household Income Groups(yuan/year) | below50,000 | 22.90% | 37.70% | 16.50% | 15.80% | 7.00% | 100.00% |
| | 50,000-100,000 | 15.60% | 40.00% | 19.40% | 21.10% | 3.90% | 100.00% |
| | 100,000-200,000 | 13.30% | 33.70% | 19.90% | 22.30% | 10.80% | 100.00% |
| | above200,000 | 8.70% | 17.30% | 26.90% | 25.00% | 22.10% | 100.00% |

Source: primary survey data

An ANOVA test is conducted on comparing the evaluation of the general impact of rail transit on their lives of different groups. Robust Tests of Equality of Means is checked and shows a significant difference among the four groups in general. Planned Contrast Tests reveal that evaluation of the lowest income group is significantly lower than the rest ($p$=0.000), and that of the mid-low income group is also significantly higher than the mid-high and highest income group ($p$=0.073). By plotting the data below in *Figure 7* it shows a quadratic trend. The mid-low income group exhibits the highest evaluation towards the transit impact on their lives, while the lowest income group exhibits the lowest evaluation.

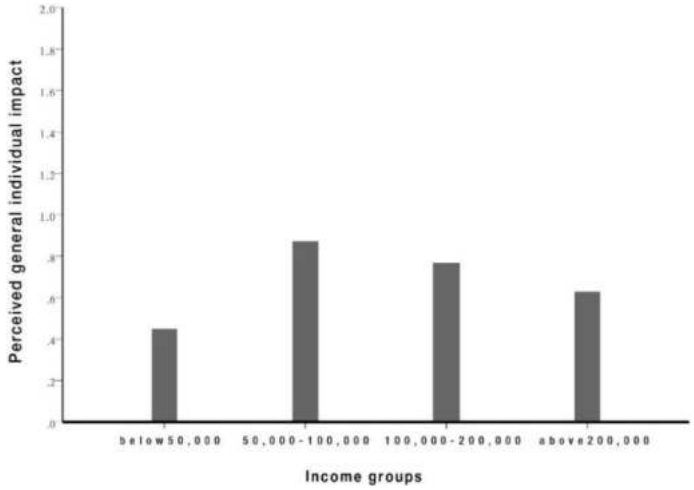

Figure 7: perceived general individual impact of transit among different income groups

Source: primary survey data

### 4.3 Multivariate analysis of separate aspects

In order to find the difference among population groups in the two facts of questionnaire study, which are perceived transit effect and individual impact, MANOVA analysis was adopted first. The MANOVA analysis was conducted on all variables together, aiming to count in any combined effects among variables. Furthermore, to break the linear combination in more detail, a discriminant analysis is carried out following the significant MANOVA, to detect what exactly distinguish the groups.

### The perceived effect of rail transit

In the MANOVA analysis, using Pillai s trace, there was a significant differentiation groups on perceived rail transit effect by a linear combination of Q23, Q25, Q36, Q37, Q38, Q39, Q40, Q41, Q42, Q43 and Q44. The following discriminant analysis revealed three discriminant functions as shown in *Table 4*. The first explained 60.7% of the variance, canonical $R^2$= 0.068, whereas the second explained 25.1%, canonical $R^2$=0.028. In combination these discriminant functions significantly differentiate the income groups *(p=0.000)*. After removing the first function, the rest functions also significantly differentiate the income groups (*p=0.062)*.The correlation (see *Table 5*) between outcome variables and the discriminant functions revealed that Q25, Q23, Q39, Q40 loaded highly onto the first function, and Q43, Q41, Q42, Q44, Q36 loaded highly onto the second function.

Table 4: Eigenvalues: perceived transit effects of different income groups

**Eigenvalues**

| Function | Eigenvalue | % of Variance | Cumulative% | Canonical Correlation |
|---|---|---|---|---|
| **1** | .068[a] | 60.7 | 60.7 | 0.253 |
| **2** | .028[a] | 25.1 | 85.8 | 0.166 |
| **3** | .016[a] | 14.2 | 100 | 0.126 |

Table 5: Structure matrix: perceived transit effects of different income groups

**Structure Matrix**

| Perceived transit effect | Functions | | |
|---|---|---|---|
| | **1** | **2** | **3** |
| Q25 Living cost | .761* | -0.320 | 0.208 |
| Q23 Property price | .645* | -0.095 | -0.291 |
| Q39 Neighborhood safety | .527* | 0.115 | 0.173 |
| Q40 Employment opportunity | .476* | 0.338 | -0.172 |
| Q43 Community harmony | 0.466 | .571* | 0.320 |
| Q44 Daily commuting convenience | 0.239 | .549* | -0.296 |
| Q41 Commercial and service facilities | 0.378 | .516* | 0.223 |
| Q42 Community population change/ floating population | 0.278 | .492* | 0.298 |
| Q36 Land development, urban image and open space | 0.314 | .374* | 0.286 |
| Q37 Pedestrian environment | 0.294 | 0.048 | .401* |
| Q38 Noise | -0.041 | -0.054 | -.100* |

In *Figure 8*, the group centroids and function plot showed that Function1 variables Q25, Q23, Q39 and Q40 significantly discriminated the lowest income Group1 from the highest income Group4, and Function2 variables Q43, Q44, Q41, Q42 and Q36 significantly discriminated the mid-low income

Group2 from Group4 and 1.

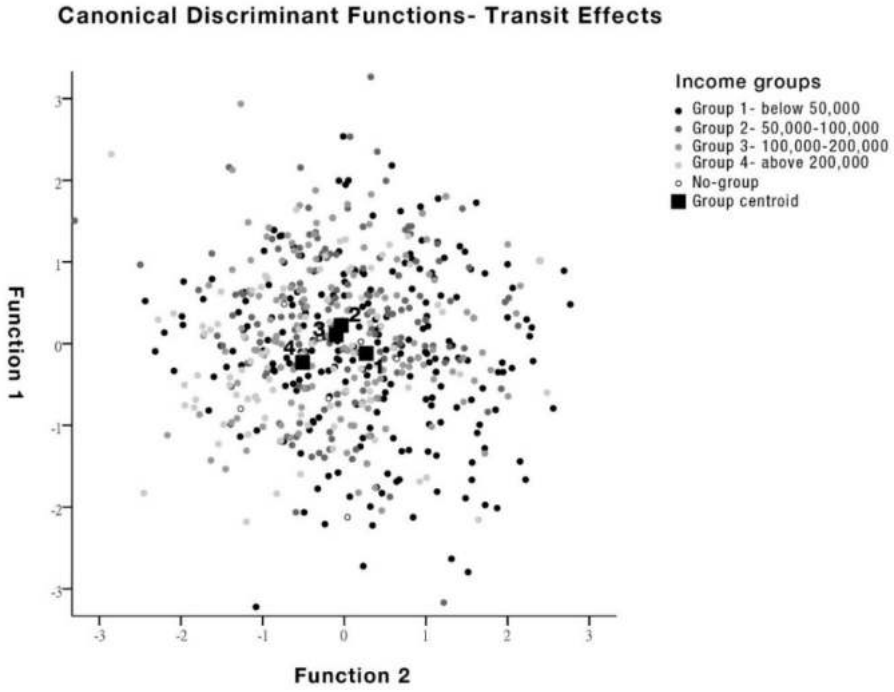

Figure 8: Canonical discriminant functions of perceived transit effects

## The impact on individuals

Similar statistical analysis process was conducted on outcome variables of individual impact and importance of transit effects. MANOVA analysis suggests there was a significant differentiation ($p$=0.000) among income groups by a linear combination of Q20, Q22, Q26, Q28, Q29, Q30, Q31, Q32, Q33, and Q34. The following discriminant analysis revealed three significant discriminant functions. (*Table 6*) The first explained 84.5% of the variance, canonical $R^2$= 0.267, whereas the second explained 12.2%, canonical $R^2$=0.039. The correlation in *Table 7* between outcome variables and the discriminant functions revealed that Q20, Q22, Q30, Q31, Q29 load highly onto the first function, and Q26, Q34, Q33 load highly onto the second function.

Table 6: Eigenvalues: individual impacts and importance of transit effects of different income groups

**Eigenvalues**

| Function | Eigenvalue | % of Variance | Cumulative% | Canonical Correlation |
|---|---|---|---|---|
| **1** | .267[a] | 84.5 | 84.5 | 0.459 |
| **2** | .039[a] | 12.2 | 96.7 | 0.193 |
| **3** | .010[a] | 3.3 | 100.0 | 0.101 |

Table 7: Structure matrix: individual impacts and importance of transit effects of different income groups

**Structure Matrix**

| Individual impacts of some transit effects or importance of some changes caused by transit | Functions | | |
|---|---|---|---|
| | 1 | 2 | 3 |
| Q20 Impact of property price rising | .780* | 0.322 | -0.111 |
| Q22 Impact of living cost rising | .651* | -0.362 | 0.178 |
| Q30 Importance of employment opportunity increase | -.381* | 0.272 | 0.373 |
| Q31 Importance of commercial and service facility improvement | .329* | -0.057 | -0.267 |
| Q29 Importance of neighborhood safety improvement | .205* | -0.111 | -0.062 |
| Q26 Importance of land development/urban image/open space improvement | 0.009 | .560* | 0.125 |
| Q34 Importance of daily commuting convenience improvement | 0.223 | .392* | -0.08 |
| Q33 Importance of community harmony improvement | -0.013 | .210* | -0.198 |
| Q32 Impact of community population change/floating population increase | 0.238 | -0.063 | .715* |
| Q28 Impact of noise | 0.012 | 0.004 | -.173* |

In *Figure 9*, the group centroids and function plot showed that Function1 variables Q20, Q22, Q30, Q31 and Q29 in combination discriminated the lowest income Group1 from the highest income Group4, and Function2 variables Q26, Q33, Q34 in combination discriminated the mid income Group3 (and Group2) from Group4.

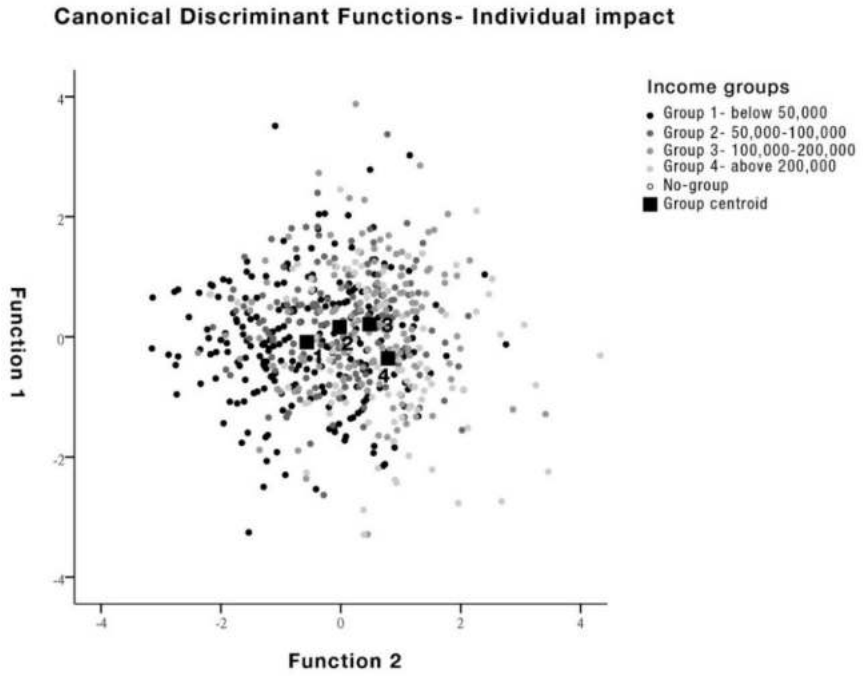

Figure 9: Canonical discriminant functions of impacts and importance of transit effects

## 4.4 Results

Derived from the MANOVA and discriminate analysis results, variables in the two facets that are perceived transit effect and evaluation of individual impacts and importance of transit effects,

respectively formulate two similar functions. The two kinds of functions in each facets have similar models to distinguish difference income groups. Variables that consist the two functions are presented with black and grey backgrounds in the table below. *Table 8* shows a correspondence of variables of the same function in the two facets.

Variables of Function1 can be amalgamated as `critical issues of living` affected by the rapid rail transit system. Property price, living cost, safety and local employment opportunities together form a linear combination and significantly distinguish the lowest income group from the highest one, in terms of both perceived transit effects and individual impacts. Secondly, variables of Function2 can be described as `further requirements influencing living standard` . Community harmony, daily co convenience, commercial and service facilities, community population change and floating population, urban image and open space form a second linear combination, which significantly differentiates the middle income groups from the highest income group.

Table 8: Variables of two discriminant functions to distinguish income groups on two facets of questionnaire study

| **Perceived transit effects in this area** | | **Individual impacts or importance of changes caused by transit effect in this area** | |
|---|---|---|---|
| Q23 Property price | Function 1 | Q20 Impact of property price rising | Function 1 |
| Q24 Property rent | Delete | Q21 Impact of property rent rising | Delete |
| Q25 Living cost | Function 1 | Q22 Impact of living cost rising | Function 1 |
| Q36 Land development, urban image and open spaces | Function 2 | Q26 Importance of land development, urban image and open space improvement | Function 2 |
| Q37 Pedestrian environment | Not significant | Q27 Importance of pedestrian environment improvement | Delete |
| Q38 Noise | Not significant | Q28 Impact of noise | Not significant |
| Q39 Neighborhood Safety | Function 1 | Q29 Importance of neighborhood safety improvement | Function 1 |
| Q40 Employment opportunity | Function 1 | Q30 Importance of employment opportunity increase | Function 1 |
| Q41 Commercial and service facilities | Function 2 | Q31 Importance of commercial and service facilities improvement | Function 1 |
| Q42 Community population change/floating population | Function 2 | Q32 Impact of community population change/floating population increase | Not significant |
| Q43 Community harmony | Function 2 | Q33 Importance of community harmony improvement | Function 2 |
| Q44 Daily commuting convenience | Function 2 | Q34 Importance of daily commuting convenience improvement | Function 2 |
| Q45 Weekend travel convenience | Delete for multi-collinearity | Q35 Importance of weekend travel convenience improvement | Delete for multi-collinearity |

Below in *Figure 10* and *Figure 11*, difference among the groups of the two facets are explained below respectively in the two Functions. In *Figure 10*, Function1 variables named `critical issues of living` are plotted. It shows consistence of variables between the above two facets. For individual impact of property price and living cost rise, evaluation of the lower income group is much more adverse than the higher income group. Though appraisal on the safety effect of transit in the catchment area by lower income group is also much higher than the higher income ones, their demand of safety in surrounding area is lower than others, as well as need of commercial facilities and service. Especially, evaluation of on perceived transit effect on local employment increase by lower income group is much higher than higher income groups. However, they also express much higher importance of local employment increase to them than the higher income ones.

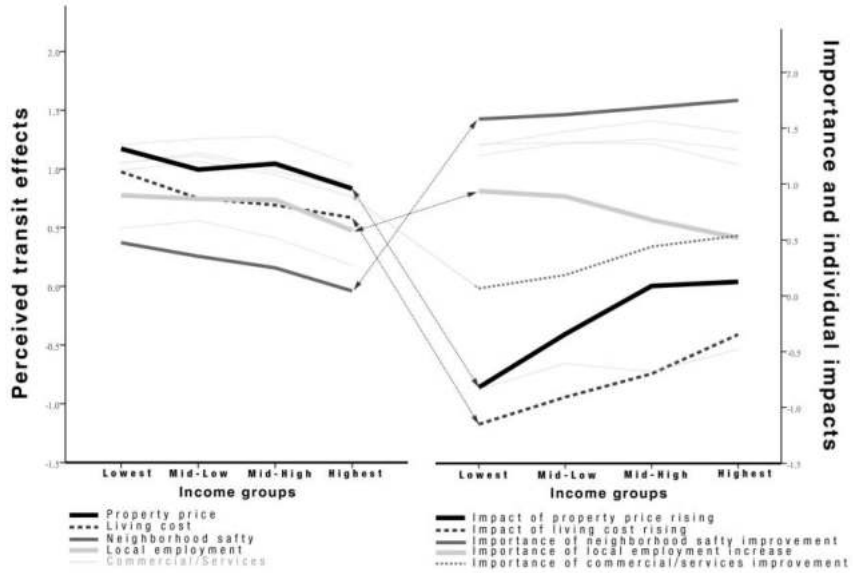

Figure 10: Function1 variables `critical issues of living`

In *Figure 11*, Function2 variables named `further requirements influencing living standar` plotted. It also shows consistence between the two facets. On commuting convenience, the lowest income group shows the least importance of commuting convenience to themselves. However, the mid high income group exhibits the highest importance of commuting convenience to themselves. What need to notice is a sensitive issue as the community population change and floating population increase in this area. The lower income groups exhibit more awareness of this aspect caused by the transit-lead development and acclaimed to receive the most adverse impact of it.

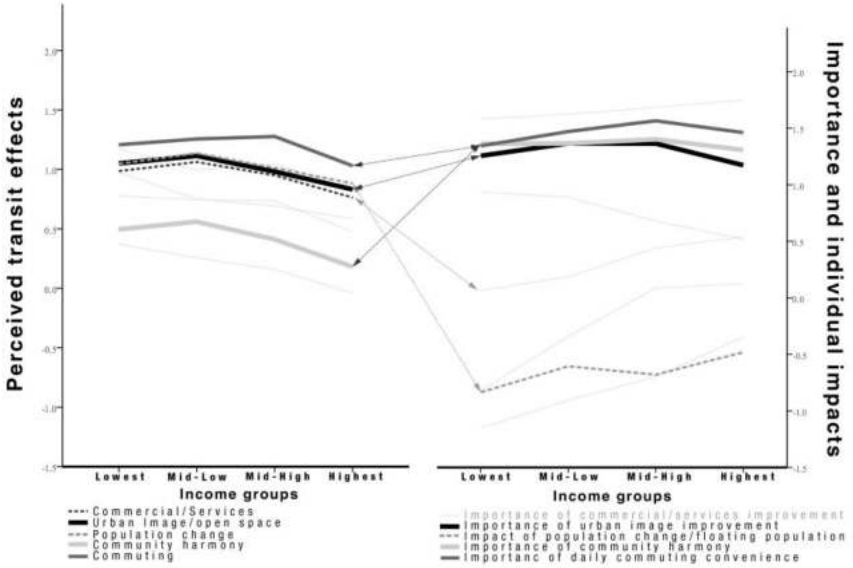

Figure 11: Function2 variables `further requirements influencing living standard`

As a result, the lowest income group generally exhibits comparatively higher level of sensitivity towards the transit effects on all the aspects above, as shown in Perceived transit effects in both Function 1 and 2. But in Function1 critical issues of living , impact of these changes on themselves are often much worse. However, for the mid low income group, their evaluation of perceived transit effects is the highest in Function2 further requirements influencing living standard . Meanwh mid high income group also exhibits the highest importance to themselves in Funtion2 variables. Also to be surprised, the highest income groups exhibits the lowest evaluation on perceived transit effect on nearly all aspects in both Function 1 and 2, although importance of some issues to them are much higher, especially those in Function2 variables.

## 5. Conclusion

Many researches put forward the argument that benefits are often distributed disproportionately among population groups, especially between the users who benefit from the use of a transport system and the affected who bears the adverse impacts. (Feitelson, 2002)There is also a substantial body of evidence suggesting that the low-income group bears the most adverse impact of new infrastructure investment. Often, however, the argument that people can be distinguished as the users and the affected are predicated on the assumption that the usage of that transport facility depends on the privilege of access. It can mostly be applied in circumstances of transport investment such as roads construction.

However, as for public transport investment such as rail transit system, this research finds that there is no viable dichotomy of population groups such as users and affected, depending on who benefits or loses. The users do not necessarily enjoy the benefits. In fact, the most frequent users can be those who are most adversely affected at the same time. As they often don t belong to the social advantage class, they depend more on public transport for their travel. As shown in *Table 3* of transit use frequency of each group, in comparison the lowest income group has much higher transit use frequency than the higher income groups daily and weekly. Although they can live near the transit station and enjoy the access advantage, they also suffer from the adverse impacts of the rail transit. Their scanty benefit from travel convenience is diluted by the adverse impacts they bear. The lowest income group exhibits the lowest evaluation of transit impact on their lives. It makes the benefit and compensation issues more complicated.

Meanwhile, the argument that assume poorer people receive more adverse impact is also predicated on a flimsy understanding of what aspects impact contains. It overlooks a threshold of equal benefit distribution of the transit system. The threshold is the demographic characteristic of income. The effect of rail transit tends to benefit a certain group of people most, as it does among locations. While the research result indicates the lowest income group receives the worst regeneration effect from the transit system, arguably, the mid-low income group are not so badly affected by the adverse impacts such as land and property value uplift. In fact, they exhibit positive attitudes towards the transit effects and the highest general evaluation of the transit impacts on their lives. Thus they can be said to benefit most from the transit investment. Meanwhile, the highest income groups exhibits receiving the least

benefit on all the aspects. The benefit distribution for them is not equal either.

In order to explore why the lowest income people benefit least from the transit, in a cross-tabulation of income groups and where people coming from, the proportion of migrants is much higher in lower income groups. The migrants of the lowest income group, who mostly come from the countryside and don t own property in the city, bear the adverse impact of property value uplift around the station. At the same time, the old residents of the lowest income group, though with proximity to rail transit stations, lack the competence required by the increased employment opportunities. With land redevelopment around the station, increased jobs are mostly either low level service jobs in restaurants and shops, or high level office jobs. Being not capable of taking the new office jobs, the old residents are also reluctant to take the service jobs which are considered by themselves more suitable for rural migrants. Combined with their economic constrains, many old residents would rather take the subsistence allowances from government than seek a job far outside their living area. This is why their commuting need is largely reduced. Therefore, although the lowest income group are quite acknowledged of transit effect, they also express their benefit are quite limited.

This research suggests that regeneration effect of transit system cast different social impacts across locations and populations. The expected results varies greatly from area to area, influenced by locational factors. Moreover, disparate individual impacts tend to aggregate among certain kinds of people. It exerts worse or better impacts on certain groups of residents in certain areas. These aggregations can trend, which potentially causes social inequity problems.

# Highway investment planning: Why CBA scarcely affects the prioritization of projects in Norway

Tore Sager
Department of Civil and Transport Engineering,
Norwegian University of Science and Technology (NTNU)
tore.sager@ntnu.no

**Keywords:** Cost-benefit analysis, Road planning, Prioritization

***Abstract:*** *It is well documented that the benefit/cost ratio is virtually uncorrelated to the likelihood of a Norwegian classified road project entering the list of projects selected for investment in the National Transport Plan. All candidate projects are cost-benefit analysed, so the parliamentarians have the information required to take social net benefits into account, should they want to. As the politicians have requested the cost-benefit analyses, their modest use of the results calls for an explanation. The paper describes the steps of the priority setting process, and for each step outlines procedural characteristics and political mechanisms that have the effect of pushing the results of cost-benefit analysis into the background. The points dealt with are of a general nature and do not pertain only to Norwegian conditions. For example:*

- *Perverse incentives: Local influence is not related to responsibility or cost coverage*
- *Agencies expected to give professional advice may be too keenly listening to political signals*
- *Equal allocation of projects to various counties trumps implementation of the economically best investments*
- *Choosing the project with the highest benefit/cost ratio is supplemented by so many other assessment criteria that the difference between professional and political judgment is dissolved*

*The prioritization effect of the formidable revenues to the Norwegian state from oil and gas production, is also considered.*

## 1 Introduction on cost-benefit analysis in Norwegian national transport planning

It is well known and documented that economic net benefit to society plays a very modest role in setting priorities among investments on classified roads in Norway (Eliasson et al. 2014, Odeck 2010, Sager and Sørensen 2011, Welde et al. 2013). Correlation of 1 between the size of the benefit/cost ratio of projects and their likelihood of entering the list of prioritized investments in the National Transport Plan (NTP) would be unreasonable, as it would be an indication of technocratic and bureaucratic power strong enough to make parliamentary politics virtually superfluous. A certain positive correlation between the result of a project s cost-benefit analysis (CBA) and its appearance on the list of selected investments could however be perceived as reasonable from a democratic point of view. The positive correlation would indicate that the Directorate of Public Roads puts a certain weight on the analyses for which it is responsible. Instead, the factual situation is that a positive correlation has not been found. Surely, the politicians take into account some of the benefit items included in the CBA, especially time savings and reduced number of traffic accidents, but the aggregated consequences measured in monetary units means little to their priority setting (Odeck 2010). Eliasson et al. (2014: 2) survey the varying degree of CBA-influence on the prioritization of road projects in several countries of Western Europe and the Americas.

The Norwegian experience is the point of departure for the present paper, which explains how characteristics of the planning and decision-making process can lead to low emphasis on economic outcome. The process starts with the local project proposals put forward by municipalities and counties, continues via project assessment in the regional and central offices of the Norwegian Public Roads Administration (NPRA), and moves on via the political adjustments of the Ministry of

Transport and Communications (MoT), to the final political comments and subsequent decisions made by the Storting (Parliament).

In 2010, 17 200 km of formerly classified roads were converted to county roads. The remaining classified roads are European highways, main connections with neighbouring countries, or important roads between provinces. On matter pertaining to classified roads, the NPRA is under the direction of the MoT. The list of prioritized investments on the national road network is worked out by the Directorate of Public Roads every fourth year. It is an important part of the transport administ common proposal for the National Transport Plan, which is handed over to the MoT for political treatment. The big difference between what the results of the cost-benefit analyses suggest, and the actually proposed investments, emerges during the NPRA s work on priority setting; that is, pre the political treatment of the NTP at the national level. It is therefore a point of discussion whether the recommendations of the Directorate of Public Roads are sufficiently freely given on a basis of professional knowledge and research.

The National Transport Plan presents the Government s visions and plans for the transport se the coming ten-year period; it is a rolling plan that is revised every fourth year. Proposed investments are listed each time, and unfinished road projects from the previous list are included in the next one. Nearly all candidate projects are economically assessed using CBA. The Storting has instructed the NPRA to prepare such analyses in accordance with guidelines from the Ministry of Finance (Direktoratet for økonomistyring 2014, Finansdepartementet 2014).

The priority setting among road projects in the NTP discloses some features deserving critical debate. First, the national politicians in the Storting (the Parliament) have a clearly stated aim of steering strategically at the coordinated and superior level. It is not clear, however, which principles of priority setting make up their platform, and whether they stick to principles and criteria at all. Second, the transport bureaucracy loyally complies with the political demand for cost and benefit estimates for every investment project in the network of classified roads, but without demonstrating the importance of these calculations in its own selection of recommendable projects. The Directorate of Public Roads recommends instead an investment portfolio that seems partly politically motivated and rests in part on professional considerations that are foreign to CBA.

The purpose of the cost-benefit analysis is not to tell the decision-making authority what to do. The analysis does not provide a complete foundation for making political decisions, and it should not aim to do so. The aim should be the more modest one of informing the politicians of which planning alternatives are the best, seen from the economic point of view. It seems reasonable to claim that the list of selected road projects should reflect that net benefit to society is an important consideration, as this importance has been laid down repeatedly by the MoT and by the Storting s standing Committee on Transport and Communications (Samferdselsdepartementet 2014: 12, Transport- og kommunikasjonskomitéen 2013: 54). Nevertheless, it cannot be demonstrated that CBA has got a breakthrough in practical politics judging from the four white papers on national transport plans that have been published since year 2000.

It could be regarded as bureaucratic steering if priority setting in the NTP was in line with a technical or economic criterion, for example, the benefit/cost ratio. On the other hand, political arbitrariness can be suspected if neither professionals nor lay people are able to identify the criteria sustaining political decisions. CBA can just as other analytical evaluation methods be given a comprehensive and technically complicated design making it very hard for politicians and the general public to grasp how results are generated. However, without publicly known criteria, the choice processes taking place in the heads of decision-makers will be just as inaccessible as the algorithms of a formal model. Black-box problems can be caused both by extended use of mathematical modelling and by diffuse subjective decisions. In both cases it is difficult for interested groups and individuals to get involved in meaningful ways, and the legitimacy of the political decisions is weakened.

The following sections describe the decision process and show that downgrading of CBA-results takes place even before the candidate list of road projects reaches the Ministry. It is then argued that the Norwegian state s ample oil revenue is an unlikely explanation for the low CBA influence. In the search for alternative explanations, the remaining sections analyse political signals, process characteristics, and critique of CBA.

## 2 The planning and decision-making process for investments in classified roads

This section follows the prospective road projects from local politicians, via bureaucrats and planners, to politicians at the national level. Planners at various levels of the bureaucracy affect the selection of road projects by contributing to the political agenda; for example, by making traffic forecasts identifying future congested areas, by reporting on serious lag in road maintenance, and by estimating the extra costs to private business due to traffic jams. Planners also gain power from describing and evaluating possible investment projects. The portrayal of strong and weak sides can attitudes to the project. The politicians also form the agenda of the day. They affect priority setting by deciding on the goal hierarchy that planners must take into account, and obviously by allocating money to projects. The balance of professional and political knowledge and the interplay of bureaucratic and political power are essential for the priority setting of the NTP.

Political signals about important themes and planning tasks are emitted very early in the national transport planning process, as guidelines from the Ministry of Transport and Communications. These are general instructions that are unrelated to particular projects. Far more concrete and project-oriented preferences are expressed by local actors at the level of municipalities and counties. The need for uniform road quality over longer distances and the wish for road capacity matching the traffic volume and corresponding to road guidelines and standards, are much used reference points for new project proposals. The counties in a region can find it opportune to launch common demands and proposals. Counties and municipalities often get involved in the planning through a Regional Transport Forum or an interim board working for improvement of the road standard in a particular corridor crossing several municipalities or counties.

The five regional offices of NPRA convey wishes from local political actors and put forward ideas of their own. The Directorate of Public Roads receives proposals from the regional offices about which road projects to include in the National Transport Plan. The CBAs conducted by the regional offices of NPRA or their hired consultancies are checked and controlled for inconsistencies as part of the assessment process. Ideas for new projects are seldom launched by the central offices of the road administration. The Directorate makes a list of prioritized road projects based on the local input. The list is an important part of the transport administrations common proposal for the

The list of recommended projects on classified roads is submitted to the Ministry of Transport and Communications. The MoT adjusts the list according to all the political considerations that have to be made by the Government. The Ministry also requests comments on the proposal from the counties and the four biggest city municipalities. The Government s NTP is sent as a report (white paper) to the Storting. This is common procedure when the Government wants to raise a matter in the Storting without a draft resolution. The white paper is handled politically by the Storting s standing Committ on Transport and Communications. The Committee aims to visit all counties to prepare for its deliberations on the NTP. The politicians thus have extensive local information to their disposal, in addition to expert analysis, when considering the plan and making budget decisions later on. Extra input is received through open hearings organized by the Committee, in which 74 organizations and political bodies aired their views on NTP 2014-2023. All the largest political parties are represented in the Committee and comment on the plan. Comments and recommendations are put forward in a report to the Storting.

The full Storting debates the report on the NTP and votes over the proposed comments to the plan. It is not voted over the NTP itself, though, as it is the Government s plan and no Storting can nevertheless ask the Government to change the economic frame of the plan or to

distribute funds in a different way, as the Progress Party proposed during the parliamentary debate in 2013. Usually, the elected representatives also advance several so-called loose proposals to the matter , drawing attention to actions which the Storting should ask the Government to implement in the planning period. No loose proposals passed in 2013, not even any of the 27 proposals that were listed in the report from the Committee on Transport and Communications. The only proposal that passed under the Storting s treatment of NTP was that Report no. 26 to the National Transport Plan 2014-2023 is enclosed with the minute book .

It is not up to the parliamentarians to pass or discard the Government s trans investments in the NTP are not formally approved until funds have been allocated over the national budget, or a motion about road tolls has been carried by the Storting. Moreover, the Storting can comment on the plan and put forward requests and appeals to the Government, which may send strong signals about the action plans to be made for each transport sector to follow up the NTP. The Storting s political discussion of the National Transport Plan is therefore an importa priority setting for projects in the network of classified roads.

## 3 Marginalization of CBA takes place in the pre-Ministry stages

It is important to the overall argument of the paper that the downgrading of the CBA-results does not start with the Ministry s political work on the NTP, but is well under way much earlier in the process, already when the regional offices of the NPRA adopt many of the project suggestions from local politicians.

Surely, the Ministry of Transport and Communications may expand the road investment budget compared to the economic framework on which the Directorate s recommendations are based (Martinsen et al. 2010: 8). In the current plan, NTP 2014-2023, the increase is due to new rules for VAT calculation and, moreover, the fact that detailed planning of some projects revealed underestimation of costs. When the budget ceiling is lifted, many projects will be supplied with more money in the Government s plan than in the proposal from the transport administrations, few will suffer small cuts and thus slower progression. With changes of this kind, the Government makes certain economic reallocations, while the social profitability of the project portfolio stays virtually the same as in the proposal from the Directorate.

It is, by and large, the same set of road projects that is proposed by the Directorate, considered politically by the Ministry, sent to the Storting by the Government, and funded by the parliamentary majority. The consistency between the prioritizations of the road bureaucracy and the Government can be documented for the planning period 2014-2023. This is done by comparing the maps showing the location of the projects on classified roads in the transport administrations proposal and the Government s plan (Samferdselsdepartementet 2013: 248-249, Sekretariatet for Nasjo transportplan 2012a: 182-183). Protection against avalanche and landslide is specified as a separate category in both sources, which is useful, as a significant part of the differences between recommendation and final plan pertains to such projects. The maps in the Government s plan display 155 projects on classified roads, of which 24 are of the protection kind.

In order to underpin the statement that the national Government tends to make only small changes in the investment proposals from the Directorate of Public Roads, the following demands should be satisfied:

- The maps in the proposal and the final NTP show almost the same set of projects; that is, the Ministry discards only a small number of the projects recommended by the Directorate, and it includes few new ones.
- Nearly all projects that are included in the Directorate s proposal only under framework (main budget alternative plus 45 %), must be selected by the Government for start-up in the second part of the planning period (that is, 2018-2023).

- Nearly all projects recommended by the Directorate even within a narrow economic framework (the main budget alternative), must either be under construction already or be planned by the Government for start-up in the first part of the planning period (that is, 2014-2017).

Comparison of the maps marking the location of the Directorate s and the Government s projects respectively, shows that the number of projects that enter or leave the list of prioritized road projects is less than 4 % of the total. The share of projects proposed by the Directorate even under a narrow framework, but still placed late in the planning period by the Government, is around 8 % (13 projects). More than half of this share (8 projects) protects against avalanche or landslide. In the NTP white paper, projects of this kind are more frequently moved to the second part of the planning period than other types of projects. Six projects that were prioritized by the Directorate only in the case of a wide budget limit, are nevertheless planned by the Government to be started in the period 2014-2017. Thus, this goes for less than 4 % of the total set, and none of the projects are of the protection kind.

It can be concluded from these quantifications that the set of prioritized projects on the classified road network undergoes only small changes on its way from the Directorate to the Storting via the MoT. It is by no means self-evident that the technical-economic experts and the politicians should make very similar judgments as to which road projects deserve priority. The results above thus justify a closer look at the relationship between the Ministry and the Directorate in a later section.

Each regional office of the NPRA is allotted an economic framework, which the regional NTP coordinator can fill up with desired road projects. Consequently, the Directorate of Public Roads can construct its list of prioritized projects on classified roads mainly by adding up the five regional lists. The Directorate does not have to remove many suggested projects to prevent breaking the total budget limit decided by the MoT. Available data does not allow quantification of the alterations made by the Directorate to the regional lists, as these lists are not made public. Based on interviews with project managers and the regional NTP coordinators, Strand et al. (2015: 10) nevertheless infer that the central level [the Directorate] makes only small changes in the regional propos that the portfolio of prioritized road projects is not changed much throughout the planning and decision-making process starting with the political-technical proposals generated locally, and ending with the set of projects receiving state funding.

Influence runs in both directions between the actors at the local and national levels. This section nevertheless indicates that the local level, represented by municipalities, counties, and the regional offices of the NPRA, holds a strong position in the planning process leading up to the final selection of road investments in the NTP. The judgment of the Norwegian Productivity Commission is that the decision-making system seems to have a weakness, in that it does not clearly lay down that unprofitable projects desired by special often local interests, should not be built (Produktivitetskommisjonen 2015: 364). The local level is powerful even if the NTP portfolio is made up of projects on classified roads including European highways; that is, roads satisfying national needs. Some consequences of the national politicians and the national competent a willingness to comply with local interests and demands are discussed in a later section.

## 4 Does the abundant petroleum income cause indifference to CBA-results?

The extraction of oil and gas from the North Sea has given the Norwegian state huge revenues and permitted the build-up of the Government Pension Fund Global, which exceeded 7 000 billion NOK by the first half of 2015. One might suspect that the good financial situation is what makes Government and Storting downplay the criterion of maximizing the benefit/cost ratio when selecting road investment projects. The idea is that the country is so materially well off anyway, that it does not matter much if politicians place political, social, and unpriced environmental benefits above the realization of economic gains. A more specific hypothesis is that Norwegian politicians at the national level do not have to set aside the many projects with negative expected net benefit to society, as enough money can be allocated over the national budget to implement both the profitable and the

unprofitable proposals. Generous budgets diminish the need to set priorities and can weaken the incentives to top-rank the most cost-effective projects. It is necessary to scrutinize this idea in order to motivate for the subsequent discussion of alternative explanations of the modest weight given to CBA-results.

In this context, it is essential to know that the Storting has restricted the transfer of petroleum income from the Fund to the national budget. All political parties except the rightwing Progress Party voted for the Budgetary Rule of 2001, according to which a maximum of four per cent can be allocated to the national budget yearly. This corresponds to the Fund s effective rate of return, which has averaged 3.7 per cent annually since 1998. Even if the limit prescribed by the Rule has been somewhat overstepped in several years, the current rightwing government with a Minister of Finance from the Progress Party transferred only 2.33 % in 2014 and is budgeting with 2.9 % for 2015. This means that one in nine NOK spent by national and local government this year is transferred from the Fund (Ministry of Finance 2014: 9). The arguments below give reasons to doubt that the prosperity of the state is the crucial variable explaining the Norwegian reluctance to invest in roads according to CBA-results.

First, as far back as the second half of the 1980s, when income from the Norwegian petroleum sector was modest, investment priorities were not set in accordance with the benefit/cost ratio. Odeck (1991) studied the selection of road projects for the Norwegian Road and Road Traffic Plan 1990-1993. The projects were assessed politically in the late 1980s and were located in six counties from the eastern, western and northern parts of the country. It is known that the distribution among counties of state funds for classified road investments was influenced much more by regional politics and fairness than by CBA-results (Elvik 1995). But the internal priority setting of each county was expected to be relatively disconnected from distributional politics and thus thought to give more room for priority setting in line with CBA. Nevertheless, for candidate road projects in each county, the conclusion was that the probability of being selected for the plan did not increase with higher value of the benefit/cost ratio. Net economic benefits to society thus turned out to be held in low political regard even when Norway had barely begun to harvest the riches of the North Sea reservoirs. By 1988, the state s net cash flow from the petroleum sector had exceeded 50 billion 2011-NOK annually for only seven years (Norwegian Government 2012).

Second, use of petroleum revenue has not raised the standard of Norwegian roads to a quality level from which further improvement will add little economic welfare. The density of the network and the percentage of roads with motorway quality are among the lowest in Europe (IRF 2014). The Norwegian network of classified roads has undergone a long period of deterioration. Sund (2012: 29) shows that it will cost around 25-40 billion NOK to eliminate the maintenance backlog. Furthermore, NPRA s cost estimate is 1000 billion NOK for bringing the entire classified road network up to the quality prescribed by the highway standards and specifications, in addition to implementing the most significant shortenings of classified routes and the building of important bridges to substitute ferries (Statens vegvesen 2015: 7). The upgrading would take more than thirty years with the current rate of investment. The marginal net benefit of proposed road projects is not low in general. The number of candidate projects on the Norwegian classified road network that is profitable according to CBA, is high enough to fill the entire NTP-budget for roads (Sekretariatet for Nasjonal transportplan 2012b).

Third, even an unlikely confirmation of the hypothesis that Norwegians feel sufficiently well-off to be more or less indifferent to further economic gains, would not give reason for political disinterest in CBA-results. Investment policy in line with the criterion of maximum benefit-cost ratio is only partly about accumulating extra wealth. It is to a higher extent about appropriating travel time savings and traffic safety gains. For a large part of the road projects in the NTP, these are the main components on the benefit side of the CBA-account. For a sample of 32 classified road projects in Norway, Welde (2009) found that the value of time savings and safety gains made up 70 per cent of the social benefit, but it is not known how representative this is for the full portfolio of NTP-projects. For a German sample ten times the size of Welde s, Holz-Rau and Scheiner (2011) demonstrate that the share of t savings and reduced fatality risk in total benefit varies widely with project type. Only a part of each

component is directly related to increased monetary income. A large portion of the travel time savings will not be transferred to working time. Concerning car travelling in Norway, 59 % of the trips by car take place during leisure time, and the occupancy is higher than for work-related trips (Vegdirektoratet 2014: 82). Moreover, around 80 % of the value of a statistical life in Norway does not reflect loss of income, as it is a willingness-to-pay measure including loss of welfare and quality of life (Veisten et al. 2010: 1). There is no evidence that safer travelling and faster journeys outside working hours are less appreciated in high-income countries. On the contrary, the income elasticity of the value of travel time is positive (Börjesson et al. 2012), which is also the case for the income elasticity of the value of a statistical life (OECD 2012: 69).

Fourth, Norway is not alone in giving low weight to cost-effectiveness when setting priorities in the road sector. The UK has a much smaller petroleum sector than Norway relative to GNP, but Nellthorp and Mackie (2000) still found that benefit/cost ratios did not seem to impact decisions on road investments. Nilsson (1991) reported very limited correlation between CBA-results and road investment decisions in Sweden. More recently, Eliasson and Lundberg (2012) found that the politicians in Sweden, without a significant petroleum sector, put very little weight on CBA-results when ranking road projects.

The reason why the Government and the great majority of the Storting do not want extra money for national road investment (and numerous other good purposes) to be readily available from the Fund, is the need to protect competitive industries from the higher wages and product prices that would result from increased overall domestic demand. Instead of heating the Norwegian economy by spending more oil revenue, the state weakens private purchasing power by making motorists pay around half of the investments on classified roads in user charges (Norheim et al. 2013: 16). If it were unproblematic to collect the money from another source, it would be politically futile to annoy potential voters by withdrawing nine billion NOK in road tolls from them in 2014 to improve the classified roads.

This section strongly indicates that the high income from the petroleum sector is not the main reason for national politicians' deviation from the maximum benefit/cost ratio as the criterion for selecting road projects. It is even less likely that bureaucrats and planners in the NPRA should let the alleged cash availability interfere with their professional principles for setting priorities. Yet this would be an implication of the hypothesis that oil revenue makes Norwegian politicians indifferent to CBA-results, as it was established in the previous section that the list of road projects selected for the NTP deviates little from the collection of projects proposed by the road experts. A search for other political and procedural explanations is thus required to understand the virtual indifference to cost-benefit results in the Norwegian road sector.

## 5 Political signals as reason for low emphasis on CBA-results

Public agencies with political superiors have to listen to signals from above. This applies to the Directorate of Public Roads when it considers projects on classified roads for the National Transport Plan. Even though professional independence is a main aspect of the Directorate's administration, it receives signals from the Ministry, which is the secretariat of the political leadership. It is less obvious that political signals from *below* should be influential, even if this is the case in the prioritization process of Norwegian road projects. Bottom-up signals usually express a preference for particular projects, while signals from the MoT tend to be about issues that are currently important, and about the balancing of political goals.

*Bottom-up political signals*

Consider now the early phase of the priority setting process, in which local demands and ideas are conveyed to the offices of the NPRA at the county and regional levels. Classified road projects that are singled out for implementation in the first four-year period of a revised NTP, have usually been politically deliberated as part of a municipal sector plan and been recommended by the municipal council (city council). A wide range of actors with conflicting points of view are involved in the planning processes at this stage. Projects sanctioned by the representative bodies are most often

compromises between local interests, where economic gain to society at large seldom has a prominent place.

The regional offices of the NPRA are in touch with transport politics at the local level through the common road administration in each county. On matter pertaining to county roads, the Regi Director is subordinated the county legislature. This arrangement implies that the county branches of the regional offices of NPRA co-operate with the transport department of the county administration regarding county road issues. The NPRA is the expert agency of the counties on these matters. The strategic management in each regional office receives many opinions on how the classified roads in the district should be improved in order to provide better services in interaction with the county road network. The purpose of the suggestions is often removal of bottlenecks or achieving uniform road standard over longer sections to enhance safety and smooth traffic flow.

Road plans are worked out, treated politically, and decided on in line with the Planning and Building Act. This means that responsibility for the plans lies primarily with the municipal council, implying that local government has decision power even over infrastructure meant to satisfy national needs. The exact alignment of the road is shown in a municipal sector plan, or possibly a community plan or a regional plan. Projects on classified roads are funded wholly or partly over the national budget, placing few if any obligations on local authorities and interest groups, except toll-paying motorists. The municipalities have weak motives to let net benefits to society influence which national projects they go for. They are not responsible for the project and do not pay for it. The municipality will, however, have a strong motive for maximizing local benefits. In some cases, this can be achieved by constructing bridges to substitute for car ferries; in other cases it requires costly road design, such as tunnels to avoid noise. Projects that are with a sober design defendable in terms of net benefit to society, are in some cases inflated and oversized, because the extra quality comes at zero price to local advocates (Samset et al. 2014). The costs are carried by the state or by drivers through road tolls. To the extent that municipalities and local branches of political parties influence the selection of projects on classified roads, significant differences between CBA-results and political priorities are to be expected (ibid).

In general terms, the reasons why local initiatives and decision rights pull the selection of classified road projects away from CBA-criteria are the following (Ostrom et al. 2001, Samset et al. 2014):

- Political institutions have created a kind of gift relationship in the road sector, with the state as donor and municipalities as recipients.
- To the extent that the state does not evaluate all assumptions and calculations of traffic, costs and benefits, an information asymmetry arises and favours the local recipients.
- In cases of local/national conflict of interest, some key politicians and other stakeholders at the donor side either have their own agenda (such as campaigning), or their loyalty is with the recipient rather than the donor (society).
